increases preceding ones, whence much damage may follow, and it hinders Purging, if it so happen that there be occasion for it afterwards: Therefore, as much as may be, I avoid the use of such things: Nor do I allow them to wounded persons, nor to such as are troubled with Bleeding, except such as bleed for no other cause but the thinness of blood, especially them, whose blood is corrupt. In these, unless there be manifest obstruction of the Bowels, we must use thickening Diet and Medicines. And the greatest share of such a Diet is to drink very little, because driness thickens the blood. If there be a thinness of blood without any manifest obstruction, we may use thickening Meats, and astringent and thickening both Meats and Medicines: But if there be any obstruction, it is better to use a dry Diet without thickening, and cooling, and dry Medicines: And if any Bowel also labour of a cold intemperature, we must abstain from all these things, using onely a dry Diet, as roasted flesh good and tender, and little drink; and if the case require it, we must give Potions contrary to the aforelaid, that is, hot and thin ones, that they may open. But we must place all our hopes in other Remedies, that is, in Revulsions, Frictions, Ligatures, Cupping-glasses, and then in local Medicines. I use to make a Powder of Gall, Alum, Flowers of Pomegranate wild and planted, Comfrey and Mastick, which I order to be blown into the Nostrils violently: for it presently comes to pass, by its mixture, that the Blood congeals, and violently stops the Veins, for the Blood it self is fibrous and stopping.

Vallesius,
comm. in e-
um locum.

II. S. a Clergy-man, sanguine and lusty, having been subject to bleed at his Nose from his youth, fearing some mischief thereby when he was grown up, for prevention, he stop it by hanging a certain Amulet about his Neck; whereupon he was taken with an Apoplexy, and twelve hours after he was dead, abundance of Blood ran out at his Nose and Mouth.

Hildanus,
cent. 3.
obs. 11.

III. It being presupposed, that immoderate Bleeding comes either through some fault in the Moveable or Blood, or in the containing and conveying Vessels, we say, that all Ischaïmous Medicines respect the Blood it self, inwardly indeed, inasmuch as they check Rarefaction and Ebullition, either Precipitants, earthy things of all sorts, of Coral, Blood-stone, Spodium, &c. Or tempering things, that are watery and cooling, as Water of Shepherd's purse, Plantain, Purslain, Water-lily, Frogspawn, Phlegm of Alum, &c. Or coagulating and congealing Acids, as Tincture of Roses, Violets, and acid Spirits. Thus I have cured some scorbutick persons who were frequently taken with Bleeding at the Nose, onely with Spirit of Vitriol joined with the Tincture of Violets: For Acids obtund and invert the volatile and too moveable particles, and do, as it were, fix, concentrate and hinder them from overflowing. And things that incrassate and astringe the ichorecent Blood inasmuch as it is too ferous, sharp and fluid; wherefore we may partly hope for Remedy from strengthening and tonic things, and partly from strong astringents and concentrating things: So in a manner all red Roots stop Blood, Tormentil, Bistort, *Alkanna*; *Heurnius* his Powder is excellent for Spitting of blood; Take of Seed of white Henbane, white Popy, each 1 drachm; Blood-stone, red Coral, each half a drachm; Camphire half a Scruple; Give half a drachm morning and evening, sometimes he adds *Terra Lemnia*, and with Conserve of Roses he makes an Electuary. And fixing things, the common Remedies of all Fluxions, *Laudanum opi-*

Wedelius,
de f. m. f. d. atum, &c.
p. 531.

IV. Both Revellents, and things that cause a motion the contrary way, are good outwardly. So Venæsection is conveniently made in a contrary part; So a dry Cupping-glass is set to the Nape of the

Neck, an *Arcanum* among the Moderns, Ligatures are made in the extreme parts, &c. and cooling Repellents, either actually such, or potentially, as Oxycrate. *S. Pauli Quadr. Botan. p. 508.* says, that Starch and Bole-armenick mixt with the white of an Egg, spread upon some combed flax of such a length, that it may reach beyond the Coronal Suture to the root of the Nose, if it be applied to the Vertex along the Sagittal Suture, does upon his frequent experience stop Bleeding at the Nose. A sudden Fright, as it suddenly recalls the blood from the circumference to the centre, and a *Leipothymie* supervening, stops blood. Sudden application of very cold Water, Vinegar or Ice to the Nape of the Neck, does the same. And Astringents and Compriments, as Blood-stone, and other things, as well by actual cold, as potential constriction from their Martial and earthy particles, held in the Hand or under the Arm-pits; I have known the Root of Cockle, held a little while under the Tongue, stop onely a slight Bleeding, but not a violent one. A piece of Money thrown into cold Water first, and then tied hard to the Forehead, to compress the Vessels and cool, is good.

Idem.

V. Ischaïmous Medicines, that respect the passages and pores of the Vessels, which being any way opened, it is absolutely necessary, that the blood left to it self must run out; Inwardly indeed they are the same, which we have spoken of already, Consolidants, Astringents and Agglutinants; Outwardly they are Compriments; for though the compression of the opening it self may seem onely to give momentary relief, which ceasing, the Bleeding returns, yet by this means the Lips being constantly prest, Nature may attend healing, wherefore it is a Remedy proper enough. Thus the Wound of a bled Vein is stop a whole day onely by the compression of a *Splenolus*, so the Bleeding of other Wounds is stop onely with Binding, if a Chirurgical hand can come at them. An Example hereof *Virulam* has, *Histor. Nat. cent. 1. n. 66.* in the Prince of Orange, the orifice of whose Wound was stop with Mens Thumbs for two days, other things being in vain. So some Hæmorrhagies of the Arteries cannot be fully cured but onely by Compression. And things that stop blood, upon which account the Fuz-ball is famous, wherefore *Van Horn, Microtechn.* writes, that if it be tough and soft, and cut into slices, and the slices be squeezed in a Press, they are able sufficiently to stop any Hæmorrhage, especially if some stegnotick Powder be strewed on them. One in *Grulingius, cent. 1. cur. 42.* was cured by the Powder of Egghells, wherein Chickens had been hatched. And Astringents, that are watry, austere and sharp. So pieces of a fungus growing on Birch, stop an external Hæmorrhage to a Miracle, according to *Crollius*, and things that coagulate and reduce the Blood as it were to a Crust, for it is glutinous, and another glutinous thing meeting with it as it comes out glues up the Vessels. See an Example in *Platerus, Obs. l. 3. p. 725.* of a Malefactor who had his Hands cut off, and the stumps immediately clapt into a Cock newly opened alive, upon which the blood wholly stop. Warm blood of Animals is given to People in Dyenteries for a Clyster. Or things that violently cause a Crust, whether actual or potential: *Willis* saw a most violent Hæmorrhage stop with the Vapour of the blood falling upon a red hot Iron. So Cauterization by roasting the Blood, and crisping and closing the Vessels is the last Remedy. You may refer hither the Sympathetick Powder, the blood dropping upon which, causes this astriction, but it is onely in a slight case. Or they respect the free passages of the blood, Wherefore Aperients do improperly and mediately stop blood, because they restore the Circulation of the blood, when hindered; as we often find them very beneficial in a too violent flux of the *menfes* and in other Hæmorrhagies.

Idem.

VI. To

VI. To divert the tendency of the blood from the Nostrils, it is sometimes convenient to open a Vein in the Arm or Foot: For the more blood is carried by the Arteries to the place of Venæsection, the afflux to the Nose will be the less. Yet this administration does not always so much good, but that a quite contrary effect sometime falls out, the reason is, because the Vessels being suddenly, but not sufficiently emptied, do take back again the incongruous humours before thrown out, stagnating within the Pores, whereby the blood is immediately put into a greater eruptive turbulence.

Willis.

That Venæsection in the Foot is more effectual than in the Arm for stopping an Hæmorrhagie at the Nose, I have learned from a late Example, and that repeated. Last March, in the year 1681. A Man about thirty years old, choleric and lean, had had a Quartane-ague from the preceding autumnal to the vernal Equinox: A double Tertian followed this, with tension of the *hypochondria* and of the whole *abdomen*, and a pertinacious Bleeding, rebellious to all Remedies: Blood was let in the Arm, and other things done, and nevertheless he bled still; after application of glutinous things, it ran into the Mouth, which he spate up concrete in abundance. His strength seemed to fail, what with the foregoing Fever and the loss of Blood, his Face fell and grew pale. But because the heat about his Heart was troublesome, his Pulse full and strong, and the Blood came out with violence, I ordered the most tumid Vein in his Foot to be bled, out of which the blood came full stream; a little after he fell into a sweet Sleep (which he wanted before, because his Ague-fits came in the evening) and he continued in it till night: afterwards his Bleeding and Ague both left him, he being rid of both by means of Bleeding in the Foot. I had prescribed him some opening Pills for his remaining obstructions, which he did not take, because within a few days, by the use of a good Diet, there appeared no signs of any, so that in four days after his Bleeding he was perfectly well. Another Instance offered it self at that same time in a young Man (whose name was *Frederick*) Servant to the Family of the illustrious Counts of *Waldeck*: he was *hypochondriack*, and he had been fore handled by a Quartane-ague all the Winter. When the cold season abated, which lasted till the latter end of April, he bled at the right Nostril: I ordered his right *Salvatella* to be opened, out of which the blood came full stream, his Bleeding at the Nose not abating. The blood being received in linen clothes appeared florid, not like to washing of flesh and ichorous: I also ordered a Vein to be opened in his right Foot; and about seven ounces of blood were taken from thence in Pottingers, which gave evident signs of corruption: Store of blood also ran into the Vessel, wherein the water was, which the Chirurgion could scarce stop after he had untied the fillet. The event was the same as in the former case; for both his Bleeding and Ague were stopt.

Hence you may gather, what the nature of the humour is, that causes a Quartane-ague, which onely the power of the returning Sun is able to conquer. The febrile Fire does lye as it were raked up in the Ashes, which, by the accession of such a blast, breaks out into a flame, but an innocent, yea a salutary one, which feeds on, and consumes onely its own fuel, leaving the solid parts, and the other humours untouched. It was my hap to observe this in the forefaid *Frederick's* Lord, the young Count *Waldeck*, who had patiently and obstinately endured a Quartane-ague from the preceding August. He had a wonderfull Antipathy to all sort of Physick. At length, as the Spring came on, when signs of a Cachexy and *Leucophlegmatia* appeared in his countenance, when he made little Urine, which had a large tartareous settling in the bottom of the Chamber-pot: I told him he was going into a

Droplie. He, being affrighted, admits of Pills (from which he was less abhorrent than from other Medicines made of *massa Pilul. de Sagapeno Camilli*, *Mercurius dulcis*, and *Tartarea Bontii*) and a laxative Pilsan to drink after them; which brought abundance of filthy stuff away; and the Ague, which of a simple one was become a treble one, at length was a single one again, and within a few days quite ceased. Yet the third day after his Ague went quite off, he was taken with a Diary, which ended in a Crisis; by stool, urine and sweat together, which was followed by perfect health. That is, by this last and gentle Burning all the febrile matter blazed out. But this by the way.

VII. Letting of blood is the chief among revulsory Remedies, but it ought to be drawn with a large hand and a broad hole. All Men in a manner bleed at a small hole, and in a small quantity, reckoning that Revulsion is better made so: But, that a contrary motion may be communicated to the blood, it must be acted by a more violent motion, because the more violent draws the weaker: Therefore at the larger hole, and the faster the blood runs, so much the sooner is the profluent blood drawn from the Nostrils: So that oftentimes a violent Bleeding at the Nose, without a *Plethora*, has been instantly stopt by Venæsection, celebrated in this manner. ¶ Whether must blood be let all at once, or at several times? I think, if it be let all at once, it will doe the Patient more good: for, when the blood gushes out of the open Vein all at once, quicker Revulsion is made of the blood, that would run out at the Nose.

Riverus.

Rasiniacus
conf. 2. lib. 3.

VIII. *Galen*, *s. Meth.* and many, who follow him, apply Cupping-glasses to the region of the Liver, which, that it cannot be done without danger, the following History does prove. A certain Courtier, labouring under a violent Bleeding at the Nose, made use of a Chirurgion, who, among other Remedies, set large Cupping-glasses to the region of his Liver. The blood indeed stopt, but an Inflammation of the Liver followed. I think cold Medicines should rather be applied to the Liver and Spleen, according to *Hippocrates* his advice, *s. Aph. 23.* In these places, whence blood runs, or is about to run, we must use what is cold, &c. Especially to places where the motion begins, unless there be obstructions, which would thereby be made worse; for as these things condense, astringe, and render the blood less fluid, so Cupping-glasses indeed retract the blood and spirits with violence; but because in a great Hæmorrhagie it is effervescent, it may easily be drawn by the Cupping-glasses to the Liver, and settle there.

Fab. Hildan.
nos. cent. 2.
obs. 47.

IX. A Noble Matron, fifty nine years old, having omitted letting of blood, by reason of her decay in years, was suddenly troubled with an enormous Bleeding at the Nose, the blood ran, as though she had been let blood. I prescribed cooling and repellent Epithemes for her Forehead and Neck, but she bled the faster. A Chirurgion put Tents into her Nose full of Powders to stop blood, but they were ready to choak her; and when they were taken out, she bled enormously. Her Fainting dissuaded me from letting of her blood: Therefore I set a large Cupping-glass first to the region of the Liver, and then another to the Nape of the Neck, and her Bleeding stopt immediately. This Remedy did others good. A Cupping-glass is dangerous in the beginning of an Hæmorrhage.

G. C. Win-
det. Misc.
cur. an. 76.
obs. 90.

X. It is well known that Cupping-glasses set to the Shoulders and Neck are a most excellent Remedy, yet I have sometimes observed, they have been used to the Patients detriment. A plethorick Man, who was ill of Bleeding at his Nose, by the advice of his Physician, got Cupping-glasses to be set to himself by the fire-side, and in a few hours his Bleeding increased so, that he lost several pounds of blood. I being called, order him presently to go from the fire, and that his Back be anointed with

with

with a cooling Ointment, Ligatures to be made upon his Arms, at the Elbows, and upon his Legs, at the Hams; I apply a linen cloth wet in Water and Vinegar to his Forehead, and I put some of my Powder described *lib. de Gangrena, cap. 19.* with Tents dipt in Whites of Eggs into his Nose. Hence let young Men learn, that in all Hæmorrhagies, the Body must not be heated, nor the Back rubbed with hot Clothes, nor exposed to the Fire.

F. Hildanus,
cem. 6. obs.
13.

XI. Cupping-glasses applied to the Shoulders, both dry and moist, retract the running blood from the Nostrils, but are not a Remedy altogether safe, for they may draw the blood from the lower to the upper parts, and give occasion to new Bleeding. Some let them upon the Arms upon the *Musculus biceps*, whereby Revulsion is made of blood from the Nose.

Riverius.

XII. Only arterious blood nourishes the Brain, and runs out at the Nose. Therefore Coolers and Afringents must not only be applied to the Neck behind, but before also upon the carotid Arteries.

Rislaous.

XIII. Topical Medicines must be applied to those parts, where need is of them immediately, or where the blood may be most cooled: For there, by immediate contact, if it be possible, they stop the orifices of the Vessels; but here, by intimately altering, they check the violent motion of the blood, so that, to repeat them in short, they are applied to the *Bregma*, Forehead, under the Tongue, to the Nape of the Neck, the Nostrils, Throat, to the Armpits, the right and left *Hypochondrium*, the Stones and the Soles of the Feet.

Wedelius.

XIV. The Blood does not always come from the Veins of the Head, but oftentimes from the small Vessels, that come out of the third *Sinus* of the *Cassa mening.* when they open, a very great Hæmorrhagic sometimes arises: In such Bleeding, Medicines must be applied, not to the Forehead, but to the *Vertex* and coronal Suture. ¶ In such a Bleeding at the Nose Topicks must be applied to the hind part of the Head, for the Blood ascends by the hinder *Sinus's* before it comes to the third: Therefore *Hippocrates* ordered the hind part of *Meton's* Head to be fomented with warm water, to the end the Blood might run more freely.

Bouhins,
Th. Anat.
l. 3. c. 8.

Sennertus.

XV. The Head must not be washed with cold water, unless Revulsions have gone before, whereby the blood may be drawn to the lower parts of the Body, or to the hind part of the Head: otherwise, being driven inwards by Coolers, it will fill the Veins which are within. ¶ Therefore the Bleeding will increase on this account, and because the Heat, gathered within by *Antiperistasis*, furthers the motion and violence of the blood: Or, if the blood be stoppt, a Convulsion, Apoplexy, *Parotitis*, or, the Blood falling upon the *Aspera Arteria*, a Difficulty of Breathing will follow.

Gal. 5. Met.
Med. c. 5.

XVI. Moreover this is suspected, when the Vaggar at the beginning lay a linen Cloth wet in cold water round the Neck: for there is fear, when the way is intercepted between the Heart and Brain, either an Apoplexy or a Swooning may follow.

Sennertus.

XVII. Cold things applied to the Forehead and Temples, and the Nape of the Neck, where the vertebral Arteries ascend, do a little check and repell the afflux of blood; Yet some doe ill in advising cooling Topicks to be applied to the jugular Veins: for so the Blood, being retarded in its return, will run more abundantly out at the Nose. Moreover, whereas it is usual to apply linen Cloths or a Sponge wet in Vinegar to the *Pubes* and *Genitals*, it does good upon no other account, than as tying of the Limbs, inasmuch, that is, as the reflux of the venous blood is thereby hindered.

Willis.

XVIII. Many use Ligatures, but I do not much approve of them, although *Galen*, 5. Meth. 6. propose them: for, as soon as the Ligature is loosed, it

fills the Head, for the Blood being retained under the Ligature, is made more violent, and runs to the weakest part. ¶ I do not willingly use Ligatures, both because they deprive the subject parts of spirit and blood, and because by the compression of the muscles, they seem to exagitate and impell the fluent blood. ¶ *Aesclepiades* of old condemned them, as *Scribonius Largus* writes.

Enchirid.
Med. lib. 5.

XIX. Cruel Ligatures, joined with an impetuous motion of the blood, are useless: for though gentle binding of the extreme parts and astriction of the Forehead be not insignificant to stop the Blood a little and to bind the Vessels, and upon that score also cold things, as Stones and the like, beside the *Effluvia*, which they send out, are commended, if they be held in the Hand, or under the Armpits; yet if the due bounds, which become a Physician, be exceeded, the Bleeding is so far from being stoppt, that it rather bleeds the faster.

Wedelius.

XX. Swathing egregiously stops Bleeding, which follows a Wound in the Veins; but if it be tied too strait, it easily causes a *Sphacelus*.

XXI. At length, if Bleeding continue obstinately, we must proceed to Escaroticks, which, by burning the extremities of the Veins, do cause a crust, and stop blood: Nevertheless much caution must be used about them, because, when the Eschar falls, the Veins open again, and so the Bleeding is usually removed. And, among such things, burnt *Vitriol* has the principal place, which, besides that it makes an Eschar, is most effectual to stop any Bleeding. ¶ Causticks and Corrosives, as *Sublimæ*, *Arsenick*, *Aqua fortis* and *Colcothar*, must not be commonly used, both because they irritate the membranous edges of the Wound, and also cause very violent Symptoms, and so Death it self; indeed in the beginning they close and bind the Veins, by reason of their pontick, styptick parts, but then they shew their corrosion, wherein they are prevalent, and communicate it to the part. Yet we must take notice, that some of the gentler sort, as *Colcothar*, may be used, and *Aqua fortis* sometimes, yet then it must be more in the lesser Vessels and Openings than in the larger. But we must not, as some doe, extend it to a red hot Iron.

Riverius.

Wedelius.

XXII. Some things stop blood, as Vinegar, and Spirit of *Vitriol*, in bleeding at the mouth, after opening a Vein, &c. So White *Vitriol* and *Alume* may, for the same reason, doe good, for they have a confipating faculty also. But we must not trust sharp things alone.

Idem.

XXIII. If a powder or liquor must be put into the Nostrils, let the Mouth be kept full of cold Water, especially when the Medicine has a caustick virtue in it, lest any of it might fall down through the Palate into the Mouth. And the Patient must lie backwards with his head. But if the Nostrils be stoppt, and the blood run down the Gullet, the Nostrils must be cleared, and let him hold cold Water in his Mouth.

Sennertus.

XXIV. The snuffing up of *Roses* and *Myrtles* is much suspected by me, as all other powders should be avoided for fear of Sneezing; in stead whereof the space between the Eye-brows, should rather be anointed outwardly with Oil of *Mars*.

Ferd.

XXV. Among Liquids, a solution of *Vitriol* made in Spring-water is not only chief, but may serve for all the rest. Some commend it for a great secret, and a most certain stopper of blood. Indeed, this same applied to a green wound, inasmuch as by corrugation, it closes up the extremities of the torn vessels, powerfully stops the bleeding. But this application in bleeding at the Nose, where the blood being brought to the Mouths of the Arteries, should be received by the Veins, inasmuch as it equally, or rather more, stops the Veins than the Arteries, it often does little or no good, as I have often found by experience. But indeed seeing water

ter put into the Nostril does not sufficiently stick to the Mouths of the Vessels, but is washed off by the blood, as it comes out, before it can exert its virtue, therefore it is more expedient, either to snuff up a Styptick powder, or to thrust a tent dipt in Vitriolick Water, or by it self, or filled with some astringent powder to the root of the Nose. I often use either *Crocus Martis* calcined very red, or powder of Vitriol camphorate, or the Vitriolick Soot, scraped off the bottom of a Brass Kettle, the dust whereof I have often tried with good success in this case.

Willis.

XXVI. The use of that Styptick Liqueur, which a Frenchman three years ago carried all over Europe, is at this day very well known. We have reason indeed to commend the invention in wounds made by a cut, but in a prick we find it not so beneficial. Besides, I have often found it useless in stopping of bleeding at the Nose, that is, where the sides of the wound can touch every where, it is of value; but that otherwise it is dull, the following example does shew. One was wounded in a Duel in the inside of his right Arm, a little above his Elbow; The Sword had made a large and deep wound, to the very Arm-pit, having cut the Artery also. The Chirurgeon dressed the wound till the eleventh day, when, all on a sudden, the blood burst out in such abundance, that the Patient swooned. Therefore he used the Styptick-water, which being for several days now and then injected, the blood at length stopt; but Convulsions followed, his Arm swelled, and he died the eighteenth day. When his body was opened, the Artery was then indeed found open, but the passage which the Sword had made, was stopt about the Artery, ^{com.} the clots of blood, which the Styptick-water ^{ing.} he made, so that the blood could not come out. ¶ In the year

Borrichius.

1677. in the Month of December, I saw it used for a bleeding at the Nose; whereby the blood stopt indeed, but attended with terrible Symptoms. A Maid 18 years old, a Merchant's Daughter of Geneva, by name *Voltaire*, fell into a continual Fever, she had in 24 hours two Fits; the second day she had a bilious *Diarrhoea*, with bleeding at the Nose, whereby she lost two pounds of blood that day. I was called the third day, and in my presence two Pottingers were filled, within an hours time, each of which held nine ounces: I order a Vein to be opened in the Arm, glutinant things to be applied, Linen clothes wet in *possea* to be laid round the neck, &c. When all things were in vain, and the blood ran full stream, a Chirurgeon thrust a Cotton-tent, wet in the foresaid Water, into her Nostrils, upon which indeed the blood stopt, but a violent Head-ach followed, and a great dulness at the bottom of her Forehead, and the Fever grew higher: but after bleeding her in the Foot, cupping and scarifying her in the back and loins, bleeding her with Leeches in the forehead, under the ears, and in the temples; the eleventh day the Fever, Head-ach, and oppression of her Lungs, wherewith she had been troubled, ceased. Hence it is clear a hæmorrhage may not rashly be stopt, and rather by Repellents than Stypticks.

XXVII. A tent made of the common, broad, flat, ischaimous fungus put into the hollow of the Nostrils to the place of the wound, stops all bleeding in a moment, like an enchantment. This singular administration must be observed; a tent is made of it, with this observation, that the smooth part must be turned inward, and the spongy, dusty part outward, a thread must be gently tied to the lower part, and hang out a little: thrust it into the Nostrils by degrees; If respiration be hindered thereby, then a Goose-quill may be put in the middle of the tent, and so both ends are answered.

Rolfingius,
conf. 2. lib.
3.

XXVIII. A robust and plethorick young Man, upon lying with his Wife in the heat of Dog-days, was taken with a violent bleeding at the Nose: After

having tried many things in vain, since he was in danger from the heat of his blood, I ordered him to be dipt in a Kettle of cold water; so the blood being cooled and thickened, the bleeding stopt by degrees.

Hildanus,
cent. 1. obs.
17.

XXIX. Mr. N. was subject to an hæmorrhage, till he was thirty years old, and he was grown so weak and lean, that he was very nigh death. He was at length cured by drinking Wine moderately; for he had been abstemious, and so he came to be an old Man: For he had been over much cooled by drinking of Water and Bleeding.

Borellus,
cent. 2. obs.
87.

XXX. I saw a most contumacious bleeding stopt in the most illustrious N. by the intervention of a Swoon (whereby the blood and Spirits are powerfully retracted to the inner parts.) He, when no remedies did him any good, said he had occasion to go to stool, as he arose out of his bed he swooned, out of which, after he came, the blood ran with far less violence: And after half a drachm of *Sal Prunelle* in cold water had been given him, the bleeding wholly stopt. This Remedy is propounded by *Hippocrates* 3. *Epidem.* 7. Concerning which *Galen* says, it must be observed, 5. *meth.* 5. that swooning does good onely, when the blood runs out at veins, which end in the *Superficies* of the body: for when it comes from the inner veins, as in spitting of Blood, the immoderate coming of the *Menses*, or in wounds of the inner parts, it will rather increase the bleeding; by retraction of the heat to the inwards, and to those parts whereout the blood runs.

Riverius.

XXXI. One was taken with a Bleeding, which no Medicines would stop; at length, when he was put into a great fright, it stopt. I ordered, that he should be vexed, and when he was fretted, that a great Basin, full of cold Water, should be thrown upon his Back, with a great noise: hereby he being immediately put into a Fright, the blood stopt.

Panarolus,
cent. 5. obs.
27.

XXXII. *Fab. Bartoletus* Professor of Mantua, relates, how a desperate bleeding at the Nose was stopt, to a miracle, while he was present, by a Sieve-maker, within half a quarter of an hour, onely with violent squeezing between his fingers, the interstice between his Nostrils. *Thuanus* also relates, how the desperate bleeding of a wound was stopt, *lib.* 75. *hisor.*

Rhodius,
cent. 1. obs.
91.

XXXIII. A Nobleman having been troubled with frequent and violent eruptions of blood, sometimes at the fœdal Veins, sometimes at the Nose, after several Venæsections, taking of Juleps, and cooling Decoctions, &c. at length, by taking the following Powder, a dose whereof he took in a Julep every sixth hour; Take of Male-Pœony, red Coral, Pearl, each 1 drachm, Ivory, Hartshorn, Bloudstone, each half a drachm, *Lapis Prunelle* 1 drachm. Make a Powder. The dose half a drachm. Take of Water of Black Cherries 8 ounces, Balm, *Cinnamomi hordeati*, each 2 ounces, Treacle-water 1 ounce, Syrup of Corals 1 ounce and an half, making Ligatures in certain places, as is usual, and then in others, according to occasion, both to quiet and to intercept the spasms of the Vessels, was cured quickly without any relapse afterwards. For I found the Disease to be merely, or chiefly spasmodick; for every day when he bled, his pulse was weak, his extreme parts cold, and all his Vessels fell flat, as if they had been too much emptied. Moreover, the Patient was troubled with a *Vertigo* almost continually, and a tremor of the heart, and a Swooning now and then, or with the fear of it. Truly the blood was so far from bursting out of the Vessels, through too much plenitude or turgescence, that rather on the contrary the Current of it ran so low and small, that it was scarce able to maintain the flood of Circulation. Notwithstanding (which was the very truth) he often in a day felt something in his body, to creep fast, like wind, sometime upwards, sometimes downwards, and oftentimes bleeding at the Nose, or hæmorrhoids,

N n

followed

followed the tendency of that motion; so that hence one might easily conclude, that the motive fibres of the blood-vessels, whereby they are contracted, being affected with a spasm, did inordinately hurry the blood, how low soever, thither, and now and then forced an eruption.

Willis. XXXIV. Things doe good that cause an Eschar, as *Colcothar*, by which remedy alone the most illustrious the Prince of *Orange*, was recalled from a fatal bleeding. He every day bled a vast quantity of blood at a wound which he had received in his jugular Veins, and it could be stopt by no remedies, but by a tent wrapt in a digestive, and good store of powder of *Colcothar*, which was thrust into the Wound. By *Colcothar* I mean burnt Vitriol.

Heurnius. XXXV. I have read in the Dutch History, that a wound in the jugular Vein of his Excellency *William* the First, Prince of *Orange*, was closed, by laying a finger upon it, and so the blood stopt. This artifice was, of old proposed by *M. Gatinaris*. Pressing Irons may serve instead of Fingers.

Van Horne. XXXVI. When a Man had in a fit of the Falling Sickness bit his Tongue where the Veins are large, so great a bleeding followed, that it could be stopt by no remedies, and his strength was so low, that he was ready to dye. A famous Chirurgion made a Pill of Wool, and dipt it in Goldsmith's Water, and thrust it with a Probe into the Wound and Vein where it was open, and within a little while the blood totally stopt.

Paterus. XXXVII. Truly the application of a red-hot Iron, after mutilation, is a horrible thing; wherefore I propose a remedy, which stops bleeding as if it were by Inchantment: It is onely Alum, of which little Tents are made, and after cutting off the Limbs, they are thrust, as far as they may, into the orifices of the greater Veins; and then the business is finished with the application of many *Splenia* and astringent Powders. So there was one who could by no means stop the bleeding of a Vein in the Arm, which I immediately stopt onely by applying Alum.

B. rellus, c. 1. 4. obs. 50. XXXVIII. To stop Bleeding, even when the Arteries are cut, nothing is better than *Galen's* Plaster, made of Aloes, Frankincense, Hare's Down most exactly powdered, and mixt with the White of an Egg, wherewith the Wound is filled to stop the Arteries. But if it stop not with this most pretious remedy, 4 grains of *Sperniola Compositum Crollii* may be given with good success, and about the neck (for a Wound of the Temporal Muscle, &c.) a Plaster may be applied, of which *Johnston* makes mention, *Id. Med. l. 8. tit. 6. c. 2.* made of Furnace Clay, and sharp Vinegar of Roses, spread upon a Rowler four inches broad, and as often as it is dried, renewed, till the bleeding stop: And oftentimes it stops within half an hour, or sooner, to a wonder. I thought good to take notice of these three remedies, because they stop every deplorable hæmorrhage.

Willis. XXXIX. Chalybeate Waters may be drunk for a month, than which, in this case, there is not a better remedy.

XL. Among other Symptoms, that are produced by the hypochondriack Disease, and the Scurvy, frequent bleeding at the Nose is not the least. A Scorbatick Man 55 years old, being afflicted with various scorbatick Symptoms, was at length taken with a great bleeding at his Nose, which, by often returning, did very much weaken him; all things were in vain; that therefore the too fluid and sharp Serum of the blood might be tempered, and the separation of it from the rest of the blood might be hindered, I gave him Spirit of Vitriol, mixt with Essence of Violets, to moderate the acidity. The business was immediately done, and now the Disease has tarried away these two years. Two other Hypochondriacks, when one of them had every morning a rising of humours from his stomach, and the

other had a bleeding at the Nose at uncertain times, found benefit by the same Medicine. But in a double Quartane, inclining to a Dropie, accompanied with bleeding at the Nose, the blood being ebullient in every new Paroxysm, this Medicine proved not altogether so successfull; nevertheless, by little and little, the bleeding at the Nose gave over. Therefore praise is due to these Acids, because they coagulate a Blood too fluid, and attenuate it, when grumescens.

Wedelius, Misc. cur. ann. 72. obs. 106.

XLI. I will here reveal to Candidates in Chirurgery a singular secret concerning Comfrey-root, of which *Tragus* formerly made mention, but very briefly; namely, the Root of Comfrey dried and powdered is dissolved in warm Spring-water, and well shaken together, till the water grow a little clammy with the viscosities of the Comfrey. Which most simple Medicine skilfull Chirurgions prefer before many other Compounds, both for bleedings, and fractures, and dislocations. But if with these powdered roots you mix the White of an Egg, or Bole Armenick, the mixture will grow grumous, the Bole consuming, or as it were imbibing, the glutinous part of the Comfrey.

S. Pauli.

XLII. *Laudanum Opiatum* is a most present remedy for bleeding, as well inwardly to stop the ebullition, as outwardly dissolved in some liquor, and snuffed up the Nose. I gave a Man that was ill of a Symptomatick bleeding in a malignant Fever 3 grains of it in conserve of Roses, with good success.

Hortius, l. 10. obs. 3.

XLIII. Narcoticks in Bleeding must be used with great prudence, and not, but upon urgent necessity: For they extinguish the innate heat, and fix and coagulate the spirits about the Membranes of the Brain, whence comes an Apoplexy, and an interception of the vessels and vital Spirit between the heart and the brain.

H. Petrus, Nosol. Harmon, p. 239.

XLIV. Ischaïmous Medicines are most proper for a simple hæmorrhage; for a complicate one *secundum quid*. So they are proper in hæmorrhages of the Nose, Wounds, Arteries, the *Menses*, Hæmorrhoids, Spitting of Blood, making of Bloody-water, Dysentery, &c. But if any other special Disease be joined with it, that limits the use of them, and we must look to it principally. So a Dysentery, and a Bloody-water after the Stone, require a proper Medicine for themselves, not absolutely things that stop blood, but with respect to the Stone, and to other causes also, which when they are answered by their proper remedies, the bleeding it self is also stopt. And besides, it is evident, they are not proper for any bleedings at all, to any other end, than when they primarily indicate astringent; as for example, it would be a foolish thing in a Pleurisy or Spitting of Blood, to stop it; The reason is the same in other cases.

Wedelius, de S. M. Jac. p. 237.

XLV. Hither also may be referred the violent stopping of the Nose: for by it in this case nothing farther is done, than that the blood regurgitates into the Mouth: And therefore this is the same, as if one would repress the violence of fermenting Must by stopping the bung of the Vessel. It were better to remove and precipitate the Orgasm; which being removed, it is easily stopt.

Idem.

XLVI. Some tye a piece of Silver-money upon an Artery wounded in the Wrist: Yet this Ligature, which must be very strait (for a lax one does not at all stop the bleeding) seems to be very dangerous, for fear of a Gangrene in the hand, and Mortification allowing thereupon. Wherefore I think Mens safety might be better provided for, if all Chirurgions (in fortuitous Wounds of the Wrist, or in opening the Arteries there on purpose) had an instrument in readiness, made of several plates of Iron, perforated with several holes, that cotton, and a linen cloth over it may be quilted into it, and fitted to the Arm like a sleeve, and that it may open and shut. This, by strongly com-

Willis, obs. 50.

compressing the cut Vessel, with its umbellated Screw, stops the dangerous flux of Arterious blood. In my time there lived at Padua an experienced Arteriotomist, who, for the cure of violent and pertinacious Head-aches, did often, by the advice of Physicians, open the Arteries of the Wrist with very good success, and having taken away the quantity of blood prescribed, and compressed the wound so close with the said Instrument, that not one drop of blood came, nor did any mischief supervene, which might otherwise have been feared, from the violent compression of the vessels. If therefore, contrary to the expectation, either of the Chirurgion or the Patient, an unskillfull and rash Barber, should cut, in stead of the Basilick Vein, the Artery that accompanies it, whence oftentimes either life flies out with the blood, or an Aneurism arises, which being ill handled may be the cause of Death; I advise, that beside the remedy proposed by D. Greg. Horstius Chirurg. Observ. 1. an instrument be applied to the Artery hurt in the bending of the Arm, with a Bill like that for the Wrist, which has immediately stoppt the bleeding by compressing the Artery, and has safely hindered the breeding of a dangerous Aneurisma. I, in defect of such an instrument, have applied a whole Peach-stone, and tied it fast down upon Arteries, that have been wounded through imprudence, with good success. In Switzerland they compress Arteries, that are broken or cut by chance, or art, with the convex woody shell of a Walnut, and with success.

Sculetus.

XLVII. If Blood come from the Arteries, the cure is very difficult. First therefore, let us by Venæsection hinder the Blood from coming into the Artery; for so the violence of the flowing Blood is stoppt: Then let us stop the Artery, upon which the greatest difficulty in the whole business depends; for we can either touch the place where the Artery is, or we cannot: If we can touch the Artery, then we press and close it with the finger; So in Bleeding at the Nose, we stop the Bleeding by pressing the jugular carotid Artery; or, if we can make a Ligature, we have recourse to it. But if we cannot touch the place where the Artery is, we use Coolers in the Vessels, and Astringents to the flesh. So P. Borellus, cent. 1. obs. 95. wraps a linen-cloth, wet in cold water, about the stones, and after Venæsection touches it only with Alume, or Colcothar, cent. 4. obs. 7. Hartman, if he can come at it, ties the Artery with a silken-thread, afterwards he fills the aperture with Colcothar, and closes it with a decent ligature over Emplastrum Diaphanum for several days: Then, to prevent all putrefaction, he sometimes foment the part affected with clothes wet in a hot Lixivium of Lapis Salutis.

Frid. Hoffmannus.

XLVIII. Although most stop Blood, after an Arm or Leg is cut off, with red hot Irons; yet Paulus Marquardus Slegelius has observed, it should rather be done by astringent powders, because, when the ends of the Veins and Arteries are burnt, the Blood cannot so easily find a way for to keep its motion, which it has, as it were in a circle, whereupon a Gangrene arises. Hence it came to pass, that in his time in Paris, in the Hospital, which they call le Hôpital Dieu, of five Men, whose Arms and Legs were cut off, onely one escaped, who was not feared, but had Bonetus, a most experienced Chirurgion, his powder applied; Take of Bole-armenick, Dragon's blood, Gypsum, Terra sigillata, Aloës, Mastick, burnt Galls, each 2 ounces, common-bole 4 ounces, fine Flower 3 ounces, Pitch, Rosin, Blood 2 ounces, Myrrh 1 ounce and an half. Make a powder. Yet I have seen searing used successfully at Padua.

Velschius, obs. 90.

XLIX. An actual Cantery is the last remedy, because, by sudden Burning, if it can touch the Veins, or the Arteries, whence the Blood comes, it stops the Bleeding. And this is done with a red-hot

Iron, made according to the wound; and the end wherewith it must Burn, must, if the place it is put into be narrow, be sharp, as into the hole where-out a Tooth has been drawn; or it must end in a round knob, which must be greater, or less; or it must have a broad superficies in large broad wounds. For which reason, in limbs that are cut off, they use to Burn the Wound with a broad Plate: Which yet sometimes has but little success, especially if Section be made in a thick and fleshy part, because this Burning does not touch the Orifices of the Vessels that are cut and retracted, but onely touches the flesh; and in that time, before the Plasters be applied, there is a great loss of Blood.

L. Galen 5. aphor. 30. advises us to prevent Bleeding, especially by taking away of Blood, towards the beginning of Spring, which if the Patients refuse, they must be purged with Physick that purges all humours: for so the carrying off of humours, the Blood especially, will follow as we would wish; for, by opening a Vein, and taking away but two ounces of bad Blood twice a year, we may gain some pounds of good Blood. For the operation of irritated Nature is not safe, who, when the vessels are opened, cannot tell how to keep any measure, as the Physician does; who moreover, when he purges by Art, does not make a custom of it.

Fortis, conf. 22. cent. 1.

LI. The Question is, Whether they that Bleed, must be kept in Bed, or up? Without doubt the weak, and they that are subject to frequent Bleeding, must not be raised, unless perhaps to try to cure them. As for them that are not so weak, I think we may thus determine. They whose stoppt pores hinder the Blood from transpiring, because the Blood is more apt to be raised into great and eruptive turgescencies by the heat of the Bed, it is expedient for them not onely to tarry up, till they leave off Bleeding, but to be cooled by external applications in the whole habit of the Body, or in most of the parts. Wherefore Fabricius Hildanus relates, how one was taken with a violent Bleeding at the Nose, whom he could not cure by any ordinary Medicines, which he had tried to no purpose: but that he quickly cured him, by plunging him into a Kettle of cold Water. And with the like success Riverius took one, that was held in the same manner, out of his Bed, ordered him to be set on a Carpet upon the floor, and fomented his Body all over with clothes dipt in cold Water. Yet this method is not proper for all Men, nor at all seasons alike; but on the contrary, it is convenient for them, whose Blood is halituous, and has more open pores, easily evaporates, and uses to dissolve into Sweat, with a moderate ambient heat, and therefore is more sedate, to be kept in Bed, not onely when they Bleed, but when they are like to Bleed. Truly this is the reason, why several, that are subject to Bleeding, live free from it all Summer-time, when they freely transpire: But when the Winter Cold nips them, because their pores are shut, they have frequent and dangerous fits of Bleeding.

Willis.

Medicines especially made use of by eminent Physicians.

1. Make a piece of Milstone red-hot, quench it in Vinegar, hold their Nose over the Smoak of it, Arius, and so you may stop their Bleeding.

2. Shepherd's-purse, if it be bruised with the White of an Egg and a little Vinegar, and applied to the Forehead, presently the Blood is stoppt, as I have often found by experience.

Bartolius.

3. A Nobleman told me, that the Moss taken off Tiles, steeped in Vinegar, and applied to the crown of the head, is good; and nothing is better than Darnel-root, which stops Bleeding to a Miracle.

4. An admirable remedy for Bleeding; Take of the leaves of Nettle, bruise them, and wet them with Water distilled off Nettle. This applied to the Soles of the Feet and the Palms of the Hands, produces wonderfull effects.
- Borellus.
5. Four drops of Oil of Mars in a draught of Wine presently stop Bleeding.
- De Bcy.
6. This is a most efficacious powder, to snuff into the Nose; Take a new Sponge, wet it in strong Vinegar, cover it with Tar, then burn it in an Earthen pot.
- Claudinus.
7. The stone of Carps powdered, and applied with the Down of Quince-apples, is highly commended.
- Crato.
8. Powder of dried Blood, with Bean-flower blown in, or applied, exceeds all credit. ¶ This powder wonderfully stops the Blood of Wounds; Take of Sheep's Blood dried and powdered 4 ounces, Crocus Martis, red Colcothar, each 2 drachms. Mix them, and strow them on Wounds.
- Deodatus.
9. Powder of a Toad is very good for the terror of the Archæus, which is a most certain remedy. ¶ Red Vitriol is good in a pertinacious hæmorrhage, which put into the Nostrils in the manner of a Tent, makes a crust like a Cautey.
- Grembs.
10. The Down which is found in Poplar-Buds, if they be pluckt in May, and laid in the shade, till they be dilated, and give a Down like Cotton, does wonderfully stop all Bleeding.
- Eustach. Rhudius.
11. The black Excrefcences appearing in Rye-Ears, if three or four grains of them be taken, stops all Bleeding.
- Stockkerus.
12. If a red-hot Iron be held under the Nose as it bleeds, so that the vapour of the Burnt-blood may ascend to the Nose, immediately the Bleeding stops.
- Willis.

Medicines.

I. I Remember, when I had the most illustrious
Ann Countess of Waldeck, of the family of
the Duke of Cleves, under cure, for a most grie-
vous and tedious Flux of the hæmorrhoids; and
when I saw that her strength was wasted, and her
spirits spent, and so, that she was in great danger, I
stopt them. But though she was refreshed the first
day thereby, yet she was wonderfully oppressed on
the following days, and she began to swell and puff
up about her heart. When I was called on the sixth
day, I was forced to open the veins, and make the
hæmorrhoids bleed again; nor could I with any se-
curity close them, till I had provided for the body
by gentle Evacuations, and for the Liver, with
other things that are alterative and corroborating.
Therefore here we must act dexterously, lest we
leap out of the Frying-pan into the Fire.

II. Because oftentimes there is no less danger
when they are too much stopt, than when they run
too much, especially in such whose custome it has
been to be purged that way at set-times, and we
must have a care they be not stopt longer than is
convenient; therefore it is proper to let Blood in
the inner veins of the Legs, about the inner An-
kle, or in the veins under the Ham: for, by open-
ing them, the suppressed Piles are provoked, accord-
ing to Galen, l. de V. S. But if the Body do not
appear very much oppressed, nor any danger as yet
seem to be feared from the suppression of them;
yet it is good to provide for, and to take care of
Mens health, lest some Disease breed by their be-
ing too much stopt: It will doe good sometimes
to open a vein in either Arm: for so you will pre-
vent the necessity of the hæmorrhoids, the cause,
that is, of that Flux, being in some measure re-
moved, and you will abate Nature's pains in bringing
them at certain times: and you will avoid some
inconvenience which may happen. ¶ For the cure,
some teach, that, according to Galen, a vein must
be opened in the Foot, because the opening of this
vein provokes the hæmorrhoids. In which matter
the Physician must not be too hasty, a plenitude of
Blood continuing, because by this Bleeding, the
Blood often falls with such violence upon the
lower parts, and especially the part affected, that
a worse Disease follows; and hence I have seen in
such a case great Inflammations, and sometimes
Gangrenes also have followed. Wherefore, the
plenitude remaining, not the lower, but rather the
upper veins must be opened. And this must be ob-
served especially, when there is an intention one-
ly to allay pain, and not to provoke the hæmor-
rhoids; for where no intention is to provoke them,
it is safer, in every case, to open the upper veins,
and the rather, if we have a mind to stop them.

III. In a preternatural running of the Hæmor-
rhoids, although a Vein must be opened in the
Arm, because the Fluxion which tends to the
Head may be drawn back by opening a Vein in
the Legs; so that which tends to the Feet or Anus,
by opening a Vein in the Arm. For if the Blood
run impetuously by the Arteries to the lower
parts, and a Vein be opened in the Arm, the Blood
cannot chuse but be carried with less violence
to

Hæmorrhoides, or, The Piles.

to the lower parts, for want of Blood, that is, if a good quantity have been taken by venæsection. And since it has an easier exit, where a Vein is open, the Blood must necessarily run by those Arteries rather, which are soonest drained by the opened Vein, than by them out of which into the Veins there is not so ready a passage; and so the Blood which before ran by the Arteries downwards, when a Vein is opened in the Arm, and the course changed, must needs tend upwards to the Arm, by the branches of the upper Arteries. Yet we must observe, if there be an Inflammation already in the Hæmorrhoids, then we must bleed rather in the Leg than in the Arm, because in this case we have not so much regard to the humour affluent, as affluxed, which wants evacuation and derivation.

Bleeding by venæsection will then be convenient, when the excessive Flux of the Hæmorrhoids proceeds from redundance of Blood in the Mesaraick Veins, for though Blood do not then run out of them by opening a Vein, because these Veins nowhere reach to the Skin; yet, because the *Vena cava*, being in some sort exhausted of the Blood by it, draws Blood out of the Mesaraicks, by the means some evacuation of it is made thence also by revulsion, and especially by plentiful bleeding in some patent Vein in the Arm or Hand: Or also by opening some apparent or manifest Vein in the Leg or Foot, the taking of Blood out of which does not provoke the Hæmorrhoids, as it does the *Menses*, because these Veins are not continued with the hæmorrhoidal Veins, as they are with them whereout the *Menstrua* come, and therefore not by attraction, but, as I said, by revulsion; in this Blood-letting the Hæmorrhoids are rather stopt than provoked.

Platerus.

IV. There are some that open the Hæmorrhoids with the point of a Knife; but some bleed immoderately, and the Blood will stop with no Remedies: Besides, the Wound made with the Instrument becomes cacoethick. Leeches cleansed from their slime should be preferred; but before they are applied, the Skin must be mollified and attenuated with an emollient fomentation: for so they easily wound the part. If they refuse to fasten on the place, it must be smeared with Hen's blood.

Enchirid.
Med. Præf.

V. Hippocrates, 6. Aphor. 12. says, that in the Cure of old Hæmorrhoids, unless some one be kept open, there is danger of a Drop sic or a Consumption impendent. Therefore *Ætius* must not be heard, who says, they must all be healed up: For if a true preparation of the body be made before the Cure, and if a due course of Diet be kept afterwards, there will be no fear of a Consumption or Drop sic, or any great Mischief: But if one be kept open, it cannot be called a Cure. And nevertheless it will afflict: for the prudent old Man, let *Ætius* doe or say what he pleases, will have one kept open: for 4. acut. l. 126. where he proposes the Cure of the Hæmorrhoids, he says, "You must always keep one open, afterwards you must purge with Hellebore, then let him be exercised, and sweat, and be much rubbed: Let him vomit thrice a month, let him drink yellow Wine, austere, watry and little"; In which words he shews the way how to avoid dangers, although one be kept open. And they are not to be regarded, who reconcile *Ætius*, saying, that where the Flux is melancholick, one should always be kept; but where it is pituitous, then all of them may be cured: seeing the Blood that comes by the Hæmorrhoids offends either in quantity or quality; and what way soever it comes, unless one be kept, there is great danger of Life; and though one be kept, that afflicts much less than more would. ¶ A dogmatick Physician should have the scope of urgency, which exceeds all, eternally in his memory: wherefore if they have bled immoderately, both long and much, then the Bleeding must be stopt, because

Fonsæca,
conf. 27.
tom. I.

he is in danger of dying suddenly, for Life consists in Blood; therefore it must be stopt presently; for all excretion of Blood is *totò genere* preternatural, and if sudden Death do not follow, a Drop sic, Cachexy, &c. will follow. What therefore should we stand upon, when the strength is brought low, and the Patient feels himself sensibly hurt, and especially when the Blood runs out of the external Veins in *Ano*? For there are two branches of Veins near the *Anus*; some internal, or in the coats of the *Intestinum rectum*, arising from the branches of the *Porta*, that is, from the anous Vessels allotted to the Spleen, which are the evacuations of the Cacochymie and seculent Blood: Others are external, which are in the Muscles of the *Anus*, and derive their original from the *Vena cava*, which evacuate a *Plethora*, and pure and laudable Blood. If therefore the Blood be superfluous, and voided by the external Veins, and is not black, as that which comes from the internal Veins, then it must be stopt by all means, for the abovesaid Reasons. But if the Blood that is yet voided, be much, come from the internal Vessels, and be black, what must be done? Whether must all the Veins be shut, or one left open? If this superfluous Blood come from the internal Veins, and be black, not of many years continuance, nor accustomed to the Man's nature (because what things Men are accustomed to, are almost natural) and in the beginning of a full Age, they may all be shut, whether the Patient have two, three or four, or but one: for it is very likely the inner Bowels have contracted no contumacious and notorious hurt or intemperature, and especially if the Man have not been ill of melancholick Diseases; yet so as that every year, at certain times, he refuse not to bleed and purge, and to keep an exquisite and curious course of Diet. On the contrary, if this Flux be inveterate, and hath been of an old standing, then they must not all be shut by no means, but one must be left open. For no Man can inviolably use so curious a course of Diet, Bleeding and Purging, but the reliques of a fierce melancholick humour may be bred again in the Body, since in chronical Diseases there must ever of necessity be great intemperatures in the Bowels, and rebellious and contumacious hurts; Wherefore without doubt there will be a greater portion of the melancholick humour, which will breed afterwards more and more, than it is possible by the efficacy of Art to evacuate wholly, seeing Mens dispositions are such, especially in our times, where greater errors by far are committed in Diet, than in ancient times. And if Hippocrates would always have one kept open, why may not the same be done in our time?

Epiphanius
Ferdinandus,
Hist. 6.

VI. If the Flux be grievous, the inner Vein of the Arm may be opened, which is a ready and effectual Remedy. If the Flux have lasted long, and spent the strength, lest there should be a sudden loss of spirits, it is good to bleed a little at several times, so the strength will be less prejudiced, and the revulsion will be more evident by iterated retractions.

Solemander.

VII. In a Man, who had had an immoderate Flux of the Hæmorrhoids for four years, I endeavoured the suppression of it, that so, not onely what was troublesome might be suppressed, but also that the good Blood, the treasure of Life, might be stopt, not regarding the Tales of those Physicians, who talk that they can set bounds to this Flux, as if, at their pleasure, and when there is occasion, it were in their power to open or stop it; while in the mean time they cast their miserable Patients into Cachexies, Atrophies, Drop sies and Death. Nor are they less to be derided, who, persuading themselves that they can defend Hippocrates or Galen's opinion, do not onely suffer the Flux of melancholick, thick Blood, for whose sake at the beginning Nature uses to raise the Hæmorrhoids, but

of

of the good also, as in process of time it very often, yea always, happens; except in a few, who at set times are moderately purged by the fecal Veins, and thereby are preserved and defended from very many Diseases enumerated by Hippocrates. Others also have interpreted Hippocrates foolishly, who, *Aphor. 6. 12.* seems to advise them that would heal this inveterate Disease with a surgical Hand, to keep one open (which yet he does not mention *lib. de Hæmorrhoid.*) wherefore they have Revellents, Incrassaters and Astringents in suspicion, as if they thought it were an easie matter to stop this evacuation. But because I have observed in my Practice, that strong Remedies did little good, and gentle ones none at all, I use all the Apparatus of Medicines to suppress it, yet so as it be not moderate, periodic, of thick and melancholick Blood, nor troublesome to the Patient; because from such the Patient rather finds relief than detriment. Of which excellent Doctrine, not I, but Galen is the Teacher, who, *4. Aph. 25.* says, that for Blood to be voided upwards, whatsoever it be, is bad; but to bleed downwards, by the Hæmorrhoids, is good; when black stuff is voided, that is, when the Man's nature gathers abundance of such humour. Otherwise we must not rashly accustom our selves to evacuation by the Hæmorrhoids. For either excess is accounted dangerous, both when Blood is voided above measure, and when it is totally stopt.

Fortis, conf.
100. cent. 2.

VIII. It ought to be observed, that they are in a gross error, who in an excessive Flux of the Hæmorrhoids from the Vessels being opened, do set Cupping-glasses to the Back-bone, and several ways draw from the Hips to the Neck or Shoulders; thinking by these means the Blood will be retracted. Whereas by these means, granting the circulation of the Blood, more Blood is drawn to the place affected, and the Vessels are opened, by increasing the Flux of Blood in the greater Vessels, which being afterwards quickened at the Heart, increases its Flux in the Arteries. ¶ Scarifications, Cuppings, Ligatures, Frictions, although they be proper for Revulsion in other Hæmorrhagies, wherein the Blood comes out of the Branches of the *Vena cava*; yet here, since they can neither exhaust the Blood out of the *Vena cava*, nor derive it from the Mesaraicks to any other place, they will doe little good.

Frid. Hofmannus.

IX. Fernelius, *lib. 6. de Part. morb. & Symptom.* c. 10. has observed, which I also have observed, that sometimes there comes out of the *Podex*, without Pain or Blood, some mucous or whitish Filth, which some mistake for Pus. He thinks it is as it were the Slime and Dregs of melancholick Blood, which the fecal Veins do void a long time, commonly after tedious melancholick Diseases, and hard riding. Platerus writes, that this comes the same way, as Womens Whites: That, like as in Women Nature rids her self of that white matter by the menstrual Veins, so here she does it by the hæmorrhoidal, of a matter not unlike the white tenaceous Menstrua.

SenDertus.

X. These Veins are not all of them of one sort, as has hitherto been believed by many, but some are internal, arising from the *Porta*, others external, from the *Cava*, to which the hæmorrhoidal Arteries are joined, by which the humours to be evacuated are carried. Onely the internal were known to the Ancients, commended as in splenick and melancholick Diseases, and as if they might be opened about the *Podex*, or Leeches might be applied to them; whereas no Branches of the *Porta*, that lies within, do reach the Skin, which may be cut. They differ, 1. In their original, for the internal come from the *Porta*, sometimes from the splenick Branch, whence comes the *Vas breve*: The external from the hypogastrick Branch of the *Cava*. 2. In insertion, for the internal are inserted into the substance of the *Intestinum rectum*: The external into the muscular substance of the *Anus*. 3. In number, the in-

ternal is one: the external three. 4. In the qualities of the contained Blood, the Blood of the internal is thick and black: of the external, thin and red. 5. In their use, the internal empty the *Porta*, and help obstructions of the Spleen: the external do empty the *Cava* and Liver by accident; but primarily the great Artery and the Heart: yea, their evacuation cures sanguine Diseases of the Head, Breast, &c. which Hippocrates also mentions in his Aphorisms; hence the internal are said to cure a Cacoehymie, the external a Plethory. 6. In profusion of Blood, the Flux of the internal is not so plentiful: of the external, so great sometimes, that Death or grievous Diseases do follow. 7. In evacuation of the external there is no pain or griping in the Belly, sometimes also no pain in the *Anus*; which in evacuation of the internal do afflict. 8. Arteries do not accompany the internal Veins: the external Veins descend to the Muscles of the *Anus* with the Arteries; therefore these are more rightly called hæmorrhoidal Vessels.

Tho. Bartholinus, li. bello 1. ca. 4.

XI. We often see thick and black humours evacuated by the Hæmorrhoids, that run spontaneously. But we must know, that this Blood comes not from the Spleen, but from the Plethory of the whole Body into these Veins, and is discharged as into the more ignoble parts; where, if it tarry, it may easily fall into corruption and putrefaction, so that it looks like a sort of Imposthume, and these Hæmorrhoids seem to be a kind of Varices.

Walrus, Met. Med. p. 86.

XII. Hippocrates, *lib. de Vict. acut.* and *lib. de Hæmorrhoid.* propounds Tying, Cutting and Burning, saving one open, which operation, as being very laborious and exceeding dangerous, is grown obsolete in our times. Yet Massoria says, he once saw this operation, the History whereof it may be useful to describe, because from thence the manner of operation and the event will appear. Fredericus Corsicus had been ill, first of a Pain, then of an immoderate Flux of the Hæmorrhoids: And when he had tried many Remedies in vain, he at length betook himself to *Padua*, where the Physicians by common consent resolved, that the Blood must be stopt by manual operation. A Neapolitan Chirurgion, who professed that thing, was called. The Hæmorrhoids were cut, tied and burnt. The sum of the operation is this: First, they conveniently bind the Man, then they excarnate the extreme heads of the Hæmorrhoids, how many soever they be, and gently separate them from the Intestine, then, with a certain proper strong Needle with a Thread, they perforate them all almost to the end, and tie them strait and few them, when this is done, they clip off the part of the Veins which is above the Suture and sear it with a red hot Iron: Truly, a very painfull and tiresome Work, what with the Ligature, Section and the Burning. A Fever and great Pain came upon Frederick, but the Chirurgion using some of his own Remedies, he, in a few days, was free from his Fever, Pain and Hæmorrhoids, to the admiration of many. But it must not be omitted, that he, being over confident of himself, did not onely omit Bleeding and Purging, but kept no good Diet, and the next year he died of a pestilential Fever. Wherefore Hippocrates his Rule, *Aphor. 12. 6.* must be observed, that one Hæmorrhoid should be kept open: Unless, according to Aetius, the Patient had rather prevent all mischief by a frugal Diet, Exercise, Bleeding and Purging.

XIII. It seems an old Flux should be stopt. 1. The Flux is *to genere* preternatural. 2. Nature is weakened by spending of the spirits. 3. The Body is cooled and deprived of its aliment thereby. It seems it should not be stopt: 1. Upon the Authority of Hippocrates, *6. Aphor. 12.* 2. For fear of the recourse of the Blood to the Liver and to the noble parts. 3. Divers mischiefs follow the stopping it, especially a Quartane-ague, and a Jaundice from the Spleen,

Schettus
Ann. Chir.
Tab. 46.

Spleen, as *Joubertus*, lib. de Quart. cap. 9. says. For the decision of this case, we must observe, that this Flux, as it is made by the expulsive faculty, forced by the superfluous and noxious Blood, in an absolute propriety of speaking, is preternatural; wherefore in that thing it differs from the menstruous Flux, because this is commonly agreeable with sound Constitutions, inasmuch as provident Nature hath granted a redundancy of good Blood, and will have the same discharged by the Womb, that in its proper time it may serve to nourish the Child: Therefore the Flux of the Hæmorrhoids does not happen to, nor should be procured in well and healthy Constitutions, as *Solanander*, sect. 3. cap. 20. says. But to whom it is peculiar, and by custome natural, in them it must be governed by singular medical prudence, that it may neither be suppressed longer than is good for the Body, nor void the humour in greater abundance, than is consistent with the Rules of Health. Therefore *Jacchinus*, in 9. Rhaf. c. 72. says well; Sometimes it must be let alone, if it return at periods, and be not excessive; Sometimes it must be stopt, if it hurt the strength, so that Concoction is vitiated, and a Dropie may thence follow. Yea, we must observe here, what *Salvus Sclanus* has, *Comm. in Art. Med. Gal. l. 3.* That in many Diseases and Fevers evacuation is made by the hæmorrhoid Veins, by applying Leeches, which must be set not onely to such as use to be opened, but to whom this evacuation is not usual, if we conjecture that adust Blood does abound: for this evacuation eases the Body of that unprofitable burthen, and also drives away all those Diseases, to which Melancholy affords matter, which *Hippocrates*, lib. Πεδ. γυγ. reckons up. To the Arguments we must say, that the affirmative do conclude, as to a Flux of laudable Blood, in Natures not used to it, coming without any periods: That the negative do intend those Hæmorrhoids, that evacuate peccant Blood in Natures used to them, and at certain times, in such as are endued with a sort of neutral constitution of Body.

XIV. The Flux of the Hæmorrhoids is sometimes so pertinacious, that it is impossible to stop it by revulsion, or by astringent Medicines. I experienced such a pertinacy in a Noble-man at Venice 26 years old, of a sanguine Complexion, in Spring-time, who was first ill (for he had never had them before) of the external Hæmorrhoids running too much. When I was called to him, when neither Blood-letting, nor dry Cupping-glasses set to his Back, nor Ligatures, nor astringent Medicines, internal and external, did any good, and the Patient was then in danger of his Life, I propounded according to *Hippocrates* and *Ætius*, contrary to *Aquapendent*, the Burning of the Veins that bled; I confirmed my opinion by *Aph. 6. sect. 1. and Aph. 6. sect. 8.* And when the Patient found that Death was not far off, he admitted of Chirurgery: Wherefore, making haste home, I furnished myself with pointed or oval Instruments, and when I came back, gave them to a Servant, to bring them to me red hot: With which, being very hot, I touched severally all the little mouths of the hæmorrhoidal Veins, which poured out the Blood, and brought a crust on them, beginning with the highest first, lest the Blood, falling from them untouched, should quench the hot Irons before the operation was finished. Thus the Noble-man recovered his former health. If Nature had formerly often opened the Hæmorrhoids, and had been accustomed to transmit the superfluous Blood to this part onely, I had left one untouched, to be stopt by Plasters and Astringents, so that it might either be opened of it self, or very easily by Art, and a passage might be made, whereby the Blood (which is gathered daily in the Body, and uses to be evacuated at set times) might be evacuated, to prevent those Diseases, which *Hippocrates* mentions, 6. Aph. 12. and 6. Epid. sect. 3. text. 33, & 34.

XV. In the Cure, which is performed by Medicines, care must be taken of the Liver and Spleen, because the mesaraick Vessels are inserted into these parts, especially if they be hot or weak. Also obstructions of the Bowels and mesaraick Veins must be opened, if they give the original to this Disease. And I have sometimes cured this contumacious Flux perfectly with Steel-pills. At the same time, above all things, the fault of the Blood must be amended with the greatest Care, which seems to be the primary cause of this Flux. Which, if it be sharp and bilious, must be corrected by an Infusion of Rheubarb often repeated, especially with Tamarinds, which, according to *Mercurialis*, have an admirable faculty to check, both in Decoctions and given in substance; instead whereof our tart Prunes may be given, frequently eaten before Meals. If the Blood be hot and thin, it must be cooled and thickened; if watry, it must be dried; if much, there must be a thin Diet. For it is vain to think of stopping the Flux, before the original of it be removed.

XVI. The Pain of the Hæmorrhoids proceeds from bad humours transmitted to the sedal Veins, and not onely from melancholick ones, as *Galen* seems to believe, lib. de atra bile, 4. but sometimes from bilious and pituitous ones, according to *Avicenna*.

XVII. For Hæmorrhoids to be prickt that are distended with the afflux of much Blood, is no new thing. *Massaria* is of opinion, that they should rather be opened with a Knife than have Leeches applied to them. Where the Pen-knife seems too cruel, especially in Children, Women, and, in a word, the effeminate, let alone the Knife, and take the hamulous *Pericarpium* of the Teazle: fix a piece of a Leaden Bullet to it, that you may drive it the more certainly in, so you may strike the part, and take away as much of the humour as is requisite. Many testify that this small thing may be done with safety.

XVIII. The hæmorrhoid Veins are sometimes prominent outwardly, but often are latent within: Some bleed, others not: Pain sometimes precedes excretion of Blood; they often bleed without Pain, and they are painful also when no bleeding follows. The Pain may be so violent, that the Bladder being ill by Sympathy, a stoppage of Urine follows. A Man was troubled with the blind and internal Piles: The Physician had used Clysters, wherein he had put Salt and *Hiera picra*, hereupon the Pain and Inflammation were so intense, that the stoppage of Urine grew to be as troublesome as the Pain of the Hæmorrhoids, and he was at a stand, for which he should use Remedies first. But he did the Patient good by injecting an ounce of Oil of Violets immediately into the Anus, the Pain of the Hæmorrhoids first, and then of the Bladder being eased. And the same being afterwards injected several times, all Pain quickly ceased.

XIX. Violent and sharp Clysters are proposed for provoking the Hæmorrhoids; I do not approve of them; because they contribute not so much to provoke the Hæmorrhoids, as they hurt the Intestines and the mesaraick Veins.

XX. *Gasper Schioppius* having been troubled with tedious Pains and running of the Hæmorrhoids, and having made use of the most famous Physicians in all Italy, to no purpose, when, by the Advice of a Dominican Friar, he had washed the part with his own Urine, and received the Fume of Sulphur by a Tunnel, he perfectly recovered.

XXI. The Vein which runs between the least Toe and the Annular, is a Branch of the *Vena saphæna*. I have experienced the benefit of opening that Vein for quieting the Pains of the Piles, under which N. had spent many tedious days and restless nights.

XXII. I had a Matron under my Cure, who had been grieved a long time with most violent Pains of the

the blind Piles. I made her an Issue below her Knee in the inside of the Leg, then her Pains were quiet, and very seldom troubled her, unless after a disorderly Diet.

XXIII. Pains must be asswaged; and in my judgment we should abstain from violent Purgers, lest the humours be farther exagitated and heated, and so be drawn to the part affected.

XXIV. Among Anodynes, first let a Fomentation of a Decoction of Lettuce, Mallows, Violets, Henbane and Poppy be applied to the seat, and then an Ointment or Injection: Which yet must be varied; Because what does one good, will not doe so to all; nay, what has done the same person good in the like case, is not always good for him.

XXV. The violence of the Pain sometimes forces us of necessity to apply Stupefiers: So we sometimes mix *Opium* with Liniments; yet this must be done dextrously, lest the *Podex*, too much cooled with Narcoticks, doe not its office. *Avicenna* applies *Philonium Tharsense*, which he describes. I have often stopt the Pain by applying new Treacle or Mithridate, and by drying and discussing the inflamed matter have removed the Swelling.

XXVI. The burning Medicines proposed by *Celsus* and *Paulus* are not safe. This is the gentlest way of Cure; Having given a Lenitive first, foment the Hæmorrhoids alternately with two Sponges, wrung out of a pound of Cow's-milk chalybeate, in which half 'an handfull' of Henbane-leaves has boiled to the consumption of the fourth part, adding an ounce of Juice of Quinces: but if the Pain continued, I found its virtue a little remiss; therefore instead of it I used this Fomentation; Take of root of Marsh-mallow 1 ounce, leaves of Mullein half an handfull, let them be boiled in Chalybeate-water strained and Red-wine, each 8 ounces, to a consumption of a third, adding to the Colature of Juice of *Hypocistis* 2 drachms, and *Opium* 5 grains. A red hot Plate being then held at a convenient distance, the Hæmorrhoids are contracted, and as it were corrugated. Which being put up into their places, that they may not fall down again, they are dextrously kept up with an Iron-ring: for the benefit whereof many are beholding to that excellent ingenious person *Paulus Servita*. A piece of Cloth is fastned to the Ring on each side, which is fastned by a Linen-girdle with four Fillets sewed to it, and their heads to the Cloth about the Ring towards the *Perineum* and the Buttocks.

XXVII. Oftentimes pain and heat are joined with the Piles: Then they should rather be treated with internal and external Medicines, than be exasperated with any Chirurgery whatever. Among external things Ointment of Toad-flax is excellent, and fresh root of Fig-wort hung about the Neck. If they swell without sense of pain and inflammation, I first of all take a broad Iron, well heated, I so hold it to the Piles, that the fire may not touch them, but that they may feel the heat, as much as the Patient can well endure. In timorous persons I open them with Leeches, and having extraded the Blood sufficiently, to strengthen the part, I apply a new Sponge, wet in black, austere Wine, and wrung out. *Hippocrates*, for the foresaid Chirurgery requires an Iron with a round or an oval head. In my judgment a broad is better in this case, because with it the operation is sooner finished. But when they do not onely swell, but one or two of them that are swelled do also run, *Hippocrates* his oval Iron is better than a broad one: for the oval easily misses the bleeding Hæmorrhoids, which doe good: but the broad one does sometimes indifferently dry up as well the running ones, as those that are simply tumid, to the Patient's great detriment; which I thought good to take notice of out of *Spigelius* his Animadversions. Sometimes the Hæmorrhoids swell inwardly, yet because of their deep situation within the *Intestinum rectum*, the

swelling can be brought by none of the foresaid ways into sight, much less can they be cured with the repeated touch of a red hot Iron, whether broad or oval: What then must be done when Medicines are used in vain? Must not some other Remedy be fetched out of the Storehouse of Chirurgery? Yes surely, for a solid Pipe is required, which, actually cold, and onely smeared over with the white of an Egg, must be thrust gently into the *Anus* and heated by a red hot Iron rod often put into it, that by heating the Hæmorrhoids, so deeply placed within, it may by little and little dry them up.

XXVIII. Because Pain usually puts men to abundance of trouble, therefore especially care must be had of it, and we must look whether the part be pained with Inflammation, or onely with heat and smarting; for if the first, we need onely cool and lax the part; because such things as cool with astriction or revulsion, doe Men hurt, unless the pain be with Fluxion. If acrimony, heat and pain be very troublesome, order the Patient to go into a Semicupe; then to the Ulcers, if there be any, apply this Medicine; Take of Oil of Roses, 4 ounces, Crust 1 ounce, Litharge half an ounce, new Wax 6 drachms, *Opium* 4 grains. Make an Unguent. But if all these things will not doe, we must use Narcoticks, if so be after easing the pain, we will wash the part with warm Wine or Water. ¶ For the Cure of this Disease I prescribe half an ounce of Balsame of Sulphur, with which warm *N.* often anointed his Hæmorrhoids, especially after excretion, and he was eased of that most bitter and odious pain, and was perfectly cured. For this Balsame in this case does certainly good, and never failed, as innumerable Experiments do testifie.

XXIX. A Man sixty years old conficted with a troublesome pain of the Piles, with a Tumour, and Inflammation of the part, which did not cease with many Remedies. I prescribed a Fomentation of Rose-water, in 6 ounces whereof 1 drachm of *Sal Saturni* was dissolved, which Fomentation was often repeated every day. Afterwards a Cataplasma was applied of a white Onyon, roasted in Embers, and mixt with as much Butter: Within two days the Inflammation was asswaged, and the Tumour in a great measure dispersed. ¶ But whether they be flat or tense, and in pain without any great heat or acrimony, then it is not good to apply cooling things, for they hinder discussion, and farther fix the Blood settled there; but then it is not good to apply Laxatives and Discutients, which if besides these faculties, they also allay pain, they will doe the more good. Here a Semicupe will be proper in Water moderately hot, in which root and leaves of Marsh-mallow, Mallow, root of Fig-wort, &c. have been boiled. Then the pained place being wiped, must be anointed with *Oleum momordicæ*, which is most effectual, or with Oil of Peach-flowers, which in this case I have often used with great success.

XXX. One being at length cured of his tedious Hæmorrhoids (by means of a Pipe and a red hot Iron in it put into the *Anus*) relapsed as often as he took a Purge, which had Senna or Scammony in it. Wherefore I forbid him the use of any thing with Senna or Scammony in it, and he lived many years free from that Disease. ¶ In Spring and Fall I approve of gentle Purges, not meddling with those purging Medicines that are proposed by Authours, whilst building on a false foundation, they endeavour to purge Melancholy and black Blood, that it fall not on the sedal Veins, not observing, that they rather cause the Defluxion, which they would avoid, by the heat, agitation and violent motion of the purgative Medicines, and, which is worse, not of black but good Blood. Far therefore be strong Purges from us; and let *Cassa* onely suffice us, or it and a little Myrobalans, adding the second time some Lenitive.

XXXI.

XXXI. Besides, pulp of Tamarinds is used to this purpose, which nevertheless, because it causes pain, which a desire of going to stool does follow, and does no good for Obstructions, is suspected: Nor do Potions of Syrups of Roses and Violets solutive, because they carry humours too violently to the part affected, want suspicion.

XXXII. Things that purge the humours are given, if through excess of Bile, or other filth in the blood of the mesaraick Veins, the Hæmorrhoids run excessively. For prevention before they come, in such as are subject to them, by purging frequently and conveniently, and hindring the encrease, and gathering of these humours; and that by Medicines proper to purge choler, yellow and black, which I think is bred of degenerate yellow, rather than of the dreggy part of the blood; which may be done with much more ease and success before they begin to run, because these excrementitious humours, lurking in the first ways, are with Purgatives quickly thrown off by Nature to the Guts.

XXXIII. If we must use aperients for Obstructions, yet we may not use Rheubarb, because it is apt to open the sedal Veins.

XXXIV. Galen, 6. de Caus. Symptom. denies that Evacuation by the Hæmorrhoids, next to a natural one, should be made use of, saying, "But if it be made seasonably, it is not altogether preternatural, and it is made seasonably, when that which is grievous is voided, and nevertheless, we must not use our selves to Evacuation by Hæmorrhoids, because either excess is dangerous, whether they run not at all, or too much."

XXXV. Then for derivation sake, and that the intemperature of the Liver might be corrected, especially because a Dropsie was beginning, I came to a Decoction of Spanish *Zarza-parilla*, of which the took fifteen Decoctions; Take of *Zarza* 2 ounces, infuse them 24 hours in 12 pounds of Spring-water, let them boil half away: Towards the end put in of Plantain Leaves 1 handfull. The Dose 7 ounces. This corrects the intemperature of the Liver, is diuretick, and proper for the *Menses*. And this was what was desired in our case, to wit, that the Hæmorrhoids might be stopt, and the *Menses* provoked. And I know not what reason *Massaria* had to suspect this way of cure by derivation to be pernicious, When it is rather extremely necessary in this case: and if perhaps some heat, little whereof I can see, might be feared in the *Zarza*, Plantain was therefore added. And this Decoction did corroborate, derive and drie up the excessive moisture of the blood.

XXXVI. Clysters are bad for such as are subject to the Hæmorrhoids; yea, the frequent and excessive use of Clysters may cause them; and sometimes breed an Ulcer in the Guts upon the regurgitation of the blood in these Vessels.

XXXVII. Ointments are not very proper for the Hæmorrhoids, because they dilate these little Bladders of the Veins, exasperate the filth gathered there, or the more florid, hot blood, hinder transpiration, &c. Wherefore though Unguents be so highly cried up among Practitioners, and especially *Unguentum de Linaria* in that case, yet I know not by what observation they were convinced when they wrote it: for I have several times observed, that it does little good to the blind, painfull Hæmorrhoids, nay, it rather encreases the pain and heat.

Medicines especially made use of by eminent Physicians.

For Pain of the Piles.

1. When the Piles are painfull and chapt, nothing is better than Beetles boiled in Lin-seed Oil

till they go to pieces in the Oil. The pain immediately ceases upon application.

2. Take of Sows 4 ounces, roots of Leek two ounces and an half, Oil Olive 6 drachms, pound them together. Then boil them in Oil, strain them and apply them.

3. *Lapis Calaminaris* ground with Rose-water, and mixt with Butter, assuages Pain much. ¶ Root of white Lily boiled, with Butter and Hen's grease, adding a little powder of Lin-seed, eases pain much.

4. The Herb All-good bruised and boiled in Cream, and then strained out, makes an excellent Ointment for the Piles.

5. Oil of Box is very effectual to ease pain, if one drop in Cotton be applied to the Hæmorrhoids. ¶ Balsam of Sulphur is excellent to ease pain, and disperse the swelling. ¶ A Decoction of Yarrow in their ordinary drink for three days does admirably disperse the pain of the Hæmorrhoids.

6. Leaves and Flowers of Toad-flax excell in a singular Prerogative to stop pain.

7. Ointment of Figwort is good. ¶ The drop-ping of a roasted Eel is good.

For excessive running of the Hæmorrhoids.

1. Galen's is the most excellent and onely Remedy, of Aloes, Frankincense, and the white of an Egg, made as thick as Honey, mixt with Hare's Down and applied.

2. This Medicine never failed me, which is made of Steel, old Sugar of Roses, and Powder of Claudine Sea-Wormwood.

3. Let the Hæmorrhoids be washed with the Patient's Urine, for it dries wonderfully and eases pain. ¶ This has been tried in several: Take of Powder of Bayberries, dried in the shade, one drachm, drink it in white Wine every third day in the morning for three times.

4. I have known the running of the Hæmorrhoids successfully stopt onely with Houseleek-water.

For the Suppression of the Piles.

Among things that open the Hæmorrhoids I must give the preheminnence to the greater Centaury root, if the bloody juice be squeezed out of it, and a Syrup made with Sugar. The Dose 2 or 3 spoonfulls in a morning. ¶ To open the Hæmorrhoids let an Onyon be hollowed, and some Oil of bitter Almonds be put into it, roast it in the Embers. Anoint the Hæmorrhoids with the juice when squeezed out.

For the Swelling of the Piles.

Powder of Mullein, given in Milk, or in some other Liqueur, is very good to waste the swelled Piles; also its Juice or Syrup may be given.

I. THESE ought to be the Prerogatives and Conditions of things which cleanse the passages, as well in a hot as cold intemperature. 1. Because of the narrowness of the ways, they must penetrate, as *Cyperus*, Schoinanth, Saffron, *Iris*. 2. They must open, as Horehound, Aromatick Wormwood, Pistachio's, root of Parsley. 3. They must concoct and mollifie, as Raisins, Figs, sweet Pomegranate Wine, Rhenish, small Wine. 4. They

must be absterfive as Honey, Sugar. 5. They must strengthen, as Agrimony, Wormwood, Schoinanth, Rue, Spike. 6. They must preserve from Putrefaction, as *Cassa lignea*, *Calamus Aromaticus*, Cinnamon, Myrrh, Amber, *Lignum Aloes*, *Rhodium*, and all sorts of Spices. 7. They must dry moderately, as shavings of Hartshorn, Ivory. 8. They must be specifick, as Rheubarb, Wolf's Liver, Raisins, Flesh of Snails. 9. They must also be astringent, correct Malignity, and not easily corrupt.

Mat. Martini de morb. ment.

II. The proper way to take things inwardly is the Mouth: The virtue is carried with the chyle to the Heart, and after to the Liver. The Moderns have an Invention, to infuse some hepatick Liquour into some Vein opened in the Arm: It is held, that by this way, the Vein being closed and tied, the Medicine communicates its singular strengthening faculty to the Parenchyma of the Liver, being carried to the Heart, and out of the right Ventricle by the great Artery into the Hepatick Artery, and so to the Liver.

Roslinus.

III. Rheubarb is indeed the life of the Liver, but to a hot Liver it is Death: because it is hot and dry to the third degree.

Riolanus.

IV. Let no man wonder how it comes to pass, that many do not only find no relief, but sometimes hurt from Oils Chymically prepared, as also from Decoctions. But let him take these true Reasons from Hofmanni, *prefat. in Lib. de Medic. Offic.* Distilled Oils, which they commonly call Essences, are so plainly Enemies to the membranous Stomach indeed, by consuming its radical moisture, and to the Liver, and other Bloud *Viscera*, by heating, or to speak more plainly, by raising an Inflammation, that some have contracted to themselves a perpetual thirst, others a bilious Cachexy, and some a hot Dropsie.

S. Pauli, *Quadr. Bo-*
tan. p. 225.

V. The Lobe of the Liver, that lies upon the Stomach, is heated by hot Ointments before the Stomach it self, which I admire indeed, how it has always passed unobserved by famous Men in their practice.

Fortis.

VI. *Altimarus* denies, that Almonds and Pistachio's are good for cold Epaticks. 1. Because things that are easily corrupted, cannot be proper for them. 2. Because they are oily, but a cold constitution of Liver is very much hurt by these things, because Obstructions, which are usually joined with them, are encreased by such a quality. 3. Because they are readily converted into Bile. On the contrary the affirmative must rather be defended with *Savonarola*, who prescribes Almonds among other convenient Medicines. 1. Because Almonds, especially bitter, have a faculty to extenuate and purge the thick and viscid humours of the Liver, *Gal. 2. de Alim. fac. c. 22. and 30.* Where the same is affirmed of Pistachio's. 2. According to *Dioscorides l. 1. c. 136. de Mat. Med.* they and Pistachio's do provoke Urine, but things that provoke Urine are good for cold Epaticks, whereby both the Liver is strengthened, and obstructions are opened. *Salus in ann. c. 82.* answers *Altimarus* his reason. To the first it is denied; for Almonds and Pistachio's are hard of Concoction: But things that are hard of Concoction, are so of corruption, in as much as all Concoction of Aliment is made by means of Corruption, considering the *Terminus a quo*. To the second, Obstruction need not be much feared from an oleaginous moisture, because whatever is oleaginous is in some measure hot. To the third, Nor doe they any harm, in that they are quickly turned into Bile, because nothing need be feared from a cooled Liver: For it requires heating and absterfive Food and Physick, which Almonds yield.

Horslius, *Dec. 7. Probl. 1.*

VII. In a certain Maid there was first a hot Intemperature, upon which account she was said to be Hepatick. There was extenuation, which seemed to tend to a Consumption, there was also driness of the Solid Parts, which hindered the encrease

crease of the Body: Which though it could not be remedied, yet it was needfull to hinder the Encrease of it. Therefore in a complicated Disease we should have respect to the Cause. Her Intemperature was hot and dry, by reason whereof, because much bilious matter was gathered, I begin to purge her with no hot Medicine, that is, with the Waters they call *Villica*, given her seven times according to Art. Alteration followed Purging, which I was minded to make by Juices of Cichory and Sow-Thistle. Cichory is most gratefull to the part, both in refrigeration and absterion of the Veins of the Liver, and also in asfriction, which it requires. *Sonchus* has the same virtue, but it is more cooling. I gave the Juice with Sugar for ten days, and all signs of heat seemed to abate. Her Diet was cooling, she used Sorrel, Lettuce, Purslain, Endive, Prunes, Cherries, Water-Melons. She avoided all salt, sweet and fat things. Outwardly Cataplasms of the same virtue, of Barley-flower, and the foresaid juices were applied: She was anointed with *Ceratum Santalinum*, &c. Then, to cure her extenuation, I proceeded to give her Milk. These things did her so much good, that she filled well with Flesh, and her colour changed for the better, more than one could have believed.

Jacchious,
esp. 30. ad
9 lib. Rhais.

VIII. Three ways the Liver, full of hot humours, uses to swell up the *Hypochondrium* in acute Diseases. 1. When the humours, having got out of their proper receptacles, are diffused through the *Parenchyma* of the part, and make a swelling both hard and painfull, which is properly called an Inflammation. 2. When the same humours, filling onely the greater Vessels of the Liver, make some distension, which swells the *Hypochondrium*. 3. When all the Veins running up and down the Liver are so full, that they cause a manifest Tumour. And as in these Cases divers parts are affected, so also the condition of the Tumour and consequent Symptoms are various, and therefore the Method of Cure must be various. For in the first the humours make a hard and painfull swelling, usually of an orbicular figure. But when the same humours onely fill the greater Vessels, it is done several ways, because sometimes they stop there, grow hot and putrescent, and cause acute and malignant Fevers, although they make no swelling in the *Hypochondrium*, apparent either to the Eye or touch: Sometimes the humours offend onely in abundance and motion, when, as they are passing from below to the upper parts, they run violently into the Liver, whereby it is suspended as by ligaments, and they fill the greatest and nearest Veins excessively, whereby they being made shorter, draw the Liver upwards, and so swell the *Hypochondrium*: Which sort of swelling *Hippocrates* calls a *revulse Hypochondrium*, and it is a sign of the tendency of the humours to the Head. This swelling is distinguished from others, because it appears most in the upper part towards the Ribs, and underneath a vacuity may be felt in the place where the end of the Liver is naturally situated: yet no hardness, nor pain is felt in the swelling, because the affection is not in the Liver, which hurts it, or swells it up; yet a kind of tension may be perceived in the tumid part; and then this affection lasts but a while, because the humours are but passing that way upwards. If the vessels dispersed through the whole *Viscus* be filled with hot humours, the third sort of swelling in the *Hypochondrium* is caused, which is also twofold: For the Juices do either simply grow hot, and do not contract putrefaction, or they putrescent in the Veins. If the first way, it is done also in a twofold manner; for either they remain quiet, distending the foresaid Vessels onely with abundance, whence comes a swelling which *Hippocrates* calls *φλεβονόστα τεβρον*, in manner of distended Veins, where a tumour indeed appears both to the Eye and touch; but if it be pressed, it resists not the Touch, nor onely because of its softness,

but also because the matter that makes the tumour being pressed with the hand, gives way, and recedes to the next place, like blood filling a Vein, when it is pressed with the finger: which indeed shews, that the fault is onely in the repletion of the Veins, not in the substance it self, because the swelling dissipates quickly, and of it self: But if these humours filling the said Vessels, be in agitation, because of admixtion of a flatuous Spirit, the same swelling rises soft, but with a pulse or Palpitation, concerning which *Coac. Sect. v. 55. A Pulse in the Hypochondrium with Tumult, is disturban of the Mind*. If finally the same humours filling all the Vessels of the Liver do putrescent farther, a swelling arises, which causes a soft distension, not very painfull, usually of a long figure, in distinction from an exquisite Inflammation of the Liver, which makes a hard and painfull swelling, circumscribed with an orbicular figure: This swelling comes when putrefaction has seized all the Veins of the Liver, and especially if the Veins themselves be inflamed: And the Inflammation is of such a Nature, that it will permit no good blood to be bred; which since it is the matter for breeding of vital spirits, of which the animal are made, hence a *Delirium* and *Phrensie* arise: The swelling is soft, because the substance of the *viscus*, which first occurs to the touch, continues as yet in its natural disposition and softness: But hardness or tension is felt inwardly, when the greater Veins are full and inflamed.

Prosp. Mar-
tianus, com-
in v. 318.
lib. 4. Epide

IX. If Blood be let plentifully, the Inflammation ceases in one day, so that the Physician may be truly said to have killed the Fever. And if the *Hæmorrhoids* be stoppt, let them be opened: If the *Menses*, and the time be near, bleed in the foot, and afterwards, if the Disease continue, in the arme. ¶ A vein must be breathed immediately, and store of blood must be taken away, not all at one time, but at several times: Nor must we desist from this operation, before the present pain of the *Hypochondrium* cease, or in a great measure be abated: Otherwise what remains, degenerates either into an abscess, or an incurable *Schirrhus*. Almost all dye, who either bleed sparingly, or not till after the fifth day. For a third time bleeding, though it be plentiful, does not cure, if it be used after the humour is fast impacted into the Liver, or tends to suppuration. Therefore if blood enough be taken the first or second day, the Inflammation is prevented thereby, if so be other Remedies be not neglected.

Saxonia.

Enchir. Med.
Prag.

X. If there be no place for Blood-letting, Cupping-glasses must be applied; yet not, as some would have them, to the Shoulders and Back: for that were to draw the Inflammation of the Liver to the Lungs and Heart: Let them therefore be set to the Buttocks and Loins. ¶ In this Disease the Ancients set Cupping glasses with Scarification to the right *Hypochondrium*; from which I think we should abstain, because they draw nothing from the part; but on the contrary draw the Humours into it out of the Veins, and so encrease the Inflammation.

Saxonia.

Enchir. Med.
Prag.

XI. In purging we must observe what part of the Liver is inflamed. If the gibbous part be inflamed, no Purge may be given, according to *Avicenna*, but Evacuators by Urine: If the simous part, we must use things that evacuate by stool; otherwise Nature will grow weak, and the Inflammation will encrease. Wherefore if the Gibbous part be inflamed, we must give Lenitives, not Purgatives; unless perhaps Nature should attempt a little evacuation by stool; wherefore when signs of Coction appear, Nature may be helped, not before: for according to 13. *Meth.* they that Purge in the beginning, make the Inflammation pertinacious. If the simous part be enflamed, *Galen*, c. 14, 15, and 16. l. 13. *Meth.* approves of *Carthamus*, Nettle, and root of Polypody: We may mix some *Epithymum*; and upon urgent necessity *Galen* says he gave black Hellebore, with Bar-

ly Ptsan strained. We may give Rheubarb, if Bile abound; Agarick, if the Inflammation be pituitous; if melancholick, *Senna*, *Epithymum*, *Polypodium*, black Hellebore. Wherefore in our Practice we must observe, that we may ascend to violent ones, not in a bilious Inflammation, but especially in a melancholick one; because this may degenerate into a

Capivaccus

Schirrhus, an incurable Disease.

XII. *Galen* approves of Purgatives mixt with meat in the foresaid places. "In process of time, says he, when the Inflammation is concocted, we may evacuate by the Belly, if the hollow part be affected, with Bastard-Saffron mixt with Meat, and with such things as gently loosen the Belly: And in the remission we may use these things more and more boldly than before; and then things that are stronger than these, partly boiled in Ptsan, partly reduced to fine powder, and these may be given even in water: For I have sometimes boiled a little Polypody, and rind of Black Hellebore in Ptsan. *Massarius*, l. 3. *Pract. c.* 13. subscribes to the same when he says: "*Galen's* way of giving purging Medicines is very worthy our notice: He used to mix them with Meat, and that in a twofold manner; one way by boiling Food and Physick together: Another way was, by pounding the Medicines, and mixing their very fine powder with Ptsan, or other Medicines. Both which ways, as they are good in other Diseases, so especially in an Inflammation of the Liver: For when the Meat passes out of the Stomach, not only it, but the Physick with it, is drawn to the Liver, whence very likely Purgings will succeed more easily, and with far less trouble. And perhaps that was the Authour's meaning, *Lib. de viâ. acut.* 4. text. 18. when he says, That at-
tractory Sorbitions must be given. Wherefore in my Judgment it were the best way to revive this way of purging, at this time disused." Some disapprove of this, because if Purgatives be mixt with meat, it corrupts, and therefore the parts are deprived of their due nourishment. 2. Because hot things are prescribed, very adverse to an inflamed Liver. But 1. This reason might conclude something, if Medicines were always and daily given with food: But it can doe no great harm, if once or twice eating do not nourish, because fasting it self is a sort of evacuation. 2. Though Medicines prescribed by *Galen*, be never so hot; yet they are tempered by mixing them with Ptsan, and such things.

XIII. Alteratives may be given, Whey of Asses Milk, either clarified or distilled: Decoctions of Cichory, Endive, Sow-Thistle, Sorrel, Liverwort; Clarified Juices of Endive, Sow-Thistle, in the foresaid decoction. But I chuse rather to give 1 pound and an half, or 2 pounds of water distilled off Juice of Endive, Cichory, or Sorrel: Or, Syrup of Juice of Lemons with some diuretick Vehicle. For Decoctions and Juices lie long on the Stomach, because they stand in need of some concoction, and so coolers come to the Liver, with their virtues much broken. And clarified Whey does not pass so easily, and distilled, it acquires a fiery quality in distillation, which is not communicated to, nor kept by Waters, which are very cooling. But *Galen's* caution 1. *acut.* 43. must be observed, That nothing be given actually cold; for cold things condense the part, and render the humours crude.

Fortis Conf.
57, cent. 3.

XIV. If internal Repellents be given as they ought, we must have regard to the form, place, time, greatness of the Inflammation, and to the use of the Part: To the form; for if the Inflammation be Erysipelaceous or legitimate, we may at the very first use Coolers: For although they may cause some Obstruction in the Liver, nevertheless the danger is greater, which we prevent by drinking cold water, than the damage that follows; for if these cooling things were not given, a Consumption or abscess would follow. The place is either the fi-

mous part, then Coolers must by no means be astringent, for if they bind the part affected, the matter will grow hard, and the bile-passage will be stoppt, and so the Bile retained in the Liver will increase the Inflammation: Or, the gibbous, then Astringents are not condemned, for they have a faculty to hinder the fluxion from the gibbous part to the firmous, and so it will be preserved from Inflammation. Upon the score of the use of the part, which is common to the whole, things must be mixt to preserve strength. If the Inflammation be pituitous or melancholick, we must abstain from astringent and very cooling things.

Saxonia

XV. Wind gathered in the Cavities of the Body, that is, in the Stomach and Guts, and pent up, if it cannot find a passage, it makes its way by force through the blind, connivent ducts, and is diffused into the ambient Membranes of the Liver, and the capillary Veins disseminated through the hollow and gibbous part of the Liver, and holds them in the manner of a *Schirrhus*, yet without a *Schirrhus* it so much distends them, that a great swelling oftentimes arises about the Region of the Liver, and shews it self by the same signs that a *Schirrhus* has, but that it is less renitent, and bred in a shorter time: For oftentimes it appears so big, that it fills the whole *Hypochondrium*, so that you can neither feel the ends of the ribs, nor get your fingers under them, nor can you feel any figure or circumscription of the Liver. It is known that this Disease comes from abundance of vaporous and gross wind; because the Patients perceive not only a sense of gravity, but of distension. Not much unlike as the Spleen is sometime distended by a flatuous Spirit, as *Trallianus* testifies, they call it *εμπνομή*, and *εμπνομή*, Windiness and Inflation. And when vulgar Physicians know not, that the swellings of both these viscera come from wind, how blindly do they go about the Cure, when they know not the cause of this Disease? Then thousands of Juleps are prescribed, the cure is protracted a long time, and at last, when they have done more harm than good, they with great constancy affirm, that it is an incurable *Schirrhus* of the Liver or the Spleen. But this Ignorance does shamefully disgrace its authors; for when this cloudy vapour impacted in the part, is in process of time dissolved by the innate heat, with fomentations, fasting, an extenuating and heating Diet, administered by old Women and Empericks, the swelling of the *Hypochondrium* vanishes, all pain is pacified, and these pains with their false opinion are rejected. I exhort therefore all ingenious lovers of truth, and such as have regard to their Good-Name and Credit, diligently to learn the difference between the Symptoms of Wind, and others. Indeed it is very difficult, but very commendable, and a thing that gains the Learned much credit. For many Patients, as if they were breathing their last, through excessive pain and trouble, do miserably cry out for no other cause, than that they come from a windy Spirit: Which if it be corrupt, if it arise from a putrid and poisonous matter, and run up and down the Limbs with intolerable pain, then it requires a man well skilled in the works of Art, who can know both the molesting Wind, and the matter whence it arises, and can distinguish this from other Diseases. Moreover, the distension of the *Hypochondrium* from wind alone is of no long continuance without the efflux of Phlegm; for continual Pain draws it, the extension of the passages admits it, and the coldness of it, yea, and of both of them, weakens the Liver, whereupon crude humours are bred. Wherefore I would advise the Physician to take care of both, but of that especially, which is most urgent. Yet we must have a care how we use hot things, especially in such as are plethorick, or have got a hot Liver, either by nature or a hot course of Diet. A large Cupping-glass applied twice or thrice, with much flame, is good; yet not

not before the phlegm be perfectly evacuated, otherwise there were danger, lest it should fix the phlegm there, and prove the cause of a true *Schirrhus*. Almost the same remedies are good for the flatulent obstruction of the Spleen, which are good for the Liver, but it requires stronger purges, if the humours be gross. But if there be no great store of flatulencies, and they be thin, without hot matter, and if the habit of the body be spare, then gentle things must be used both inwardly and outwardly, and oftentimes the applying of a Cupping-glass will be sufficient.

XVI. My Tincture made of Mars and Saccharum Saturni in Plantain-water is good against an Inflammation of the Liver: For Saturn is contrary to all Inflammations: But we must have a care, that we use it not too often. Externally the same may be used with Water of Plantain, Roses, Strawberry, or Nightshade. ¶ If you would know whether there be an Inflammation in it, or in any other part, apply hot Topicks. If the part can bear them, there is no inflammation: But if it cannot bear them, certainly know, there is an Inflammation, and that an Abscess will follow.

XVII. The Wife of N. being ill of a *Schirrhus* in her Liver, used so many emollient things, that at length an Inflammation, and then a great Abscess arose, after which an Ulcer, and Death followed. From whence it is clear, that Emollients must not be used to Scirrhus Tumours, as Galen 5. *simp. cap. 1.* advises. And not only Scirrhus Tumours of the Internal parts, but of the external also, are exasperated by them, and turn to Cancers.

XVIII. If the *Schirrhus* be contumacious, *Emplastrum de Cicuta Hildani* does the business. I used it with good success in a Lawyer of Marburg. Although it cause pain, yet it must be kept on, and renewed every third day.

XIX. The Liver, being a noble part, must be treated with great caution; for you must not think, that you need not care with what remedies you alter it, so as you may reduce it to its natural Symmetry; but you must see, when it rages with heat, that you do not apply to it chilly things, whereby the small veins of the Liver may be stoppt: for thence a great calamity of Putrefaction may arise, and a foundation may be laid for the greatest Fevers. Let them therefore be openers of obstructions, such as breathe a gentle heat: for this is a part of so great authority, that Life cannot subsist without it. ¶ I indeed avoid the excessive use of cold things to the Liver: Because it is a part, which, when it is hot, easily falls into the contrary fault. Yet to them that have a natural strength in that part, and their Liver burns with a hot intemperature, an *Oxyrrhodinum*, actually cold, may be applied, as it is used to the Forehead, and also a Cataplasma made of it and Barley-flower, or of bruised herbs, cold virtually as well as actually: And truly I have found this very seasonable in Burning Fevers, with an Inflammation of it.

XX. When the Liver is hot, we must consider whether the Intemperature be simple, or come of bile: If from bile, we must cool with gentle aperients, and bind a little, as with Conserve of Maiden-hair, with Cichoraceous things, Bugloss, and the greater cold Seeds.

XXI. Then for tempering the heat of the Liver and Blood, two great remedies must be used; the one internal, the other external; The Internal is Asses Milk and Sugar, methodically given for forty days and more; And the External is a Bath of sweet Water for the whole body, made of a decoction of leaves of Mallow, Violets, Willow, Water-lily, &c.

XXII. After the Meat is passed out of the Stomach, and concocted, it is good to drink, especially Beer well boiled and wrought; for so the Stomach, as *Avicenna* says, is washed; the Guts, whose

moisture is exhausted by the heat of the Liver, are moistened, and the Belly is loosed; the Chyle also penetrates aright into the Veins; for drink is no crato: thing but the Vehicle of the Chyle.

XXIII. *Avicenna* says, A Vein must be opened in an obstruction of the Liver, when it is old: Which must be rightly understood; for if we should always tarry till the Obstruction were old, certainly it would be so increased, that it would be dangerous. *Avicenna* therefore means some great fault in the blood, and if the Obstruction be from blood, and give not way to gentle Medicines, a Vein must be opened.

XXIV. Whether the Liver or Spleen labour of an Obstruction of crude, thin and unconcocted humours, or of a *Schirrhus*, the Physician may quickly remove the Disease, if he carry off the matter by strong Purges: But if out of timorousness, because of *Aph. 22. 1.* he delay it, the bad humours mix themselves with the Mass of blood, so that afterwards there arises a tedious Disease.

XXV. If there be no occasion not reason to let blood, we must take care to purge the blood from the pollution of the serous and watry humour, by giving things to purge the serous Tumour; For which purpose, I have learned, by long experience, that Juice of Seed of *Carthamus*, and an Infusion of Agarick and Rheubarb are good; which you must doe at short Intervals, namely, every third or fourth day: for you must in this manner purge the obstructions of the Liver, especially them that are in the gibbous or hollow part of the Liver: Because, to purge more plentifully, would either be to no purpose, or dangerous, seeing it is impossible for a great deal to pass the obstructed cavities; but in an obstruction, that is not in the passages, we may evacuate more liberally. When you have done this six times, you must betake your self to things that have a virtue to evacuate the humidity of the Liver, and to correct its fault; and so for six or eight days you must give every morning *Confectio de jecore Lupi* made into Lozenges; also Powder, or Lozenges of China and Dock-root, with twice as much Sugar; or *Diarrhodon* with powder of *Schoenanth*; Trochiscs of Rheubarb with a little *Dialacca* and Sugar. And so at intervals, you must purge what is watry, and strengthen the Liver, and you must endeavour to open it with the foresaid Medicines.

XXVI. Error is committed by many in the use of Rheubarb. If the obstruction come from bile, it is approved; if from phlegm or melancholy, by no means, especially when the phlegm is thin: But if thick phlegm or melancholy offend, it will doe harm, for it evacuates Bile, which is matter of Health in the Body, because by its heat, the coldness of the phlegm and melancholy abates, it attenuates also, and in some measure is deterfive. This is another error, Because this Disease is of long continuance, Physicians prescribe, that the Patient do frequently, that is, every, or every other day, chew Rheubarb, and swallow it: but they are mistaken; for bile is evacuated, which does not offend, and the obstruction is increased, because it is not administered in infusion, but in substance, which is thick and stops. They err also, who order it to be chewed with Raisins, to take off the unpleasantness: But by this means its substance is carried to the Liver, the place obstructed; for sweet things serve for a vehicle to others; whereby the vessels are more obstructed.

XXVII. It is a good way of cure, which evacuates by Urine; but we must not use all evacuators by Urine: for things that breed much aqueous humidity, do rather give an augmentation to the cause, and increase obstructions. Wherefore many doe amiss in using emulsions of the cold Seeds for obstructions remaining after acute diseases. Therefore, I think, such things should be used, which either

either have a property to move Urine, as Rheubarb, Seed of *Carthamus*, or are absterfive, as Turpentine, and Chalybeate Medicines. For things that are properly diuretick, as such as put the humours in fusion, seem a little suspicious: though sometimes they may be usefull, because they contribute much to the carrying of other Medicines.

Mercatus.

XXVIII. Things that dissolve Tartar, bred any where in the body, do open obstructions of the Liver, from what cause soever they proceed: For as the obstructions of the Macrocosm, so also of the Microcosm, are made by Tartar. But things may be added to them, which are commonly prescribed by Practitioners: for though they cannot doe the business, yet they are sure vehicles, to carry deobstruent Medicines, that is, things that dissolve Tartar, to the part affected, and render them more effectual. Therefore distilled Waters, Apozemes, Infusions, Syrups, &c. ought not to be neglected. Iron, and its various preparations are the principal Medicines in this case. Many preparations of it are invented; but, the simpler they are, the better. It is admirable, how effectual the crude filings of Mars are in such diseases, taken twice or thrice a day, from half a scruple to half a drachm.

Hartman-
nus.

XXIX. We must always take care, that some Astringents be mixt with things that open obstructions, and attenuate, that the substance of the *viscus* may be strengthened, and the aperients, being longer detained there, may act more effectually. For it has been found, that the Liver has been not a little hurt by the excessive and continual use of aperients.

Vallesius.

XXX. They deserve reprehension, who give but 1 ounce and an half of *Oxymel*: which small quantity scarce moistens the bottom of the Stomach, it is kept partly in the *Parishmia*, and after it is taken is spit out again, and partly in the Gullet; wherefore both the quantity and virtue of it are so diminished in the journey, before it comes at the Liver, that the *materia prima* of the *Oxymel* gets not thither. I give 4 ounces of *Oxymel*, and sometimes 6 every day, but at divers hours, that is, 1 ounce and an half early in the morning, and as much a little before dinner and supper: for if it should all be given in the morning, it would hurt the Stomach too much.

Sanctorius.

XXI. In opening obstructions of the Liver, we must proceed in this order, first the concave, then the gibbous part of it must be opened; and indeed in the concave preparation must be used, with clarified juice of Cichory, Liverwort, and Agrimony, to 3 ounces in a decoction of Cichory, Agrimony, Hops, *Asparagus*, and roots of Grails; having first given a *Bolus* of *Pil. de tribus* half a drachm, with *Cassia*, persisting several days, that both the passages may be opened, and the gross excrements carried off, not omitting a Purge of Agarick, Rheubarb, Senna, &c. The hollow part being opened, the gibbous part of the Liver must be cured with violent openers and purgers; for example; Take of extract of Rheubarb 1 scruple, *Tartarum vitriolatum* half a scruple. Mix them. Make a *Bolus*, upon which, let the Patient drink some distilled Water of Agrimony, in which, after a while, ten drops of redified Spirit of Tartar may be dropd.

Fortis.

XXXII. Purgatives must answer in proportion to the foresaid preparers and aperients, among which, since Rheubarb has the prerogative, we must not depart from it; yet observing this difference, that as the substance purges the hollow more than the gibbous part, so the Infusion purges the gibbous part more than the hollow of the Liver, because it communicates its subtiler parts to the Infusion. Let 2 drachms be infused in Agrimony-water, adding a little Spike, Senna, and Polypody of the Oak, and to the expression add some Syrup of Roses solutive.

Idem.

XXXIII. We must not desist from the use of aperients, till all pain be quite gone, or well abated, and the *Hypochondria* be lighter, since the obstruction of the Liver is a chronic Disease, and usually cannot be opened in one week, nay, scarce in a whole year. We must be very industrious to take it away; for there is the beginning and foundation of all Diseases; and unless it be carefully and totally taken away, it causes the corruption of the Blood, Inflammations, Fevers, *Schirrhi*, divers Fluxes of the Belly, Cachexy, Dropsie, Jaundice, &c. 2. A due order must be observed in giving of all Medicines, Universals must always be given before Particulars and Topicks. 3. Medicines must not be given till long after Meat. 4. They must be Liquid, that they may penetrate. 5. Attenuant, dissolving and discussing things; besides that, they must be moderate, and must also be hepatick and astringent. 6. In Diseases of the Liver we must not use sweet things as Meat, but as Sauce, after recovery: but they must not be offered to any, while they are indisposed. External Topicks must never be cold; but always hot, or warm.

Hofmannus.

XXXIV. One at Padua was ill of a deplorable Ulcer of the Liver, he was otherwise a lusty Man, and addicted to Sea-affairs. The Excellent H. S. a Physician of Venice, contrary to the advice of the rest of the Physicians, got his *Abdomen* opened with a Razor upon the Region of the Liver, that much of the Pus might run out at the wound; After which the wound was cured, and the Man survived, and three years after he leaped and wrought, and found no inconvenience.

Capivacci-
us.

XXXV. Some are of opinion, that an Imposthume of the Liver must not be opened, because, according to *Fernelius* 6. de part. Morb. cap. 4. and *Foressius*, lib. 19. obs. 10. an Ulcer contracted from an Abscess, which is continually washed with aliment, must perpetually be very foul; nor can it ever heal, seeing the substance of the Liver is spermatick, and can no more be repaired than other such parts. This Disease therefore, since it is of it self mortal, let the Physician abstain from external incision or burning, lest he be thought to have killed the Man, whom the violence of the Disease destroyed. But on the contrary, where it is not possible to evacuate the Pus by Urine, or any other way. *Mercatus Pract. lib. 4. cap. 2.* intimates, that the opening of it with a red hot Iron may be practised, by a skilfull and honest Chirurgion. "If, saith he, the abscess appear outwardly, certainly, it is bad not to cut it, because if incision be omitted, the Liver is eroded by the Pus, and there is no escaping of Death. But if you be minded to cut it (without a red-hot Iron) there will be danger of an hemorrhage, and the Man will immediately be destroyed. Notwithstanding, *Capivaccius*, l. 3. Pract. c. 23. and, *Saxonia*, l. 3. *Panthei*, c. 29. give instances of the opening of it with success. Some tumours come to suppuration, and because the Liver is of little sence; for onely the gibbous part of it has Nerves, therefore crude ones cannot be distinguished from suppurable ones, but in process of time: For then they that suppurate, especially on the gibbous part, stand out sharp, and indicate Section, without endangering of Life, as I have experienced in several: although the common integuments, the Muscles and *Peritoneum* were cut. But if it be in the hollow part, it must be purged by Urine, as I observed in a Nun. Which cannot be done in a Tumour of the gibbous part. When it is cut, a Tent may be put in, dipt in the White of an Egg. Then we must use digestives, as in the wound of that part; Afterwards a cicatrice must be made with Sarcoticks, and then with Epuloticks; yet all the purulent matter must first be evacuated by help of Tents, and leaden Pipes, by which it is purged sooner, and with more convenience. In this manner I have cured several, who, at this present, live

Marchetti,
obs. 52.

live well in health. ¶ *Hippocrates* 7. *Apb.* 46. teaches us how a purulent Liver may be healed. But almost all Men judge them desperate, who have a purulent Liver. The Cure, I believe, is not so difficult, but it may be attempted with some hopes of recovery; But Physicians fearing lest the Pus should be found bloody and fetid (in which case they certainly die) are afraid, lest the cause of death should be imputed to them. I visited one, whose Liver I immediately judged was inflamed and purulent: Others believed he was troubled with a malignant Fever. I thought to have cut him over against the Swelling, to let the Pus out, which remedy was derided: After he was dead, I ordered the place to be opened, which the wretched Man, while he lived, pointed to, as most tormented, and the Coat of the Liver was found parted from the *Parenchyma*, and in that space there were five pounds of white Pus, as I foretold. ¶ Although *Hippocrates* 7. *Apb.* 42. says, the case is desperate, when Pus comes out like to Lees of Oil; yet we must not wholly desist from good hope, seeing this seems to proceed rather from the natural condition of the suppurated Liver, than from the default of heat only, because, when the substance of the Liver is inflamed, the heat is not such, as to be able to turn the substance of it into white Pus. But, if you will venture on it, make the hole large outwardly, and narrow inwardly.

Sanctorius.

Mercatus.

and make a Rupture there. It happens above the Navel, but very seldom. Not only I, but others with me, have seen one below the Navel, and by the sides of it, and far above the Groin, which they dealt with as with an Abscess. And the Chirurgeon could produce no other reason for his error, but that it was not the usual place for Ruptures. Practice shews us many other Ruptures besides simple and compound ones, which are not found among Writers. For experience has taught me, that the *Peritoneum* may burst in the hind part toward the back, and there make a Rupture: we find also, that the process of the *Peritoneum* may be so burst in the Groin, that the Guts may not fall into the *Scrotum*, but thrust themselves between the Skin and the Muscles, towards the thigh. Besides, I have more than once observed a *vas deferens* corrugated has fallen into the *Scrotum*, and caused a Rupture there, which might easily be put up by help of the hand; yea, which upon lying on his back would go in of itself, from which no danger need be feared.

Barbette.

II. Medicines acting by a manifest quality, are such, as by their excellent astringent and drying quality do contract the process of the *Peritoneum*, and stop the going out of the Guts: But the use of them in grown persons is very much suspected; for by long using of them, the Liver, and other of the Inwards are hurt and obstructed, and then I see not how the virtue of them, because of their astringent faculty, can get to the place affected. Besides, the Belly is made very costive, but how dangerous costiveness is for a Rupture, is known to all Men. Yet I have often experienced these things following, which act by their specifick virtue, to be excellent, Comfrey-root, Rupture-wort, Earth-worms, spotted Lungwort, Stag's-pizzle, Seed of Thorow-wax.

Hildanus.

III. The noble J. J. a *Diespach* had been ill for 20 years of a great Rupture of his Guts; for curing of which; he had used several experienced Men, but in vain. At length, when he did not dream of being cured of it, he had a fit of sickness, which confined him above six months to his bed. After this he found not the least sign of his preceding Rupture, nor did he use Trusses any more. And that it was a perfect cure, this is a sign, for when two years afterwards he was troubled with stoppage of Urine and Costiveness, and used an emollient Bath and laxative Ointments, not the least sign of any Rupture appeared. ¶ Contrary to the expectation of many, I cured a Man who had had a Rupture in his guts 10 years, thus. I ordered him to keep his Bed for a month, keeping his Legs as close together as he could, not spreading them abroad: to keep a drying diet, unless perhaps he took a few stewed Prunes, to loosen him: to eat nothing windy, crude, and hard of digestion, except feet of Hogs, Kids, or Sheep. And he used these Medicines; Take of *Terra Sigillata*, Comfrey-root, true Bole-Armenick, each 2 drachms, burnt Hartshorn 1 drachm. Let him take for 14 or 15 days 1 drachm and an half, or 2 drachms, every morning in Capon-broth. Then take of Dragon's-bloud, Mumy, Mastich, Frankincense, Comfrey-root, Bole-Armenick, Red Snails, Hedge-hog powdered 1 ounce. Let them all be incorporated with the Turpentine, make a Plaster, and apply it to the Groin. Yet let universals be used before.

Idem.

Riverius.

IV. In fitting the *Splenium* to the Truss, our chief care must be to make it fit, that it be not round like a ball, as they are usually made by unskillfull Chirurgeons: for when they are so extuberant, they drive the Groin too much inward, that the torn membrane cannot chuse but keep open continually, and will never knit. So also it comes to pass, that the Gut bursts out, upon any violent motion, and notwithstanding that turgid round *Splenium*, it slips down into the *Scrotum*: Therefore the *Splenium* must be three-cornered, large enough for the

Hernia, or, A Rupture.

I. THE Groin is the usual place for Ruptures; but do not persuade your self, that the *Peritoneum* cannot be dilated, or burst in other places,

the Groin affected, so gently supported, and covered with a plate outwardly convex a little, or with some hard renitent matter, that the inner *Superficies* may not be plainly extruberant, but so made, that it may be firm, and as it were a little concave, which may neatly receive the Groin, and may gently press it, when it is every way aptly comprehended.

Solenander,
Sect. 4. c.
23.

Fortis.

V. A Truss must be fitted to each Groin; for if it be applied but to one onely, it swells the other, and easily causes a *Bubonocèle*.

Vesichius.

VI. They that go about to cure Ruptures by Section, let them first see and diligently enquire, whether the Intestines, fallen into the *Scrotum*, through the processes of the *Peritonæum*, and straitened by the narrowness of the way, have contracted a Gangrene: for then, though they cut never so well, the Man will dye the next day. And it will be thought that the Chirurgion has killed him. Of which thing *Stegelius* observed examples in France.

VII. Being called to some too late, when the Gut was inflamed, so that it could not get back again by the narrow hole in the broken *Peritonæum*, for the Swelling, I saved three Patients from present death by dilating the hole with incision, thus; First, I place him, as I said before, for reposition, binding him fast, so that he cannot stir in the operation: After this, I draw a transverse line with Ink over the line of the strangulation of the Gut, where the Rupture of the *Peritonæum* is. Then I draw another line, to cut the former perpendicularly, just upon the place of Strangulation, and in the middle of it: then I take up the skin between my two fingers, on each side, according to the transverse Section, and cut it with a Razour along the perpendicular, about 2 inches in length: Then the muscles that cover the Rupture are elevated by degrees, and separated with a Penknife, till the production of the *Peritonæum* be laid open: And when it is laid open, it is cut open with the same Penknife, and in this manner the Gut is put up again. But if the Gut be so swelled with the inflammation or wind, that it cannot be thrust back into the *Abdomen*, the apertion already made, may be amplified, by putting a cannulated Catheter into the Wound, upon which lithotomy is made, and the *Abdomen* may be cut upon it with a pair of Scissers, above or below, as the Chirurgion shall think meet. ¶ In the City of Padua I observed intestinal Ruptures often wedged in, attended with black Vomiting, and tending quickly to death. I opened three dead persons, and with the greatest care examined the falling down of the writhen Gut *Ileon*, and the manner how the Excrements were wedged in. Thence being emboldened, at my earnest request to the Patient and By-standers, I ventured on cutting, though very dangerous, and GOD blessed it. I eased the Gut by cutting the skin, the process of the Muscles and the *Peritonæum*. When it was put up, and suture made, the wound was cured without any subsequent Rupture.

Riverius.

Rosinccius.

VIII. I have been spectatour to a Frenchman, who successfully cured many in a very safe method: for it is done with little or no pain, and the vessels are not tinged with blood, and therefore may better be seen and handled: And it is the more desirable in Males, because it may be done without cutting out a Testicle. He applied a potential Cautey a little above the Region of the Testicle, on the broken side, where the Bag falls into the process of the *Peritonæum*, in such a quantity, that by mortifying the skin about half an inch in length, he made an Eschar: Which being cut off, he applied another Cautey, till the skin being quite taken away, the fat appeared, which he cut with a pair of Scissers, till the process that carried the seminary vessels appeared: Two days after which was done, he separated these vessels from the process artificially with his fingers; and with a crooked Needle he drew a

Thread underneath, and tied the process gently, putting him then to no pain at all. The Thread afterwards, in success of time, falling off, and Sarcotick Ointments applied, he produced flesh there by degrees like a *Callus*, which grows the more easily to this process, because the red Coat, called *Elythris*, is carnosus and muscous; and so by pressing and filling the place of the lost substance, he stoppt the falling down of the Guts, and so perfectly and happily performed the cure.

Platerus,
Tom. 3. c. 22

IX. Castration exposes the Patient to manifest danger of death: for they that castrate, do, for fear lest, when the cure is finished, a relaxation should remain, by their violent drawing, draw aside the process of the *Peritonæum* from the parts to which it sticks, and also a Nerve of the sixth conjugation, which goes to the testicle; from which things arises great pain, convulsion, bleeding, inflammation, putrefaction, death. But they that escape these dangers, are deprived of their generating faculty. Wherefore I should never subscribe to the cutting out of the stones, unless perhaps a *Sarcocèle*, or a Gangrene seize them.

Parvus, l. 7.
c. 16.

X. There is a late invention of the Spaniards to cure intestinal Ruptures, without cutting out of the Stones. They make a simple Section lengthways along the process of the dilated *Peritonæum*, they thrust the Testicle of the side affected into the capacity of the *Abdomen*, and then making a golden puncture, they heal the wound. But because after this cure all are made barren, if it be done on both sides, Counsel was desired from Rome concerning Matrimony, Whether such could lawfully Marry, as being unable to get Children? We expect a solution of the difficulty. ¶ But the most skillfull Chirurgeons do not approve of this way of cure, because, if the hole be larger than the stone, it quickly falls down again, and the Patient is as bad as before; and because, if the stone be larger than the hole, if it be straitned it is pained, whence follows inflammation, barrenness, or death.

Henricus 2
Monichen,
Obs. 24.

Scultetus;

XI. Be not unmindfull, how that the edges of the burst *Peritonæum* in old Men, and old Ruptures, are sometimes so hardened with a *Callus*, that they cannot grow together again, though they are never so accurately brought to mutual contact; but in this case the business must be done with Trusses: But in children they grow up easily, so that here Swathes seem more proper than the best Truss-Barbette; ses.

XII. *Valescus de Taranta* says, that he who presumes to cure a cacoehymick, a weak or an old Man by incision, does plainly desire to be accounted a Murderer. Yet *Hildanus*, Cent. 6. Obs. 73. shews, by an example, that it may be done in decrepit Men, upon extreme necessity, if so be the Inwards be sound.

XIII. If an Inflammation and the excrements concur in hindring the reposition of the Gut, the case indeed is very desperate, yet nevertheless a discharge of the Excrements must be attempted by Baths, or Fomentations, which relax the distension, and by lenient Clysters, letting alone the taking of Purges by the mouth, which otherwise would cause a greater afflux of the humours to the part affected, and according to *Fallopins*, hasten the Patient's death.

Scultetus;

XIV. Some deny, that Clysters may be given, when the Gut is fallen into the *Scrotum*: But the falling down of the Gut must be distinguished, which is either but falling, or is fallen and inveterate. I reckon it is falling, in the beginning, as soon as the Gut falls into the *Scrotum*, and increases the Malady, then it is better to loosen the bound body with a Suppository, and then to apply a bag of Roots of emollient Herbs, Flowers and Seeds, than to give a Clyster presently, lest it should fall with the Gut into the *Scrotum*, and make it worse: I reckon it is inveterate, when the Gut has been for some days kept in the *Scrotum*, so that bad Symptoms,

proms, hardness, tension of the *Scrotum*, pain, vomiting, restlessness, &c. torment the Patient: in these, Clysters are not onely convenient, but necessary; nor need we fear, that they can easily fall into the *Scrotum*: For when the Gut is inclosed in the hole of the *Peritonæum* and the Sheath, and therefore compressed, it is scarce possible, that the Clyster should get into the *Scrotum*. In the mean time the giving a Clyster makes the Gut soft and slippery, allwages pain, and discharges wind, all which things are requisite.

Hildanus.

XV. I ordered one, who had a perfect rupture, among other proper things, to stop the coming of it down with a Truss, which he used for the space of six years, and at length he affirmed he was well: And indeed, when his genitals were examined, no sign of a Rupture appeared. When he was dead, I searched by what means Nature had hindered the falling down of the Guts. And I found a fatty substance about the hole in the process of the *Peritonæum*, about the bigness of a Tennis-ball, so close knit to the said process, that it could scarce be separated without tearing the adjacent parts. I have known others, who have been cured by constant wearing of a Truss, and by that alone; who, being formerly lean, and afterwards fat, fat has gathered about the Guts, which has made them swell, and so there was no passage for them into the *Scrotum*.

Patzus.

XVI. Mr. N. above 50 years old, says, he was cured onely with a Truss, and often taking Saracen's confound, and Thorow-wax in Broth, with the fat of a Hen, Honey and May-butter: But he used these things a year.

Cur. Mifc. obs. 306. 47. 92.

XVII. The descent of the Gut, by the holes of the Tendons, which are alternately disposed, must be observed, lest in putting back of the Gut, which is done by Chirurgical operation, it should be put among the *Aponeuroses*, for the hole of the last Tendon must be cut, that the Gut may be thrust back, in which thing many Chirurgeons mistake, even the most skilfull, to the hazard of Life.

Riolanus, Enchir. p. 161.

XVIII. Chirurgeons are very earnest to have an Incision made in the *Scrotum*, to let out the watry humour; and they doe well, in my opinion. But it seems an absurd thing to me, that this Incision should not be made in the lower part of the *Scrotum*: for when the Testicle is wholly elevated, Section may more safely be made in the bottom. Neither have I observed, that any harm followed upon it hitherto. Nor let any one say, that a Tent put into the emissary made below, does prick the Testicle; because a skilfull Chirurgeon prevents that.

Amatus, cent. 2. cur. 84.

XIX. J. Vellingius reported, that he formerly saw in Egypt a Man threescore years old cured of an *Hydrocele* by burning with Flax, a thing familiar with the Egyptians, above the shoulder blades, on each side in the Neck; and in like manner upon the Groin, at the root of the process of the *Peritonæum*, the aqueous Tumour vanishing by degrees, without the help of other external things.

Rhodius, cent. 5. obs. 38.

XX. Let the Chirurgeon be cautious in making Section, because of bad Symptoms, that supervene, especially let him not go about this operation, till the body be well prepared. But if he know, that there is any intemperature or fault in the Kidney, let him either abstain from the operation, or let him cut the *Scrotum* onely in the lower part, that the serous humour may run out. Yet let the passage be no way stoppt (as it is, when a Testicle is cut out) lest the serous humour, which cannot be drawn by the Kidneys, be retained in the *Abdomen*, but if need be, may run that way. I saw at Byzantium a Man threescore years old, whose *Scrotum* every year was perforated in the lower part for a *Hydrocele*, and the serous humour was evacuated, then the Ulcer was cicatrized, and he lived to a great Age. But if the Kidney be not in fault, and you would

stop the defluxion, it is convenient to make the incision in the upper part of the *Scrotum*, near the Groin: for the Chirurgeon has a two-fold scope.

1. To evacuate the serous humour. 2. To hinder it from coming afresh into the *Scrotum*: But because usually the water falls from the Body upon the *Tunica erythroidea*, and extends it, incision must of necessity be made in the upper part of the *Scrotum*: for so the dilated Coats are corrugated, and the Cicatrice hinders the water from falling easily upon the *Scrotum*. And that the operation may the better be performed, the Patient must not be bound to a form, nor lye on his back, but ought to sit in a chair, that the water may the better descend, and the coats in the Groin may more easily be separated and taken hold of with a Needle. Besides, let the Chirurgeon diligently examine all the signs concerning Ruptures, laid down by Celsus, Paulus and others, and let him diligently examine the nature of the disease, before he put his hand to the work, lest he make the disease worse. Besides, let him see, that the Body be not full of ill humours, nor any great fault in the Kidneys. But whenever the Chirurgeon knows that with the water there is flesh grown round about the Testicle, it is best to cut the *Scrotum*, to separate the Testicle, and whatever is grown about it, and to cut it off, if it may, by the root. For if the schirrhous matter have seized the process, or *Didymus*, and stick to the *Ab-*

Hildanus, cent. 4. obs. 66, & 67.

XXI. The cure of an *Hydrocele*, by simple puncture, is easie: but it always returns, unless the abundance of the redundant water be spent by a dry diet, as is observed by some. The most skilfull Chirurgeons, that they may remove all fear of a relapse, when the puncture is made, they put in a Wax Candle for a Tent, and with it gently velli-cating the process of the *Peritonæum*, they cause some inflammation in the upper part of it, after whose suppuration the process is more united and contracted, nor does so easily as before receive the humours into it. Some, instead of a Candle, put in a Leaden-pipe: but I have seen unhappy instances of it: for, by pricking too sharply, it caused greater inflammations, whereby (to say nothing of a Symptomatick Fever, which, contrary to the expectation of both, carries off the Patient) there is a greater confux of humours to that part, so that the whole Testicle being forced to imbibe it, has laboured of a *Sarcocoele*.

Henricus 3 Molinicher, obs. 18.

XXII. If the *Scrotum* be very much swelled, we must come to *Paracentesis*, or pricking, yet so, as that immediately after the Water is got out, a cicatrice may be made, Nor must the hole be kept open with a Pipe or Tent of Lint; for thence there would be danger of a Gangrene.

Silvaticus, cent. 1. cons. 17.

XXIII. A Noble youth, being ill of a *Hydrocele*, had divers Medicines prescribed him for four years. His Parents desired of me, that I would try to cure him any way, without the loss of his Testicle. I consented, and hoped that within three weeks I might perform the cure: for nothing appeared outwardly but Water, without any hardness, so that I thought there was onely Water. But after I had prepared and purged his body, when I had perforated the *Scrotum* without pain, with my Caustick, and the third day after had separated the Eschar, besides the Water I found a certain fleshy hard substance, about the Spermatick Vessels: After Excision therefore of the Eschar, when some of the serous humour had run out, a great pain, but momentary, arises suddenly in the bottom of his Belly, especially about the right Groin, the part affected: The night following the *Scrotum* swelled a little, and there was a very hard Swelling more plainly found in the upper part of the Sheath, round about the Spermatick Vessels. Then the

P P violent

violent and exceeding dangerous Symptoms, which I have sometimes known proceed from such openings, came into my mind. The same thing happened to *Griffonius*, a most excellent Medico-Chirurgion, who, when he had opened the *Scrotum* of a Savoyard, besides a *Hydrocele*, there was also found fleshy-matter growing to these vessels, which turned into a Malignant Cancer, whereto he applied Medicines, the Knife and Fire, to no purpose.

Hildanus,
cent. 4.
obs. 63.

XXIV. Sometimes a *Pneumatocoele*, or Wind-rupture is caused in the four Vessels, which nourish the Testicles, or in the intercurrent Arteries of the *Dartos*; The former tumour is harder, and gives not way to the finger, when touched, and admits of a cure: This latter goes in again and vanishes, if pressed with the finger, and is scarce curable, because of the danger of incessant bleeding. ¶ Wind may also be taken away by Chirurgery or Section. Yet that which comes from the Arteries, we reject as desperate. The other before-mentioned we cure like varicous ruptures. See Sect. XXX.

Geiger. Che-
legr. cap. 3.

Idem, c. 13.

XXV. *Aquapendent* goes a safe way to work, *Pentateuch. Chir. lib. 1. cap. 29.* if an aqueous rupture be joined with a carnosus. But if there be no Water, you must let alone the operation, because whether you cut or no, the case is dangerous, and perforation onely may cause a Gangrene. You may see before what Hildanus says.

Silvaticus,
cent. 3. conf.
74.

XXVI. The Noble N. complained of a great *Sarcocoele* of his left Testicle, which, universals premised, and a good course of Diet, I insensibly dissolved, with the following Plaster and Powder of Rest-harrow, which *Matthiolus*, l. 2. c. 18. commends; Take of Gum Ammoniack, *Galbanum*, *Bdellium*, dissolved in Vinegar, each half an ounce; add of Ducks-grease melted and strained half an ounce, yellow wax two ounces, Oil of White Lilies, the Marrow of a Beef marrow-bone, each 10 drachms. Make a Plaster. Spread it on a Linen-cloth, apply it to the *Scrotum*, and renew it every fourth day. He took a drachm of the Powder of Rest-harrow in a draught of Wormwood-wine every morning. He had an Issue made in his Thigh, four inches above his Knee, and continued the use of the foresaid Medicines, so that in four Months time he was perfectly well. Several others have, by degrees, recovered, with the use of this Powder alone.

Scultetus.

XXVII. Impure blood is not the cause of a carnosus Rupture, since even the best may produce it: Nor simply abundant, since it shews it self even in lean bodies; although in these it never arrives at that bigness which it does in others. But indeed, I believe, the true cause of the Rupture consists in this, when the Membranes, which use to shut the mouths of the Capillary vessels, and hinder the nutritious blood running too suddenly into the part, are either eroded, broken, or dilated, whereby it then comes to pass, that more blood runs into the part, than is required for its nutrition. Nature, in the mean time, turns the blood, which would otherwise putrefie, into flesh. It must be observed also, that this flesh grows sometimes to the second of the common coats of the *Scrotum*, and not to the Testicles, in which it may be taken out without hurting or excision of them. In the beginning, when the little membranes of the vessels, being eroded, broken or dilated, do permit too great plenty of blood to pass, we do much with the use of repellent and astringent things: But if it begin to grow big, these remedies suffice not to root out the evil; yet it must be attempted by the means following. Make a little hole in the *Scrotum*, rather in the upper than in the lower part, through it, by help of a rag, apply suppurating Medicines, that by this means, if it be possible, that flesh may be taken away: But every visit all the Pus must not be let out, that the relics of the flesh may so much the better be consumed. But if these things succeed not; The Testicle must be taken out with the Rupture.

Barbette.

XXVIII. Yet the cause ought to be searched diligently before the Chirurgion set himself to the operation: for sometimes the *Parastatae* are so swelled, especially when the Testicles are scirrhus, that they might easily deceive you with the shew of a carnosus rupture. 2. The Spermatick vessels being kept in the *Scrotum*, do often, by a *lufus naturae*, exceed the Stones themselves in bigness; and cause no other inconvenience but fear, which I have found true in more than one.

Idem.

XXIX. We must observe in a Ligature, which is made, when the Testicle must be taken away together with the Rupture, that it must be made as near as may be to the Tumour: for the higher the process of the *Peritonaeum* is perforated, so much the thicker it is observed to be; which thing will hinder suppuration, and the falling off of the thread.

Idem.

XXX. A Varicous Rupture is easily known, because a multitude of Veins and Arteries appears on the superficies of the *Scrotum*, involving the whole *Scrotum* with their vast extension, as a Vine twists round a Tree. The cure of it, as also of a carnosus one, *Avicenna* says, is the cure of hard Imposthumes; and oftentimes indeed anointing with asswaging Fats and Marrows is sufficient in a varicous Rupture. But if those things, which are good for a varicous Rupture, will do no good, we must proceed to Chirurgery, and the cure must be insisted on, either by incision, or a potential Caustick. Incision is performed in this manner; When the Patient is fixt in a proper posture; handling the *Scrotum* we drive down the Nerve, whereby the Testicle hangs, into the lower part; which indeed may easily be distinguished, because it being firm and strong, feels smaller and more solid, and renitent than the veins, and if it be prest, causes greater pain; and besides, it lies near the virile member, which being depressed, we take hold of them with our own and our assistants fingers, and draw them this way and that, and violently extend them; then we cut the skin, over against the Veins, drawing the Knife gently and obliquely; then with hooks fixt in we cut the parts underneath, and separate them from the Skin, and when the Veins are bare, we run a Needle with a double thread underneath them, and then we tie them with the thread, cutting a *Sinus* in two places, where the varication begins, and where it ends, yet having first made incision lengthway, and let out the blood; afterwards we cure it with things that breed Pus, till the thread and the veins also fall off. So *Leonides* advises us to do, when some of the vessels which feed the Testicle are varicous; for if all of them be so, the Testicle must be taken together with them, lest, when it wants nourishment, it should corrupt. This Rupture also may be cured with a potential Caustery, unless the Varication be too great. If therefore it be more in the ambient Veins of the Testicle, than in the *Scrotum* (for then an excessive haemorrhagy might be feared from the corrosion of those large Veins) the Caustery must be applied in greater plenty, that it may not onely burn and waste these Veins, but the Testicle also: for so the crust will be stronger and thicker, which will hinder any excessive haemorrhage.

Geiger. Che-
legr. c. 13.

XXXI. Because it may be feared, a Vein may grow varicous in the *Scrotum*, therefore the *Scrotum Fortis* must be anointed with *Oleum Saturni*.

XXXII. Since the matter of a varicous Rupture is melancholick Blood, poured from the upper parts upon the *Scrotum*, either by critical transmutation of the melancholick matter, or the termination of some Sickness: Or it is caused by a Spleen, weak in drawing melancholick dregs from the Liver; or the Liver not expelling the melancholick Blood as it ought; besides external causes, which multiply melancholick Blood. That it may be rightly cured, we must abstain from such causes,

ses, then, when the common excrements are discharged, Blood must be let out of some lienary Vein, for usually such ruptured persons have an obstruction in their Spleen, and find a pain in their left hypochondrium; then we must use Decoctions; to purify the Blood, and remove obstructions of the Spleen.

Geiger. Chel-
leg. c. 14.

Medicines especially made use of by eminent Physicians.

1. This is admirable for a Rupture of the Guts, which we have tried, and so cured, that others have admired. Let Paper lye three days in Water, till it have soaked up the moisture, like a Sponge: Make a Ball of it, and when the Gut is put up, apply it to the Groin, bind it on with some convenient Ligature, and do not remove it for three days.

Abius.

2. When, because of the Swelling, the Guts cannot be put up again; Boil some Oats in a sufficient quantity of Water, then add half a pound of fresh Butter: boil it again. Then let the boiled Oats be put in two Bags, and by turns let one of the Bags be put into the Water, and so foment the part, and put up the split Guts gently with the Bag. This Remedy has been found very beneficial.

Loyse Bour-
gois.

3. This is admirable good in all Ruptures; Take of root of white Carline Thistle, Dove's-foot dried; boil these two in red styptick Wine, give a draught of the Wine sometimes in the morning.

Brendelius.

4. A Plaster of Hare's-down burnt, with Powder of Comfrey, mixt with Oil of unripe Roses and Pitch, is excellent.

Claudius.

5. In the month of May there are Bladders found upon Elm-leaves full of Water, which is peculiarly good for Wounds and Ruptures. The round things, which hang upon Oak-leaves gathered in the month of May, and exposed to the Sun in a Glass, do dissolve of themselves into Water, which anointed on the Rupture, is good.

Crollius.

6. Ruptures are cured with the depurated Juice of Rupture-wort, which is mixed with Bean-flower, and applied to the part for 15 days, the Patient keeping his Bed all the time. ¶ Spirit of common Salt and Sal Gemm, if 3 or 4 drops of it be taken in the morning, with Flix-wood or Comfrey-water, is a great secret for curing a Rupture.

Faber.

7. I have had great experience and much success of this; After the Gut is put up, let the Patient for 20 days take of prepared Steel 1 scruple, mixt with 2 scruples of Sugar, and drink a little Malmsey-Wine upon it.

Fallopious.

8. A Man of fifty had a Rupture, which grew as big as one's Head, and hard, which could be softened by no Fomentations, nor put up. I gave him a draught of Wine just boiled up once, with some Anise, Caraway and Fenil-seeds bruised, and the Hardness immediately was softened, and the Rupture was put up.

Van Hel-
mont.

9. Let a Load-stone powdered be given in Potage, then let the Groin, through which the Gut slips, be anointed with Honey, and fine filings of Steel strewed upon it, this Remedy must be used for several days, and the part affected must be carefully kept up with a Truss.

Hofmannus.

10. It is evident from infallible experience, that the Root of Wake-Robin has a singular Virtue against Ruptures: About a drachm, or a little less, given in some convenient liquor, not onely draws back the Prociency, but heals the Rupture of the Peritonæum, if either the Patients lye on their backs in bed, or if they use a Truss.

Laurenber-
gius.

11. In a windy Rupture I have often experienced this, *Emplastrum de Vigo cum Mercurio* and *Emplast. Diachaliteos*, dissolved into generous Malmsey-wine, with Oil of Bayes.

Patrus.

12. Greater Ants, distilled with Bread, if every day in the morning, carious Ruptures be anointed therewith; or a little of the Water be taken, doe good.

Petrus.

13. Some commend this as a most certain Cure; Take of white Cichory, gathered about St. James Tide 3 pugils, Pasque-flower 2 pugils, Seed of Thorow-wax 2 pugils. Make a Powder. The Dose, as much as one can take up with his three fingers in some flesh broth, at Dinner and Supper, till the Patient recover. 2. Take roots of Elecampane, Sanicle, Comfrey, *Saracen's Confound*, each what is sufficient, make a Decoction in Water, to the Consumption of half. In this Decoction hot wet Cloths, and let the place affected be often fomented and afterwards anointed with the following Unguent. Take Oil of Eggs and Tormentill-powder. Mix them. Make an Unguent.

Sennerius.

Medicines.

I. Some think Venæsection not at all proper for the Biting of a Mad Dog, because it draws the Poison through the whole Body into the Veins; yet *Avicenna*, l. 4. sen. 6. tr. 4. c. 9. writes, that blood must be let after the fourth day; and that not onely once, but twice, especially when a Man has not been bled immediately after the Bite, and when Blood abounds: Yet some modern Physicians, after the Biting of a Mad Dog, to prevent Madnes, are so abhorrent from Blood-letting, that they maintain it must be avoided, as a thing which by emptying the Veins, causes the Poison to penetrate deeper: But these Men seem to think that the Venom of a Mad Dog is not dispersed all over the Body, till the Fear of Water seizes a Man. Which, notwithstanding, the gravest Authours do shew, is false, *Avicenna* and *Celsus*, *Dioscorides* also, l. 6. c. 39. when after the first days he rejects the Knife and Burning in the bitten place, as useless, but orders Sweat before and after Meal, does manifestly shew, that the Poison is diffused all over the body: which he seems to confirm, when he adds Plasters and Synapisms by turns all over the body: yea, *Avicenna* in the forecited place says, that it may not onely happen, that the venom may be dispersed after the fourth day, but in less time. Therefore in this so important a case we must distinguish; if we be in the first days, when the venom is yet in the Wound, or is contained not far from it, then Blood-letting must by no means be used, and the reasons clash: For it would draw from the circumference to the centre, from the small Veins to the great, and therefore from the less noble to the more noble parts, and to the Heart it self. But if it be already dispersed, then Blood must be let, as *Celsus* shews: but not in a place near the Bite, because then it is not convenient, as *Avicenna*, imitating *Dioscorides*, shews; for then there is no occasion for or benefit in such a thing, but from the Arm, that the Poison then diffused may be drawn out of the greater Veins and the whole Body.

Rubius, in
cap. 27.
lib. 2. l. 5:
Celsi.

II. Bleeding is by no means convenient in the beginning, as it is when the Poison has dispersed it self into the humours. ¶ In Biting of Animals Venæsection is not convenient, unless the venom be dispersed all over the body, or there be plenitude. Jac. Ponc.

P p 2

¶ But

¶ But if an acute Fever happen, Bloud must not be let within forty days; but scarifying in the lower parts, and opening of Veins in parts most remote from the Bite, must be used.

Sancta crux.

III. They that deny the taking a Purge, doe it chiefly on this score, because the nature of this venom consists not in first and manifest qualities, but in occult; and is not cured by the alteration of the first qualities, nor by Purgatives, but by Alexipharmacks, and things that act by their whole substance, because Purgatives are enemies to our heat, and therefore seem rather to waste than preserve strength. Others, on the contrary, admit of Purgatives, who indeed confess that Purgatives do not directly oppose and purge out this Malady, but this is done onely by peculiar Alexipharmacks; yet in the mean time they judge that they may doe this mediately, namely, while they carry off the vitious humours where the venom resides, and so they at the same time evacuate the poison, especially because this is a slow poison, and carries long in the body.

Sennertus.

IV. Rhases, tr. 8. ad Almanf. judges we must purge Melancholy in the beginning: but others both Greeks and Arabians forbid it in the beginning, that is, when the venom does yet reside in the external parts. But here we must consider, how this poison gets into the body; for if the poison be drawn into the body with the Lips and Tongue, we may purge at first, because we have no other way to get out the poison; but if the poison be communicated by Biting, to the external parts, we may not purge in the beginning. Therefore when Rhases says we may purge in the beginning, it must be understood of the former case; But the Greeks and Arabians, of the latter, when they forbid the use of Purgatives in the beginning, lest the venom be carried from the wound to the inner parts of the body; but then at length a Purge must be given, when all things are done about the wound, as they should, and although when all things are done right, there may be hopes, that the poison will be extinct: yet since it may easily happen, that some portion of it may get to the inner parts; this, be it never so little, corrupts the humours, and changes them into matter, like to it self. And therefore these corrupt humours must be evacuated, that the venom may be evacuated also, and that other humours may not be infected by the venom and corrupt humours, Alexipharmacks in the mean time not being neglected. All the Ancients commend white Hellebore for purging, and things which respect the melancholick and black humour. They that fear white Hellebore, may use black; or Agarick, to which an Alexiterick virtue is ascribed.

Idem.

V. Some proceed to the use of Antimony, as by agitation and violent commotion of the humours it is able to carry off the poisonous humours from within. Indeed some preparation of the humours premised for five or six days, a strong Purge may be given. So Dioscorides writes, that one near to a Hydrophobia recovered by taking Hellebore, and Orbasius gave a Purge every day of Colocynthida, to the quantity of a Bean. We may give Electuar. Diaphan. with Confectio Hamech or Extract of Hellebore to half a drachm, mixt with Cassia: Which chologogue Medicines are proper, because the Canine venom contains adustion, especially if the Complexion be hot and dry, or the Habit of the body Lean or Cacoehymick. After all which Purges, nevertheless, store of clarified Whey must be drunk, and they must often be repeated. Nor must Rhases be heard by any means, who, contrary to the common opinion both of the Greeks and Arabians, advises the giving of strong Purges not onely in the progress but at the beginning. ¶ I saw a young Man lately bitten with a Mad Dog, who was killed by taking an Infusion of Antimony the same day, although the violence of the Poison had not as then

Fortis.

caused a Delirium; for he warned all about him from coming near him, because of his inclination to bite.

VI. From the venomous biting of a Mad Dog fear of the Water arises, in which they are killed with thirst, and yet they do not drink, of which misery the onely Remedy is (according to Celsus, l. 5. cap. 27.) to throw them into a Pond unawares, especially if they go that way before they fear the Water, otherwise, according to the same Authour, there is but small hope, and it is according to Experience also, the truest Mistress. This sort of Remedy is of such value among our country People, that being content with it alone, they scarce desire any other, nor without good reason, since the Sea cures all: Nor have I as yet seen one (though I have seen many) who, if he were timely thrown into the Sea, ever found any harm afterwards. But if this Remedy were either slighted or feared or used late, many have paid for their negligence.

Tulpius, obs. l. 1. c. 20.

VII. Some, if the nature of the part will bear it, think the part must immediately be cut off, after the example of them that being bit by an Asp or Viper, have cut off their Fingers, and have escaped. But this seems not so necessary, seeing the venom of a Mad Dog is not of such speedy activity, as the poison of an Asp or Viper, and may well enough be evacuated otherways.

Sennertus.

VIII. At Venice I saw a Mother and her Son bit by a house dog at one and the same time in Summer. He bit the Son's thumb and forefinger of his Right hand, and the Mother's Arm, a little above her Wrist, and I found signs of Madnes in the Dog, he was leaner than ordinary, his eyes red, his tail hanging, foaming at the mouth, his tongue hanging out, tinged as it were with yellow bile, running up and down disorderly, and then stopping on a sudden, he would neither eat nor drink, though his panting shewed his great thirst. Thus being sure of the Madnes of the Dog, I went to cure my Patients; 1. By intercepting, recalling and extracting the venom. 2. By hindring the venom from creeping to the inner parts, and from diffusing it self through the whole body. 3. By opposing the quality of the poison with Alexipharmacks. Immediately therefore Deligation was made above the part affected, an Astringent being applied underneath made of a binding Powder, white of an Egg and Rose-water, which we applied to the Boy while we were curing the Mother. Then I ordered the lips of the wound to be scarified round about, and then a great Cupping-glass to be applied with much flame. Then, the Wound being first washed with all Wine warm, because water is very hurtfull, I ordered a Plaster to be applied of Onions and Garlick bruised, adding some Wall-nut, Rue, Leven, Salt and Honey. In the mean time I ordered the Dog to be killed, the Liver to be taken out and washed with Wine, and the Medicine described by Galen, 3. K. T. cap. 5. to be made, and of all them that used this, he never saw one dye; Take of Pitch 1 pound, sharpest Vinegar 8 ounces, Opoponax 3 ounces. Mix them according to Art: to this I ordered to be added half an ounce of the Powder of the said Liver, which by a specific property draws out the Canine poison. But to the Boy, who had a wound in his Thumb and Finger, because he would not endure Cupping, Scarifying or Burning, I ordered several Leeches about the Wounds, and then applied the same Plaster that his Mother had. I prescribed both of them a Decoction of Alysson or Madwort and Gentian in distilled Carduus-water, adding half an ounce of Cinnamon-water, having first given a Bolus of Treacle to the Mother, and of Mithridate to the Son, reformed with the Powder of Terra sigillata virga. I ordered their Pulses in their Temples, Arms and Legs to be anointed every three or four hours with Oleum M. Ducis Hetruria, and de Scorpien. Matthioli mixt together.

I did

I did not forbid them Wine, but I forbid them Sleep, till night. The next day I found the Mother had done all that I ordered her, and the Son nothing, so that the little wounds were almost healed up, and seemed to be slighted: nevertheless, I applied *Galen's* Medicine to them both, and ordered them the same internal things again. In the mean time for the third Intention, letting alone dubious things, I had recourse to true Alexipharmacks; the Powder of River-Crabs, which are brought from *Arno* a River of *Florence* hither; Take of Powder of River-Crabs 10 drachms, Gentian 10 drachms, Frankincense 1 drachm. Mix them. The Dose, a great spoonfull to two. I would have them prepared for the whole year; And the Crabs must never be burnt before the rise of the Dog-star, but when the Sun is in *Leo*, and the Moon 18 days old, in a Platter of red brass, which *Galen* gave for 40 days. They took these things for 7 days; after this they began to take the Powder of Crabs in *Scorzonera* and *Carduus benedictus* water; and in the mean time the Chirurgeon treated the Wounds like others; yet he hindered healing of them, and kept them wide open above 40 days. But as the Mother was observant in all things, (who took Powder of Crabs 40 days, kept the Wound open 50, applying in the mean time bruised Walnuts frequently to the Wound, which at the first day being given to Hens, killed two, after the seventh they were harmless, and had no sign of poison in them) so the Son was delinquent in all, whom his Mother observed to be thirsty in the first days, and to drink beyond his custome and out of reason, who notwithstanding about the twentieth day began to abstain from drink, and to be penfive and silent, he began to talk strange things, to loath his Meat, to have the Hickup, and at length, having had some convulsive motions, on the twenty seventh he died; but his Mother recovered.

The Contents.

We must be cautious how we purge. I.

The Efficacy of Calomelanos. II.

Cured with Sudorificks. III.

Whether Tapping be good? IV.

The Cure, by boring a hole in the Rib. V.

The benefit of Diureticks. VI.

An Example of an happy Cure. VII.

I. THIS must be carefully observed, that when the Disease is confirmed, and great store of serous humour is gathered in the Breast, if a violent Purge be given, these humours are much disturbed, whence a great Suffocation comes upon the Patient, which quickly carries him off. Therefore we must act cautiously, and Medicines must be given by repeated turns, and they must be mixt with strong Aperients and Diureticks, that the passages may also be opened, and part of the serous matter carried to the ways of Urine. Among Hydrogogues, those that are made of Minerals are most proper in this Disease, such as *Mercurius dulcis* and *Mercurius vitæ*, so corrected, as to evacuate one-ly by the lower parts.

Riverius.

II. A Man of fifty had been ill of a great difficulty of Breathing for three months, nor was he relieved by Medicines. I reckoned he was ill of a Dropsie in his Breast, because there was no Cough nor Ratling, no viscid and thick Spittle, as in a true *Asthma*: his Legs also were cedematous, and his Belly began to swell: He had not lain down in Bed for two months, but sat panting and choaking in his Chair, and was ready to draw his last. Because I despaired of his Recovery, I was unwilling to prescribe him Medicines, but being prevailed on by importunity, the next day I gave him a Bolus of Calomelanos 1 scruple, *Diagridium* half a scruple, with Conserve of Roses. It purged him seven times, and he voided abundance of serous matter, upon which he found much ease that day, and breathed more freely. After two days the same Medicine was repeated, with the like success, and the night following he lay down in Bed, without any oppression of his Breast. When the Swelling of his Belly was abated, one might handle his *Hypochondria*, and I found his Spleen big and scirrhus, therefore I prescribed him Apozemes with Salt of Tartar and Spirit of Sulphur, and Fomentations and Liniments to be applied to the *Hypochondria*, with the foresaid Purge repeated every third day. Which being continued for 15 days, he was brought into a much better condition, so that he thought he was perfectly cured; but when one month was over, all the Symptomes returned, his Belly swelled more, and in two months more he died. Here the great efficacy of Calomelanos may be observed, which was able to doe so much good in a mortal Disease.

Idem.

III. Sudorificks are very good to discharge the serous matter, and I saw a Man of threescore cured by taking a Sudorifick Decoction of *Guaiacum* and *Sassa* for 15 days, by causing Sweat, with the vapour of Spirit of Wine.

Idem.

IV. It seems the safest way, that the matter should be evacuated sensibly by opening the Breast. And it should be done betimes, according to *Hippocrates*, 6. *Epid. f. 7. Ὡστεν δὲ τὰς ἀδύνας ἀνοίγειν, ἵνα τὰς συστροφὰς ῥαγίως, ἵνα τὰς συστροφὰς ῥαγίως*, Cut watry gatherings quickly, lest the Lungs be corrupted by the Water.

V. The ingenious opening of the Breast must not be past by, which *Hippocrates*, lib. de nat. Mulieb. propounds, when he orders a Rib to be bored through in the middle: for so the Water may by a Tent be more easily kept from running out all at once, than by making Section in the intercostal Muscles. Wherefore when Water is to be got out, it is best to boar a Rib; but when Pus is gathered in the Breast, it will be best to cut in the Muscles.

P. Marti-
nus.

VI. Evacuation of the Serum in the Breast must be attempted by Urine. The Emperour *Maximilian* the Second found great benefit hereby, who, when he had laboured of a Dropsie in his Breast with a Palpitation of his Heart for twenty years, he sometimes made 6 pounds of Water in one day, and when that motion of the matter stopt, he died.

Crato.

VII. A healthy, strong young Man, being formerly accustomed to immoderate exercise of Body, at length felt a fulness, or as it were a puffing up in his Breast, in so much, that the left side of his Lungs seemed to be swollen and the Heart seemed to be thrust out of its place, to the right side: Afterwards on a certain day he felt, as if some Vessel were broken within the cavity of the Breast, and after that for half an hours time, in that region, not onely he himself felt something fall from aloft into the bottom of his Breast, but it might be heard by the By-standers. Therefore, since it was without doubt, that then this Noble person had a Dropsie in his Breast, because the Lymphæducts (a great number of which branch themselves all over the Lungs) which run to their left side, being broken, dropt out their moisture into the cavity of the Breast, after some Medicines had been tried without any benefit, Tapping his side was unanimously resolved on. Therefore after provision had been made for the whole, the Chirurgion applied a Caутery between the sixth and seventh *Vertebra*, and the next day, having cut a hole in the cavity of the Breast, he put in a Pipe, which being done, immediately a thick liquour and white like Chyle or Milk ran out: About 6 ounces onely of this were taken away at the first time, and the next day as much: The third day, when a little larger quantity was let out, he was immediately seized with a great languidness, and was feverish and very bad for a day or two after it: Wherefore, till he had recovered his former temper and strength, we thought good to let no more of this matter out: But afterwards, a little evacuation of the same being made every day, the cavity of the Breast was almost all evacuated: And yet he carries a Tap with a Spigot in the hole, which being opened once in 24 hours, a little moisture still runs out. In the mean time he has a good Stomach, he looks well, and is strong, and goes about his usual business. After Tapping I ordered him Cordials, and afterwards a Traumatick Decoction, to be taken twice every day. But there is a necessity for preventing filth from gathering in the Breast, that this hole be left constantly open, instead of a Sink.

Willis.

I. IN a simple Anasarca we may purge violently; and it often does abundance of good. And indeed from this Disease being sometime cured by Purging, Empericks have good opportunity to brag of their Cures, and some of their Medicines are indeed highly cried up for curing of Dropsies. For sooth if they chance ever to cure one or two of an Anasarca with specifick Hydragogues or Elatericks, they have enough to set out themselves and their skill, although they may kill an hundred A-sciticks with the same Medicine. Wherefore though

Preparations of Spurge or *Elaterium*, and other Hydragogues have sometimes done good in certain cases; yet if they be given indifferently to all Hydropicks, or at all to weak Constitutions, and such as have bad Inwards either in tone or conformation, they oftner kill than cure. And the reason why Catharticks operate more successfully and effectually in this Disease, than in other sorts of Dropsies, is, because in an Anasarca the morbid matter (which is the *Lympha*) resides partly in the mass of Blood, partly in the habit of the Body, within the pores and vacuities, among the ends of the vessels: Wherefore when a strong Purge is given, it presently exagitates and thins the mass of Blood, and fits it to excretion of any thing superfluous; and also it irritates the mouths of the Arteries, opening towards the Guts, so that the humour being rejected by the Purge, may find a passage by these outlets. Hereby first of all the Water fluctuating among the Blood, is plentifully washed away, then the emptied vessels soak up the intercutal Water, and they discharge it partly by stool immediately, and partly by urine or sweat. In the mean time there is no fear left, as in a Tympany, because the fibres in the Stomach and Guts are too much irritated by the Purge, these Bowels should be incited to tetaneous extumescencies. For while the Bowels are firm and well constituted, the particles of the Medicine doe them no prejudice, but, being thence delivered into the mass of Blood, they do not onely draw Water out of it, but by exagitating its mass, they raise the active particles, before overwhelmed, and dispose them towards a fermentative faculty.

Willis.

II. But sometimes it requires Letting of blood, when it arises from abundance of cold Blood. Indeed upon the account of its Coldness it does not stand in need of Heating, but because the abatement of its quantity eases Nature, so as she may the more easily conquer the Disease: It is not contrary; but very consentaneous to reason, to use Bleeding here. And we must evacuate after Bleeding, which Bleeding must be tried before any thing else, if strength will permit; for if it be low, though there be abundance of Blood, yet we must not let blood, till strength be repaired. ¶ It may very well be administered, if stopping either of the *Menses* or *Hæmorrhoids* have caused it, or if there be a bilious Cachexy: Yet Blood must be taken much more sparingly than in other Diseases, because of the want of Heat.

Trallianus, l. 9. c. 2.

Enchirid. Med. Pract.

III. We must carefully observe this, that in an Anasarca, as also in a Dropsie, what days evacuations, whether purgative or diuretick, are not given, always on those days opening Alternatives, and Strengtheners of the innate heat of the Bowels, especially that the altering and concocting faculty may be strengthened, must be given: for if these things be neglected, evacuators will doe little good.

Knoblochius.

IV. For curing an Anasarca, Lixivial Diureticks (as has ever been evident from my observation) do far excell all other Diureticks. For now it is a trite and vulgar Remedy, after Purging to take 6 or 8 ounces of a Lixivium made of Ashes of Wormwood or Broom, with White-wine, and to continue the use of it for several days. This Medicine, as I have observed in several, provokes Urine plentifully, so that the Patients, to a Miracle, recover in a short time. But why Medicines endued with a fixt and lixivial Salt, do force Urine more than those endued with an acid *Alkali*, or a volatile, the reason, I think, is this, viz. in persons affected with this Disease, upon the failing of the fermentation and sanguifick virtue of the Blood, watry and crude humours gathered both in its mass, and within the habit of the Body, after they have tarried a while there immoveable, then they (as it is the nature of all watry Juices when they stagnate a little) grow sowre, wherefore the Lixivial particles

particles

particles of the Medicine, being poured into the Blood, do immediately ferment with the acid particles of the Water; and moreover while they exagitate and ferment them, they raise a notable excretive fermentation in the whole mass of Blood, so that farther, when all the particles are put in motion, not only the watry and recrementitious, separated from the rest, are discharged by the Kidneys, but also the innate and active particles of the Blood it self, do extricate themselves from the grosser with which they are entangled, and at length recovering, do begin to resume their fermentative virtue, and to sanguifie.

V. Diaphoreticks often doe much good, and are usually more agreeable with this Disease confirmed, than in other kinds of Dropsies: And although at the first they be not able to cause Sweat, because the habit of the Body swims with a flood of thick humours, however, while they exagitate the Blood they rouse up its inbred active particles, that were asleep and half drowned before, dispose them to a fermentation, and moreover, put all the recrementitious and especially the watry particles into motion, so that these running immediately out of their receptacles, go off with ease and speed. But Hydroticks must be given in a little larger doze; for their quantity is very small, and their active particles are drowned in the Water, before they can be diffused in the Blood, and can begin to exert their virtues upon the Blood. Wherefore Spirits, whether Armoniack or of Wine, Tinctures also and Elixirs; yea, and Powders, are seldom used for this Disease, because in a little doze, they doe little good, and if they be given in a large doze, they, by their efferation often hurt the Bowels. But some such things must rather be made use of, which taken in a larger doze and hot, may pass into the Blood not weakened, such especially are Decoctions of Wood and Seeds, whose particles being pretty congruous to the Blood, and invincible by it, do pass through its whole mass, and exert their elastick virtue by putting all the humours in motion.

VI. Among external Administrations, whereby the Water gathered within the habit of the Body is stirred, Oil of Scorpions (so it be genuine) applied by it self or added to Liniments (made of Sulphur and divers kinds of Salts, and of Quicklime and other Minerals, which being powdered and mixt with the mucilaginous extracts of sharp Herbs may be reduced to the form of an Unguent) does oftentimes much good. I knew a Boy, who was much swelled with an universal Anasarca, and was cured by this onely Medicine: for his Mother (I know not by whose Advice) did anoint all his Body morning and evening with Oil of Scorpions, rubbing all the parts with her hot Hand very hard. Upon doing of which, within three days he began to make a great deal of Water, and when he had continued for some days so to make Water, the Swelling fell by degrees, and he recovered.

VII. Baths are scarce proper for any Dropsie but an Anasarca, and not for this neither, unless in the inclination to it, or decrease of it: Because, when the Blood is heated and incited by the ambient heat of the Bath, and moves the Waters stagnating every where, and drinking them up into it self transports them by divers ways, there is danger left (as it often happens) it receiving them out of the habit of the Body into its mass, should presently discharge them into the Brain or Precordia: for nothing is more usual than for Diseases of those parts, to wit, an Asthma or Apoplexy, to seize Hydroticks after bathing. Notwithstanding, when the conjunct cause of the Disease, that is, the intumescence, is either moderate or not great, a Bath of Water impregnated with Salts and Sulphur, or also a Stove, whereby gentle Sweat may be provoked, is often used with success.

VIII. Stoves, by heating, thinning and colliquating the subcutaneous humours, by opening the passages, and drawing out Sweat, doe good. Notwithstanding we must abstain from them, if immoderate evacuation of Blood have given occasion to this Disease; for they heat and stir the Blood, and draw out of the Veins.

IX. In an Anasarca Issues in the Legs are commended, but in the beginning of the Disease; otherwise, if the Disease be old, Fluxions and Gangrenes are easily caused. You may reckon the same of Blisters and Incisions, one of which will be enough for one Leg, which must be kept lifted up a little; for by little and little the Water runs out without any danger. Vescicatories let out the intercutal water plentifully, and sometimes too much; because such an Epispastick applied to swelled places makes too wide an out-let, which being opened, the Water that comes first out, often draws a flood out of the parts adjoining, upon which a great sinking of the Spirits follows. Moreover, the place suddenly so opened, because it is deprived of the Heat and Spirits, quickly gangrenes. Wherefore this Medicine is seldom applied to the Legs or Feet of hydropick persons, when the Heat is weak, and the Swelling big, but sometimes it is safely applied to the Thighs and Arms. Escharoticks are used with a little more safety than Vescicatories to the swelled places, because at this emissary the flux of the water is not so heady and copious at the first, but it begins moderately and proceeds by degrees to a great Current, which Nature (after she has been gradually used to it) bears the better. Moreover there is less fear of a Gangrene from an Escharotick than from a Vescatory, because in that application, the part, whose continuity is dissolved, is guarded against the dissolution of the Heart by an Eschar.

X. There remains yet another (not inferiour to, though less usual than the other) way of getting out intercutal Water by Acupuncture, which also must be very cautiously and gradually celebrated, lest a hasty and excessive flux of Water be raised. Take an ordinary Needle (such as Tailors use) and prick the Skin with it in the most cedematous place, so as the Blood may not come, and make at one time 6 or 7 little holes about an inch one from another, the Water will burst out drop by drop out of every such little hole, and so will drop out continually, till the Swelling round the prickt places do vanish: Then the next time, about 12 hours after, let 18 or 24 other such punctures be made in some other part either of the same or the other Leg, and so let such emissaries of the intercutal Water be made in this or that, one Limb or two, or more together, once or twice a-day: for by this means the hydropick matter may be discharged more plentifully and safely, than by any other outward administration: A new product whereof in the mean time if it be prevented by internal Pharmacy, the Disease will easily be cured. Moreover, in a deplorable Dropsie, Life is the best prolonged by that administration, inasmuch, that is, as, the Water being continually discharged by these external emissaries, the internal vital inundation is longer kept off.

XI. Chalybeates doe often in this Disease, as well as in the Green-sickness, a great deal of good, so that often the whole or chief scope of Cure depends on this sort of Medicine: Yet we must take notice that all such Medicines are not a-like proper in these cases; for those that are most used, that is, Sal Chalybis or Vitriolum Martis, and other things prepared with acids, and wholly despoiled of their Sulphur, doe no good, because they do not promote the ferment of the Blood, but rather on the contrary, when it is too fierce and elastick, they fix it; Yet Chalybeates of this Nature may be used for an Anasarca, and any cedematous Cachexy

in the habit of the Body, in which the sulphureous particles are left, and are prevalent, as especially filings and scalings of Steel reduced to Powder, also Steel melted with Sulphur and powdered. These Powders being taken, are presently dissolved by the acid Salts within our Body, whereby the sulphureous, metallick particles being set loose, and carried into the Blood, do ferment its whole mass, and raise the homogeneal particles therein, which before were asleep, and joining with them, do invigorate the Blood, and renew its fermentative or sanguifick virtue, before depressed. Wherefore we may observe, that upon using these Chalybeates but a little time, the green colour of the Face is turned into a florid countenance.

I. Formerly the Liver was reckoned the principal Subject of the Dropsie, the onely Instrument of venous alimentary blood, ennobled with that Prerogative by *Galen*, 5. de loc. aff. c. 7. and 2. progn. l. 1. where he also reads, that it is not always necessary, it should be essentially affected at first, the beginning of the Disease arising in it, but it may also be affected by consent with other parts: Yea, he judges no Dropsie can arise without some fault in the Liver, or without its consent and conspiracy. *Hippocrates* has named not onely the Liver, but other parts; So 2. Progn. Most Dropsies begin in the Illia or empty places, or in the Liver. By $\tau\acute{\alpha}\varsigma\ \delta\alpha\phi\acute{\nu}\tau\epsilon\varsigma$ he means Veins; by $\tau\acute{\alpha}\varsigma\ \chi\alpha\tau\alpha\iota\acute{\nu}\alpha\varsigma$, the Spleen, Mesentery and Womb. The same, 4. de Morbis, acknowledges a Dropsie from the Spleen, when the Patient draws drink out of the Stomach. The Moderns do attest, that upon opening of dead Bodies, the Liver is not affected primarily in a Dropsie. A Dropsie is often observed when the Liver is in no fault. Oftentimes the Kidneys and Mesentery are found to have an Abscess or Tumour in them, when the Liver is florid; sometimes it has been observed a little paler, because soaked in Water, but it turned florid again upon touching the Air. We are clearly against *Galen*, and as we ascribe the royal power of Sanguification to the Heart, so we do not deny that it is affected, when this operation is hurt. Yet we chiefly blame the ministry of the Bowels, which wait on the Heart; such especially is the Liver, the Colatory, Seive and Separatory of the Bile; the Spleen, of cold and dry Atoms, and the Kidneys, of the serous Atoms: While these parts are weak and do not perform their office, and the aquosities that are gathered, do not pass by the Kidneys and Bladder, stagnating in the hollow of the Abdomen, or poured into the Habit of the Body, or dissolved into Wind, do cause a Dropsie and all the sorts of it. The immediate cause is the ill tone both of the principal and ministering parts destined to Chylification and Sanguification. Chylification of the Stomach and Guts especially, if it be hurt, because the faculty is hurt, by intemperature, evil conformation or any common fault, or because of some external error. If the Sanguification of the Heart and Arteries succeed not according to desire, if the serous Water be not separated by the Lymphatics, and drawn by the Kidneys and Ureters, they stagnate in the Body, and in an Ascites are poured into the cavity of the Abdomen. The ways are not onely the Vena Porta, and the Arteries that accompany it, and the Branches that are dispersed through the Cawl and Mesentery, but the Lymphatick Vessels also; for being weary of their load, they expell the Water, which of it self affects a passage out: and they expel it by Anastomasis, Diarexis and Diapedesis: and the rarity of the Membrane of the Liver, which is open with Hydatides, often afford it a passage: Bursting of Water out of the least hole of the Liver, about the Porta Jecoris, where the Membrane is the thinnest, Ulceration and Erosion of the Kidneys, Bladder and Ureters, do all deserve the name of Dropsies. There are many mediate Causes.

II. The ordinary Cure sometimes is not proper, if, namely, the Dropsie in a hot and dry constitution be produced by heating Causes, which dissipate the innate Heat, as it usually happens in bilious and violent Fevers: for then cold Hepaticks, with Aperients, that are not very hot, are proper, such as are used in tedious Fevers. For Drink, he may take a Decoction of Cichory and Star-thistle, or of other temperate Aperients, but in a larger quantity; which, namely, may assuage thirst, temper the heat of the Liver, and may moisten it when dried. Which Doctrine (though it be established by *Avicenna*, *Trallianus*, and others; yet, because it seems a Paradox to some, and is of great moment in practice) it will not be useless to confirm it by a fa-

cious, Epi-
Meth. l. 2.
c. 9.

a famous Example related by *Baytista Montanus*, *conf.* 263. "I saw, saith he, at Venice, a Religious Man, hydropick of an Ascites and a Tympany, who was cured: There were with me *Papiensis*, *Eugubinus*, *Trincavella* and others: He had a Tympany with an Ascites, and a Consumption with a Hætick. We must then dry and moisten, wherefore we were at great difference. I was for having him drink much, but such things as might open, because he had abundance of obstructions: besides, I was for having him moistened, because he was in a Consumption. I ordered him *Syrupus acetosus*, with all things which provoke Urine. *Eugubinus* was not willing he should drink any thing, and he told us a story of one that was cured by dry things: *Papiensis*, to put an end to the Controversie, concluded that he might drink neither plentifully, nor yet not at all. The Debate continued till night. The Gentleman waited upon every Physician to his Boat. When *Papiensis* was there, he turned to a great Person and spake his mind freely, which he had dissembled before. If you will save this Man's life, you must follow *Montanus* his Advice". In this case Medicines of Steel, Tartar and Vitriol are proper, because they open powerfully and provoke Urine, especially mineral Waters, and vitriolate Spaws. *Avicenna* reports how a Woman was cured with Pomegranates.

Riversius.

III. *Galen*, and the rest of his Followers, who attribute all to the qualities of the Elements, say that the Dropsie arises not from the Spirits, but rather from a cold and moist intemperature of the Liver: But how aptly for a right Cure, you may guess; For let them give as hot things as they please, for the Liver, they doe no good, they increase thirst, waste strength, and feed and increase the Disease. But let them break the violence of the spirits, and open the stop passages; the Water gathered within will run out, and the Dropsie will be cured. Which practice has succeeded well with me in all: But in some, where there is a corruption of substance, or at least some suspicion of it, I dare not run this course, but do judge I must leave them to the Prognostick.

IV. It seems contrary to the Rules of Art, and to Reason, to affirm that Bleeding can be convenient in a Dropsie, which nevertheless *Hippocrates*, 11. *Epid. sect. 5.* and *lib. Acutor. n. 62.* did commend. I know many will say, that Bleeding is usually admitted of in this Disease, when it, as *Hippocrates* says, arises from Inflammation: Yet of these many, that talk thus, when there is no occasion, you will see but few either propose it, or when it is proposed admit of it, when it ought to be done, and this to the Patients great damage. But if they knew how to use this Remedy in time and in a convenient manner, the Liver, or Spleen, or both, would not be afflicted with too much or bad blood, through want or delay of bleeding, the indisposition of which parts a Dropsie does usually follow. But whether did *Galen* always omit bleeding in this Disease? He, *adversus Erasistratum*, cap. 5. de V. S. has these words, *I have often cured a Consumption and Dropsie by Blood-letting.* Therefore since an intemperature of the Spleen or Liver, whether imminent, or already conceived, uses to be greatly amended, or oftentimes removed by evacuation of blood, whether spontaneous or procured by Art, for this reason it ought not so readily and generally to be condemned, as it is by most Men, when there is some suspicion of a Dropsie, or one beginning; especially since *Hippocrates*, *l. de Affection. n. 21.* holds, that Bleeding must frequently be repeated in the Splenic Vein, when Men are troubled with the Spleen and inclined to a Dropsie. But what drew me formerly, and my Masters, and other Physicians, into this fear, I think I may lawfully tell. It was indeed an ill custome, handed from one to another: for it suffices most Men, instead of Learning

or Reason to defend themselves by common usage: And a fallacious consequence deduced from a true saying of *Galen's*, *l. 2. de natur. facult. c. 8.* and *lib. 6. aph. 12.* Cure after old Hemorrhoids, &c. and from other places, where he affirms, he has seen many made hydropick, both Men and Women, upon the suppression or diminution of the Hemorrhoids or Menstrua, or when they run too much, whereby the Liver is cooled, and its sanguifick virtue diminished: Whereby it so comes to pass, that it fares with the Liver and Veins in making and retaining of the Blood, as it does with the cooled Stomach and Guts in concocting and retaining food, when we are troubled with a diarrhoea. Hence Physicians that are not over perspicacious, being deceived by the fallacy of Similitude, infer that Blood-letting is not onely not safe, but very dangerous for such as are disposed to a Dropsie, who how badly they collect, and worse connect, the experiments of Art do most evidently testify. Since oftentimes a Dropsie takes them from whom neither any Blood was taken, nor spontaneously voided, yea them rather who had it stop by the suppression of the Hemorrhoids or Menfes: And, on the contrary, nothing is more rare, than for a Dropsie to follow simple effusions of Blood: I call them Simple, which come without any Impurity of the Blood or Fault of the Liver, as such as follow Wounds, which may be proved by many Instances of such as after a Wound and after a Crisis have lost a great deal of blood, none of whom were ever taken with a Dropsie. Therefore evacuation of Blood causes not a Dropsie, but the useless redundance or impurity of it; by one, or both of which joined the innate heat of the Liver is suffocated, or abated, or inflamed, then Nature is stimulated, and through the load and fault of that which should have been the nourishment of the Body, it endeavours to expell it as its greatest enemy by the Veins of the Nostrils, or the Anus, or the Womb. But notwithstanding, because Nature cannot always observe the stated and convenient moderation in these spontaneous openings of the Vessels, hence it comes to pass, that often after them, especially if there be any fault in the Blood or Liver, Dropsies come, as *Galen* said. Wherefore the prime and chief scope of avoiding a Dropsie imminent, or of curing one beginning or already begun, must relie on those Remedies that abate the useless quantity of Blood, and correct its impurity, and free the Liver from its intemperature (especially a hot one, to which it above all the other parts of the Body is most obnoxious) Among which Remedies all Learned men agree, and it is found by experience, that letting of Blood has the principal Prerogative. Yet farther, I suppose, the use of this Remedy proposed by several may more easily be allowed me in one imminent, or just beginning, than in a confirmed and violent Dropsie, in which nevertheless *Hippocrates*, 11. *Epid. sect. 5.* reckoned it not altogether useless, when he orders the inner Veins to be opened, when this Disease is great in intention. But when the Dropsie is confirmed already, and arises from some fault in the Liver or Spleen, as there is no hope of the Cure of this; so neither must this said Remedy be rashly exposed to calumny. Which indeed, though it may relieve a Man, just ready to be suffocated, so that Life may be prolonged a few days; yet it must not be propounded or performed, without signifying to the Patient what fruit he can expect from it, lest being bolstered up with vain hope of Cure, Men blame both the Remedy and the Adviser of it.

V. Evacuation by Vomit, because it disturbs the Belly too much, and increases shortness of Breath, is hurtfull to some; yet it may doe some Mengood, if any revulsion be made from the mesaraick Veins to the Stomach and Guts; or for the removal of the Cause, whence the store of Serum comes, especially

Leonardus
Botallus, *l.*
de curat. per
S. M. c. 25.

if they be easie to vomit; as also if through excessive thirst they have drunk abundance of Water, for the vomiting of it up again, which some give sometimes, that they may presently vomit it up again. ¶ We presently proceeded to vomit him: for he was easie to vomit: The Vomit was procured by warm Water, *Syrupus acetosus* and Oil. We often gave on purpose three pounds or thereabout of cold Water, and presently made him vomit it up again, and so there came away a green water, and at last bilious and bitter excrements. He was better after vomiting.

Epiph. Ferdinandus, Hist. 37.

VI. Hippocrates, *Aphor. 14. lib. 6.* opens the way of Cure (if Water flow out of the Veins into the Belly of Hydropicks, it cures the Disease) deduced from the imitation of Nature. But this must be observed, that it is impossible that by a weak Medicine the humour which swims below the *Peritoneum* and the Guts, should be drawn into the Guts: For they that think they can doe this with Juice of *Iris*, or *Diatarbith*, or *Soldanella*, are deceived: for these things do easily carry off the Water contained in the Veins, but not that which swims in the *Abdomen*, wherefore there is need of *Elaterium*. I mix some grains of it with *Pilule Aloephangini*, or else I give a small quantity of *Euphorbium*, mixt with some *Cassa* newly drawn. ¶ If he purge too much, give a little *Opium* with Treacle and Syrup of Citrons, for when Sweat is caused, the Purging stops.

Heurnius.

Idem.

VII. Always in giving of Purges it must be observed, that strong ones be not used too often, as *Galen, 9. Kaza rous*, shews, because they debilitate the Body, so that a greater quantity of Water gathers. Therefore Strengtheners and Openers must be oftner prescribed than Purgatives. Experience teaches, that evacuation by urine often succeeds better, than that by stool.

Riverius.

VIII. We may, according to *Seuerius*, use *Mercurius vitæ* to carry off the Water, though it be a Vomitory, if it be made fixt by long Digestion: for in Hydropicks it will not easily cause a Vomit: The reason whereof, according to him, seems, because in such abundance of Water, the solid parts cannot be so vellicated: Or, because the Salt of the *Serum* fixes the volatility of Vomitories. This is done in Gum *Gutta*, if it be mixt with Spirit of Salt or of Vitriol. ¶ I do not question but more would be saved from the Jaws of Death, if Nature were helped with a little stronger Remedies, especially Mineral ones. A Boy nine years old, having been some months hydropick after a Cachexy, was given over for desperate by others: He was ascitick with an *Anasarca*. I first of all advise Evacuation by *Mercurius dulcis* and *Diagrydium*, which being repeated once or twice, I make use of a medicated Spring in the neighbourhood, which was nitrous, and mixt with Sulphur and Vitriol, I first applied it with new Sponges; then I gave it in Drink and for a Bath: sometimes also giving a Purge made of an Infusion of Leaves of *Senna*, *Agarick*, black *Mechocacan*, Seeds of *Carthamum*, with Currants, Aniseeds, &c. in the foresaid Mineral water, by benefit whereof not onely the Belly was loosned, but store of Urine was voided, his Belly falling by little and little, so that in a few months time he was perfectly restored to health. In like manner a Girl about three years old, being puffed up with an *Anasarca* all over her Body, and utterly abhorring all Medicines, was recovered by the use of *Mercurius dulcis*, with a few grains of Magistery of Jalap, when she was at Death's door, and by giving the said Medicines several times she was plentifully purged without any trouble. ¶ The Medicines of most moment are such as are made of Antimony, as *Mercurius vitæ*, the Dose whereof at first must be 4 grains in extract of Hellebore, or *Coloquintida*: Afterwards, if the strength will bear it, it may be increased to twelve: The use of it must be continued for some days, especially in a confirmed Dropsie, and when the tone

Hæferus, Herc. Med. l. 3. c. 2.

Horstius.

of the Stomach is not spoiled; In this case it causes no Vomit, but onely purges downwards; And in old People it causes a *Procidencia ani*.

Hartmanus.

IX. I use *Elaterium*, I begin with 1 grain and an half, and afterwards I give 2, then 3, and to 5; but gradually; nor must the Dose be increased, unless the matter to be evacuated require it, and the Disease will bear it. This is the Receipt: Take of *Elaterium* 2 grains, *Pilule Aloephangini* 1 scruple. With Juice of *Orrice* make Pills. Some Hydropicks cannot take *Elaterium*, but they fall into a *Syncope*; then it must not be given them. They can neither bear Antimony, nor Juice of Spurge. Then I follow *Ætius*; I take the root of wild Cucumber; I cut it, and reduce it to Powder, I put it in generous Wine, as in Malmsey, and steep it in 12 or 14 ounces thereof for 3 days, and I give this Wine with the Powder at 3 times, for 3 days one after another: Then I intermit for 3 or 4 days, and I give it again for 3 days: I intermit again, and I give it again. And so the Swelling abates without any trouble: for this Root is corrected by the Wine, which also strengthens the Stomach and Liver.

Capivaccius.

X. Fernelius, in his *Pharmacopœia*, describes an Ointment, which applied powerfully carries off the Water in the Dropsie, and abates the Swelling of the Belly. But you cannot make tryal of this and the like, without discredit: for the purgative virtue communicated to the Muscles and Membranes, often causes a mortal loofness.

Riverius.

XI. Diureticks must not be given till the Body be purged and made fluid: for it is found by experience, that the more Diureticks and things that thin the humours are given to Hydropicks, the more they swell. The hollow of the Liver must first be cleared from aquosity by stool, before the gibbons part be cleared by urine. I have seen diuretick Potions succeed ill, in which there was *Soldanella*, when the first ways had not been taken care of before, and repletion removed. But after evacuation of the whole, they are admirable good.

XII. *Lixivia* taken inwardly are not proper for all Hydropicks promiscuously: Outwardly they are good to cleanse, resist Putrefaction, and to other ends. They are proper indeed, because by their diuretick virtue they cause urine, for making of which Hydropicks are usually famous, but not for all promiscuously: Not for such as are consummate, and make a red deep coloured urine, and not for such as have a weak Stomach. And in general, the tone of the Stomach must always be observed in these men; because it is greatly hurt by *Lixivials*, the ferment dies, which delights in an acid volatility, and they increase the Salts, which are there in great plenty already, and threaten a mortification of the Bowels.

Wedelius.

XIII. Sometimes Hydropicks do suffer a stoppage of Urine, whereby, not onely the water is increased in the Belly, but there is imminent danger of sudden death: Wherefore some potent remedy should be had in readiness, as the taking of *Cantharides* inwardly, which are most proper in an *Ascites*. Hippocrates approves of them, 4 de *vict. acut. t. 124*. But they must be given upon certain conditions, 1. If in a Dropsie (and in other cases also) the Urine be so stopt, that it will not yield to other Medicines. Therefore because there is danger of Death, we are forced to have recourse to the strongest remedies: But we must suppose, the Urine stops because of some fault in the Kidneys, which is usual in Dropsies. 2. *Cantharides* must be given whole; for we give the belly, to provoke Urine, but lest they should do mischief, we mix the wings and feet, which parts hinder them from hurting the Bladder. The conditions also must be observed, proposed by *Galen, c. 23. l. 3. simpl.* that they be given in a small quantity, and mixt with other Medicines, especially such as defend the bladder. Wherefore we may give one whole *Cantharis*, with a scruple

a scruple of Powder, either of Rue, or Spike, or some such thing: And some fat thing must be given to drink after it, as four or six ounces of Broth of a fat Chicken. In this manner they are given with benefit and safety. I have seen some, who have been given over by all, recover, by taking *Cantharides*.

Capivacci.
ut.

XIV. Any one would be apt to think, that Diuretick Medicines were good to carry off Water from any place or hole in the body. Indeed, it is apparent from experience, that they frequently cure an *Anasarca*, and doe more good therein than any other remedies. We must consider therefore, what they can doe towards the discharging of the *Abdomen*. As to this, first of all it is manifest, that no immediate passage is open from the Ascitick Pond, though near, to the Kidneys; but, what water soever is carried from the *Abdomen* thither, it must of necessity be received back into the mass of blood, and then be poured out of it into the Urinary sink. But how small a matter is it, that the mouths of the Veins, opening upon the superficies of the Bowels (if they open at all) can receive? And this is all that Diureticks can doe; they make the blood, by melting it, and driving its serosities plentifully to the Kidneys, when it is emptied, to draw the water fluctuating in the Belly, to it self. In the mean time there is no less danger, lest Diureticks given unseasonably, while they put the blood too much into fusion, should drive the Serum, forced to separate, more into the nest of the *Ascites*, than into the Kidneys, and so rather increase, than remove the flood in the Belly: for it has appeared, by frequent observation, that it usually so falls out. Wherefore, when Diureticks are prescribed for the cure of a Dropsie, we must have a great care of this contrary effect. Truly it is for this reason, that (from the authority of the Ancients, and practice found by experience) Afringents and Strengtheners are always mixt with Hydropick Medicines; not that such things confirm the tone of the Liver (as is commonly said) but they preserve the *crasis*, or mixture of the blood from being dissolved with too much fusion. Wherefore, in an *Ascites*, which comes chiefly, or partly, because the frames of the Bowels and vessels, and especially the Coats, Glands and Fibres, and the Interstices of them, are stuffed with a serous humour, and greatly swelled thereby; as Catharticks, so also Diureticks are proper, and are often taken with good success, inasmuch, that is, as by taking of them the Mass of blood (the Serum being copiously derived to the Kidneys) that is emptied, does take in, by the mouths of the Veins, the water stagnating near them, and conveys it to the Urinary passage. But on the contrary, in a mere *Ascites*, where the flood of water overflows the cavity of the Belly, when the texture of the Bowels is free from any serous obstruction, Diureticks are given either in vain, or inconveniently: inasmuch as they get nothing out of the pond of the Belly, and by often putting the blood into fusion, do force the Water, that is apt to drop in, with more impetuosity.

Willis.

XV. All Diureticks are not equally proper for an *Ascites*, and must not be given indifferently: for we may observe, that they who are troubled with this Disease, do, for the most part, make little Urine, but red and lixivial, which is a sign indeed that the *crasis* of the blood is too strict in such, from a fixt and sulphureous salt exalted and combined together, and therefore the Serum is not duely separated in the Kidneys, which yet is left about the turnings and windings of the obstructed inwards, and so discharged into the cavity of the Belly. Wherefore, in this state, only such things must be given to provoke Urine, as do so restore and amend the constitution of the blood, that the enormities of the fixt salt and sulphur being removed, the serous part may be separated, and more plentifully dis-

charged by the Kidneys: For which purpose, not acids, or lixivials, but things endued with a volatile salt are designed. For I have often observed in such Patients, when Spirit of Salt, and other acid *Stagmas* of Minerals, and when Salt of Tartar, Broom, and the *deliquia*, or dissolutions of other things have done rather hurt than good; that juice of Plantain, Brooklime, and other herbs, abounding with a volatile salt, also the expression of *Millepedes*, have done much good: for the same reason Salt Nitre highly purified, or *Crystallum Minerale* often does good.

XVI. Oftentimes the Dropsie is caused without any fault in the Liver, because of the weakness of the Kidneys, which should draw the Serum, and these passages cannot be opened by any the most generous Diureticks: Therefore we must endeavour to cleanse these parts, the neighbouring especially, and also to restore the lost faculty by Fomentations.

XVII. But while Diureticks are taking, Clysters must be given frequently, of a decoction of Mercury, *Soldanella*, Centaury, Fenil, Bayberries, with some Hydragogue Elecuary, or: *Meli refar. so.*

Fortis Conf.
62. cent. 233

XVIII. Men commonly reckon that Diureticks in a Dropsie do carry onely that matter to the Urinary Vessels, which may fall into the cavity of the Belly, and not that which is gathered there already, for it is no way possible for it to be evacuated by Urine, because if the matter residing in the cavity were to be evacuated by Urine, it must of necessity enter the *Viscera* again, which is impossible. But this fear is without ground, for they may be given with great benefit, as they are able, not onely to derive the serous matter, which is as yet contained in the vessels, and is about to run into the Belly, but also to draw back into the Veins and Lymphatick Vessels that very Water which retagnates in the cavity of the *Abdomen*. So *Rondeletius* l. 6. c. 36. l. 2. saw a Woman in a Dropsie cured by flux of Urine. But we must know, 1. That the body must be purged before, and made fluid. 2. That they have this advantage, that they can at the same time free the inwards from obstructions, of which number are Spirit of Salt, Urine, and its Volatile Salt, *Spiritus aperitivus Penoti*, *Tinctura aperitiva D. Mabil*, Salt of Wormwood coagulated with the Spirit of Salt, *Fel vitri*, with a decoction of River Crabs, &c. *Helmont* has noted a passage, *lib. de potest. Medicam. Sect. 32.* which agrees with this, *I perceived*, saith he, *that all simple Salts pass by Urine and the Guts, and in the mean time dissolve the filth in these passages, and make the expulsive faculty mindfull of its office.* 3. That they must be frequently used. 4. That they must be often changed, lest Nature accustom her self to them. 5. That they must be given in Powder. 6. That we must abstain from them in an *Anasarca* of the Veins, and colliquation of the humours.

Heimanus.

XIX. Amongst hydragogue Medicines drinking of the Waters is chief: And of all these the *Spaw* water is best, which promises certain health to Hydropicks, even confirmed; for it carries off the redundant water in the *Abdomen* by the way of Urine, and wonderfully restores lost strength to the Stomach, Liver, and to the rest of the natural parts, and so confirms it, when restored, that a Man, after taking of this water, repeated several times every day, perfectly recovers his lost health.

XX. Sudorificks are reckoned among evacuating Medicines, which, as in an *Anasarca* they always doe good, so in a Tympany, and an *Ascites*, sometimes they doe harm: If, that is, driness of the Liver, as it often does, give original to the disease; besides, for the most part it is impossible to raise a Sweat in Hydropick persons.

Riverius.

XXI. Diaphoreticks, though they be of special use in an *Anasarca*; yet in an *Ascites* they are either of none, or but very rare, because used unseasonably, they often doe the Patient a great deal of harm,

Q q 2

without

without any benefit: inasmuch namely as by heating the blood, they cause the waters fluctuating in the cavity of the Belly, to rage, and as it were to boil, so that the spirits and humours are very much disturbed by vapours raised from thence, and so a disorder of all the functions does follow, and the Inwards themselves are very much hurt, as if they were perboiled. Moreover, by Sweating thus amiss, the blood being forced into fusion and precipitation of the Serum, discharges more of it into the nest of the *Ascites*.

Willis.

XXII. Sweat must not be raised by Decoctions, which by their actual humidity doe harm, but by Claudinus. Extracts of *Guaiaicum*, *Sassafras*, *Cardus Benedictus*, &c.

XXIII. They greatly mistake, who try to expell an absolute and full Cacoehymie, as in a Dropsie, by Sudorifics: Indeed this is sometimes good in the Venereal Disease; but it is onely in this case, and that onely sometimes. It happens sometimes that in Hydropicks, little blisters appear on their Belly: by opening of these oftentimes more water comes out in two or three hours time, than the best Hofmannus. Sweat would get out in a whole night.

XXIV. Let any one be ill of an inveterate Dropsie, in the end he is troubled with continual want of Sleep; and he that goes to cure this with Narcotics, kills the Patient. Hydropicks dye upon taking one grain of *Opium*. If the Patient desire help for his want of Sleep, let the Physician prescribe some well-known Medicine, lest, when the Patient must of necessity dye, hastning of his Death be ascribed to Medicines.

Walsus.

XXV. Whoever gives an Hydropick person half a drachm of Treacle, he highly endangers his Patient's life, and his own credit, even by giving of one grain: For such Opiates do not onely lay the Spirits asleep, but they make the shortness of breath worse, to which Symptoms almost all Hydropicks are obnoxious.

Hofmannus.

XXVI. Perforation of the *Abdomen* is the greatest Remedy, which must be used, when there are indicant and permittent Intentions: The Indicant are watry Matter. It is lawfull to perforate in an *Ascites* onely. *Avicenna* does not tap the *Abdomen*, unless the body be very strong: When therefore you come to Patients, do not tarry till they grow weak, because it will be in vain afterwards to use this remedy. Concerning the time, *Avicenna* says, You must not dare to tap the Belly, as long as any other cure is possible. The Moderns explain it thus; All things must be tried before the Knife: but this is a great error: for *Avicenna* used other Remedies after Tapping. But he would shew us that we must not proceed to Tapping, unless we foresee the Disease will not be cured with less remedies. When therefore we find the Belly swell fast, and other accidents, we must presently have recourse to this remedy: But if we should try all things first, without doubt the Patient would be enfeebled, and his weakness would not allow it. ¶ We must tap Hydropicks quickly. ¶ *Aurelianus* says, there is no other reason why most dye, whatever some may object, but because this cure is always tried too late, and when the disease, by diuturnity, is become incurable.

Capivaccius.
Hippocrates.

Vallesius.

XXVII. It ought to be considered, that Nature her self, who being taught by no Man, yet does those things that are proper, has, as it were, pointed out to us this operation, while she has saved the Patient oftentimes from present death, by swelling and opening the Navel in a Dropsie: And though it be very difficult to tap the Navel, yet, when it is swelled, we must seek no other place. But if the Navel chance not to rise in a blister, some other convenient place must be sought: And that is on the left-side of the Navel, three inches below the Navel, and so many on one side of it: Yet first, as the Patient stands upright, if there be not an excessive

quantity of Serum, or as he sits or lies, when his belly is very much swelled, the place must be carefully marked with Ink. Formerly Section was made with a Penknife through the skin, muscles and *Peritoneum*, not without fear of hurting the Guts; then after Section, they put a smooth-shouldred Silver pipe into the wound, exactly fitting the hole. Which because it was very difficult, the Moderns have found out a far more convenient way, and that is, by a Pipe, having a very sharp edge at the end, which *Barbette, Chirurg.* p. 1. c. 15. describes, for by this the *Abdomen* is perforated by degrees: But as soon as it has penetrated into the hollow part, presently the water uses to run out at the holes, that are on each side of the edge, the excessive flux whereof, if we would stop, we stop the hole of the pipe with a Silver pen exactly fitting it, and when we have a mind to let it run again, we draw it out: When we have a mind often to repeat this operation, either a new hole is made, or that is opened again, which was made before. A little Lint, with an agglutinant plaster applied over it, shuts the hole securely.

Van Horne
Microscop.

XXVIII. We must hasten to tapping, not the vulgar way, which is full of danger, but a new and safe way by a Silver pin, hollow, which is gently thrust into the *Abdomen*, about four inches below the Navel, and as many on one side of it, and after a sufficient quantity of water is let out, it is drawn out again; and in like manner, at some other time or day, it is thrust into the same hole, unless it seem good to make a new hole some other where. There is no danger in this operation, because, when the pin is drawn out, no more liquor will run out; but by applying a *Diapalma* plaster, the opened place is not onely defended from the injuries of the ambient Air, but its consolidation is promoted.

Sylvius.

XXIX. Although *Erastistratus*, *Avicenna* and *Gordonius*, think it destructive, yet if there be all the conditions for the safe performance of it, I should willingly order it immediately. And these conditions are six. 1. That not deplorable persons, but such as have strength, be tapped. 2. That they be not very feverish. 3. That there be no *Schirrhus* in the bowels. 4. That the disease be new, and the bowels not corrupted by the water. 5. All the water must not be evacuated. 6. It must neither be in Summer nor in Winter time, if it be possible. But in a Dropsie of many months, the decay of the Inwards may be suspected, which alone may dehort from so great a Remedy, the unhappy success whereof may easily be ascribed to the Physician. Hence *Rhases* his Error easily appears, who thinks, we must onely use tapping in the progress of the disease, whereas then Influxions are rather convenient, which are proposed by *Avicenna*, *Albucasis* and *Celsus*.

Fortis.

XXX. Moreover, we must observe, that the Belly must not be opened with a red-hot knife; for the *Peritoneum* is inflamed, as I have experienced. ¶ Nor must it be done with a Caustick; for when a great and round Eschar is made, the water will come out at the large hole made within, with such violence, that no dam can check it. One was applied, against my mind, to the Noble Mr. *Alexander de Harpy*, a famous Lawyer in *Geneva*, the day before his death, which, but that it anticipated, he had died at the first gushing out of the water: for, when he was dead, and the penknife thrust into it, the water could scarce be stoped by applying the Thumb. When we looked on the place, to which the caustick stone had been applied, it had passed all the integuments to the *Peritoneum*, with a wide hole, and had not this by its thickness hindered (which in Hydropicks is observed to grow very thick) he had died immediately.

Panarolus.

XXXI. Concerning this operation, it must be observed, that Hydropicks must not be tapped, unless an *Exomphalos*, or a starting of the Navel appear, Nature

ture as it were affecting that way for the discharge of the water: Otherwise, all that are opened, when the Navel is not prominent, die; And this prominence of the Navel may be procured by Art, by setting dry Cupping-glasses, with much flame, to the Navel, and also by emollient and drawing fomentations, which in three days, or thereabout, cause a prominence, in which Tapping may be administered.

Formius ad
Riverium.

XXXII. Modern Practitioners say, something must be evacuated morning and evening, but this way of evacuating to me seems pernicious; for I saw the water once so let out, and the Patient died in two days: And, I think, the onely cause of his death was the taking away of so little water: For when the way was once made, the water trying to get out, rushes upon it with great violence, and lying with all its weight on the wound, does farther debilitate the part, which is debilitated with fection already. Thence, 1. There arises a great difficulty in retaining the water, which being retained by violence, endangers a Gangrene, as it happened to him I spoke of. 2. What benefit is there from so little evacuation? for in the belly of one that is perfectly Hydropick, 30 or 40 pints of water are contained, and what relief can evacuation of half a pint give? But it is my judgment, 1. That a great quantity should be taken away, about half, or at least a third part, and till the Belly fall remarkably: In the mean time, left the Patient should be weakened by the loss of so much, he must be refreshed with oil of Cloves, Cinnamon-water, &c. the next day about two or three pints must be taken away, and the third day again; but ever less and less: for because the parts have so long a time been accustomed to the water, therefore I think the last of it should be left a good while; but the first should be taken out much at once, to the end Nature may presently find manifest relief. For then especially there will not be so great difficulty in keeping the water; there will not be so great a weight of water upon the wounded and weak part; and it will not be necessary to thrust in tents and pipes so hard, with pain, or to press the wounded part so violently. And that there is not so great danger in evacuating the water at once, examples of several do shew, from whom it has burst, either of it self, or by accident, so that it has almost all run out, and yet they have recovered. Thus we heard lately here at *Lochin*, how almost all the water burst out of an ascitick Woman at once, in a very short time, and yet she recovered.

Ficinus.

Barbette.

XXXIII. In Hydropicks the coats of the *Peritoneum* grow very thick, yea, in success of time they acquire a cartilagineous hardness, which, in tapping of the *Abdomen*, is very necessary to be known.

XXXIV. They who refuse Tapping, admit of opening the *Scrotum* (but the bowels must be safe, and the strength good) which being turgid, must be opened with a Penknife or a Lancet, and afterwards must be kept open with a Seton. Sometimes a Gangrene comes, but this not always of any great moment; for so, way being made, the water runs out more easily, and such cutaneous Gangrenes are not so difficult to cure. ¶ A Black-smith, in the year 1653. afforded me an instance, in whose *Scrotum*, when it had swelled after a Dropsie, Pustules arose, and the water of the *Abdomen* ran out that way, upon which a Gangrene followed in the *Scrotum*, of which he was cured by the industry of Mr. *Sabourin*, a Chirurgeon of *Geneva*: He survived it three years, and when the Dropsie came again, through a bad Diet, he died.

Hildanus,
cent. 1. obs.
48.

XXXV. According to *Aetius*, we may sometimes prick the *Scrotum* with Needles, into which water is fallen, and experience shews, this remedy is very good. A Seton is made with a red-hot Iron, where-with the skin of the *Scrotum* is perforated. There-

fore we may either use pricking, or a Seton, according as the Patients admit of the one remedy rather than the other.

Capivaccius.

XXXVI. *Holleus* has a new way of getting out the water in Dropsies; he says, that one escaped a Dropsie, and Death it self, by cutting his Nails of his feet and hands to the quick: But with how much danger this cure is accompanied, appears from *Henric. ab Heer obs. 12.* who affirms, that an hydro-pick person, about fifty years old, when he had cut his Nails of his feet to the quick, was presently taken with a Gangrene, and not long after he died.

XXXVII. Scarification of the legs was a famous remedy among the Ancients. *H. Saxonia*, out of *Alex. Benedicti lib. 15. cur. Morb.* does commend the Scarification of the Skin on the *Abdomen*; But in the Ankles and Legs he advises to abstain from it, for fear of a Gangrene: Yet *Langius* confirms it by his own experience, and advises, to remember well the remedy of Scarifying the inner Ankle. Which experience I also found true about five years ago in a Man, who, after he had been ill of a double Tertian, with a *delirium*, afterwards fell into an *Ascites*, and when no other remedies would doe good, he rashly, of himself, ventured on this scarifying of the Legs: For Water came out thence, and he bore it very well; He is now about 70 years old, and lives well, and free from any disease.

Frid. Hofmann.

XXXVIII. In our time, at *Padua*, the water ran so abundantly out of two cuts in the Ankle, that the Woman presently died: And when blood, the fountain of heat, is subtracted, sometime a Gangrene follows.

Rhodiæ,
cent. 3. obs.
17.

XXXIX. If Medicines doe no good, Physicians use to have recourse to the remedies propounded by *Celsus* and *Aetius*, that is, to Issues in both Legs near the Ankles, by which, being kept long open, the Water, that would otherwise, by its weight, fall upon the lower parts, is, in a long time, discharged. ¶ I made Issues in the Legs of an Ascitick, below the Knee, whence an incredible quantity of yellow Water was voided, and hereby he was cured, yet not neglecting in the mean time remedies, that were able to strengthen the Bowels. He kept his Issues for many years, till they dried up of themselves, nor did he die for some years, but at length it killed him. ¶ *Hildanus* (*obs. 42. cent. 6.*) being asked, Whether Issues were proper in a Dropsie? "When, saith he, the inner parts have been a little relieved, and cured by proper remedies, an Issue may be made in both Legs, in the right Leg at least, without any danger; but besides, the internal parts will be purged by means thereof from excrementitious humours, to the great advantage of health. But because the swelling of the Legs seems suspected to the Gentleman, It will not be amiss, before the Issues be made, to bind the Legs tight, beginning at the foot, and so proceeding to the Knee: Yet before this be done, it is proper to put the Legs in a decoction made of Wormwood, Centaury, Scordium, Sage, Betony, wild Marjoram, Rosemary, Juniper-berries, and the like, with Water and Salt, and in the evening especially, when he goes to bed. But in the Day-time, especially when he goes abroad, and exposes himself to the open Air, it is best to apply dry things. Hitherto *Hildanus*."

Mercutialis.

Glandorp.

XL. Scarification, according to *Aesclepius* his judgment, is propounded onely about the calves of the Legs, near the Ankles; yet he orders it to be deep, that all the water may conveniently be evacuated by degrees. But *Leonides*, as *Aetius* relates, is of the same mind with *Hippocrates*, and approves of Scarification, not onely about the calves of the Legs, but also about the Thighs, *Scrotum* and the Arms. *Alexander Benedictus*, to whom others also adhere, commends these Scarifications upon the Belly, under the

the Navel, in the same place, where Tapping is performed. It is confirmed by manifold experience, that these Scarifications do wonderfully help Hydropicks, and the water is got out without loss of strength. But as Scarifications of the *Abdomen* and *Scrotum* may be celebrated without danger, so Scarifications of the Belly and Thighs, in a great oedematous swelling and violent cooling of the innate heat are dangerous, and easily turn to a Gangrene. It is therefore my advice, when the heat is very languid, to abstain from them.

Saxonia.

XXI. Some advise the applying of Blisters to the inside of the Ankles: But it is safest to abstain: 1. Because little moisture is discharged. 2. Patients usually complain of Pain about these parts. 3. The Sores cannot be healed up, before a perfect Cure, since the Ulcers of Hydropicks, 6. aph. 3. are incurable. 4. There is great danger of a Gangrene. *Hildanus*, cent. 1. obs. 48. relates a history of a Gangrene arising upon the use of Blisters. *Platerus* has also observed that one can scarce be prevented, when Blisters arise of themselves. *Septalius* rejects them. *C. Piso*, de Morbis à colluvie serosa, found the event of them fatal. *Hildanus*, cent. 6. obs. 43. advises them.

XXII. I have found by long experience, that Infusions or Decoctions made in Wines do operate safer and better than any other forms of Medicines, and that a Dropsie, if it be possible to be cured, is best cured with them.

Platerus.

XXIII. Clysters for Dropsies must have no Oil in them, or only a very little Oil of Rue.

Rondeletius.

XLIV. *Camerarius*, a Lawyer, lay ill of a dangerous Dropsie; He begged of *Packischius* his Physician, to let him have some Herrings; *Packischius* consented, but on this condition; that he should take no potent matter for the space of two hours after he had eaten them; The Patient obeys; And what then? He at length had occasion to make water, and made such a quantity, that he continued making it for almost a quarter of an hour, and his Belly began sensibly to fall more and more. *D. Bucetius* also confessed, that he cured three People of Dropsies by the continued use of Herrings only for several days and weeks, and ordering little drink.

Sennertus.

XLV. A Boy 12 years old, hectic, ascitic and leprous, laboured of a putrid Fever, he was under the care of no ordinary Physician: But when his Medicines would do no good, I am called. We could scarce tell where to begin. Besides, he had a Pain in his Liver. It was our Advice, that he should eat bread made of Spelt with water of Ashes, some Fenil-feed and half Wheat-flower. The way of Cure was Juice of Cichory with Powder of Madder and Spike. He came to that pass, that he made 10 or 12 pounds of Urine in a day, and so he was cured.

Cardanus.

XLVI. Remedies that are used with most benefit near the places affected are Clysters and Plasters. The first do, without the fusion of the whole mass of blood (which strong Purges do raise) draw the Serum out of the vessels and glands of the Guts and Mesentery, which being thereby emptied, do a little imbibe the extravasated Lympha. To this purpose the following Clyster is very good, inasmuch namely as it both vellicates the intestinal fibres, and draws the Serum imbibed by the blood, or contained in it before, towards the Kidneys. Take of the Urine of a healthy Man, that drinks Wine, 1 pound, Venice Turpentine mixt with the Yolk of an Egg 1 ounce and an half, Sal. Prunelle 1 drachm and an half. Make a Clyster. Let it be repeated every day. Plasters sometimes do good in an *Ascites*; Yet they must be such as by their restraining and strengthening virtue, do strengthen and bind the mouths of the vessels, that they may not spue out the serosities too much. For this purpose, I often use to apply *Emplastrum Diasapenis* with good success to a swollen Belly.

Willis.

XLVII. In the use of Topicks, which are applied to the Belly, we must have a care of the Region of the Liver; for oftentimes they are very hot, and the Liver would be overheated by them, and weakened; But that they may do no hurt, the Region of the Liver must be guarded with some Unguent, as *Santalinum*, &c.

Chalmers.

XLVIII. The bruised flesh of Earth-snails, applied to the Belly is very good, with which *Dioscorides* advises to mix the Shells: Which that it may more conveniently be done, they must be reduced to powder first; and it may easily be done, for they are very brittle. But if we would mix the Shells with them, as some advise, it is best first to reduce them to Ashes, because they are not so easily powdered. The Slime of Snails also is good.

Platerus.

XLIX. *Michael Sterpinus*, a famous Chymist, cured the Dropsie which was much swelled, by making a hole in the skin of one Foot, and applying a Seton; for all the water ran and dropt out at it, as by an Alembick. *Erastus* got first of all three long Incisions made in the sole of the Foot, that the water might run out; which being done, the Swelling of the Belly fell, and then he used his hydragogue wines. Others make long Scarifications, although these ways do not want danger. I have found nothing safer, than to apply Escharoticks to the calves of the Legs, and while the water runs out, to provide for a weak Liver. For so I have cured several of a Dropsie.

Reusnerus, obs. 88.

L. I have observed, it is in vain to give Medicines for a Dropsie, which arises from an Ague, while the Ague lasts. For you will find the Ague by this means firmer rooted in, and the Dropsie not removed. We must tarry therefore till the Ague be gone, and then we must make haste to undertake the business.

Sydenham.

Hydrops Tympanitis, or, A Tympany.

The Contents.

Sometimes it must be cured with cooling things. I.
Purgatives do more harm than good. II.
We must use things to disperse Wind modestly. III.
The nature of Topicks, which do little good. IV.
It arises from Wind pent up in the Stomach and Guts. V.
The Cure by Tapping. VI.

I. A Gross Wind is the cause of this Dropsie, to the generation of which two things are required: First, Gross Matter, and indeed usually black Choler: For since they that have black Choler under the bottom of their Stomach, abound with wind, and sometimes belch much, (yea, oftentimes the greatest share of their Food is turned into wind) if the wind be detained, it distends the Belly, and may make this sort of Dropsie. Nor must the cause of it be sought in the Liver only, but oftentimes in the first ways, according to *Aphor.* 4. 11. Secondly, an Efficient, which is reckoned a weak heat: but it is not simply such, but only in respect to the matter, which it is not able to conquer and disperse: Yea, oftentimes it is preternatural and great enough, and acts suddenly and violently upon all the matter, and disturbs it, this I reckon is what is usually done in a Tympany. For if the heat were truly weak, it would not act on the matter, nor would wind be bred. And so an *Ascites* and a Tympany differ in respect of their matter and the efficient: For the matter in a Tympany is more melancholic, and the heat is roasting and burning. Wherefore also sometimes we must have recourse to cooling Medicines. And *Mercatus* writes, If all these Remedies (that is, hot things) do no good

good, we must use *Hippocrates* his Advice and Prudence, who when he had for several days used hot things in these Pains, and found no benefit thereby, he passed to cold things with great benefit.

Sennertus.

Hartmannus.

II. Purges are so far from doing any good in a Tympany, that they rather exasperate it: But Purgatives, especially Mercurial ones, do often remove that which is joined with an *Ascites*. ¶ Almost the whole intention of Cure is directed against wind, by evacuating the matter, whence the wind arises. Wherefore Purges are usually prescribed on purpose, against the humour most suspected with great confidence, though usually with very little, or with bad success. For this Disease (as it appears from my observation) uses almost always to be exasperated by Purgers, especially strong ones, and seldom or never relieved: The reason whereof is sufficiently evident, because when the nervous Fibres are irritated by a sharp Medicine, the animal spirits re-iterate their irregular excursions, and still increase more and more rather than abate: Wherefore although frequent and large watry and windy stools be procured thereby, yet the Belly swells more. But though Medicine be so little able to do good in this Disease, yet it must not (as if it did nothing, or only harm) be wholly neglected, but we should leave no Stone unturned, some way or other to help the Patient, that at length a Cure, or at least an Alleviation may be obtained. Therefore though strong Purges always do harm, and gentle ones are scarce ever able to carry off the conjunct Cause: yet these latter, because they a little abate the matter of the Disease, and make way for other Medicines to exert their energies more freely, ought to have their place in medical practice; that is, once in 6 or 8 days; and at other times Clysters. (the use whereof is much more excellent) may be given frequently.

Willis.

III. When the humours are evacuated, and the strength refreshed, we must endeavour what we can to discuss wind, which the following Decoction will wonderfully perform. Take of *Album Græcum*, whole Barley, each 1 ounce and an half; boil them on a gentle fire in 3 or 4 pounds of French-wine, till the Barley bursts. Then boil the Colature defæcated by residence to half, then clarify and aromatize it with a sufficient quantity of Cinnamon, and sweeten it with Sugar. The Dose five drachms thrice a day on an empty Stomach, and he will break wind wonderfully, and the Belly will fall by degrees. But we must use these things moderately, otherwise they will hurt most grievously. A certain Woman, miserably afflicted with a Tympany, committed her self to a Physician for cure. He being intent upon the discussing of wind only, gave her some very hot Electuary, without giving her any other Medicine before: She, a little after, found the rumbling of the wind greater, and her gripes more troublesome, she breathed with more difficulty, and the old swelling of her Belly remaining, a new one grew, which elevating it self from the *Cartilago Enniformis*, where the first terminated, did wonderfully distend the whole Breast; and the tumours were parted with a pit between. She died the third day after I was called. I reckon the cause of the new tumour was the heating and evacuating virtue of the Medicine.

Ficinus.

IV. Great things are expected from Topicks, because they are applied to the Disease more immediately, and by contact, and because they dissolve or discuss tumours in other parts very well. Yet not all Dissolvents, not indeed such as do most good in other tumours, are proper here: For hot things, which are held for Discutients, whether they be used in Fomentation, Liniment, Cataplasim or Plaster, do often more harm than good in a Tympany, for they open and dilate the ducts of the Fibres, so that they lye more open to the incursions of spirits, and they also raise the impacted par-

ticles, so that when they possess a larger space; the inflation and swelling are increased. ¶ While Medicines are taken inwardly, Topicks also and external applications must be carefully applied, not hot and discutient ones, but things endued with particles of a volatile Salt, and nitrous ones, which namely destroy the combinations of other Salts, and dissolve the impositions of the spirits, to which end we propound the things following. If fomentations may be used at all, they must not be applied too hot. Beside, they must not be made of things, we call carminative, but especially of Salts and Minerals. *Cabrolus* (as *Helmont* relates) tells how he cured a Man of fourcore, whose Belly he fomented twice a day with a *Lixivium* in which Salt, Alum and Sulphur had been boiled; and then he used Cow's-dung for a Cataplasim.

Idem.

V. Wind detained in the Guts and Stomach, and not yet got into the space of the *Abdomen*, does not only breed Colick pains, but if it be so enclosed, that, no passage being open, it lift them up so high, that the whole Belly appears distended thereby, a certain sort of Tympany may arise from thence, and may be more frequent, than that which Men commonly take to come of wind burst out into the Belly. As in those who have been thought to be tympanitick, we could find no wind to burst out of the hollow of the Belly, when cut, nor the Belly subside, but the Guts, especially the smaller, have started out so turgid with wind and twisted, that they could not be thrust back again into the Belly. There is the same cause of this Tympany as of another.

Platerus;
Tom. 3. c. 2.

VI. When all will do nothing, and the wind cannot be conquered by Medicines, it would be convenient to perforate the *Abdomen* it self, with a hollow silver Pin, to its cavity, made by the *Peritonæum*, and to make way for the wind with that hollow instrument, or to get it out with some more proper instrument.

Sylvius.

Dr. Sydenham's Method of curing the Dropsie.

THE true and genuine curative Indications must either be directed to the evacuation of the water contained in the Belly and other parts, or to the strengthening of the blood, that a new product of it may be prevented. As to evacuation of the *Serum*, it concerns us diligently to observe, that those Catharticks which work either too much or too little, do more harm than good: for there is not one purgative Medicine that is not an enemy to Nature, and in that very respect wherein they purge, they in some measure debilitate and hurt the blood; Wherefore, except they pass and be expelled the body quickly, while they disturb the filth, which they cannot carry off, and put the blood into a tumult, they increase the Swelling more. Whenever therefore Hydragogues must be used, we must have a carefull regard to the facility or difficulty, with which the Patient's body is used to bear purging: Which can no way be more certainly known, than by diligent enquiry, how Purges taken at other times have wrought. For since in bodies there is found a certain Idiosyncrasy as to the ease or difficult operation of Catharticks, he will often endanger his Patient's life, who makes the sensible temperament of the body his measure and rule: When it often happens that they who are of an Athletick habit of body are easily wrought upon by gentle Catharticks, whereas, they that are of the contrary habit, are scarce wrought upon by the strongest. Now, because a Dropsie, as I said before, does above all other Diseases require a strong and quick Purge; and since in this Disease purging by

Emmons,

omnigenis, or by little and little, which does good in some other Diseases, must by no means be admitted (since this sort of purging does not lessen, but increase the Swelling.) For this reason, I say, a Purge a little too strong is to be preferred before one that is too weak, especially since we want not *Laudanum*, which gives a most certain and sudden check to a *Hypercatharsis*, or Over-purging. Besides, this must be diligently observed in all Catharticks proper for Hydropicks, that the water must be carried off with as great celerity as the Patient's strength will bear; that is, he must be purged every day: unless by reason of the weakness of his body or the too violent operation of a preceding Purge one day or two may pass between: for if purging be not repeated but at long intervals, how large soever the evacuation have been before, we shall give occasion to the breeding of water anew in great quantity. There is danger also left the water, by long tarrying in the Bowels, infect them with putrefaction. And moreover, which ought not to be slighted, the water put in motion by the preceding Catharticks, is more propense to do mischief, than when it lay quiet. For this reason therefore as well as for others before mentioned, we must quickly satisfy this intention, which respects the serous matter shut up within, nor must we desist from it, unless on urgent necessity, till the whole flood of water be drawn out. This moreover must be observed, that since it appears from practice, that almost all hydragogues, out of a particular *genus* they have, if they be given alone, do not answer our ends in such as are hard to be wrought upon; and a larger dose of them does not so much purge as disturb the blood (whereby the Swelling, which ought to have been abated, is increased.) These therefore have no other use in such bodies, than to quicken gentle Purges, notwithstanding which, in such as are easy to be wrought upon, these hydragogues work quickly and with great effect. Wherefore in such as are easy to be wrought upon, Syrup of Buckthorn-berry, even alone, purges water plentifully. Which Medicine indeed in such Persons, purges water only, and that in great quantity, neither disturbing the blood, nor making the urine higher coloured, as other Purges do. This Syrup has onely this inconvenience, that in the working it causes great thirst. But if it be given to others, who are hard to be wrought on, in a great dose, neither many stools will follow, nor those so full of water as they ought. Indeed I well remember (when I was first called to cure a Dropsie) that about 27 years ago I was called to a pious, good Woman, one Mrs. Saltmarsh, who lived at Westminster, whose Belly was swelled with the Dropsie to an incredible bigness, than which I never saw a more grievous one. I gave her, as the custome was then, an ounce of this Syrup before dinner. It is scarce to be believed what a power of water she voided by stool, and that without any disturbance, without any loss of strength to the Patient. Which encouraged me to give her it every day, unless that now and then I omitted a day or two, when she appeared any thing weak, and so the water being got out by degrees, her Belly fell, and she perfectly recovered. I, like a confident, unexperienced young Man, thought I had got a Medicine, wherewith I could cure all Dropsies: but I was convinced of my error within a few weeks. For when I was called to prescribe Physick to another Woman who was ill of the same Disease, which followed a tedious Quartan-Agüe, I gave her the same Syrup; by which often repeated, and the Dose gradually increased, I irritated the Disease; but when I had tried to evacuate the water to no purpose, no purging following, but the swelling of her Belly rather increasing, she left me off, and, as I remember, recovered her health by the help of another Phy-

cian, who used more effectual Remedies. When therefore it is manifest that the Patient is of such a habit of Body, that gentle Catharticks do their work neither quickly nor kindly, stronger things must be tried. In which case it must be observed, that though few Hydragogues, if they be given alone, answer expectation, yet if they be mixt with gentle things, as a quickner, they are very effectual. In such Bodies, for example sake, I have often prescribed the following Potion with success. Take of Tamarinds half an ounce, Leaves of *Senna* 2 drachms, Rheubarb 1 drachm and an half. Boil them in a sufficient quantity of Spring-water to 3 ounces. In the Colature dissolve of Manna and Syrup of Roses solutive each 1 ounce, Syrup of Buckthorn half an ounce, Electuary of Juice of Roses 2 drachms. Mix them. Make a Potion. Which Potion nevertheless must not be given but to the stronger sort, which purges, when other things are able to do no good: as I have tried by manifold experience of it. Here follows another Receipt not infrequent with me, which they may very conveniently use, who hate the repeated use of other Purgatives; when in purging it both heats the Patient, and strengthens him; For Example; Take of root of Jalap bruised, Hermodactyls, each half an ounce; crude Scammony 3 drachms, Leaves of *Senna* 2 ounces, scraped Liquorice, Aniseed, Caraway, each half an ounce; Tops of Wormwood, Leaves of Sage, each 1 handfull. Infuse them cold in four pounds of common *Aqua vite*, and strain it onely at the time of use. Let him take one spoonfull at the hour of sleep, and two the next morning, increasing or diminishing the Dose according to the operation. But the two chief Medicines, in my opinion, are behind; and for such as are hard to be wrought upon, they are stronger than any of the rest, that I have either enumerated, or yet found. I mean *Elaterium* and an Infusion of *Crocus metallorum*. *Elaterium*, or the *Fæcula* of wild Cucumber, does in a very little quantity exert its virtue powerfully in purging the Belly and discharging the excrements with the serous and watry humours, so that two grains, to speak in general, is a proper Dose for most Bodies. I use to mix half a scruple of *Pilular. Coch. maj.* which I order to be made into two little Pills, and to be taken in the morning. As for the Infusion of *Crocus metallorum*, an ounce and an half of it (or for those that are hard to purge, two ounces) given in the morning and repeated every day according to the Patient's strength, although at first bluish it promise little more, than to carry off the filth lodged in the Stomach, yet it will so work, that at length it will ease the Belly of its load of superincumbent water. For besides, that when the Vomiting ceases, it purges downwards, it is altogether necessary, that since there is so great an agitation and concussion of the Stomach and Bowels, after so notable a corrivation of water, wherewith they are as it were every way surrounded, an evacuation of it by passages not open enough according to the common Law of Nature, must follow so violent a straining. Nevertheless, if the foresaid Vomitory do not sufficiently purge the lower Belly, I sometimes, though very seldom, add, both Electuary of Juice of Roses and Syrup of Buckthorn, after the third or fourth Dose of a mere Infusion of *Crocus metallorum*; for example; Take of *Carduus benedictus* water 3 ounces, Infusion of *Crocus metallorum* 1 ounce and an half, Syrup of Buckthorn half an ounce, Electuary of Juice of Roses 2 drachms. Mix them. Make a Potion. There is also another common simple Medicine, which cures the Dropsie the same way as that whereof we have last treated, namely, 3 handfulls of the inner rind of Elder scraped from the Wood, boiled in 2 pounds of Milk and Water mixt together, to 1 pound. Let one half of this Decoction be taken in the morning, and the other in the evening every day, till the

the Patient be well. This Medicine both vomits and purges like *Crocus metallorum*, and therefore cures the Disease the same way, and not by any specifick virtue. Wherefore if it perform neither of these operations, or but moderately and sparingly, it does not one jot of good; but when it produces either of them effectually, especially if both of them, it conduces wonderfully to the Cure of this Disease. But indeed, which ought seriously to be taken notice of, it often happens, that water falls not onely into the Legs and Thighs, but also into the cavity of the *Abdomen*, which nevertheless must not be got out by Medicines, either purging upwards or downwards. For example, when such a Swelling either follows a tedious Consumption, or arises from some decay or putrefaction of the Inwards, or from the tone of the blood, If I may so say, being relaxed or destroyed, and from the spirits being utterly exhausted by some old *Fistula's* in the carnos parts, which have voided much *Sanies*, or from too great debility and evacuation as well of the humours as spirits, which has been brought upon a Man, either by salivation, sweating, or too violent purging, and a thin diet in the Cure of the Venereal Disease, used more than the case required. In these and other Diseases which come in this manner, the Patient will not onely not be relieved by purging, but the tone of the blood being still farther decayed, the Disease will be increased. Wherefore, the case standing thus, the whole stress of the Cure rests upon the blood and Inwards being strengthened by all means. Among other things of this nature, besides strengthening things to be reckoned up hereafter, I am informed by certain experience, that change of the Air, and Exercise in a free Air, such as the Patient can bear, does very fitly answer this Indication; the spirits, that is, being inspired, as it were, with a new life, by these means, and the excretory Organs minded again of the office incumbent on them. Sometimes also without any such cause, we must satisfy this Intention, which respects evacuating the water, neither with Catharticks nor Emeticks: for whenever the Patient is of a weakly constitution, or a Woman very subject to vapours and ataxies of the animal spirits; it cannot be, that the business can be done by Catharticks, much less by Emeticks. Here therefore the evacuation of the water must be committed to Diureticks. Of which rank, though very many be of great fame in the Writings of Physicians; yet the most effectual are they (not to say onely they) as I think, which are made of Lixivial Salts: Nor makes it any matter, of what sort of Vegetables the Athes are made. But seeing scarce any one Vegetable is more easie to be had than Broom, and it is well accounted of in this Disease, I usually order 1 pound of its Athes to be infused in 4 pounds of Rhenish-wine cold, adding a pugil or two of Leaves of common Wormwood. I order 4 ounces of the Liqueur, strained by filtration, to be constantly drunk by the Patient, in the morning, at five in the afternoon, and at night. By which Remedy alone I have seen Dropsies cured which have been reckoned desperate, in such whose Constitution has been too weak to bear purging.

But when the water (that we may hasten to the second Intention) which is the proximate cause of the Disease is now wholly evacuated, we are come for the most part but half way of the Cure, unless the weakened blood, which was the first original of the Disease, be helped by long and constant taking of heating and strengthening Medicines, whereby a new product of water may be prevented: For though it may so happen to young People oftentimes, that when the water is well purged out, they recover without any other Remedy, because their natural heat, being then rid of the load and pressure of the water, may supply the place of

the said Remedies; yet in elder People, or them that have no very sound habit of body, it is altogether necessary, that presently, when the evacuation of the water is finished, they have recourse to the use of those Simples that heat and invigorate the blood. Among which, those things I have formerly recommended in the Cure of the Gout, whether they respect the Remedies themselves, or the six non-natural things, besides those, which shall afterwards be spoken of, are proper (unless that Wine, from which we must wholly abstain in the Gout, does not onely no harm in the Dropsie, but a great deal of good, if it be used for Mens ordinary drink) seeing these two Diseases agree in this, that the same strengthening Medicines oppose the original cause of either of them. Moreover to satisfy this intention, of which we are now treating, namely, the strengthening of the blood, whether the evacuation of the water be procured, as before, by a Diuretick, a Purge, or a Vomit, it is altogether necessary that the Patient, as much as the case requires, be obliged to drink Wine, while he is under Cure (so he begin not to drink Wine, before the passages be a little opened, and way made for the water) or at least strong Beer instead of Wine; seeing all thin and cooling Liqueurs, how pleasant soever they be to the Palate, which is ever in a manner thirsty in this Disease, do make the Patient more phlegmatick and augment the water: these therefore must seldom or never be allowed. And on the contrary, generous Liqueurs, so they be not distilled spirits, promote health so far, that sometimes they alone restore it when lost; as in the beginning of the Disease, before the Belly be much stretched with water; especially if they be impregnated with heating and strengthening Herbs. For the poorer sort, whose Purse will not afford better Medicines, strong Beer, in which a sufficient quantity of root of Horseradish, Leaves of common Wormwood, garden Scurgrass, lesser Centaury, and tops of Broom have been steeped, is by my Advice used for their ordinary drink, and may serve instead of all. For the richer sort, *Canary* Wine may be impregnated with the same bitter Herbs, a draught of which may be taken twice or thrice a-day among the forementioned Medicines. Or if this please not the Palate so well, Wormwood-wine may be drunk in its stead, of which the Patient may take nine spoonfulls after taking two drachms of the digestive Electuary (described *Tit. de Arthritis*, Book I.) at Medicinal hours, that is, morning, four in the afternoon, and night. This Electuary far surpasses any other strengthening Medicine, in satisfying this Intention. But here it is of great moment, that the Patient drink sparingly of any small Liqueurs; seeing all of them, whatever they be, give increase to the water; so that wholly abstaining from drink has cured some: And therefore, if the Patient must sometimes be indulged these Liqueurs, he must drink them very sparingly. Notwithstanding, because this Disease is accompanied with great thirst, which abstaining from small drink does increase, it will be proper for the Patient to wash his mouth often with cold water, sharpened with spirit of Vitriol, or let him keep some Tamarinds in his mouth, or chew Lemon, but swallow neither of them, because of their Coldness, which is not so proper for the Disease. But among strengtheners Steel in the Cure of a Dropsie beginning deserves not the last place; for it invigorates and heats the blood. Which is the reason why Garlick is so good in this case; for I have known a Dropsie cured with it onely, omitting Evacuators, by other Mens Prescription, not mine. For it must be observed, that the Dropsie, which has onely swelled the Feet, or the Belly also, but moderately, does not presently require a Cure by Emeticks and Catharticks; but often gives way to these said heating and strengthening Liqueurs.

R r

But

But above all things it must be seriously observed, that whenever we set upon this Disease onely with strengthners, or Lixivials also, the Patient must by no means be purged, either with a gentle or strong Purge, so long as we are endeavouring to strengthen the Blood. For a Purge will pull down what a strengthner has built up; which every one must be forced to acknowledge, who has observed, that the Swelling, which by the use of strengthners began to abate, does presently increase after Purging. For although, when we desire to satisfy the intention of getting out the Water, it would not be amiss also now and then to give strengthners; yet when our whole business is to strengthen the blood, it is altogether necessary to abstain from Catharticks. It is to be observed also, that the Patient is not always cured, though we satisfy both Indications, that is, though the water gathered in the Belly be wholly got out, and Heaters and Strengthners also be given afterwards, to prevent a new product of Water. For it often happens, that an *Astiter*, which has lasted many years, by the long incubation of the Water upon the Inwards, has perverted, and as it were perboiled their substance: And has utterly corrupted both the Bowels themselves, and the neighbouring parts, breeding preternatural Glands, and Bladders turgid with *Sanies*, and turning all things, contained within the cavity of the *Abdomen*, into a kind of putrilage; as Dissolution of Bodies of such as have died of an inveterate Dropsie, has made manifest. When the Disease is arrived at this height, it contemns all the helps of Art, as far as I see. Nevertheless, it is the Physicians duty, since he cannot certainly know what harm is done to the Inwards as yet; to endeavour the cure by all means, by Evacuating, as well as Strengthening Medicines: And he must neither be discouraged, nor must he discourage his Patient. We must endeavour to doe this, for this reason especially, because in many Diseases, when the matter of them is discharged, Nature, who watches and provides for our good day and night, does wonderfully endeavour of her self to guard and defend the Patient from the pernicious relics of this disease. Wherefore, every *Astiter*, how inveterate soever, and how much mischief soever it hath done to the Bowels, must be treated in no other manner, than as if it were just begun. (*What he says of External Remedies, you have more at large in other Authors, passages out of whom you may read before.*)

Sydenham.
Traité de Hy-
drope.

Medicines especially made use of by eminent Physicians.

- Aetius.** 1. A Spoonfull of burnt Cow's-dung taken in a pint of Wine every day, is very good.
- Claudianus.** 2. A Toad split, and applied to the Kidneys of one in a Dropsie, wonderfully voids the Water by Urine. ¶ One Man insensibly waits the Water of Hydropicks by a secret remedy, by applying the Stone of a Water-Snake to the Belly.
- Benedictus.** 3. The flesh of a dried Hedge-hog does peculiarly help this disease, if it be beaten and drunk in old Wine; 2 drachms of it must be taken every day.
4. A Woman was cured with this decoction onely, called *Syrupus S. Ambrosii*. It is made thus. Take of Millet excocticated 2 drachms, Spring-water 2 pounds, Boil them till onely 3 ounces remain. Strain it. Put as much White-wine to it. Give it hot to one in a Dropsie. She was well recovered, and she sweat plentifully, and she took it 8 days.
- Crato.** 5. I have experienced, that the juice of *Iris*, crude, not boiled, cures any Dropsie, which is curable by humane help.
- Gordonius.** 6. Mullen is a specifick herb for a Tympany, 1 scruple whereof, with a decoction of Seed and Root of Fenil expells Wind egregiously.
- Cremon.**

Hypercatharsis, or over-purging.

Its prevention and Cure.

A Hypercatharsis comes, when the Purgative being disproportionate in quality or quantity, works more violently or longer than it should, both as by too much irritating the nervous fibres, it drives the animal spirits into exandescencies, not easily appeased, and as it in a manner melts the blood and humours, so that what is separated from them, being discharged into the cavity of the bowels, makes the excretory irritations yet greater. The therapeutick method respects both the prevention and cure; as to the first (before Physick) there is need of great consideration, and care in the operation of it, and after it: For first of all, we must well consider, both the constitution of the body to be purged, the strength and custome, and the nature of the Medicine to be given, its dose, manner of operation, and the ordinary effects; then comparing things together, we must proportionate the virtue of the agent according to the tolerance of the Patient. 2. While the Physick works, the parts for concoction, the blood and animal spirits, must be kept free from any other perturbation. Wherefore, at this time, neither gross, viscous, nor much food, which molests the Stomach, must be given. The meeting with the external Cold, whereby the pores of the body may be stoppt, must carefully be avoided; finally, the mind must be kept quiet and serene, void of care and of severer studies. 3. When the Physick has done working, both the exandescence of the animal spirits, and the effervescence of the blood and humours must be quieted, to which ends an Anodyne Medicine, or a gentle Hypnotick must be given; but if omitting, or notwithstanding this care, a Hypercatharsis follow Purging, the Patient must presently be put in bed, and be thus treated. First of all, let a Plaster of Treacle, or a fomentation with Flanel, dipt in a decoction of Wormwood, Mint and Spices hot, and wrung out, be applied to the region of the Stomach, and the whole *Epigastrium*: Then let him presently either take a *Bolus* of *Theriaca Andromachi*, or a solution of it made in Cinnamon water: Then a little Burnt-wine, diluted with Mint water, must be given frequently by spoonfulls. If Gripping be troublesome, a Clyster may be given of warm Milk, with Treacle dissolved therein: In the mean time warm Frictions, and sometimes Ligatures, must be used to the external Limbs, whereby the blood may be called outwards, and be kept from too great colligation, and effusion, into the cavity of the Bowels. Then in the evening, if the strength be good, and the Pulse strong enough, a dose either of *Diascordium*, or liquid *Laudanum*, may be taken in some proper Vehicle.

Medicines.

I. Seeing the humours, the cause of the Disease, lodge in the branches of the *Porta*, if they could be opened in the same manner, as the branches of the *Cava* may be any where, the vitious humours might be conveniently evacuated by them together with the blood: But there is no such convenience, nor does any branch of the *Porta* reach to the extreme parts of the body, except the hæmorrhoidal branch, which reaches to the *Intestinum rectum*. Therefore if this be opened, it cures this disease most happily, because it evacuates the vitious humours gathered in the branches of the *Porta*: But this scarce ever happens successfully, unless Nature opens these hæmorrhoids of her own accord, or thrust out the humours thither, and be accustomed to evacuate the vitious humours that way. For if this should not be done, but the external hæmorrhoids should be opened by Art, then that which *Riolanus* takes notice of, happens, and the blood that offends in the *Porta* is not evacuated, but the good blood out of the *Cava*, which offends not. And the internal Hæmorrhoids, if it can conveniently be done, may be opened even in those, in whom they

never ran nor swelled, that the vitious humours latent thereabout, may be evacuated by them, and that Nature may accustom her self to evacuate the vitious blood this way, which oftentimes, even of her own accord, uses to evacuate the vitious humours, gathered in the branches of the *Porta*, to the Patient's great benefit. But though we acknowledge the difference of the Hæmorrhoid veins, laid down by the most learned Men, that is, that the Internal arise from the *Porta*, and the External from the *Cava*; And though we admit also, that they cannot conveniently be opened, for evacuating of the melancholick humour, except they be opened spontaneously by Nature; yet we think, that even by the External hæmorrhoids, black, and other bad humours may be evacuated, which are gathered about the Spleen and Liver. For since the Ancients were not ignorant of these veins, as having them obvious before their Eyes, and having often burnt them, and in the mean time they affirm, that the feculent matter of the Liver, black Choler, is evacuated by the Hæmorrhoids, that the Hæmorrhoids are the best remedy for melancholy, and good for them that are troubled with black Choler, that they cure a hardened Spleen; hence it easily appears, that Experience taught them, that black, and other bad humours, gathered about the Spleen and Liver, in the branches of the *vena porta*, are evacuated by them. And that it is so, every one that pleases may observe daily in his practice: For if he inquire into them, that find benefit by the Hæmorrhoids, he will find they are all Hypochondriack. If moreover it be inquired, whether Hæmorrhoids run, the Internal or External? He will understand that in most the external do run, and do also benefit Hypochondriack Patients; but that the Internal are seldom opened, and therefore that not onely a *Plethora*, but also a *Cacoehymie* and vitious humours are evacuated by them. And although sometimes also some thin humours, and red blood seem to be evacuated by them, yet it is not pure, but serous and salt, and an *Ichor* also runs without any blood. But not onely gross and black humours are gathered in the branches of the *Porta*, but also oftentimes serous and salt ones. And although the Internal and External Hæmorrhoids have their rise from different Veins, yet because they are inserted into the same *Intestinum rectum*, that there is some communication of these Vessels, and that their mouths meet one another, and that vitious humours are communicated from the Internal to the External Hæmorrhoids, and discharged by them, the thing it self, and what daily befalls Patients, speaks, since we see, that even the running of the External Hæmorrhoids does much good to those that are ill of Hypochondriack Diseases.

II. Though the melancholick and adust humour, which is the most obstinate, be infected with no putrefaction, nor easily take it, and therefore is not so fit for concoction; yet it is no less exasperated, and made more earthy and gross, and therefore rendered no less unfit for exclusion and concoction, than a *Cancer* is by digestive and absterfive remedies, applied finistrously and amiss.

III. Preparation is performed by Attenuants and Aperients; yet without any great heating or drying, because, for the most part, there is a certain heat and driness of the melaraick vessels, and these parts, and all near the lower orifice of the Stomach, have something like an Inflammation in them. In which case they offend, who having regard onely to Wind, with which Hypochondriacks abound, do use hot and dry Medicines, whereby the Disease is rather exasperated. Nor on the contrary are coolers and moistners without some opening convenient, seeing it is always proper to remove the Obstructions, which are in those parts. Yet where much watry matter is mixt, hot things

Sennertus.

Willis.

must not be omitted. And so, as the condition of the humour is various in this Disease, and according as this or the other part is most hurt, so the cure requires one while hot things, another while not so hot, or even moderately cooling and moistning, all which things nevertheless must be opening and attenuant. ¶ There are two principal cases of Sick persons, whereto magistral remedies must be accommodated, according to their strength and quality. Namely, either the blood is thick and cold, and earthy, with an obstructed Spleen, which requires hot fermenting Medicines, and especially Chalybeates; Or the Blood being plainly adust and hot, ferments above measure, and the *Hypochondria* do also astuate very much, and the blood and vapours boil up in them, in which state onely temperate and quieting Medicines are indicated, which may stop the immoderate fermentation of the humours, where Chalybeates must altogether be avoided.

IV. The alteration of the peccant humours will be various, both according to the variety of the humour, and according to the fault of every humour. The humour is both pituitous and bilious. The pituitous offends especially, when its acidity or viscosity is increased. The augmented acidity of the pituitous humour will be corrected first of all with a lixivious Salt, and with all things endued with a lixivious Salt; Such, as all Salt extracted out of the Ashes of Plants, as also Coral, Pearl, Crabs-eyes, filings of Steel, &c. For while, by the means of these things, an effervescence is made with the Acid Phlegm, the Acid humour is coagulated with them. But because an excessive effervescence is urgent in this Disease, which causes many Symptoms, we must have a great care, lest it be irritated, rather than checked and amended, by taking things that produce a new effervescence, which will be done, by using first of all these things, by which an Acid Spirit is rather concentrated than coagulated, such as Chalk, next to which are Crabs-eyes, Coral and filings of Steel. But if any one have a mind to use alixivial Salt, that effervescence may be made the less by it, let him temper it first by other means, that is, by some volatile Spirit or Oil: Wherefore *Venice* and common Soap are of great virtue in checking the effervescence. Whenever the pituitous humour offends in viscosity, then it must be incided and attenuated with acid and gumous things, as the humour gives way to the one, rather than the other; which it is easie to experience or try: Yea, it is the part of a prudent Physician, not to think he knows all things; For it is the part of a prudent Man not to begin rashly, but when he has observed, in dubious cases, by what the Patient is chiefly holpen, he may proceed courageously: Therefore, when by gentle procedure a remedy is found, by means whereof especially the Patient is relieved, then we may proceed more cheerfully in the use of it. And divers Gums occur very convenient in this case, *Galbanum*, *Sagapenum*, *Ammoniack*, *Opoponax*, and the like; all, or each of which may be used according as there shall be occasion, and especially in form of Pills. Among Acids, which may also be given, there occur divers Spirits prepared by Art, of Salt, Nitre, Vitriol, Sulphur, and also Wine-vinegar distilled, and sometimes not distilled; wherein, if the bulb of a Squill be infused, it is called Vinegar of Squills, and is an excellent Medicine in this and the like diseases, arising from viscid Phlegm. These things also are good for correcting of viscid Phlegm, Mastick, Amber, and the volatile Salt made of it, as also the sublimated Salt of Hartshorn, Castor, Myrrhe; moreover Steel prepared the common way, or Vitriol of it, with which, some Mens opening Pills are prepared. Every volatile Salt conduces, above all things, to correct and amend the viscid Phlegm, which has a virtue of reducing that humour insensibly to a mediocri-

ty. Wherefore I recommend to all the preparation and use of such Salts, whether they be prepared in a dry form, or in a moist. In the mean time this must be observed, that volatile Salts, prepared in a dry form, when they are very subtil, can scarce be kept, but do easily turn to Air; it is better therefore to prepare them in a moist form, or at least to keep them for use, dissolved in moist and watry things. The bilious humour offends especially by reason of a fixt lixivious Salt, which will be amended and tempered most powerfully by Acids: But because then at the same time an Effervescence is raised, by reason whereof this Hypochondriack disease is produced, it seems not so safe or convenient to make use of Acids, unless they be tempered with a volatile Spirit, by means whereof the violence of the Acid Spirit is not a little infringed, so that a less effervescence is caused thereby. For the tempering also of lixivial Salts, Acids mixt with oily things may be made use of, for all sharp things, as well Saline as Acid, are tempered with fat things. In the mean time we must have a care of oily Acids; when, besides a lixivial Salt, Oil

Sylvius de le Boë.

V. A Lenitive being premised, the first preparative must be *Julapium Acetosum* about three ounces, with half an ounce of Creme of Tartar finely powdered; for they may well be mixt together. When five days are over, again a Lenitive must be repeated, drinking upon it two pounds, either of clarified Whey, or Barley-water. Then we must proceed to open obstructions, and prepare the humours lodged in the veins. To which purpose aperient and mundifying juices clarified may be prescribed, since Medicines made with Honey or Sugar are good for few Hypochondriacks; Thus the clarified juices of Borage, Cichory, Endive, Mallows, Hops and *Ceterach*, may be given the next day after the Physick, and the next day after that half a drachm of Rhu-barb mixt with two drachms of *Flos Cassie* may be given, after which a full Glas of Cichory and Agrimony-water may be drunk. Then the day after the juices may be repeated, and so alternately the Rhu-barb and the juices may be taken.

Fortis, conf. 28. cent. 3.

VI. For a successfull and more accurate preparation, I am willing to abstain from sweet Syrups made of Sugar and Honey, as also from very lower things, since they puff up the bowels, and increase the heat, and these cause a fermentation in the humours. Wherefore clarified juices of Borage, Endive, sweet Apples, &c. must be given to about three ounces, in Broth altered with Mallow, Borage, Cichory, root of Cinquefoil, Cichory, &c.

Fortis.

VII. In the use of Preparatives we must consider, whether an Acid or a Nidorous crudity be more troublesome to the Patient, and conduce to this evil: for although it may be bred of either, yet, as the accidents vary, according to the one or the other, so also the way of cure varies. For in an Acid crudity we may use hot things: but in a Nidorous one, and where great inflammation is, we must use temperate ones.

Sennertus.

VIII. If the Disease be inveterate, gentle Aperients can doe but little good; yet they must be given first. For experience has taught, that these Aperients (*Creme of Tartar*, *Tartarum vitriolatum*, *Vinum Martiale*, *Pulvis cachecticus*) have qualified the Disease, but could never eradicate it. The case is the same in medical Waters: For, used once a year, they open the Inwards a little, but do not take away the Disease it self. It is necessary therefore, that against an inveterate Hypochondriack Disease such things be used, as may pluck up the Disease by the root, such as *Aqua Philosophica*, or *Spiritus Vini Tartarizatus*, if in some convenient liquor it be so given, as to begin with the least and to ascend to the highest drop, from one drop to twelve, and according to the precedent circumstances we must contin-

nuc

nue a while in one dose, and we must add now a drop, and then a drop to it.

Hartmannus

IX. Preparation by Syrups and distilled waters, while the humours are attenuated, and run to the parts obstructed, makes the Obstructions daily worse: for they tire the Patients and Nature too much, they hurt the Stomach grievously, and manifestly destroy concoction.

Crato.

X. Vinegar may be used, but it must be sparingly, and onely for relish sake; and reason tells us, it must be used in cholerick, rather than in pituitous persons, lest the exuberant melancholick juice be fermented with the excessive fowreness, and the swelling of the Spleen be increased, or way be made for fowre Belching.

Martini.

XI. Creme and Crytals of Tartar, and *Tartarum vitriolatum* are so common now adays, that several scarce prescribe any Medicines wherein some one of these is not put; yea, *Tartarum vitriolatum* is called by *Crollius*, *Universale Digestivum*: And I acknowledge indeed, that Medicines made of Tartar have a great virtue in inciding and attenuating melancholick humours, and therefore in opening obstructions. But seeing it often happens, that in a Hypochondriack affection there are found black cholerick humours, sale and bitter, and that are very fowre, and such as contain in them the seminaries of fire as it were, certainly *Tartarum vitriolatum*, and such sharp Medicines cannot be proper for such humours, seeing they do not take off their Acrimony; but such things should rather be used, as temper the bad qualities of such humours, and contrary qualities must needs be opposed to their contraries.

Sennertus.

XII. In Purging: If there be an Acid crudity, and any pituitous or viscid humour be mixt with it, pretty strong things, and such also as purge Phlegm, as Agarick, *Turbit*, *Species Diaturbit*, *Episcopi*, and the like, may be used. But on this condition, that the Patients fast not above two or three hours after they have taken the Physick, lest the virtue of the strong Medicine reach to parts beyond the Liver and Spleen, but it must evacuate onely what is about the Stomach, Liver and Spleen. But if there has been a nidorous crudity, we must use gentle things, as *Manna*, Syrup of Roses, or Violets solutive, Rheubarb, leaves of *Senna*, and lest the heat of the bowels should any way be increased by taking of Physick, it is good after taking the Purge, a little before Meat, to take a good draught of Whey or Posset drink, which both purges and cleanses, and tempers the heat in the Bowels.

Sennertus.

XIII. If crude cold humours be bred in the Stomach, onely through defect of the innate heat, as it happens to Scholars, and such as are too much given to study (then their Belching and Wind are neither fowre nor nidorous) we must abstain from frequent Purgings, because the innate heat is farther debilitated by them: But the innate heat must be increased and cherished, and a good Diet must be ordered. But if the Disease have its rise from cold causes, and be accompanied with a cold humour, and an Acid crudity, we must Purge frequently; for the crude humours are not easily evacuated at one time. So, if some adust humours be bred of a great heat in the Bowels, and if they be fed by that, we must wholly abstain from violent things, which increase that intemperature: But if the humour be thick, and the hot intemperature of the Bowels less, strong Medicines may more safely be used.

Idem.

XIV. When the humour to be purged comes from a large stock of Bloud, abundance of Heat, and from the hot intemperature of some part, no Man need doubt, but the Patients will be disturbed beyond measure, and thereby the melancholick juice will intolerably be increased. In which case gentle Purgatives are preferred before all others, and indeed taken in such a quantity, as may plentifully discharge the humours without too much agi-

tation, and may be sufficient to cut off the cause of the Disease. But if a gross and terrene humour alone cause an effervescence, the nature of the humour requires stronger Purges, which are apt neither to waste the strength, nor disturb the body too much. Therefore they must be given in a less dose, and be often repeated. Finally, when the Body is consuming, and the strength is in a great measure spent by the severity of the Symptoms, and when an enormous adustion and driness is contracted in the humours, then we may well use gentle Purgatives, yet more plentifully than in the first case, but on this condition, that the least occasion may not be given to the agitation of the humours.

XV. In this case Women bear the strongest Medicines, because their Inwards and their Stomach are presently so vitiated, that they plentifully abound with gross viscid Excrements, mixt with a Melancholick humour.

Martini.

XVI. After taking of strong Purges, lest the parts of the Medicines, cleaving to the coats of the Stomach, should cause erosion, or a long flux of the belly; before meal let a decoction of Barley be given, made with Water, not with flesh-broth, adding some Sugar, or broth of Pease, or of black Vetches. And for the strengthening and detersion of the mouth of the Stomach, let some Pilsan be given, to them especially, who are inclined to Vomit, and let sleep be indulged a little.

Idem.

XVII. Antimony helps all Diseases in general, which black choler has caused, and them especially which have an inflammation in their Hypochondria. Indeed I saw at Prague a Parish Priest, who became Melancholick and doated. He had ten grains of *Sibium* given him, which a little after carried off abundance of black choler by stool, wherewith were mixt, as it were, pieces of flesh, which looked like *Varices* cut into pieces: for these excrements looked rather like blond than any other humour. This did him so much good, that the next day he seemed to have recovered his understanding: And because he was of a strong body and good courage, no wonder if he easily bore so great a quantity of Physick. But the *Sibium* must be well prepared.

Matthioli.

XVIII. The humours that are not to be amended by Alteration, and are exuberant, must be carried off by convenient ways, and especially by stool, as a way more proper and easie to Nature; seldom by Vomit, unless the peccant humours cannot be carried downwards, or do affect a way upwards. Divers things evacuate the pituitous humour downwards, among which *Coloquintida* is chief, Trochiscs made of it, called *Albandal*, &c. Among Chymical things all Mercurials are commended, divers precipitates, white, yellow, red, &c. and *sublimatum dulce*. For I would advise all to abstain from the Corrosive, seeing it can onely be given in a very small quantity: And besides, it always, in a manner, uses to cause Vomiting, and violently disturbs the body. Divers Antimonials are here also excellent good, though most of them also do Vomit. Rheubarb, Scammony, Aloes, Tamarinds, &c. purge Bile. Where the saline part of the bile principally offends, Root of Jalap, Mechoacan, *Gummi Gotte*, &c. may be used; Among Chymical things Antimonials are convenient. Antimonials evacuate bile most conveniently by Vomit, which, because they use to carry off Phlegm as well, and also discharge both humours downwards, and moreover, because they may be safer given than Mercurials, I prefer them before all others, if they be made of Glafs of Antimony, its *Regulus*, *Crocus metallorum*, *Mercurius vitæ* (which is an Antimonial Medicine) flowers of Antimony, and the like.

Sylvius de le Boë.

XIX. It will be advisable to give Clysters every other day, that the Vapours tending upwards may be drawn back, and part of the peccant humour may be carried off: for if they go far into the Guts, they

they draw the greatest part of the filth from the melaerick Veins. I knew a certain Nobleman, who by frequent Clysters was so relieved of this inveterate Disease, that he seemed to be perfectly cured, when many other Remedies had been used in vain.

Riverius.

XX. In the progress of the Cure, if there be any necessity to empty the Sink of the Belly, it is better to doe it with Suppositories, than with Clysters, lest a Vapour arising from thence might increase the Pain.

Martini.

XXI. Sometimes, when the Disease continues long, Reason teaches us, we must procure a Vomit in such as are used to it: for vomiting has been often found to cure those, whom purging could not. It may be procured first of all by gentle things, by and by, when they will doe no good, by stronger, yet such, according to *Ætius*, as create no trouble to the Belly and Stomach. For Experience, as well as *Ætius*, has taught us, that several, upon taking violent Vomits, without the violence of any other causes, have fallen into Melancholy. ¶ Oftentimes a Vomit, especially of *Aqua benedicta* cures one beginning; for by this means the filth being got out of the Stomach and parts adjoining, renders the Cure more easie, which afterwards must wholly be employed in opening obstructions. Aperients therefore must either be given before or after Vomits. It must be left to the Physician's prudence, whether to doe, which is here of great moment, since the success of the Cure depends thereon.

Idem.

Hartmannus.

XXII. *Hippocrates*, 2. de morb. sect. 3. v. 248. in the Cure of the Drying Disease, which is the hypochondriack Disease, begins it with evacuation downwards, and then finishes it with vomiting upwards. The reason is, because evacuation must be begun in that part which is next the Disease; so that in Diseases infesting parts below the Diaphragm, we must begin with purging downwards: but with vomiting, if the Disease be in parts above it, according to *Aphor.* 184. Which must be understood, when the Disease wants both evacuations. Because therefore in this Disease the part affected is below the *Septum transversum* (for the parts serving the natural faculty especially suffer in this Disease) for that reason he begins with purging downwards. Which way of Cure is consonant to reason; For, 1. We must first evacuate the parts next to the Disease, both because as *Celsus*, l. 2. c. 9. says, the matter which prevails in the parts next to the place affected, is more malignant than that which abounds in the rest of the Body, wherefore it must immediately be evacuated by the next way, that it may more readily be carried off, and lest if it be carried off by a long journey, the whole Body be infected. 2. Lest going a contrary course, the matter remote from the part affected be drawn thither, when it is disturbed by Physick, and thereby the Disease so increase, that it either kills the Patient, or afterwards will not give way to Medicines.

Martianus,
Com. in eum
locum.

XXIII. Concerning the drinking of *Spaw* waters there is no small clashing among Authours. Some, as *Sennertus*, do altogether approve of them, because by the Minerals, from which they derive their virtues, they both wash the first ways and carry off the vitious humours, that lodge in them, by stool and urine, heat the Stomach, and strengthen the Liver and Spleen: But yet heating and drying may be feared from the external use of these waters, not the internal. Others, as *Claudinus*, wholly reject them, for their said drying faculty. *Montanus* both rejects and admits them: He thinks they are good for the coldness of the Stomach, an inseparable Companion of this Disease: but upon account of a hot Liver and Bloud, he will have the Liver and Spleen, and all the region of the Loins guarded with a refrigerant: This way, he says, the waters doe no harm, because they fix more in the Sto-

mach and cold parts, and onely pass through the other parts, and make no tarrying there. I think they are good, if a cold Stomach have gathered abundance of thick and viscid Phlegm, and if there be no great heat in the Liver, the hurt of which part may in a great measure be avoided by applying a cooling Ointment, and giving some cooling Broth after drinking of the waters, and after the complete taking of them, by using a cooling and moistning Bath for some days.

Riverius.

XXIV. It is made a question by some, Whether the use of Steel be proper? For since this Disease proceeds from a dry humour, and, if it be black bile, a hot one also, Steel seems unfit to conquer it: besides, its virtue is to make the Belly costive and dry. But though these things be so, yet long and frequent experience shews, that Steel is an approved Remedy for the Hypochondriack Disease, Cachexy in Women from obstruction of their *Menses*, and for other Diseases arising from pertinacious obstructions of the Spleen and Melaericks, and therefore to be much valued. Among the Ancients, see *Pliny*, lib. 34. c. 15. *Ægineta*, lib. 3. c. 49. *Dioscorides*, lib. 5. c. 53. *Ætius*, Tetrab. 3. f. 2. cap. 11. *Oribasius*, *Rhazes*, and others: Among the Neotericks, *Claudinus*, *Respons.* 29. *de ingr. ad inf.* in Append. sect. 2. *Mercatus*, de Morb. Mul. l. 2. c. 6. and others.

Sennertus.

XXV. I say Steel is as it were the proper Alexipharmack of hypochondriack Melancholy, because by using of it I always find happy success: for in opening obstructions (on which the whole stress of the cure lies) it comes behind no Medicine: For it is temperate in the active qualities; but in this Disease we must abstain from proper Aperients, which are hot in the third degree, for fear of an Inflammation. Therefore *Galen* says, that Hypochondriacks are helped by cold things. And its driness, since it does good by cooling, need not be feared, since that may be amended by Conserve of Borage, &c. or by taking of Ptisan before Supper. Therefore I prefer it before Bath-waters, which cannot so conveniently be corrected.

Claudinus.

XXVI. But such things must not be used at the beginning as strongly move Urine, lest they carry the vitious matter out of the first ways to the Liver or *Vena cava*, increase the Disease, or cause one in the Kidneys: Or lest the more subtle parts being carried off, the grosser, which are turned to Melancholy, should remain. ¶ *Hollerius* rejects them for another Reason, that is, because there is no communication or passage from the Spleen to the Kidneys: But modern Anatomists shew a passage (See *Laurentius*, Qu. 38.) and there is a very convenient passage from the Spleen to the Kidneys by the emulgent Arteries. Besides, experience testifies, that often black matter is discharged by Urine, to the Patient's great benefit. I observed this a year ago in a Noble Lawyer, who being subject to obstructions of the Hypochondria and Spleen, after three days pain at his Stomach, made water for two days time, like Ink in colour and consistency, to his great relief: Yet in giving of Diureticks, we must, according to *Capsivacellus* his mind, keep within bounds, and both in discussing and moving Urine, we must proceed without much heating. *Ætius* admits them, l. 2. *serm.* 2. c. 10. yet not till the Body and first ways be exactly purged.

Rondeletius.

XXVII. There are some, who for several years, in the beginning of Autumn and Spring, have their Spleen swell, with a pain in the Hypochondrium, and a livid colour all over their body, growing worse and worse, which nevertheless is often cured by voiding abundance of Urine, as black almost as Ink, for a week.

Martini.

XXVIII. The error of the Physicians of our age must not be imitated, who either give onely heating and drying things, for breaking and dispersing of the Wind, neglecting in the mean time the Intemperature of the Liver, in which case indeed it is

it is very likely, the Disease is much increased: Or, if obstructions in the Spleen be urgent, they cure by violent Coolers and Moistners, wholly neglecting Digestives and things that are able to open and soften its obstructions.

Idem.

Sylvaticus.

Idem.

XXIX. Asses Milk is good, made purgative with *Diagridium*, and three pounds of it taken for eight or ten days every morning, for it will temper the heat of the Liver, and will purge hot humours. ¶ It will not be amiss to take two pounds of Asses Milk with two drachms of Cream of Tartar.

Fortis, cent. 3. conf. 29.

XXX. But it must be taken as soon as it is milked, with Sugar in it, but by no means with any Bread, lest it tarry too long in the Stomach, and fill the Head, the taking of it must be continued for forty days. In the mean time, lest any gross part of it should curdle in the Mesentery and stick there, every ten days one ounce of Cream of Tartar dissolved in Broth may be taken, to the end those ways may be cleansed.

XXXI. Concerning these words, *Aph. 64. 6. It is bad to give Milk to them whose Hypochondria are swelled and rumble*; it must not be passed by, that he joined these two Symptoms, to shew that Milk may be given to such whose *Hypochondria* do onely rumble, and to such who have them onely swelled. For if the Liver swell with Bile, Milk is proper; so *lib. de int. eff. v. 225.* in the second *Hepatitis*, from Bile flowing into the Liver, from which it grows hard and painful, he gives not onely Asses Milk or Goats, to purge, but he gives Cows Milk also, for several days to temper the Bile: In like manner, when the Belly rumbles without any swelling, Milk is not prohibited, because, if the rumbling be caused by Bile running up and down the Belly, it may be good to give Milk. Wherefore *Hippocrates* forbids giving of Milk, when the swelled *Hypochondria* do also rumble: for these things depend on abundance of Wind, having its rise in the *Hypochondria*, for which Milk is bad, not onely because it is windy, but also because, since persons so affected are subject to acid corruption, the Milk in their Stomach, through analogy, easily turns sowre.

Martianus, Comm. in cit. Aphor.

XXXII. If great heat be found in the *Hypochondria*, an hour before Meat half a pound or a pound of Whey made of Goats Milk may conveniently be given, which both tempers the heat and cools the veins of the Mesentery, and wastes the matter, which is the cause of this obstruction; but the use of it must be continued for eight or fourteen days. And that it may do no damage, but may be more effectual, convenient Powders or Pills may be used before the Whey. Take of root of male Fern, Cinquefoil, Wormwood, *Cardus benedictus*, Germanander, Spleenwort, Agrimony, each 1 drachm. With *Syrupus Acetosatis Citri*, make large Pills. Give six or ten of them. Or make an Extract of these Powders: So the Whey will have more power to open and penetrate, and it will doe less harm by cooling. But it must of necessity be taken in a large quantity, especially when the Stomach is not very weak, namely, three pounds or more. And let one glass be drunk after another, sipping it, and after taking the Whey, he must walk, to the end it may insinuate it self, and may carry off the matter, that causes the obstruction, by stool and urine. Nor need the large quantity be feared; For if it must pass the Veins, and be voided again presently by stool and urine, a great quantity is required: So Bath and Spaw-waters must be drunk in a great quantity.

Sennertus.

XXXIII. Concerning *Spiritus vitrioli Martis*, there is a question whether it perform in Hypochondriacks the same that other Chalybeates do? Since there is no small alteration of the Substance, and other Acids are Enemies to Melancholicks, and exalt black Choler. I think truly it does not doe all things that other Chalybeates doe, my reason is, because other Chalybeates give a stool, but this

does not, which must be ascribed to the change of the Substance. Yet nevertheless, I make no question but it is good for Hypochondriacks, because of its aperient virtue. Nor does its Sowreness hinder, for onely the excessive use of Acids hurts Melancholicks and exalts black Choler; on the contrary, their moderate use is proper.

Idem.

XXXIV. I think *Elixir proprietatis* is very good for them: for by reason of the Aloes and Spirit of Sulphur it egregiously opens the obstructions: It corrects the putrefaction of the humours not onely because of them, but because of the Saffron and Myrrhe: It egregiously dissolves Wind, because of the Myrrhe and Spirit of Wine chiefly: And it strengthens the Heart and Stomach by its whole Substance.

Idem.

XXXV. *Crocus Martis* tinges the excrements, which denotes the extraction of the Vitriol, the fating of the austere humours, and, in a word, the actuating of the Medicine, just as by the mixture of Vinegar and Galls in water Ink is produced. But if the excrements be not tinged, it is a sign, unless a very small quantity be sufficient, that the Medicine is not well actuated.

Wedelid.

XXXVI. You write that in hypochondriack Diseases *Antimonium Diaphoreticum* is commended. Indeed, I should not wholly reject it, had it any portion of the Nitre left in it, for so it would be far fitter to open obstructions of the Vessels: But if it be without Nitre, I am afraid lest when the thin humours are spent, the gross and earthy ones grow harder and increase the obstruction. ¶ Do you doubt whether it consume onely the thin humours, or attenuate, and put in fusion, the gross ones also? I affirm the first, and now the same may also beneficially be given for gross humours also, but I affirm it with a distinction: For the gross humours are either already actually tartareous, or onely mucilaginous and phlegmatick, in these I allow it; in the former I deny it. A scorbutick Man was cured by me, whose blood, when it was let, grew like a gelly in water: And among other things I gave him *Antimonium Diaphoreticum*.

Doringius ad Sennert. cent. 2. ep. 30.

Sennertus Epist. 35.

XXXVII. If an austere pancreatick Juice be bred (which frequent hypochondriack Suffocation, with fear of Strangling, as also vomiting of austere humours does argue) volatile Salts must frequently be used, and especially Aromaticks, and indeed in a small quantity, suppose four, five or six drops in a spoonfull of Wine: for I know nothing hitherto, which so powerfully, effectually and so quickly amends the Austre in us, as every volatile Salt, but especially an Aromatick one, which, I attest, I have experienced a thousand times.

Sylvius de le Boë.

XXXVIII. Capers are commonly commended, but they must be used aright, for they are not onely difficult of Concoction, but the Vinegar also, wherewith they are pickled, ferments and exalts the melancholick humour. They are the best prepared, if they be pickled with a third part of Corinths, the same quantity of Sugar, and a little Vinegar.

Sennertus.

XXXIX. Cold and moist Alteratives, or Attenuants, need not be feared, because there is Wind; for it is dry exhalations, raised by heat out of a dry *Minera*, and not vapours from a moist one, as most men falsely think, who therefore mistake, and give *Hiera* and Aloëtics and hot Medicines to their Patients with ill success.

Fortis.

XL. In this Disease *Galen*, 3. de loc. aff. 7. has taught, that the Stomach is always hurt, according to *Diocles* his opinion; yea, daily experience shews as much. Notwithstanding, the hurt of it must not be reckoned Idiopathick, but rather Sympathick: Wherefore he, 2. de locis 4. has told us, that when Concoction in the Stomach is amiss, we must presently consider the parts about it, namely, the Liver, Spleen, Mesentery, *Omentum* and the rest, before we lay the blame on the Stomach it self.

self: for it often comes to pass, and especially in this Disease always, if it be legitimate, that the Stomach is affected privatively, not positively, by the excessive circumambient extraneous heat, both of the Liver and the Hypochondria, because of obstructions propagated from the lacteal Veins to the Mesenterick, not onely from crudities, but also from thick blood, where, I think, an Inflammation is under the Pylorus, from which the heat is diffused into the bottom of the Stomach, disproportionate to Concoction, which therefore not concocting, but corrupting the food, turns it into a nidorous and strange quality, by reason whereof it being altogether unfit for Concoction, is thrown up by Vomit, as an useless load, by the expulsive faculty, irritated sometimes by an acid, wherefore, according to Galen, as Anxiety befalls the Patient after Meat, so relief comes by vomiting. Nor is crude and viscid matter opposite to this nidorous corruption, when it is mixt with a cholerick and bitter Juice, because the end and effect of any hurt in the Concoction of the Stomach is Crudity: And Acidity little resists, when oftentimes it proceeds from Heat, according to Trallianus, who inveighs against these Physicians, that ascribe Acidity always to Cold, from the instance of Vinegar: Yea, and black Choler, which is the most acid, corroding and fermenting the earth, though cold, yet has a hot, yea, a burning cause, upon account of its sharpness, so Vinegar owes all its coldness it has to heat onely.

Idem.

XLII. Hot Anointings outwardly must be avoided, both because, if the Stomach be hurt, it is not essentially, but by consent with the Hypochondria, and rather by hot and dry exhalations than by cold and moisture: Wherefore in this Case and Disease I suspect sulphureous Mud and Waters, and think them altogether hurtfull for the Hypochondria; and because the lobe of the Liver lying upon the Stomach is heated before the Stomach it self.

Idem.

XLII. Fomentations, when the Disease is tedious, is a proper kind of preparation: because by their warmth and steam they comfort and sustain every part and its innate heat, they stir up, mollifie and dissolve the humours that are lodged in them, and make them fluid, that they may more easily give way to an attractive Medicine. ¶ But we must have a care that we do not cause sweat by them, the humour to be purged, must onely be mollified.

Martini.

Fernelius;

XLIII. By the virtue of a Bath in an hepatic, hypochondriack Disease, the humours lodged in the capillary Veins, and sending out fuliginous exhalations from thence are put in fusion, Fluxions are diverted and dissipated. The Vessel of warm water must not be made for sweating, but so that the Patient may lye on his back in the water from his Knees onely to his Navel. But we must have a care lest any crude humour stick in the first ways, and lest there be any impurity in the Bowels, which by the Bath might be distributed over the whole Body.

Martini.

XLIV. In two cases the hypochondriack Disease seems to forbid a sulphureous Bath. First, when there is a great inflammation and heat in the Hypochondria. Secondly, when there is any swelling in them. Although then the Abdomen may be plentifully anointed with Unguentum rosaceum Mesues, to prevent the penetration of the water.

Fortis.

XLV. Neither hot nor temperate, aperient, emollient nor strengthening Ointments are proper. Not hot, because by virtue of them new matter is drawn from another place, and the part is parched with heat; besides, they harden more, when the thin parts are dispersed. Not temperate ones, because if they be emollient, they will make lax the part, and new filth will run into the parts, as into a Sink. Not astringent or strengthening, because they will prevent Insensible Transpiration.

Sanctorius;

XLVI. Some commend a Stove, wherein they say there is great virtue in attenuating and concocting crude, melancholick humours: Yet care must be taken, that the humours grow not too hot by the use of it, and that, the thin portion being dissipated by Sweat, the rest either grow not hard about the Bowels, or degenerate into black Choler: Which Inconvenience you will prevent, if every fourth day you omit the Stove, and take things to evacuate the prepared humour.

Enchirid.
Med. Prae.

XLVII. You must take notice, it sometimes happens, that upon giving Aperients, especially when the obstructions are opened, that the Belly is so loose, that a Dysentery might be feared to follow. Then we must provide for it with strengtheners, especially Tincture of Corals and Elixir proprietas.

Hartmannus.

XLVIII. Crocus Martis, especially Sulphuratus, breeds nidorous belchings, and tinges the excrements a little. For as in the preparation of Vitriol of Mars we see, by the accession of an acid flagma a dissolution is made into bubbles and exhalations, so it is no less done by the acid humours abounding in hypochondriack Bodies, which are as it were sated with Martial things and consequently edulcorated. And indeed this manner of Martial things acting is very easie to demonstrate. Hence Belchings arise, even from simple filings of Steel, an argument that the Stomach acts upon them, and from the reaction of these, and their mutual dissolution belching follows, as signs and products of exhalations: for the effect testifies of its cause. Therefore Croci Martis aperitivi are given on purpose with Stomachicks and Aromaticks. So we use to prepare our cachectick Powder of Pulvis stomachicus Quercetani of root of Aron, Crocus Martis and Oil of Cinnamon. For they correct Mars and help Nature to conquer him. But sulphurate especially causes belching, as being cruder, therefore we use not to give Crocus Martis so much, prepared the crude way, as we give it first freed from the Atoms of Sulphur by a new calcination, which is better, more subtil, and obedient to the heat of the Stomach, a thing, which must principally be observed in Hypochondriacks who are delicate and of a rare texture, for these belchings swell like rotten eggs. Septalius, lib. 9. cant. 58. commends this made into a Powder and prepared with Vinegar.

Wedelius;

XLIX. We must have a care that we promote not the fermentation of the humours by Emulsions, and consequently left, while we would cure Thirst, Weakness, &c. we doe more harm than good. Therefore in general whenever the organs of the humours is in the lower Belly, it is advisable to abstain from them: for (as Hippocrates says) unequal things ferment. Wherefore in Hystericks, where it concerns us to quiet the Symptoms, and also in Hypochondriacks, they cannot be proper.

Idem.

L. The quieting of the Paroxysms and of the most urgent Symptoms consists especially in checking the effervescence of the humours, in discussion of the rising exhalations, asswaging of Pain. The effervescence will be stopt chiefly with Medicines that correct the acrimony of both humours (the Acid pituitous and the Bilious) which is owing to fat and spirituous things, but variously mixt with other things, according to the various manner of effervescence in each person. Wherefore that Medicine which does one Man good, often does another harm. And it must be a temperate Medicine, which must consist of much water and little oil, but that so mixt with a volatile salt, that it may mix with the water. For all the skill lies here (I repeat it) The temperate Medicine must consist of much water, as being a thing which by it self and a lixivious salt, is fit to dilute an acid spirit, and so infringe its strength; To this water oil (but a little) must be added, as being apt to temper both the lixivious salt and the acid spirit. And because oil cannot

cannot be mixt with water, but by means of a Lixivial Salt, this must be there also; but corrected and volatilized with a volatile Spirit, because the same and a volatile spirit, use to temper a lixivious salt and an acid spirit. In such a Medicine therefore so tempered there occur three things, Water, Oil and Volatile Spirit tempering the two Sharps, the lixivious Salt, and the acid Spirit.

Sylvius de
le Boë.

LI. Among the Symptoms of this Disease I have observed that a sense and fear of Suffocation and Strangling is not onely peculiar to Women, though it take them oftner than Men. I think this grievance has its rise from various exhalations, and especially austere ones, rising from the small gut, to the upper mouth of the Stomach, and so to the Gullet, and causing a sense of Suffocation and Strangling in these parts. But whenever part of these exhalations tends by the lacteal Veins to the thoracick Duct, penetrates into the right ventricle of the Heart, and into the Lungs, and sticking there, causes shortness of Breath; no wonder, if then, either through want of proper Medicines, or abundance of Exhalations, the Patients are sometime suffocated and choaked; which, I remember, once happened to one of my Patients, abundance of austere Exhalations being translated to the Lungs, with a violent hypochondriack Suffocation, as the most urgent Symptome then, and returning with such violence every Paroxysm, that it would give way to no Medicines, but caused Death. And this Evil had been neglected at the beginning, so much does it concern us to cure all things in time. Certainly this Ail is often too much neglected, not being sufficiently known to several Physicians, and therefore the seldomer cured. For curing of this volatile Salts are very good, and amongst them Spirit of Sal Ammoniac, which if it had no other virtues, yet in regard to this Ail it ought to be esteemed by all Physicians. Except in this case, I do not remember any Patient of mine ever died of an hypochondriack Suffocation, to whom I use in time to prescribe and inculcate volatile Salts, which all persons may easily use, even in their ordinary drink. Whereas *Castor*, which many use with good success, is an ingratefull thing, and is loathed by many. The Cure of this multifarious Disease is performed first of all by discussion and suppression of all manner of Exhalations. Secondly, by correction of the humours whence they arise. Thirdly, And by the diminution of them, where they exceed. All volatile Salts and Aromaticks, and especially oleous ones, discuss all manner of Vapours. Among which also *Castor* it self may be reckoned, seeing it is part of an Animal, or an Excrement, which is the same thing; seeing all the parts and each of an Animal abound with a volatile Salt. And every particular humour, as it offends in divers qualities, must in a divers manner be corrected, and diminished with its Purgatives. But as often as a manifest sense of Strangling is urgent upon the Patient, besides this Spirit of Sal Ammoniac, *Castor*, is also convenient and its Tincture, as also distilled Oil of Mace and Amber, if one, two or three drops thereof be taken. When these Exhalations are more glutinous or also more sharp, then, besides volatile Salts, sweet Spirit of Nitre, Oil of Orange Pill, &c.

may be used. When they are more watry, and there is rather a faintness of Spirits than sense of Strangling, then to the volatile Salts there may profitably be added aromatick Tinctures of Cinnamon, Saffron, Nutmeg, Mace, &c. made with rectified Spirit of Wine, not neglecting the taking of Hydragogues now and then, to abate the watry humours.

Idem

LII. And Difficulty of Breathing comes in for its share, which is grievous enough to many, the chief cause whereof is various Winds and Vapours, often produced by humours in the small Gut, which being carried by the lacteal Veins and thoracick duct to the right ventricle of the Heart, and so to the Lungs; and tarrying there awhile, so they both distend the Lungs and keep them distended, and so hinder the playing of them, and consequently respiration, and therefore must be discussed with the same Medicines.

Idem

Medicines especially made use of by eminent Physicians.

1. *Tartarus vitriolatus*, with extract of Fern and some convenient Water is an excellent deopillative. ¶ Take of Gum Ammoniac 2 ounces and an half, dissolved in Vinegar of Squills to the consistency of Honey. Add of Powder of Spleen-wort, Dodder, each 1 ounce; Oil of Capers 2 ounces, of Violets 1 ounce, of Bricks and Wax what is sufficient. Make a Plaster and apply it.

Agricola

2. *Diapyliticum* in hypochondriack melancholy with crudity of the Stomach is a singular Remedy; by the use whereof *Galen* happily cured desperate Hypochondriacks, reduced almost to extreme Leanness. ¶ The virtue of *Mumia Viperina* is admirable in renovation of the blood.

Baroletus

3. Aperients in this Disease give great relief, among which I attribute the first place to the root of the greater Rhapontick Centaury. The bloody juice is expressed out of the fresh root. Make a Syrup with Sugar, of which 2 spoonfulls may be taken every morning.

Crato.

4. This is a famous Physician's secret Water for hypochondriack Melancholy; Take of Flowers of Bugloss, Borage, *Stachas Arabica*, each half an ounce; Rosemary, Majoran, Balm, each 2 drachms; Root of Bugloss 4 drachms, Betony 2 drachms, Water of Borage, Bugloss, each 4 ounces; Powder of Cinnamon, Galangal, Cloves, Saffron, Seed of Basil, each 1 drachm. Pour 5 pounds of *Rhenish* Wine to them. Let them stand in infusion for 2 or 3 days. Distill them in *Balneo Mariae*. The Dose 4 spoonfulls.

Finkius

5. An ease Remedy for this Disease. One took onely some Cichory Broth for the first Mese, and he recovered.

Rhodium

6. *Sal vitrioli Martis* excels all other Medicines; Take of Oil of Vitriol or Sulphur half a pound, Spirit of Wine 1 pound. Put them in a clean Frying-pan. Cover them with a Board, so within 15 days the Salt will shoot, which may be set in the Sun or an Oven to dry, stirring it now and then. Keep it safe from the Air. The Dose from 12 grains to 20.

Riverius

 The black Jaundice does not always come from the Spleen. XII.
 It does not require the same cure with the Sturvy. XIII.
 Whether opening of the Veins under the Tongue be usefull in it? XIV.
 Medicines.

Fortis, conf.
 55. cent. 2.

I. **W**hen Bile abounds, if the abundance of it be not diminished first, blood must not be let, because it is a check to the Bile. If a Vein be opened to cool the heat of the Liver, blood must be let sparingly, since letting of blood is not a proper remedy for obstructions, and it must be observed whether it comes out black; for when an Icteric was let blood, it appeared all yellow.

II. The Question is, Whether Cholagogues may be prescribed? The Affirmative may be maintain-

ed, because Bile is superabundant; therefore *Jacchinus*, lib. 9. cap. 51. prescribes Purges of Scammony, Electuary of juice of Roses, and the like. *Mercurialis m. m.* lib. 3. cap. 33. propounds the like Catharticks which purge Bile, to the end the humours which feed the Bile poured out to the Skin, may be carried off. The Negative is concluded from *Hippocrates*, lib. de intern. affectib. where he dissuades Cholagogues, lest the body be more disturbed: Besides, frequently in the Jaundice, it is not abundance of Bile, but effusion of Bile following the obstruction of the Gall-bladder; that offends, but these will not remove obstructions. Observe for a decision, according to *Mercatus*, lib. 4. praxic. cap. 4. that in a Jaundice we must purge two manner of ways. First, with these Catharticks, which carry off and absterge thick and stopping humours, that, when the Obstruction is opened, the bilious humour, that is bred, may freely pass to the places natural to it: by which means alone, if you carefully apply attenuants, and incisers, you will cure the Disease. Secondly, there is need of such Medicines, as diminish and evacuate the Bile, which the natural vessels cannot receive. *Hippocrates* his saying intimates the former: *Jacchinus* and *Mercarius* intend the latter.

Horstius,
 Prob. Dec. 7.
 24. 5.

III. Whether are strong Catharticks necessary? *Altianus*, according to *Ætius* his judgment, holds the Affirmative, because weak things, by reason of the driness of the Belly, doe no good, and Nature, translating the matter to the circumference of the Body, does not much help these evacuations. *Mercatus* concludes on the contrary, judging, that strong Purges are very hurtfull, because in an obstructed body it is better to Purge the Bile from far by degrees, and to get the thick humour out of the obstructed vessel by little and little, than by a sudden forcing of the excrement to make the Obstruction greater and firmer, as it often happens to the unskillfull

Idem, ibid.

skilfull and careleis. Wherefore it is more advisable to use gentle Purges several times, than by any violence to render the Disease worse.

IV. The Belly may be loosened with lenitive Electuary, and Creme of Tartar. The matter contained in the first ways may be prepared with Honey of Roses, and *Jalapium Acetosum*, or with half an ounce of Creme of Tartar dissolved in Broth. A Purge may be given the first time of *Cassa*, with Lenitive and *Pilul. de tribus*, or an Infusion of Agarick, Rheubarb, *Senna*, &c. The second preparation must be made with Syrup of juice of Borage, Cichory, *Byzantium simplex*. But because sugared things in Bilious Diseases are not very safe, therefore about three ounces of juice should rather be taken, in a decoction of Cichory, Dodder of Time, Agrimony, Cinquefoil, Germander, Horehound, Wormwood, first taking a *Bolus* of Extract of Rheubarb, with *Tartarum Vitriolatum*. And then he must be purged with a little stronger things, respecting rather the thick humours than the bilious, such as *Diaphanica. Pilul. de tribus*, &c. and then 6, 7, 8 or 9 ounces of *Decoct. Epith. Mesues* may be taken every day, upon which, about three hours after, he may drink one pound of Whey of Goat's Milk, then for a few days he may take juices of Cichory, Borage, Fumitory, Mallows, prepared in Broth. Both indeed, because this Disease, according to *Galen*, gives not way to weak Purgatives: And because things that purge Choler are had before the attenuation of the humours, according to *Aetius*, with whom *Galen* agrees, *lib. de Nat. Hom.* who uses deobstruents, and afterwards things to purge Bile. Therefore we must proceed to stronger Aperients. And though *Galen, lib. de Purg. Med.* boast, that he has cured Ictericks presently with one Purge; that Jaundice was from heat of the Liver, and redundancy of Bile, without any obstruction of the passages. Therefore two ounces of *Syrupus Fernelii Cachecticus* will be very proper in some aperient Broth, to which, if a just evacuation succeed, the taking of it must be insisted on for twelve or fifteen days: But if not, more efficacious aperients must be given, as *Crocus Martis Aperitivus*, made with the Acid of Sulphur, with Extract of Rheubarb, Ammoniack, &c.

Fortis, conf. 54. cent. 3.

V. In a new Jaundice, Emetick Medicines, while the Tone and Faculties of the *Viscera* are good, often give relief; inasmuch namely as they rid the Stomach of a load of Phlegm, wherewith almost always it is burthened in this Disease. Moreover, by irritating the choledochal Vessels, and by shaking all the hepatick ducts, they both open their obstructions, and make a passage for the Bile by the usual ways.

Willis.

VI. A Boy ill of a Dropsie devoured seven or nine Lice, the Disease by degrees disappeared, and in the room of it there followed Paleness, excessive Appetite, Atrophy and Death. When his Body was opened, there appeared an unusual cluster of Lice, of a monstrous bigness. If they do any good at all in the Jaundice, they do it by their Volatile Salt, which makes the Obstructions to remove, and the liquor necessary for our bodies to move more briskly.

G. Hannus, AB. Danic. an. 1675. obs. 23.

VII. I Judge, whether there be an Obstruction of any Biliary Duct, or no such thing can be supposed, the Bile then undergoes a notable change, by reason whereof it is carried more impetuously and copiously towards the blood, with which notwithstanding it is not so well mixt as it used, but is onely confounded with it, and therefore it more easily recedes from the blood, and not onely joins it self to the Skin and external parts, but joins it self also to the Muscles and the Inwards, and dyes and tinges them with its colour. For Bile naturally constituted, both in the small gut and in the right Ventricle of the heart, is not onely loose, but intimately mixt with the occurrent humours;

and so indeed, that it cannot any more be separated from them: Which union is made by reason of the effervescence of it in both places upon its meeting with an Acid. Both the said effervescences are either diminished, or taken away. The cure therefore of the Jaundice will consist in this, First, in taking away the more remote causes. Secondly, in correcting and removing the mediate causes, glutinous Phlegm, stopping the biliary duct, &c. Thirdly, in amending the proximate cause, corrupt and vitiated Bile, being too spirituous, and rendered unfit for effervescence, that it may be carried again to the Guts. Fourthly, in taking away the discolouring of the Skin. Glutinous Phlegm is corrected and incided with Aromaticks and volatile Salts. When it is corrected, Phlegmagogues carry it off, which may also serve for Correction; for Example; Take of Root of Madder, greater Celandine, mallage, each half an ounce, Flowers of Broom half a handfull, Seeds of Columbine, Parsly, Anise, each 2 drachms, crude Tartar 1 drachm and an half. Boil them in an equal quantity of White-wine and water, what is sufficient. In twenty ounces of the Colature dissolve of *Syrupus Diacnicus*, Syrup of Cichory with Rheubarb each 1 ounce and an half. Mix them. Let the Patient take some of this Apozeme twice or thrice a day, so as he may have two or three stools, and may void the Choler together with the Phlegm. When the Jaundice comes from the poison of a Viper, or from any other, then, to correct and expell it, all Sudorificks abounding with a volatile Salt are good, which answer both Indications. Hither conduces *Antimonium Diaphoreticum* to fifteen grains, *Bezoardicum minerale*, to half a scruple, volatile Salt of Hartshorn, or of any Animal, got by distillation: and if it be strong, five or six drops or grains of it, often given in some convenient liquor. Treacle also is good, and various preparations of Vipers. The Bile of Ictericks, that is depraved and vitiated, and made too spirituous, will be amended especially by oily and fat things, by means whereof an aptitude to right effervescence, is restored to the Bile. Thus I have cured several of the Jaundice, by giving them five or six ounces of a decoction of Hempleed in fat Cow's Milk, boiled till it burst, and strained, twice or thrice a day. Thus also, having premised what ought, I have several times successfully cured a Jaundice by giving one drachm of any Soap dissolved in warm Milk and Sugar, once or twice a day. Soap indeed seems to doe good, as by its lixivial Salt it dissolves the obstruction in the intestinal Biliary duct; which (because it cannot be said of Hempleed, which cures the same Disease) I suppose is good; First, Upon account of the Lixivial Salt, but fixt, of which it is made, as it being joyned to the Bile, corrupted by its excessive spirituousity, corrects and diminishes the too great volatility and spirituousity thereof, by assuming to it self some share of the volatile Spirit luxuriant in the Bile. And, Secondly, Upon account of the fat or oil, but thick, and not at all Aromatick or Volatile, by means whereof it takes off the edge of the volatile and spirituous Salt, which has the predominance in the Bile. This opinion of mine seems to be confirmed by Saffron, familiar in the cure of the Jaundice, which being commended for its fatness, in that very thing, favours my opinion; for Saffron is easily joined to a volatile Spirit. Therefore volatile Spirits may be fixt and bound, and brought to tranquillity with fat and oily things. Whence it appears, if, when they are joined with the Bile, in too great a quantity, or exalted in it, they cause a Jaundice, by making it more volatile and moveable; that this said volatility and mobility of Spirits must be conquer'd by oily things, and such as cause gentle sleep, and thereby the Jaundice must be cured. The discolouring of the Skin goes away of it self, but it's sooner removed by

Sylvius de
le Boë.

subtile Sudorifics, and things endued with a volatile Salt, whether Sweat follow or not.

VIII. In this class of Medicines, whereby the stercitious dyscrasie of the blood is intended to be relieved, Chalybeate Medicines seem to have a place of right, wherefore they doe as great good in the Jaundice as in other diseases of Cachexy, as well by opening the obstructions of the Bowels, as by depressing the effusions of the Sulphur and fixt Salt, and by volatilizing the blood. Therefore filings of Steel, or its Powder (the Mineral frame of it being dissolved) or the Vitriolick Salt extracted, may conveniently be added to Decoctions and Infusions.

Idem.

IX. Hence it is, that the Waters sometimes cure Ictericks to a miracle, who have been left to the Prognostick: Though also these drunk in a large quantity, as they pass through all the Vessels, do also open the hepatic ducts, how much soever stop.

Willis.

X. If a hot Intemperature of the Liver be the cause, it must be altered, whether it be with or without an Inflammation; But this I advise, that their counsel must not be taken, who use external Medicines actually cold and astringent to the Liver: for they hinder the passage of the Bile to the whole body, and so for an intemperature they raise an Erysipelaceous Disease.

Saxonia.

XI. Since it is difficult to know when stones arise from Bile, no wonder, if the cure of them look like an unheard of thing to many Physicians: Yet because, when stones after death are found in the Gall-bladder, the rest of the Bile looks like Lees of Oil, and is full of filth and subsiding dregs, as I have several times seen voided by Vomit, I should think that in such, there were fear left some part of the Bile might turn to stones, whilst another turns to such excrements. And therefore then Medicines should be used to dissolve these Bilious stones, and to hinder any concretion. Among things that dissolve Bilious stones, I make no scruple to place Roots of Grass, and the Herb it self, either distilled, or which I prefer, boiled or bruised, and the juice squeezed out of it, making it palatable with Sugar, since it is known by abundant experience, that Cows and Sheep, which in Winter feed on Hay, and in whose Biliary duct a strong or calculous crust grows, when in the Month of May they feed on green grass again, are, by degrees, freed from that Ail. A certain Argument, that in green and fresh grass there is a virtue to dissolve stones, which perishes, when Grass is dried into Hay. Spirit of Nitre also is good; which I therefore commend in this case, and especially when it is made sweet and mild with Spirit of Wine, which may safely be taken to ten or twelve drops in this or the other drink several times a day. Volatile Salts, and especially oily ones, hinder a new concretion.

Sylvius.

XII. Although the black Jaundice come especially from some fault in the Spleen; yet, I think, Platerus, his opinion, *Pract. l. 1. tract. 3. cap. 2.* should not wholly be rejected. Who judges, that its cause is preternatural Bile, corrupted in the melaerick vessels, and there growing black, because it is not probable that such Bile can come from the Spleen, seeing it has no cavity or Sinus there where it can be gathered; nor does there come any vein from the Spleen, by which it can be carried to the Cava. Sennertus endeavours to reconcile this to the common opinion, judging, that black choler, after it has been gathered in the melaerick veins, when abundance of it comes to the Liver, is mingled with the yellow choler, and gathered in the Gall Bladder, and the colour of the yellow choler is changed thereby, which, unless it be evacuated by convenient ways, is diffused with the blood all over the body, and causes the black Jaundice; notwithstanding that there is no branch, which reaches from the

Spleen to the Cava, because by means of the *vena portæ*, the humours gathered about the Spleen may reach to the Liver, and may be derived to the rest of the body.

XIII. Although there be some agreement between the Scurvey and the black Jaundice, as both diseases come from some fault in the Spleen, through the weakness of which, in each of them, the rest of the body is affected: But notwithstanding, since the manner of hurt, as is manifest by divers signs, is far different, therefore it follows, that the *αἰσθητὴν ἀκίνητον*, or principal thing capable, of each disease, to wit, the Spleen, is differently out of order. This diversity introduces a diversity of cure, inasmuch as in the Scurvey, we have not regard simply to abundance of melancholick blood, and obstructions of the Spleen, as we have in the Jaundice; but we are forced to be most solicitous about a certain specifick corruption, the proper matter of the Scurvey, which requires its peculiar and proper remedies.

Horstius,
Probl. Dec.
7. 24. 6.

XIV. Hippocrates 2. de morb. n. 1. would have the veins under the Tongue opened in the black Jaundice. Petrus Salius thinks, this cure has respect to a Symptome, not to the Cause, which is store of black choler in the large veins. But seeing this is a production of the external Jugular, which is a branch of the *superclavia*, and of the *cava ascendens*, What should hinder, when it is much exhausted, that less of the greater blood may be exhausted, but that it may much alleviate this Disease, since it does more nighly and quickly evacuate, than the veins of the Armes.

Severinus,

Medicines especially made use of by eminent Physicians.

For the Yellow Jaundice.

1. A drachm of Gum Ammoniack dissolved in 2 Augenius; or 3 ounces of Oxymel, or Hydromel, given for four days, or more, five hours before Meal, cures the Jaundice to a Miracle.
2. One recovered onely by taking condensed juice of Cichory.
3. One was cured of this disease by Conserve of Flowers of Broom and Marigold.
4. A Decoction of Root of Celandine cures the Jaundice.
5. A Decoction of Strawberry-leaves carries off the Tartar, as I have often seen.
6. A Decoction, or the Powder, or the Essence Pauli, of *Scorzonera*-Root, is very good in a contumacious Jaundice.
7. The White Excrement of Chickens is a most certain Medicine.
8. Take some Goose-dung, dissolve it in Worm-wood-wine. Drink it hot in the morning for three days, and Sweat upon it.

The Cure of the Colick, turning into the Iliack Passion. XV.

A singular Cure of an Ileus. XVI.

One caused by Incarceration of the Gut, must be cured by Section in the Groin. XVII.

Medicines.

I. IN the Iliack Passion the cause of inversion of the peristaltick motion of the Guts is usually thus. Sharp and malignant humours are discharged by the blood in a fever newly begun, into the Stomach and Guts, next at hand, whereby the Stomach is first forced to invert its motion, and with great violence to throw up the troublesome matter contained in it, by the Mouth. Then the small Guts joined to it, being already weakened, give way to the strong motion of the Stomach, and with these the greater are drawn into consent, the Stomach inclining to vomit, leading the dance. This Disease I call the true Ileus or Twisting of the Guts. The method of curing it has hitherto been unknown, whatever some may boast of the use of Quicksilver and Bullets, which besides that they do little good, they often do a great deal of harm. I take this method with success. When it is plain from Clysters rejected by the Mouth, and from other signs, that it is a true Ileus, then I endeavour these three things; 1. To hinder that contrary motion in the Stomach, which causes a like motion in the Guts: 2. To strengthen the Guts weakened with the sharp humour: 3. To free the Stomach and Guts of those humours. To satisfy which Indications, I insist upon the Cure in this manner: 1. I prescribe 1 scruple of Salt of Wormwood to be taken morning and evening in a spoonfull of Juice of Lemons; and between whiles I give a few spoonfulls of distilled Mint-water, without Sugar or any other addition, twice every hour, by the repeated use of which even alone both the Vomiting and Pain arising from it will quickly vanish. While these things are doing, I order a young Whelp to lye continually to the Belly. But after the Pain and Vomiting have ceased for about a day or two, then I give a drachm of *Pil. coch. maj.* dissolved in Mint-water; which Water (that I may more certainly prevent the return of the Vomiting) I order to be taken often all the time of Purging: Nor must the Whelp be removed, before the Patient take his Purge. I have observed, it is to no purpose, to give these Pills, or any other Cathartick how strong soever, till the Stomach be strengthened, and so reduced to its natural motion, and the Guts also be reduced to their natural motion, for otherwise all Catharticks that are taken will prove emetick, and will do more harm than good. This is the reason that I offer no violence by Purgatives, till for some time I have used those Medicines that respect the Stomach. I prescribe a very spare Diet; so that I allow no more than a few spoonfulls of Chicken-broth to be taken twice or thrice a day. But in the mean time I order the Patient to keep his Bed all the time of his Sickness, till signs of a perfect cure appear; and also I order him for a long time after his recovery to persist in the use of the foresaid Water, and to fence his Belly well with a double Flannel from the cold, that he may not relapse, which People in this, above any other Disease, are apt to do.

II. Concerning a Vomit Question may be made: for if the Twisting of the Guts have the mortal vomiting (of the Ordure) it seems not to be irritated: Notwithstanding, it is convenient at the beginning of the Inflammation onely, to wit, when much corrupt and sharp excrements are gathered in

the Stomach and upper Guts, which may be transmitted to the Inflammation: for if the humours do not abound in these first ways, a Vomit is dangerous. It is good also in an Ileus from sharp humours; for if such be gathered in the Stomach and Guts, by reason of bad Food or Physick; they must be purged by Vomit. But the Vomits must be very gentle and epicerafick, as Warm-water, Barley-water, &c.

III. Because at the beginning of the Inflammation the faeces are retained, it is sufficient to give Medicines, that are cool and repress the Inflammation, *Cassa, Elect. Diaprun. simpl.* Whey of Goat's milk in abundance: But when the Inflammation is increased, these things do no good, and we must use stronger Medicines: Then *Elect. de succ. Rosar. Rosat. Mesues*, about half an ounce with 3 drachms of *Cassa* is proper: And Oil of sweet Almonds with four or five grains of *Diagridium*, and a little Sugar of Roses. In this case we may try all things, rather than suffer the excrements to come up at the Mouth; therefore we may venture on Antimony or *Elaterium*, which may be given in a small quantity, about four or five grains in Wine, whatever the matter be. And let no Man object, that the Inflammation prohibits these things, for an Inflammation, when it is fixt, is treated with hot and digesting things: therefore though they be hot, they do no harm, and the abundance of excrement retained does more harm, than Physick does, if it purge. Therefore no mean Physicians in deplorable cases give Quicksilver, which presently causes a stool by its weight. ¶ Some successfully give a Pill of Glais of Antimony, which makes way by its weight, and by its cathartick virtue discharges the excrements.

IV. A Woman about thirty years old had had a groin rupture, which swelled a little, for two years, after a disorderly motion of her Body, she was taken with frequent Vomiting, and brought up her ordure, and what she brought up was very offensive, by its foetidness, both to the Patient and to the By-standers. She was cured by five Antimonial Clysters, a Loosness following for several days, which exceeding required the help of *Opium*, and found it propitious. Such operations as these may be tried, if the loss of strength and desperateness of the Inflammation do not hinder.

V. Clysters, yea, and Suppositories, being brought up by Vomit, do sufficiently testify, that in an Ileus, the passage of the Guts is not so stoppt, as is commonly reckoned, but there is rather an inverted motion of the expulsive faculty in the Guts. *Galen* acknowledged this cause clearly enough, 2. *de Sympt. caus. cap. 3.* so that it is a wonder this has not been taken notice of by Practitioners, considering that it is of no small moment towards the Cure, but when the fibres are relaxed, this motion abates. And Experience it self testifies, that such evacuations are often increased by strengtheners and astringents, and on the contrary are checked by laxatives and emollients.

VI. We may not, upon the score of Phlegm, proceed to very attenuating things, as to generous Wine with *Aqua vite*, *Elizir. vite* with Cinnamon water, prescribed by *Mercatus* and *Salius*: But first of all, let him take about five ounces of fresh Oil of sweet Almonds, with four ounces of Linseed Oil; about six or seven hours after let him go into a Bath of sweet Oil, to which an emollient and laxative decoction may be poured. When he is got out of the Bath, and wiped, let him take 10 drachms of fresh *Cassa*, after which, if there be no fear of Vomiting, let him drink some Broth altered with Mallows; then let him go to sleep, let him take a little but very nutritive food, and after eating let him go to sleep again; and about four hours after let him take a Clyster to soften and evacuate the excrements; Take of a decoction of Mallow, Betes, Mercury, Chamæ-

Saxonia.

Idem.

Rolinsci.

Sennettus.

Chamaemil, 1 pound; *Mel rosar. solut.* Oil of sweet Almonds, each 3 ounces; Sal Gem 3 drachms, Yolks of Eggs N^o 2. Mix them. When this is done, we must rest, or rather the laxatives must be repeated, to wit, fresh Oil of sweet Almonds mixt with Oil of bitter Almonds, or a little Wine of *Crete*, and the Patient must be put again in the Bath. To which, if the Disease will not give way, we must proceed to tumefacients, to things that remove the excrements, and thrust them down with their weight.

Fortis.

VII. Several Authours testify that Quicksilver may be taken without any harm, for by its weight it does disintangle and loose the Gut that is as it were tied on a knot, thrusting down the hardened and stopping excrements. *Hab Heers* affirms he has often seen it given without any harm, when it has been often strained through a leather, it being voided in a moment and carrying the excrements along with it. After taking of it he presently gave a Clyster of pure *Crete* Wine; by means whereof he has saved several, that have been ready to die of the excessive tension of the Colon. ¶ *Paræus* says several have been cured by drinking three pounds of it onely in water; but so great a quantity is suspicious: for there is danger of extinguishing the innate heat by its cold, and of the concretion of the blood in the veins. Some give two ounces in a rear Egg, but one has had very good success. ¶ *Petrus Pena*, as *Velschius* obs. 43. relates, cleansed the Quicksilver from the leaden part by boiling it with Wine and Vinegar, and then passing it through a leather, then he tied it in a bunch with a thread, in a thin parchment wherein Gold had been beaten: he inclosed an ounce and an half of Quicksilver so purified, and covered it with a glew made of Gum Tragacanth, and when it was dried in a gentle fire, he took off the thread, and gave the Patient the Pill to swallow, dipt in Honey or Syrup; so the glew being presently dissolved in the Stomach, the Quicksilver purged plentifully. One was cured by twice taking such a thing.

VIII. *Hippocrates*, 3 de morbis, propounds as the last Remedy blowing into the Belly by a Smith's bellows, after which an emollient Clyster with trochiscs of Alhandal should be given, that the excrements may be got out. *Aurelianus* disapproves of this Remedy, because the Wind that is forced in with the Bellows may doe harm by its coldness. Yet this Remedy is good, upon the experience of *Amatus Lusitanus*, cent. 1. obs. 100. and of *Epiphanius Ferdinandus*, who saved the life of *J. Altmarus* his Son by it, when he was ready to die of the Iliack passion. For it does not onely good by untwisting the Guts, but by opening a grievous and contumacious obstruction, by dilating the Gut.

IX. In the twisting of the small Guts much cold mere Wine must be given, according to reason, till sleep or pain in the Legs arise, *Hippocr.* 2. epidem. sect. 6. He shews a very fine way of curing an Ileus, and one that I have often experienced; not of every one, but of that which is caused by a gross Wind distending the small Guts, or carrying the hard excrements to the small Guts, or by a cold Juice settled there. For nothing will better cure such an one than mere Wine: for it concocts crude things, extenuates gross ones, dissipates Wind, digests and carries it through the Body: Wherefore either by concocting or dissipating the cause, or thrusting it into another place, it cures this Disease: For Wine uses to cause sleep or pain in the Limbs, and both these things are wholesome in this Disease. Sleep indeed, because by rest and indolence the faculty is refreshed, and the heat being called inwards, the cause is concocted: The Pain in the limbs or joints, because when such an Abscess is made, the former Disease uses to cease, as we have it very observable in Gouty persons; There is scarce a Disease from which they are not freed, when the Gout comes upon them. For, according to *Hippocrates*, it is impossible

that all things should be in pain at once. Therefore these very Reasons convince us that Wine is good, because it causes sleep and pain in the Legs, and when it does either of these things, it is enough. For if in these pains Stupifiers be often usefull, because they cause sleep, which yet are otherwise hurtfull to the Disease; How much better is Wine then, which is both somniferous, and of it self good to take away the cause of the Disease? Yet it will not doe these things every way, but, that it may be able to doe them effectually, give much of it and mere Wine: for diluted or in a small quantity, it neither causes sleep nor pain in the Legs: Much of it, if it be given all at once, cannot be kept, but will presently be vomited up again, or if it were kept, it could not be concocted by the weak faculty; therefore it would grow sowre, and being turned to Vinegar it would increase the Disease. Therefore much mere Wine must be given by little and little, by frequent and small draughts, so it will be kept and be concocted, and will help to concoct, and doe other good offices.

Vallesius.

X. In a Twisting of the Guts, from sharp and malignant humours, *Ætius* commends Treacle after Vomiting, to whom all his Successors adhere. But I should recommend Treacle or other Alexipharmacks onely when the poison is cold, for in hot poisons you must rather use Milk or Whey, mixt with water of Sorel, *Terra Lemnia*, or some other Alexipharmack, but cooling.

Saxonia.

XI. It has been observed sometimes, when several Clysters, and very strong ones have done nothing, that external emollients of the Belly by fomentations, anointings, &c. have done much good: Emollient Clysters also may be given. Nor would it be useles to take emollient things by the mouth, as Oil of sweet Almonds, fat Broths, with Mallow, or Marsh-mallow, boiled in them; Seeing that *Maid in Matthæus de Gradibus, cap. de Vomitu*, who in the Iliack passion vomited up both Clysters and Suppositories, was cured with fat Broths, when other Medicines had been used in vain; And although such things should be rejected by Vomit once and again; yet the taking of them must be continued: For so, when the fibres of the Guts are relaxed, their perverse motion is quieted.

Sennertus.

XII. In an Ileus from Inflammation I do not at all commend a Bath administered to the whole Body, though *Rondeletius* approves it; for if it be cold, it drives the humours inwards; if hot, it melts and colliquates them, and renders them inclinable to the place affected; As *Galen* also 12 meth. cap. 3. has observed. But a Bath is convenient in an Ileus from hardened Excrements, whether it be of Water altered with Emollient things, or of Oil.

Saxonia.

XIII. When the Disease is an Inflammation in the small Guts, sharp Clysters are not proper, lest the excrements be drawn to the part affected from the remote parts, nor over deterfive ones, lest by irritating they increase the Pain: It is hurtfull also, when a great quantity is given, which reaches almost to the part affected.

Rondeletius.

XIV. If the Rupture of the Guts be so great, that when they are got out at a little hole, they cannot get back again by the same hole, and cannot afford a passage for the excrements downwards, it occasions an Inflammation and Gangrene; which are often increased, or produced by fomentations, applied amiss and overhot, as also by a preposterous and violent rubbing of the swelled part; and by the violent forcing back of the swollen Guts.

Sylvius.

XV. A young Man twenty four years old, of a melancholick constitution, fell into the Colick, which, after many things had been tried in vain, degenerated into the Iliack passion, with straitness about the Heart, he swallowed a leaden Bullet of 2 drachms weight, well covered with 1 drachm of Quicksilver, and lest it should hurt his Jaws or raise

a Pty-

Melchior
Fride. in
Mise. cur.
an. 1672.
abf. 96.

a Ptyalism, it was artificially wrapt up: After three hours he broke wind and had ease, and the fourth hour there followed two stools, in which he voided above six pounds of matter of party colours, yet he recovered without any harm.

XVI. A poor Woman, after an ill course of Diet, fell into an obstruction of the Belly, which lasted three weeks, so that she brought up the excrements at her mouth, as in an *Ileus*. Divers things were used, without any benefit. At length she often drank the Juice of *Bardorffe* Apples, that were rotten, to about six pounds, upon which she grew loose, and the Woman narrowly escaped Death.

XVII. If the *Iliac* passion be joined with a Rupture, a supervening mortal sign whereof is the vomiting of the Chyle and Excrements, when the Gut *Ileon* is split into the *Scrotum*, after the falling down of which *Hippocrates* never saw any Man recover, the onely way of Cure, if there be any, is, as soon as the violent pain of the left side of the *Scrotum*, reaching, vomiting, and such things have convinced you of the Gut *Ileon* being split; Then, without delay, the very same day the ligament or *vinculum inguinis* must be cut in sunder with a Razor, that is, where the *peritonaeum* is joined with the Groin by a coat, or the testicle of the same side may be cut out.

Duretus,
comm. in
Hollerium.

Medicines especially made use of by eminent Physicians.

1. A Decoction of Dill is admirable good, though Men do vomit after drinking of it, Bread must be put in warm water, and immediately warm pieces of it must be give to eat.

Agnetia.

2. This gives great ease, Let 4 ounces of Wine of *Crete*, and 16 ounces of Oil be boiled together, to the consumption of the Wine, this given for a Clyster mitigates pain, causes sleep, softens the excrements, and breaks wind.

Benedictus.

3. The Blood of a Bat anointed on the *hypochondria* by admirable experience is reckoned to stop the pains of the Twisting of the Guts.

Joel.

4. They that are held of this Disease, are wonderfully relieved, although they vomit their ordure, if they eat pieces of hot bread dipt in oil. They will be saved, though they were in a manner dead.

Oribasius.

5. Spirit of Turpentine, given inwardly, egregiously dissolves the Tartar, and causes the Excrements to descend and pass the natural way.

Petrus.

6. If the Disease come from thick and viscid Phlegm, a Decoction, or Infusion, or Water of Radish is highly approved, and also strong Wine, in which inciding and attenuating Herbs have been boiled.

Rhudius.

Inappetentia, or, Want of Appetite.

The Contents.

Phlegm, which is the Cause of it, must be beaten by little and little. I.

It requires rather the correcting some fault in the Liver, than in the Stomach. II.

Whether Spirit of Vitriol recovers an Appetite? III.

(See Diseases of the Stomach, BOOK XVIII.)

I. **BILE** and Phlegm especially hinder the sense of Appetite. Concerning Phlegm it must be observed, that it, as it is cold, indicates heating things, yet it must not be done all at once and on a sudden, lest the humours being suddenly dissolved breed wind, and be distributed into the whole Body, and cause obstructions: wherefore

here we must act with caution: and first of all, we must take care that the Patient eat and drink sparingly, and use an attenuating Diet. Salt Meats also may be given the first melf, because Salt has an inciding and attenuating virtue; and afterwards things that have a deterfive faculty may be used, such as the decoction of Cabbage, boiled but a little. But first of all, to attenuate, let *Oxymel* be given with a fourth part of Honey of Roses, afterwards that Medicine which is called *Diatrion Piperis*, and that the simple, which is onely made of the three sorts of Pepper: for although Pepper heat violently, yet it is of thin substance and parts, which are therefore quickly dissolved, and therefore doe the Liver no harm.

Senacutus.

II. Loss of Appetite, and loathing of Flesh especially, follows the excessive heat of the Liver (for Physicians are under a mistake, who, when their Patients loath Flesh, so that they can scarce bear the smell of it, think the Stomach is onely ill) Flowers of Cichory must be given, either preserved with Sugar, or fresh, and the obstructions of the mesaraick Vessels must be helped: For Flowers of Cichory do not onely help a hot Liver, but they excite the faculty of the Stomach, and free from obstructions. ¶ Roots of Cichory, especially the wild, have as much virtue in them and more.

Crato.

III. There are some, who perfectly abhor the use of Spirit of Vitriol, as appears from *Sylvaticus* contrav. 48. and others, who infer several inconveniences from the noxious qualities of common Vitriol not prepared and not separated from its impurities, but to no purpose, for it is one thing to consider what *Galen* and *Dioscorides* say, where they onely speak of crude Vitriol, another to consider prepared Vitriol, of which there is great variety, so that it alone to several Hermeticks may seem sufficient to furnish an Apothecaries shop. The question here is concerning Spirit of Vitriol, which is now-a-days frequently used. That it conduces much to check great putrefaction both Experience and *Crato* apud *Scholtzium* do testifie, though greater caution must be observed in dry Bodies than in moist. We likewise daily experience, that it does much good in a dejected Appetite, then especially, when the internal parts of the Stomach are, as it were, lined and obstructed with pituitous and mucilaginous excrements, so that the Spirits which cause hunger, that is, the innate heat of the Stomach, is oppressed and rendered unfit to perform its operation. As it contains in it self a penetrating, inciding and cleansing virtue, so it attenuates, digests and consumes the mucilaginous matter and crudities. Wherefore consequently it excites the hungry Spirits, that before were buried as it were, which produce the usual effects in extimulating the sense of the orifice, and breed hunger.

Hortius.

Infantium Regimen, or, The Regiment of Children.

The Contents.

The umbilical Vessels must be tied neither too strait, nor too loose. I.

Whether Children new born should be washed in hot or cold Water? II.

They must not be swathed too strait. III.

Whether the Mother's milk be always best? IV.

Whether new or old milk be better? V.

Whether a Nurse who has her menstrua, should be rejected? VI.

Whether great or small Breasts should be preferred? VII.

Whether a Nurse must always be interdicted coition? VIII.

When a fault in the Milk must be amended? IX.

The way of making Pap. X.

When

When the Child should be weaned? XI.

Often caused by touching of the Navel-string, when it is cut. CVI.

By Milk. CVII.

Hardness from obstruction of the Vessels, how to be cured?

CVIII.

Vermes, or, Worms.

(See Lumbrici, BOOK X.)

They must be killed, before they be carried off. CIX.

Sweet things must be mixt with bitter. CX.

Chylsters must be sweet. CXI.

Medicines must not be violent. CXII.

They must be given when the Stomach is empty. CXIII.

The efficacy of Coralwort. CXIV.

They are easily dissolved. CXV.

The Cure is not the same when there is a Fever, as when there is none. CXVI.

How they must be killed, when there is a Loosness? CXVII.

Whether a Decoction of Guaiacum be proper? CXVIII.

Whether Treacle may be given? CXIX.

Quicksilver not proper for all Ages. CXX.

The way of giving Aloes. CXXI.

Cruditities, which breed them, must be taken away. CXXII.

Vigiliæ, or, Want of Sleep.

Must be otherwise cured than in grown people. CXXIII.

Whether Saffron be good? CXXIV.

Narcotics must not be given. CXXV.

Umbilici Tumor, Inflammatio, or, Swelling and Inflammation of the Navel.

Sometimes a Chirurgical Cure is required. CXXVI.

Whether Oil of Roses be good in the Inflammation? CXXVII.

An Abscess arising must not be opened. CXXVIII.

The Cure of a Swelling from a carnosus substance. CXXIX.

If it come from Blood or arterious Spirit, it must not be opened. CXXX.

An effectual Plaster in the rupture of it. CXXXI.

Vomitus, or, Vomiting.

It proceeds from several Causes. CXXXII.

Strengtheners of the Stomach, at what hour they must be given? CXXXIII.

Regimen recens Natorum, or, The Regiment of new born Children.

I. **S**OME unskillfull Midwives use sometimes to tie the umbilical Vessels and Navel-string of Children; either too strait, that it may the sooner be cut off; or too loose, so that the ligature is not sufficient to keep in the blood; As it happened to two Infants, whose strength was so exhausted by bleeding that they could by no means be recovered. Therefore these Vessels must be carefully tied with a thread several times double: And, for the greater security, when they are cut off, strew on this Powder, with which they must always be furnished; Take of Aloes, Frakincense, Dragon's-bloud, each 1 drachm; burnt Hart's-horn, Terra sigillata, Fine-flower, each 2 drachms; Hare's-down, cut very small, half a drachm. Mix them. *Hildanus.*

II. Let the Midwife wash the new born Child gently with her hand, and let her have swatches and clothes, as soft as may be, in readiness: for either to wash the body much, or more than once, or to strew on astringent Powders or Salt onely, are usually the causes of more hurt than good, wherefore the use of them is deservedly left off; for it is better to clean the body with warm water at most, than either with dry things to condense, or to heat, or cool, or soften the body, that is above measure soft, as they used to doe of old. But if the Child be born cold, and full of mucous and

Tt viscid

viscid excrements, it is sufficient to wash it in warm Wine, yea absolutely necessary. But if it be born lean, hot, and much extenuated, it is the wisest course, not onely presently after it is born, but for three or four months time to anoint the Child, after making it clean, with Oil of *Sesamum*, when it goes to sleep. But in such bodies it is a very good way to put the Child to a Virgin, who must be young, fleshy, of a good habit, and fresh coloured, who must cherish the Child with her own heat in bed: For I have known several saved by the benefit of this onely. ¶ Some Northern people wash the bodies of their new-born Children in cold water, yea, they dip them into it, to make them strong. *Galen* reprehends the custome, because of the sudden change from heat to cold, and constipation of the pores of the Skin, which may be the cause of putrefaction, breaking out, and other diseases. Nor must they be washed with warm water. *Fabricius Hildanus*, cent. 14. obs. 56. observed, that a Child, after such washing, lived subject to Catarrhs. *Galen*, before the Child be swathed, if the constitution of its body be without any fault, sprinkles it all over with Salt finely powdered, lib. 1. de san. t. c. 6. He is blamed by *Averrhoes*, because that age cannot bear the acrimony of the Salt, and for the danger, left by the attrition of the Salt, the vitious juices, which perspire by the Skin, should be kept in. It were better, according to *Avicenna's* advice, to wash the body in Wine, wherein red Roses have been boiled, or in its Urine.

III. In some Countries and Families Children are swathed too strait, hence it often comes to pass, that their body grows gibbous, and their Limbs crooked, or otherways deformed. For their bones being yet tender, soft and cartilaginous, are easily wrested, and removed out of their natural posture, which, when they grow hard, keep their vitiated figure. Country peoples Children have large Breasts, because they are not tied; or lay looser in the Cradles. They that are swathed tight, have their ribs compressed, and their Breast grows sharp. Maids who lace themselves too strait, that they may look slender, either die of a Consumption, or grow Crooked. A certain Midwife, as *Borellus* observes, cent. 2. obs. 59. was accounted a Witch, because all the Children she swathed, grew either Consumptive, or lived weakly, which was caused onely by too strait compression. Nurses also sometimes tie their heads, for comeliness sake (because sharp ones seem finer to them) hereby the Skull being compressed and growing long, the Brain and its Ventricles are compressed, which being so weakened, is rendered obnoxious to Catarrhs: Such, if they grow up, are dull of understanding, because the spirits are not elaborated aright, or their free passage through the windings of the Brain is hindered. It is an error also of the Nurses, to carry their Children always in the same Arm, whereby they grow left-handed, or rest them on their Legs onely, whereby they make them lame.

IV. It is the best way for Mothers to give their own children suck, because their Milk is made of the same blood, wherewith the Child was nourished. But the Nurses Milk, although it be Milk, and indeed Humane; yet there is not one jot less difference in this, than is between the constitution of body, and temperament of the Mother and Nurse; and no Nurses Milk agrees so well with the Child's body as the Mothers: Since therefore every Animal is nourished with things like it self, the Mother's Milk must be preferred, because it is more like. *Phavorinus in Gellius*, l. 12. c. 1. brings many pretty reasons for it, but moral ones. But because many Mothers are not of a good constitution, but diseased, and sometimes also of bad manners, or because great Persons, and others who are weak, cannot bear the trouble of giving suck, a well-disposed Nurse must be chosen, which is not so

subject to passion, of a composed mind, not a Fool, Angry, Drunken, Melancholick, Salacious, but of a good habit, in the prime of her years, &c.

V. Some reckon it a superstitious thing to chuse a new Milk, because, to speak properly, Milk is never old, since new is bred every day, whose Nature may vary according to the different temper of the Woman, and the difference of diet, but not because of the act of breeding Milk. Yet it were better, that the Nurses Lying-in should coincide with the birth of the Child to be brought up, or not differ above a month; for a more serous and diluted Milk is proper for new-born children; such as Nature has given the Mother, when she has newly lain in, that it may the better cleanse the filth from the Stomach of the young child: But an old Milk is without doubt thicker, and therefore not so proper.

VI. *c. a Vega* thinks, the Milk is made purer, if the feculent blood be evacuated, by a mixture with which in the body before it is polluted. He instances them that give suck, in whom, because they have their Menstrua but seldom, a Cacochymie grows in their body. One that gave suck, in *Hippocrates* 2. Epidem. Sect. 2. had Blisters all over her body: but when she gave over suckling, they went away in Summer. If therefore suppression of the Menstrua, even in them that give suck, be a cause of Cacochymie, Why are Nurses desired, who have them not? For is it not better to have them every Month, than that the blood should be foul? *Valerius* replies, Since there cannot be an expulsion of the excrements, without a separation before, all the blood must of necessity be disturbed every month at the time of excretion (which we know from antecedent pains of the whole body) and when it is disturbed, the Milk must be spoiled. It is better therefore to chuse a temperate Nurse, and to procure good juices for her, than from her menstruous purgation to expect the purging of the blood, with its frequent disturbance. Beside, there is order in the work of Nature: Since therefore menstruous blood is the principle of generation, when it appears, nature inclines to another birth, wherefore she begins to be unfit for the former, and therefore the Child must be put to another Nurse. But if there should be no more Nurses to be had but onely one, who has her Menfes every month, while they are upon her, let her give suck as little as she can, and let her avoid it more a day or two before they come, which is the time of secretion, than when they are come.

VII. Some condemn little Breasts, and not without reason, because they breed less Milk. And I know not why great Breasts should be counted bad: for they afford a large quantity of Milk, which may be good: And it is not the capacity of the Breasts, but their temper, which alters the Milk.

VIII. Let the Nurse wholly abstain from Venus, for it disturbs the Milk, draws the Blood to the Womb, whereby the Milk is spoiled, and the quantity of it abated. Yet *Varandæus* allows it to such as live with their Husbands, lest their longing disturb them. And we see Mothers, who live with their Husbands, and lye with them, do yet suckle their Children without any harm. *Bonacchius* writes, that the Mother's Milk does not corrupt, if she conceive by the same Man.

IX. Whether is it good for Children, who are taken with any disease, presently to change their Nurse (as it is for other bodies, when they are taken with any acute disease, to change the course of their Diet into a more spare one) and take another who has a thinner Milk? Here, first of all, it must be considered, on what occasion the Child began to be sick: for if from an external cause, whether Meat, or Drink, or Air, it seems a vain thing to change the Milk, that is familiar and friendly, into an unaccustomed one, at a time, when the strength

is least able to bear an alteration of custom. In which case, though in other Diseases it be not necessary to change, if the disease be acute, in which the accustomed food, how friendly soever, must be changed into a thinner, it is convenient to chuse a Nurse, which has a thinner Milk: which indeed is not so necessary in diseases that are not so violent, nor so acute, and because of the gentleness of the symptoms waste the strength but little. But in acute diseases, or if the Child be ill, through some fault in the Milk, whether that come from some disease in the Nurse, be it from the temperature of the Breasts being destroyed, or from the diuturnity of giving suck, or from alteration of the diet or life, or from her being with child, or from a sudden fall, or from any other cause, either because the Milk is not so pure and choice as it was at the beginning; or be not convenient for the Child, when grown, as it was before; then indeed, without any delay, we must change the Nurse, for one who has a Milk like to the former, if the Disease be of small moment: but if it be an acute one, for a Nurse, who has a very thin Milk, such as the violence of the disease requires, for the reasons alledged. For when children are ill I cannot commend the endeavouring to correct the Milk in the same Nurse, by Medicines or Purges, for it will be much more spotted, and in hopes of future health we give the Child far worse aliment; And therefore it will be better to change the Nurse, than to add one disease to another: For it is certain, that what diseases come from diet, are amended by diet, and what do not come from thence, do not increase thereby. But when the Child refuses to take the Breast any longer, then indeed you are bound of necessity to attenuate and correct the Milk in the Nurse her self, not indeed by Purgers, when the Child is sick, but by alteratives towards that quality, which is contrary to the Disease, or towards tenuity, as is necessary in acute diseases: for you may extenuate it, by feeding the Nurse with Parsly, Fenil, &c. and by moderate exercise. But if any salt or bitter taste, or the like, be predominant in the Milk, I should rather chuse to change the Nurse, than endeavour in vain to correct it.

Mercatus.

X. The usual food of Children, when they are weaned, is Pap, made of Flower, Wheaten especially, and Milk, of a middle consistence, between a Solid and a Liquid, although it come nearer the former; for it cannot be supped. Because of its viscosity, for which it cannot get through the narrow passages, it is the Authour of many diseases, especially of Obstructions: For if a most tenacious Paste be made of Flower and Water, for external use, what may not be made of it by addition of viscid and thick Milk? It will certainly make a food, difficult of concoction and stopping. Some endeavour to amend this fault by long boiling, to take the crudity off the Flower; But by that means the Whey, which gave it a little fluidity, is exhausted, the butyrous part remaining, which is viscid and tough; and the caseous, which is the gross and earthy portion of the Milk. Others, by mixing it well, and stirring it, make Pap with a gentle boiling, lest the Whey should be lost, from whence it has a virtue to permeate and loosen the Belly; But neither thus is the mischief avoided, for the Flower remains crude, incoctible, and insuperable. And this is the way to make it, not onely proper for children, but for the use of the Kitchen, of which an easie dish may be made, by mixing it with Milk, Broth, &c. Take Barley, or Oaten flower, put it in a Bag of thick cloth, boil it in a Kettle for twelve hours, so as that the Water may be always above it, keeping down the Bag, by laying a weight upon it. When the Flower is taken out, set it in an hot Oven, after the Bread is taken out, and keep the Mass for use. The excellent *Theodorus Zwingerus*, in his *Theses* for his degree,

made Anno 1680. *med. acad. regias*, does curiously reprehend this fault of making Pap the common way. "The Matter, saith he, of Pap, is Flower and Milk; nay, and often instead of this it is made of Water, of which things, without Fermentation, a Paste is made onely by simple boiling, with which they cram children every day as long as they will hold. But now it is evident to every Man, if not from his own, at least from other Mens experience, that the strongest stomach is notoriously offended, with Bread but a little, or not at all leavened; concoction is disturbed, and Acid crudities are gathered: If it fare thus with strong Men, who can any longer wonder, that such Pap is often corrupted, and turned into a glutinous, Acid Paste, in young Children's stomachs, which are far weaker?"

XI. One set time for weaning cannot be fixt for all, nor again, can there be any certain Law and Rule, since one body differs from another body, and one nature from another nature; Moreover, all cannot bear weaning alike; but, according to the solidity of the flesh, strength, condition, and appetite of Milk; or otherwise, so you may advise weaning sooner or later. Many Children, that have been weaned before their time, have born it so ill, that the Physicians have been forced to put them to the Breast again, for fear of a Consumption, or some future diseases: Also, when weaning is long deferred, it is then a difficult thing to be done, and not without danger; in which thing we must know, that no Child should be weaned before dentition be perfected, or a little before it; for that is the Law of Nature in craving solid meat. Moreover, the Child must not be weaned all on a sudden; but, as his Teeth begin to come, so, by degrees, and by little and little, he must be fed with more solid Meat. Besides, you must not wean him, without that firmness, concoction of food, and alacrity to actions, which is sufficient to bear the weaning. And the sum of the case is, that he crave other food, digest, sleep in the night, and do not at all regard Milk, for it is a very difficult thing to wean Children, that live by sucking.

Mercatus.

XII. If it be convenient to give a Child Milk, to Purge him, At what time must the Medicine be given to the Woman? I answer, If the opinion of *Galen* and his followers were true, to wit, that Milk is bred of blood onely, the Physick must be given at least a day before, because, before it pass so many concoctions, less time cannot intervene. But it is evident from *Hippocrates* his Doctrine, *lib. de Natur. Pueri. v. 250.* that the matter of Milk is twofold; one indeed plentiful, which comes from meat and drink not yet concocted in the Stomach; Another little, which is blood ascending from the Womb to the Breasts, and this looks rather like an Agent than the Matter. For I observed in less than an hours time, that Milk became purgative in Mrs. N. who, having taken a Purge, gave the Breast immediately to a Girl a year old, not thinking that the virtue of the Medicine could have come so soon to the Breasts (for I had forbid her to doe it) which was Purged so violently, that we were afraid of a mortal *Hypercatharsis*, but it did not give the Mother one Stool.

XIII. In Children it is always safer to give Purgatives in too little, than in too great a quantity, because, if it do not work in a few hours, more of it may be given the Child, and so we may try the strength of any Medicine in any body without danger. For as it fares with old people, so it does with Children, all are not purged alike easily, quickly, and plentifully by every Purge: for which reason, lest any mischief should be created them by a strong Medicine, it is better to give the most gentle Purge at several times, and a little at each, than all at once. For the Physician cannot be too cautious; because, if ever, certainly about Infants

Sylvius de le
Boë.

we may not make two mistakes, seeing they are delicate, and quickly perish.

XIV. It is to be observed, that Children are averse to all sorts of Medicines; therefore, as they are averse to Medicines, so we must try all our skill to make them take them: I speak of Medicines taken by the mouth, because they easily admit of outward things. The way of forcing Children is shewn by *Paulus*, lib. 4. cap. 55. where he mentions the Instruments that must be used to force Children: and they are a Spoon, which first is forced between the Teeth, to keep them firm together; and then a large Pipe, which is small at one end and wide at the other. This is thrust with the narrow part into the Mouth to the Jaws, and Medicines are poured in at the broad end, and so whether they will or no, they must take the Physick.

Mercurialis.

XV. There are two things in Physick which grievously perplex me, in which I am greatly straitned, am full of difficulties, and almost fumble, to wit, when I have Women with Child, and Children, under Cure; for they cannot express, where, nor what their pain is, nor any thing else. And it is very true what *Galen* 2. de Alimentis speaks out of *Plato*, That Children are the most intractable of all wild Beasts.

Ferdinandus

Ani proidentia, or, The falling out of the Arse-gut.

XVI. If the falling out of the Arse-gut be with Inflammation, in stead of blood-letting we must use Cupping-glasses, and also frictions; but if the Child be of any age, scarifying may be used. Besides, the Child must be gently purged: But if we give a strong Purge, without doubt a greater Inflammation will be raised in the going out of the Excrements. In this case therefore we must see to keep the belly a little loose, and the body should rather be purged by Urine than by Stool. And for a Diuretick I would recommend half a pound of Whey well clarified, and an ounce and an half of juice of Melon-seeds: For this Medicine will purge especially by Urine, and if it give a Stool, it will do it gently, and without any griping.

Mercurialis.

XVII. Powders and Oils keep the Arse-gut from falling, as, Take of Oil of Myrtle, and unripe Oil of Roses, let the Anus be anointed herewith, then strew on a little of this Powder; Take of Ceruss, Antimony, Galls, Alame, each three drachms, powder them and apply them. This Powder is commended by *Rhases*, and I have found it very effectual: But we must observe what *Aetius* admonishes, that in Infants and young Children we must not use these Powders, especially the Astringent and more efficacious, because they greatly exasperate and cause pain; wherefore, unless the Child be well grown, we must not use the foresaid powder. There are several Medicines 9. n. r. too violent for young Children: Therefore I rather commend *Galen's* advice, 3. *Euporist*. that is, to use Smith's-water, and Powder of burnt Snails.

Idem.

XVIII. The same *Galen* 2. de Simpl. writes, that several have written, that a *Torpedo* applied is good for the falling of the Arse-gut: But he subjoyns, that he had tried that remedy in vain. Powder of a Serpent's slough is also very good.

Idem.

XIX. But if these Medicines will not perfectly cure it, the followers of the *Arabians* commend the making of two cauteries in the end of the Spine; that is, near the Rump, one on each side. Which remedy nevertheless I would advise onely to be used in adult ones, and when other things will do no good.

XX. It is often hindred from going back into its place by the *Mucus*; wherewith it is covered, which you must absterge, not with brine, as some have advised, because the sense of the part will not bear it; but with Sugared-water, especially with Rain-water, or with Water of Honey much

diluted, which you must doe often, and wrap up the Anus in clothes wet with water.

Aphthe, or, A Thrush.

XXI. Because a Thrush is usually attended with great Inflammation, and consequently draws the humours from the body, and increases the disease thereby: Therefore it will be good to apply Cupping-glasses, but to the buttocks, or the end of the back, by which one may evacuate as much blood, as the age and habit of the body will bear.

Mercurialis.

XXII. If the Thrush be malignant, we must oppose the pravity; but we must have regard to the Age and the tenderness of the body. We may not therefore in this age use those remedies, which an elder might bear. And the Medicine may be such; Take of *Scordium* finely powdered 1 drachm, Pomegranate Pills finely powdered 2 scruples, burnt Alum 1 scruple, Honey what is sufficient. Mix them.

Idem.

XXIII. But we must observe, whether powders, or whatever else be given, it is necessary that it be mixt with some thing that is gratefull to the palate, for there the Gustatory faculty is placed, and we must have great regard to the Taste; Wherefore, as may be seen in *Galen* 6. de Med. local. the Ancients made up their Medicines for the Thrush either with *Sapa*, or Honey.

Idem.

XXIV. If the Child be big, because it is very material to have the pravity checkt presently, lest it grow to spreading Ulcers, we must endeavour to take away all malignity immediately with strong Medicines, which the juice of Pomegranates, and especially of sowre ones, does admirably. Which, *Theophrastus* says, does in a wonderfull manner preserve from putrefaction. And though the Pomegranate, by *Dioscorides*, be called *ἄσπερον*; yet we must not say with *Ruellius*, it is hurtfull to the mouth, which is very false, but that it is ungratefull. It appears indeed from experience, that it is unpleasant and ungratefull, nevertheless it is very good to stop a putrid Thrush.

Idem.

XXV. But it often so happens, that this Medicine does not suffice, wherefore we must proceed to stronger. In which case, in those of elder years, we may use either *Aqua Aluminis magistralis*, or *Unguentum Egyptiacum*, or *flos aris*, corrected with *Diamoron*; all which things must not be used but upon great necessity. The reason is, because according to *Galen* 6. n. r. in the palate there are two wide passages, one of which goes to the Lungs, the other to the Stomach; wherefore it is very dangerous, if any poisonous Medicine get into these parts. Therefore he said, that Vitriol must not be used in Medicines for the Mouth; because of the imminent danger, if any part of such a Medicine should get either into the Stomach or Lungs. Besides, when we must use some such Medicines, it will be best to use them in such a form, as cannot go farther than the Palate, as when a malignant Thrush is touched with Oil of Vitriol, or of Sulphur, or with Sublimate water.

Idem.

XXVI. Whether is Butter good for a Thrush? It is good in the beginning; but it may be questioned, 1. Because fat things make Ulcers foul. 2. By its heat it might increase the Inflammation. 3. It does not at all agree with other Medicines, which must be used in the progress of the Disease. I answer. 1. The argument holds good in deep Ulcers, which must be deterged. 2. Fresh Butter is reckoned temperate, because of the serous humidity mixt with it. 3. Nor does it hinder, that other Medicines are of other qualities; because in the progress we dry and deterge more.

Horstius.

XXVII. A Boy about four years old had a very sharp Fluxion upon his Tongue and Jaws, so that he had an infinite number of white Ulcers, very painfull, with a great inflammation; he could swallow

low

low nothing, he had no sleep, but roared continually, he was lean, and almost quite consumed. Honey of Roses, with Spirit of Vitriol, which did others good, did him none. He had a plentiful Loosness, with much porraceous bile. A Blister did him much good, but his pain and roaring continued, and a ferous sharp humour ran out of his mouth continually, the pain and inflammation drawing more and more. At length I gave 1 grain of *Laudanum* in broth, whereby the pain was eased, a gentle sleep procured, which afterwards continued moderate, and came at due hours. Then his fluxion into his mouth ceased, and he began to recover.

Riverius.

Atrophia, or want of Nourishment.

XXVIII. There are four causes of Leanness in Children; First, Ineptitude of Aliment. Secondly, Want of Heat, whose office it is to concoct it. Thirdly, Obstruction of the passages, by which the Aliment passes to its elaboratories, or whereby it is carried from them to the parts to be nourished. Fourthly, Any cause, that is able to waste, dissipate, and melt the fat and flesh. To the ineptitude of Aliment, the condition of the Milk belongs, which is either afforded, in far less quantity than it should; or is so thin, that it is dissipated by the heat; or of its own nature, it is of little Aliment, because it has but little of the butyrous substance, and much of the other; Or when it is bitter, salt, &c. which Nature is therefore averse to. So, want of Innate Heat causes an Atrophy a thousand ways, because it is able neither to concoct laudable Aliment, or if it be, it does not distribute it, or does not assimilate it, when distributed, &c. Thus Childrens bodies are also emaciated, because the ways, channels and pores of the Elaboratories, and the Flesh, are obstructed, corrugated, fallen flat, compressed, or some way or other straitened. Of which cause we must have a great care. Then the cause which wastes the fat and flesh, is either internal or external; internal, whatever is unable to contain the substance that should nourish, as it happens in fluxes of blood, or of any other good substance: or it dissipates by sweat, insensible transpiration, by Urine or Stool. But these are seldom seen in Children; for in them the dissipating heat, or consuming drought usually waste the humidity that should nourish. The external cause is, either the æstuating dissipating heat, or the violent cold extinguishing the heat, or the use of Salt meats.

XXIX. If the heat appear as it were extinct by a cold disease or humour, then indeed Children are usually very hungry (although sometimes their stomachs are squeamish, that is, when Phlegm putrefies, or becomes mucilaginous) and the more they cram, the leaner they grow: Moreover, they are of a white colour, and though their body be extenuated, their eyes, face and feet swell, being forerunners of another mischief. You cannot heal this disease by change, or increase of diet, but by such things as waste and concoct the Phlegm, and make the heat more brisk. In which case, it is good for Children, when they are weaned, to take a very little Wine, with Biscoft-bread, or in drink, so it be much diluted, for it concocts phlegm, and crude juices, corrects the cold intemperature, and excites the heat. Aromatics are also good, which, if they cannot be given a sucking Child, you mix them in all the Nurses victuals: for they thin the Milk, and make it pass easily.

XXX. There is a Disease very frequent in these Countries, in which Children, that suck, and those that are weaned, are consumed with an Atrophy to a *Skeleton*, onely the Belly (as if there were a soft *Parachyma* lying underneath) being swelled, and so far like the Rickets (but that there is not such a tension of the joints) and for the rest it comes

without any concurrence of Worms, or of any other cause, but onely through some fault in the radical ducts and glands: For the method and cure of the common Consumption turning to an *Atrophie*, of a Tympany, and the like Diseases, sometimes used in this case has not been sufficient. Not yet afterwards have the remedies usually prescribed in a more accurate method for *Schirrhi* and abscesses of the mesentery (which indeed are rather the products of the inveterate Disease) Laxatives, Purgatives, Aperients and Strengtheners, and external Anointings, Bathings, &c. been found to satisfy expectation, or to hinder those that are so held, from being carried off at last by an Hæctick, with a supervening Epileptic, colliquative Flux, Lientery, and other Symptoms. Within these few years a little Daughter of N. was brought to me, than whom, in all my practice, I have not seen one more Consumptive; she had taken an infinite number of Medicines. Being much intreated, and the case being desperate, after I had given the Prognostick, I happened, I know not how, upon *Tinctura Martis aperitiva-Vitriolata*, and upon *Arcanum duplicatum*, which, it may be, might go nearer to the root of the Disease, than any usual things, for all their known energy. Therefore we gave, for the first week, every day, and for the next, every other day in the morning, 2 drops of the Tincture for every year of her age; and, at 4 a clock in the afternoon likewise, for every year of her age, 1 grain of the *Arcanum*. And so in a few days she began to be better in plight, and, in a short time after (Nature recollecting her self, of her own accord) she was perfectly restored, and is at this day brisk and corpulent enough. After which Observation, being farther confirmed by reason, I have, after that, to this very day, cured several in the same manner, without the help, almost, of any other Remedies. And this Martial Tincture is made of Vitriol of Mars (made with Spirit of Wine) and of the Acid of Tartar, each 4 ounces, boiled sufficiently in 3 pounds of steel water, and insensibly exhaled in stirring, to the thickness of Honey, which, by pouring on 3 pounds of Spirit of Wine, is dissolved by digesting, little sediment (if all things have been done as they ought) being left. And so the liquor is saturated, and after little or no abstraction, or exhalation, is set by for use, and it may be farther tinged, if you please, with essence of red Popy. You may have *Arcanum duplicatum* in *Schroder. Pharmac. l. 3. p. 474.* and *Hofman. in Clavi. p. 344.*

XXXI. A Boy two years old was brought to me, Anno 1567. the Son of Mr. David Merueilleux, Counsellor to the most Serene Prince of Longeville, my intimate Friend, consumed with a great Atrophy, together with a Loosness. His Breast was diaphanous, if it were held to a Candle. He was given over by all, especially by a City Pastor, who practised Physick. I believed he was not desperate, because he had a liveliness in his eyes. And he was recovered by taking Milk, in which red-hot Flints had been quenched, adding Sugar of Roses, and a little *terra sigillata*. Within a month he throve upon it, now he is a lusty Man, and follows the Wars.

XXXII. Sometimes Childrens Atrophy comes from Worms, which are bred under the Skin in fleshy parts, of corrupt nutriment. This is an approved cure; Take 1 ounce or 2 of Bryony-root: boil it in Lye of Oakashes, till it grow like pap. Anoint the Body of the Child with this, either in a stove, or in some warm place, then the Worms put out their heads at the pores, and then presently the Skin must be shaven with a Razour, for so the heads are cut off the Worms, and the cause of deficient nutrition is removed. And this operation must be performed once and again, namely, till it be evident, that all the worms are gone. Then the Children must be bathed often in Bathes of a decoction

Don. Ludo-
vici, Episc-
opi Gem.
an. 3. obs.
251.

cotion of a Sheep's-head and Feer, Mallow, Marsh-mallow, Pellitory and Linseed, &c.

XXXIII. And there are not wanting some, who affirm, that Women-witches suck children lean. In which matter, which I leave for others to discuss, it is enough to know that they are emaciated, because we find children are bewitched, because perhaps they are infected with the Touch, Sight and Breath of some infected, maleficious Body. For their tender bodies are easily made worse by any thing.

But how comes it to pass, that a beautifull and healthy child presently grows worse, discoloured and lean? You must know, that such a sudden change may happen in children, either, because the child by its innate principles, is at the very perfection of health, according to the indigence of its Age, beyond which it cannot go one degree, nor continue in the same; then it must needs go into a worse state. At which time, I think, we should use no Remedy, but it may be hoped that by a good moderation of life and diet, he may be brought to the utmost extent of Age which he is able to live, while Nature grows stronger, and the body arrives at a more solid state by the same action of Nature. For so it happens to us all, while we commit no error in our life; otherwise that alteration is a fore-runner of some Disease at hand.

Or again, the foresaid change of a sound into a morbid body proceeds from the breath, or from the depraved spirit and aspect of the eyes, permeating, dissipating or infecting, or any other way changing the very tender substance of the Child. At which time, if any thing superstitious or maleficious come from the wickedness of the Devil, the Assistance of Holy Church being first desired, we must proceed to such Remedies as may dissipate, dissolve and weaken the breath, wind, or foul and contagious spirit. For which purpose, it is a vulgar practice, and confirmed by reason, to fly to Fumigations; Some of which strengthen the principal parts and the whole body, and prevent Childrens being hurt by bewitching Vapours; such are all Spices almost, and things of a gratefull smell. Others waste, dissolve and dissipate the bad exhalation, humour, wind or spirit. For example, odoriferous Wine, *Lignum Aloes*, Rose-water, Baytree, Juniper, Mastick, Rue, &c. which by the actual heat of the fume do dissipate, by the potential attenuate, by their smell obscure and weaken the strength and power of the exhalations, and whatever it is, whether substance or quality, which weakens the Child. Whence it came to pass, by the advice of the Ancients, and experience a thousand times confirmed, that Nurses defend and cure their Children of these fascinations by frequent fumes. Again, other fumes are written of, as Exorcists experience, to drive away witchcraft, and to cast out evil spirits. *Aetius*, *serm.* 13. *cap.* 119. describes the fume called *Berenices Suffumigium*. In *Tobias* there is one of the heart of a Fish to drive away the Devil *Asmodeus*. Of this nature are both foetid and strong smelling things, Frankincense, Myrrhe, *Stirax*, *Ladanum*, *Galbanum*, *Asa fœtida*, Rue, &c. How far these things drive away evil Spirits, is no disquisition of mine, it is sufficient to advise to join Sacrifice and Prayers, which are the best Incense and the most efficacious Fume to destroy Witchcraft. Anointings also are of great force in the foresaid fascinations, with Oil Olive, of Sweet Almonds all over the Back, Belly and Limbs, with a little odoriferous Wine. Among several things Rue, *St. John's-wort*, Seed of herb *Parry*, *Pæony*, Sulphur, &c. are commended. (See *Tit. de Venenis*, BOOK XVIII.)

Aurium Dolor, Inflammatio, or, A Pain, or Inflammation of the Ears.

XXXIV. Pain in the Ears uses to be so tough and grievous, that there will be a necessity of proceeding to Chirurgical operations; Therefore, if the Age will bear it, to divert the matter which the Pain draws, it will be convenient to apply Cupping-glasses, first to the Buttocks, and then to the Shoulders. And sometimes in extreme Pain I have known Issues made in Childrens Heads do much good; both because the Flux of the matter to the Ears is retarded, and because the very moisture of the Brain, which otherwise would run to the Ears, is almost consumed by the Issues.

Mercurialis.

XXXV. It must be observed, that Water must never be poured into the Ears, though they ake never so much; because Water is very hurtfull for the Ears. Wherefore *Aristotle* said, that Divers, when they must dive under the Water, put Oil into the Ears, that they may not be hurt.

Idem.

XXXVI. It is to be doubted, whether the White of an Egg be good in an Inflammation of the Ears; because, 1. It has a repellent virtue; 2. It hinders the expulsive faculty; 3. The matter producing the Inflammation being hot and moist, does rather seem to require dissolving things. But, seeing the violent pain of the Ears does necessarily require some lenient thing, we approve of the White of an Egg mixt with Woman's Milk, in which we grant there is a little repellent faculty, having regard to the great Afflux, which, by reason of the continuance of the Pain would otherwise be. And we grant, that where the matter is little, the expulsive faculty must not be hindered: but where the Afflux is great, we must have regard not onely to the Humours affluxed, but to those that will be affluent. By which reason the third objection is answered, where the matter settled in the part indicates dissolution and attenuation, but not that which is still in fluxion.

Horrius.

Catarrhus, or, A Catarrh.

XXXVII. *Paulus*, *lib.* 1. *c.* 7. whose Authority *Avicenna* produces, writes, that it is good to consume the Moisture of the Head, if warm water be poured on childrens heads, as if this were the most effectual Remedy to put an end to Distillations and Coughs of children. But, with *Paulus* and *Avicenna's* leave, I cannot approve of the advice, because the pouring on of warm water, if it be too hot, does harm, for it dissolves the matter more, and violently strikes the weak senses of the child: And if it be but warm, it is clear, that it farther relaxes and moistens, and consequently increases the sickness. But I think *Paulus* was deceived by misunderstanding the meaning of *Hippocrates* and *Galen*, who, *5. Aphorism.* 22. said, that pouring warm water on the Head cures a *Κεφαλαλγία*, meaning the Headach: Where *Galen* says, that pouring warm water on the Head, dissipates and consumes the Moisture, which causes the Headach. But it differs much to cure the Headach, especially in Men; and to cure, either a Cough, or the Headach, or Difficulty of Breathing in Children. Wherefore, if any thing should be applied to the Head in this case, such things must be applied as gently exulcerate the Skin. For as we see Ulcers spontaneously arising in childrens heads do preserve them from such Ails, so it is consentaneous to reason, that Ulcers raised by Art may doe the like.

Mercurialis.

XXXVIII. A Boy eleven months old had a Catarrh with a continual Cough and Fever: He frequently vomited Phlegm, he sucked much Milk, and pissed little. After many Medicines tried to very little purpose, I ordered that the Region of his Kidneys should be anointed thrice a day with *Oleum*

Scorpi.

Scorpionum Matthioli, which made him make much water, and the Catarrh abated. For *Mercatus*, lib. de Morb. pueror. says, that a Catarrh in children comes sometimes from some fault and weakness in the Kidneys, which do not draw the ferous humour, whence it comes to pass, that it being translated upwards, becomes the matter of the Catarrh. If that Symptom had continued, the means propounded by the same *Mercatus*, for the stoppage of urine in children should have been used, as Clysters, opening

Riversius.

Broths, &c. *Claudicatio*, or, Leanness.

XXXIX. Children, though they be exposed to infinite other Dangers, yet their condition is especially miserable in this, that the heads of their bones, chiefly of the Thigh-bone, part and separate from the rest of the Bone, sometimes upon a slight occasion. That this conjunction is very lax in Infants and young Lambs, &c. if you boil them, the thing it self shews: for the *os pubis* may be parted from its *diapophysis* with a small impression of the fingers ends onely. If the Parents be negligent, and those that look after them, put them too soon to their feet, it gives great occasion to this mischief. In Children and Youths oftentimes the same separation of the head of the Thigh-bone from the neck of the bone happens, and it is commonly taken for a disjuncting. This error in Diagnosticks often hinders the cure, and costs the Patient dear. In both cases indeed extension is necessary; but it were far better to know the very truth of the matter, and by judgment to comprehend it.

Rolinsecius.

Convulsio, or, A Convulsion.

XL. Let no man wonder, that I persuade to Bleeding of young children, since Blood, as far as ever I could observe hitherto, may as safely be taken out of their Veins, as out of old peoples. And indeed it is so necessary, that without blood-letting we cannot certainly cure some Symptoms which befall children; for example, How can we cure childrens Convulsions, when they are breeding their Teeth, which come upon them in the ninth or tenth month (with Swelling and Pain in the Gums, when the Nerves are pressed upon and irritated by the Teeth, whence these Symptoms arise) without letting of blood, which alone is far to be preferred in this case above the most famous Specificks that are yet known: Some of which doe harm by their adventitious heat, and while they are believed to oppose the Disease by some occult quality, they militate against it with their manifest heat, and kill the Patient.

Sydenham.

XLI. It is incumbent on us to prevent Convulsions in children, or to cure them as they are beginning; For if the former children of the same Parent have been subject to Convulsions, that mischief must be prevented in them that are born afterwards, by the timely use of Medicines. To this end it is usual to give the child some antispasmodick Medicine as soon as it is born; some give it a few drops of the purest Honey; others, a spoonfull of Canary-wine with a little Sugar; others, a spoonfull of Oil of sweet Almonds; others, one drop of Oil of Amber, or half a spoonfull of Epileptick Water. Some within three or four hours after the child is born make an Issue in the Neck; then, if it be of a fresh colour, they draw one ounce and an half or two ounces of blood from the Jugulars by Leeches, having a care that it doe not bleed while it is a-sleep. Let the Temples and Neck be gently rubbed with such an Ointment; Take of Oil of Nutmegs by expression two drachms, *Ol. Capivi* three drachms, Amber one scruple. Hang a piece of Elk's hoof or Pæony root about the Neck. The Nurse must take Antispasmodick Medicines constantly.

Willis.

XLII. But if an infant be actually taken with a Convulsion, because Issues operate but slowly and little, it is expedient to make a Blister in the Neck, or behind each Ear; and, unless a cold constitution hinder, Blood must be taken from the jugular Veins, by Leeches. Liniments must be applied to the Temples, Nostrils and Neck; and Plasters to the Feet. Clysters, which may loosen plentifully, must be given every day. Every sixth or eighth hour specificck Medicines must be taken inwardly. *Untzerus* highly commends the Gall of a sucking Whelp, taken in a little Linden-flower-water. A Learned Physician told me, that he has known several cured with this Remedy.

Idem.

XLIII. When Convulsions proceed from difficulty in breeding of Teeth, as this Symptom is secondary, and not so dangerous, so in the Cure our chief and principal aim need not be directed to it; but sometimes we may be solicitous for easing of Pain, and for removing the febrile intemperature. Wherefore both the Patient and his Nurse must use a spare and cooling Diet, the Gums, where the Teeth are coming out, must be rubbed or cut open; and when the parts are swelled and pained, Anodynes must be applied, Clysters and Bleeding are often proper in this case.

Idem.

XLIV. Sleep must be procured, and the raging of the Blood laid; In the mean time Antispasmodick Medicines must be used; but temperate ones, and such as do not disturb the Blood and Humours. Blisters, because they evacuate the Serum that is apt to be poured into the Head, often give relief.

Idem.

XLV. When children are taken with Convulsions, neither presently after they are born, nor upon their breeding of Teeth, but upon other occasions and accidents, the cause of such an Ail does usually reside in the Head, or somewhere about the parts of Concoction. When there is a suspicion of the former (as usually it appears from signs which argue, that too much ferous matter is gathered about the Brain) the Remedies beforementioned ought to be given in a little larger Dose. Moreover, such as bear Purging well, may sometimes take a Vomitt or a gentle Purge. Wine and Oxynt of Squills, also *Mercurius dulcis*, Rheubarb and Refin of Jalap are of great use.

Idem.

XLVI. When the cause of the Convulsion appears to be in the Bowels, or when Worms or sharp griping Humours are found to be in fault; for the Worms a Purge may be given of Rheubarb, or *Mercurius dulcis*, with a little Refin of Jalap. Formerly I gave a Boy that was strongly afflicted with Convulsions, who was ready to die, a Dose of *Mercurius dulcis* with Refin of Jalap. He had four stools, and voided twelve Worms, and quickly recovered.

Idem.

XLVII. If we suspect that the Convulsion proceeds from the irritation of the Stomach and Guts by sharp Humours, we must either purge or vomit gently, or doe both one after the other. To this purpose gentle Emeticks must be given of Wine of Squills or Salt of Vitriol; if the Patient at any time have an inclination to vomit. But if you shall rather think fit to purge, an Infusion or Powder of Rheubarb, Syrup of Cichory with Rheubarb, or of Roses with Agarick, must be given. And I have often seen the Convulsion cured in children, by giving these Medicines in time. Moreover, in this case, Clysters must be given frequently. But we must not omit to apply external Medicines, Fomentations, Liniments and Plasters, to the Belly.

Dentitio, or, Breeding of Teeth.

XLVIII. Experience testifies that a Hare's Brain is good to breed Teeth: for by its coolness it helps to temper the heat of the Gums, and by astriction strengthens those parts; perhaps it does it by a specificck property: but it may be doubted, because here a hot attenuating virtue seems rather requisite, than

than

than a cold astringent one, since the coming out of the Teeth would be helped thereby. I answer, That things temperately cold, and moderately astringent, do strengthen Nature, so that the Heat having thereby got a temper, may more commodiously perform its operation.

Horstius.

XLIX. *Strobelbergerus, lib. de Dentium Podagra*, mentions a certain bastard Dentition, when some Swellings bunch out in the back part of the Gums, when children make a noise and sibilation as they suck the Milk. The Physician may be ascertained of this spurious Dentition, if he press the child behind the Ear with his finger, for it will presently cry out for Pain. This Evil wants not danger, the best course to get it away, is, to anoint often the external region of the Ears, especially behind, with Hare's fat, and the Gums frequently with Oil of sweet Almonds.

L. It often happens, that all Medicines do no good, because of the hardness of the Gums, or the weakness of the Child. Therefore in such a case, before mortal signs supervene, I would advise the Chirurgion to open the Gums with a Penknife, where the Teeth swell, to make way for the Tooth, and to ease the Gum, which Remedy I have tried with good success in several of my own children. This is better, than as the Nurses doe, to scratch and tear the Child's Gums with the Nails. The Duke of *Nevers* had a Boy who lately died at eight months of age: when I, with the Physicians who were there, did narrowly enquire into the cause of the Patient's death, we could find no other but the excessive hardness of the Gums, which was not meet for that Age; for so the Teeth could not make their way: Of which opinion this was an Argument, that when we had opened the Gum with a Penknife, all the Teeth appeared ready to cut, only they wanted a little of this help.

Parac.

Diarrhaea, or, A Loosness.

LI. I had a Boy about three years old under cure for a long and desperate Flux of the Belly, sometimes dysenterick, sometimes lienterick, for which I used many things both internal and external, but in vain. At length, when there was little hope, and the Mother was brought to bed again, I persuaded her to put her new born Daughter to another Nurse, and to give her Son of three years of Age suck again. She followed my advice, and the business succeeded so well, that, by degrees, the Loosness stopt, and he recovered his strength, so that now he lives lusty and well.

Hil Janus.

LII. Sometimes childrens bellies are loose from the corruption of Milk, which degenerates into a porraceous or green colour: In which sort of Flux, though it may be questioned, whether it may be stopt, because it looks of such a colour as is reckoned altogether preternatural; yet we must not think so in children, since the Greenness proceeds from the roasting heat, which portends always destruction, but from the quality of the Milk and mixture with a bilious Serum. Wherefore the Loosness must not be stopt, but the Stomach must be strengthened, and alteration must be made. ¶ Because sometimes fowre green excrements use to come from children, with or without curdling, we must consider, why such things appear in children, and smell so fowre, when they are otherwise well? Since it is certain that the Greenness in them comes not from adustion, as in hot Diseases of the Liver and Veins. I am bold to affirm, that the greenness comes from cold, but not from cold matter only, but from heat and cold, that is, from a bilious and a pituitous matter. For oftentimes such excrements appear in children which have a hot Liver, and breed much Bile, and a cold, raw Stomach, which causes that fowreness in the excrements: For it is certain, that neither the greenness nor fowreness can

Mercatus.

come from Bile alone, and therefore Bile comes from the heat of the Liver; nor do they come only from Phlegm and crude Milk, but from both these together, with Bile going altogether into the belly, and by the natural heat of the belly the corruption of the white Milk and yellow Choler, being matter unfit for Chyle, a corruption is made, which degenerates into an excrement of a green colour. ¶ *Sylvius* derives these green stools from an acid sharp Bile turning green, which change of colours is no strange thing to Diets. And, he says, the green colour is owing to an acid, partly by reason of the fowre smell, which always attends it; and partly from the change of the Bile into a green colour by some Acid. And he places that Acid in the Pancreatick Juice, contrasted partly from the bad Diet of the Mother, and partly of the Nurse. He places the Cure in the correction and tempering of the Acid.

Quassatio vertebrarum Dorso, or, A Wrenching of the Back.

LIII. *Galen, 3. de Artic. text. 2.* reckons up four Luxations of the vertebrae of the Back; among these he reckons *stasis*, that is, a wrenching, when the joining of them is loosned, they remaining in their places. They that are troubled with this, complain of a Pain in their Back and their Stomach, their Appetite is gone, some People Vomit, their Head akes, a febrile Heat takes them, yea oftentimes a violent Fever, equal in Symptoms to a malignant one. The cause is imputed to the Mother's carrying some great burthen, or inordinate motion of her Spine. This is their way of cure in *Germany*; They set a piece of Wax-candle lighted to the childrens Navel, and set a Pot upon it, like a Cupping-glass, and they let it stick there till it fall off of it self.

Sennertus.

Epilepsia, or, The Falling-sickness.

LIV. Most children have abundance of bilious meconium when they are born, which I use carefully to purge, otherwise the following nutriment is corrupted, and Milk is coagulated, whence come Gripes, and because of malignant Vapours arising, an Epilepsie follows. If this connate excrement be rightly purged either by the Strength of Nature, or by Medicines, children are preserved; but if not, they are either troubled or killed with an Epilepsie. I use *Syr. Ros. mosch.* or *Elect. de Manna*. ¶ *I Rager, Misc. contr. p. 996.* have seen children taken with an Epilepsie; together with Gripings and green stools. This was helped not by Antepileptick Powders, nor by searing the hind part of the head; but by cleansing the first ways with *Mel. rosar. solut.* and Syrup of Cichory, with a few drops of Spirit of Vitriol.

LV. For childrens Epilepsie the *Italians* burn the head behind, and make an Issue there for evacuation of the humour. *Celsus, l. 3. c. 23.* approves of it, and *Rondeletius*, because it may doe good in an Idiopathic one, but not at all in a Sympathick one. Others, as *Sennertus*, disapprove of it, because of the Pain it would put the tender bodies of Infants to, which therefore can neither well bear Purging nor Bleeding. But the case is not the same: for Catharticks exert their violence upon the Bowels, and by their malignity may easily hurt the substance of Infants, which is easily dissolved. But Causticks are only once applied to the external parts, and evacuate the noxious humours slowly, without great pain. ¶ As well for the cure as prevention of this Primæviæ Disease. Physicians have found a present Remedy, Burning of the Head behind, which, as it is very safe, so also it evacuates the troublesome Phlegm, and makes revulsion, interception and derivation of it, with manifest benefit. For the said inuision (though *J. B. Sylvaticus, contr. 87.* dissuade it) is so frequent at *Florence*, that very few children can be found, who have not undergone it. Having therefore shaven off the Hair behind, let an oval, oblong Iron,

answe.

answering to the hole behind in the *occiput*, be made red hot, and, for prevention, in children let the cavity be gently touched: But, for the cure, it may be set harder on, in the very fit; and when the Ulcer has been kept open several days, it may be so done twice or thrice.

Sculetus.

LVII. And that you may know when and how to use this wholesome Remedy, Know that it is good for those children, who have had an Epileptick fit of any long continuance, and when there has preceded a sensible preparation to it. Secondly, It is convenient, without tarrying for the first fit, in them that carry a hereditary Character, to make an Issue; for the urgency of the Disease requires it, and (when it has contracted a habit) the severity of it; for afterwards it is cured with difficulty, and an Issue does little good: and also the tender substance requires it, which even from one fit contracts an habit.

Mercatus.

LVII. But, for the right use of this Remedy, you must remember, that when there is onely some small epileptick affection, concerning which it may be a question, Whether it be epileptick, or arise from Fainting, it is not proper to use this Remedy presently, and it were a rashness to open the Head immediately: 1. Because if there hath been no previous affection in the Head, that requires this Remedy, it were erroneous to doe it, onely for fear of an uncertain event. 2. Because Physicians, who use this Remedy, are bound to keep the place open, the greatest part of their Patients lives. The reason is, Because what expires and is purged by it at that time, is either an epileptick Apparatus, which we know in three or four years time is wholly purged out, a new one breeding like to the found part of the Head, which being bred, we may safely close up the Issue. But if there be none of this Apparatus in the Head, it is evident, that that onely can be purged, which results from the natural cohesion of the Brain; and because this breeds all ones life time, it is necessary that the Issue continue as long: If you close this up, you may certainly conclude, that Epilepsies, Apoplexies, Convulsions, Palsies, &c. may easily breed; or, that those excrements may fall upon the Breast, Stomach or Heart, as we find by certain experience.

Idem.

LVIII. An Issue must also be made with the hand of a skilfull Artist, for I have often observed from an inextrous way of making an Issue in the *occiput* a thousand mischiefs and death has followed: for if the Chirurgion try to burn all the Skin with the Iron, I have often seen a Convulsion follow, and the child die of a most cruel death: And if that do not follow, if the hole be made too wide and deep, a fluxion is raised to the back and nervous parts, whereby the children grow crooked: for he that would use this Remedy with security, must consider, that it is enough to burn part of the Skin for the cure and prevention of it in children: for it is sufficient, that the Head be purged by the cutaneous Veins, without having any thing to run at the greater and deeper Veins of the Head, whereby it is often weakened, and made liable to a thousand disasters. Besides, that when we would close the Issue, it may be done without any danger, whereas it is quite otherwise, when it is made deep.

Idem.

LIX. Among things that cure several Symptoms in the Epilepsie of children, Aniseeds may be reckoned for one. For seeing most of their Diseases, especially the Epilepsie derives its original from Phlegm, Wind and Worms, this Seed deserves great commendation, because by its aromack virtue it cuts Phlegm, dissolves Wind, and kills Worms with its Acrimony. It may not therefore without benefit be mixt with childrens Powders.

Grube.

LX. For they must not be heeded, who without distinction commend Powders of mere Astringents, Coral, burnt Hart's-horn, Crabs-eyes, Man's-skull, &c. though these by their astringent virtue

strengthen the weak parts in children, and so doe much good; yet we must have respect to the cause, which makes children subject to frequent Catarrhs and Coughs. Which things being so, I use the following Powder, the use whereof I have often experienced, giving a few grains, according to the Age; Take of burnt Hart's-horn 1 scruple and an half, Powder of root of Peony, Florentine *lin*, Aniseeds, each half a scruple; hoof of an Elk prepared 4 grains, Oriental Bezoar-stone 3 grains, Magistery of Man's-skull, Crabs-eyes, each 1 grain, a little Sugar: Mix them.

Idem.

Febris, or, A Fever.

LXI. I judge, that all the time of sucking, if blood must be drawn, it must be done onely by Scarifying, and no other way, till the child be three years old. And if the child be weaned before that Age, you must rarely cut a Vein, unless the child be one of those that *Celsus* describes for strong ones, or if the Disease be a Quinsy, Pleurisy, or some such dangerous one.

Mercatus.

LXII. Both the inconvenience of pain from Scarifying, and of loss of strength by opening a Vein, may be avoided by applying of Leeches. But neither do they want danger; for besides that according to *Walaus* his opinion in *sua methodo med.* they draw arterious rather than venous blood, it is a very hard thing to stop the Bleeding; so that Physicians, who prescribe them, do always order a small quantity of blood, because oftentimes the bleeding exceeds, against their will. I experienced this in my eldest Son, whom I bled with Leeches in a burning Fever, when he was about four years old: In the morning I set about three to the bending of his Arm. The blood seemed as if it were stopt: But in the night it burst out again in such abundance, that he was almost drowned in it, which weakened him so much, that I gave him up for dead. It could scarce be stopt with the mixture of the white of an Egg and Carpenters riddle which I took up one day, as I was walking. But by God's blessing the event proved well: for the next day his Fever left him; but he looked pale for several days.

LXIII. In the months of *July*, *August* and *September*, a great number of sucking children dies, which the Women hold to be ill of Worms. But I maintain that their death proceeds from the sharpness of the Nurfs milk, whereby the Stomach is inflamed; for there is coldness of the extreme parts, unquenchable thirst, great anxiety, squeamishness, vomiting and looseness; Wherefore a Vein must be opened: then apply to the region of the Stomach a Cataplasim of Barley-flower, boiled in Goat's-milk, with a little Juice of Nightshade, and Oil of Roses. The Nurse must be changed, and Mucilage of Seed of *Psyllium* must be given with Sugar of Roses: Chicken-broth altered with Purslain, Sorrel and Lettuce: Also the Heat must be drawn outwards, by applying Animals split in the Back.

Pachecius obs. 56. Riv. com.

LXIV. If a lingering Fever arise from Obstructions, there is nothing better, according to *Montanus*, *conf. 10.* than an Infusion of Rheubarb in Endive-water. He says, he never met with a Fever from obstructions, which was not cured with this Remedy, if the use of it were constantly kept to. The Infusion of Rheubarb, now in common use, is made of half a drachm, or a drachm of it, grossly bruised and tied in a bag and infused in two or three pounds of Spring-water cold for a day. The use of it may be continued a month or more, according to the contumacy of the Disease.

LXV. We must not give Spirit of Vitriol, Sulphur and the like to sucking children in Fevers, or any other Distempers, as we find them commended by Practitioners in their Books; seeing by taking them Milk is curdled in the Stomach.

Hormannus

U u Hydrocephalus

Hydrocephalus, or, The Dropie in the Head.

LXVI. In an *Hydrocephalus*, if abundance of water be gathered without the *Cranium*, the use of Medicines both internal and external is usually vain: for as strong internal Medicines are not proper for this age, so moderate or weak ones doe no good, the case is the same in externals. Wherefore we can have no hopes in any thing but in a sensible evacuation of the humour. Now this evacuation must be made by Chirurgery, i.e. by Section; in performing of which we must observe what *Aetius* and *Paulus* write, that if the Swelling have an high top, it must be cut at once, but if it be broad, it must be cut at two or three times and places.

Mercurialis.

LXVII. Some make running Ulcers with Caustick Medicines, which Cure childrens heads cannot well bear, though they be good in other cases. Others advise Burning round the head in divers parts, which sort of Remedy they are far less able to bear, because the substance of the Brain is very tender. Besides, the water will neither be discharged quickly, nor as it should: And it is certain, that the Skull, if the water abide there long, will be prejudiced, which makes it more dangerous. And *Mercatus* disapproves of *Mercurialis* his opening the Head in two or three places, because the water is too suddenly discharged; which is prohibited in these Diseases.

LXVIII. It must be observed also, that Section must always be made in the nethermost part, because evacuation may much more easily and readily be made, when the water has declivous places to run out at.

Idem.

LXIX. You must moreover have a care you do not cut near the temporal Muscle, till the water fall to one side of it, and then you must open carefully in some remote part, and apply upon the aperture Lint, with the White of an Egg, and Oil of unripe Roses.

Mercatus.

LXX. When Section is made, the humour must not be evacuated at once, but by little and little: And if this must be done in a Dropie of the Belly, it ought much more to be done in a Dropie of the Head, which is the seat of animal Spirits.

Mercurialis.

LXXI. *Aetius* his advice must be followed, if children be strong, that Medicines must be strait tied down; but if they be tender and weak, it will be enough to cover the wounded place with soft Wooll or a very soft light Cap.

Idem.

LXXII. If the tumour proceeds from the Ichors of other humours, which tumour *Avicenna* calls *Atas*, he advises that the Nurse be fed with cooling things, as Pisan and Barley-water, to apply Oil of Violets to the Head, and to abstain from Bathing; because bathing with warm water heats the Head more.

Idem.

LXXIII. A child newly born was ill of an *Hydrocephalus*, all over his Head, with a great dilatation of the Sutures; I cured this Disease perfectly, onely with *Guido's* Swathe, made in form of a Cap, where-with the whole Head was rolled, the two ends being tied in a knot. The said Swathe was renewed every day, and within fifteen or twenty days, the Swelling vanished.

Formis, obs. 6.

LXXIV. And you must have a care in this case how you make an Issue behind in the Head: for by communication of Veins, the water may easily fall on the Tendons and Muscles of the Neck, upon which it may be feared that mortal Convulsions and other Diseases may grow. It is better in a strong child to make an Issue in the Arm, when other Remedies will doe no good.

Mercatus.

LXXV. Sometimes a Contusion happens in the child's head, by reason whereof a great Swelling full of Bloud arises, to which the name of *Hydrocephalus* suits but improperly. And it is caused either by the Midwife's fault, who bruises the child's

head in the Delivery; or by reason of some vessels being open by the forcing of the child to get out, some of the Serum and thinner part of the bloud going out by it. And it may be the Nurses fault, in letting the child fall, and dashing it against a thing, or in binding the head-bands too strait, whereby the veins and arteries, that are then tender, are compressed. This serum and bloud is diffused between the Skull and the Skin, sometimes upon the crassa meninx, and sometimes upon the Brain it self. If the Contusion be slight, it may be dissolved by the help of Fomentations and Liniments; of a Decoction of Roses, Flowers of Melilot and Chamæmil; adding a Liniment of Oil of Roses and St. John's wort mixt together: or applying a Plaster of *Diachalcit.* and *Diachylum Ireatum*: But if the Contusion be great, it will be in vain to try to dissipate it by Discutients, according to Experience. ¶ I have a Daughter called *Elizabeth*, thirteen years old, born before her time, that is, fifteen days before the seventh month. By reason in the Birth she could not force, because of her Weakness, the whole affair depended upon the Mother and the Midwife. But the Midwife, drawing out the Girl by main force, so bruised her head, that for two months after she was born, she voided clotted black bloud at her mouth, nostrils and ears. In the mean time whatever Food she took, it was not given her by the breast, but in a spoon. She was swathed double round her body, while her Nails were wanting: But when the time was over, that she ought to have remained in the Womb, she began to take the breast and to thrive. In the eighth month she began to pronounce some words. And this present year 1681. she is brisk and well, and almost fit to marry.

Guillemeau, de educatione infantum, cap. 17.

Imperforati, or, They that are Imperforate.

LXXVI. It was *Albucasis* his Judgment, that Midwives ought very carefully to search children when they are new born, and if the hole be stoppt, to open it gently with their Finger, or with an Instrument, and then to lay on Wooll wet with Wine and Oil, then to cure it with Unguents, to put in a leaden Pipe, and keep it in. What I say concerning the urinary passage being stoppt, the same may be said of the anus. And, first, we must diligently consider, whether the anus can be perforated without danger to the sphincter: For if it so happen that the whole Muscle be grown together, and so Nature have made a way through the vulva it self, as I observed in a certain Girl, Perforation must not be attempted, because most certainly the Muscle would be hurt, and one evil would be followed by a worse. But if it any way appear, that onely a Skin is grown over the Muscle, then the place must be marked carefully, and a round Iron must be put into it, and we must proceed as in other cases, with Medicines and Pipes.

Mercurialis.

Labiolum Fissura, Tumor, or, Chapping of the Lips, their Swelling.

LXXVII. The Cure of the Fissure of the Lips consists in two things, in restoring the continuative moisture, and in agglutination or union of the divided parts. But because neither the continuative moisture can be restored, nor the parts united, unless care be taken that no new matter flow to these parts, it seems very necessary, that the body be kept clean, and to accomplish this end, it will be very good, unless the Skin of the Head be open, to open it gently with vitex or Mustard, and then to apply Mallow: For, as *Hippocr.* lib. de Sac. morb. says, Whenever childrens heads run any moisture at an Ulcer, always the Flux is retracted from other parts of the body, which of consequence remain safe.

Idem.

LXXVIII.

LXXXVIII. It often happens in Children, and other tender bodies, that gentle things (which must be moderately astringent and dry, without any asperity, but with a little viscosities) do no good. Such as in a hot cause are unripe Oil of Roses, Tragacanth, Juice of Gall, Pomegranates, old Fat of a Hen, Calves Marrow, &c. In a cold cause *Mel rosarum*, Tragacanth, Gum-Arabick, Mastick, &c. We must proceed therefore to such things as are drying; but yet among them we must have a care of very dry things. *Agineta* commends Turpentine with Honey, and Hogs Lard. And if the things proposed do no good, let a little more drying things be added, as half an ounce of washed Ceruis, or Litharge, more or less. If the pain be very troublesome, a little *Opium* may be mixt with the Womans Milk.

LXXXIX. I have a Son 7 years old, who, after obstructions of his Bowels, and the Swelling of his Belly, had his upper Lip much swelled and scabbed. When it refused all internal Remedies, I ordered two Issues to be made between his Shoulders with the Caustick stone; out of which much corruption ran, the Swelling of his Lip asswaged, and the Scab fell off, Anno 1680.

Linguae Frænum, or, Tongue-tiedness.

LXXX. In cutting the *Frænum* of the Tongue, the adjoining parts, and the branches of the Veins, must be very carefully avoided; yea, the Salival Ducts, in the sixth pair of Nerves, are so near to this string, that they might very easily be hurt by deep cutting, whence a continual Salivation is raised.

LXXXI. It is almost a common custom, either for Midwives to break the Bridle of Childrens Tongues with their finger as soon as they are born, or for ignorant Barbers to cut it with a common Lancet: for they think, according to the opinion confirmed by the authority of very learned Physicians, that the speech will not be perfect, if this string should remain whole; but they are much mistaken: Indeed, it cannot be denied, that sometimes the string of the Tongue wants correction; yet I make bold to affirm, that the error of the Midwives especially is intolerable, who try to break it in all, when I have known many speak well without breaking it; but several, who have immediately been almost choked with blood, and a little after died, because an Inflammation arose, which causing pain, hindered sucking. If therefore we suspect any such fault in the Tongue, it is expedient to defer the Chirurgery till the time of speaking, or to have a skilfull administration of it, according to *Aquapendent's* way.

LXXXII. In the mean time it behoves the Chirurgeon to know this, that among an hundred Children, scarce one can be found, which wants this Chirurgery; and that those Midwives are silly and ignorant, who cut all Children as soon as they are born, whereby they deprive Children of their Milk, and, other accidents following, of their lives.

LXXXIII. A Midwife cut a Girls Tongue, after her fashion, with her finger: Pain and Inflammation followed, which hindered her taking of the Breast. Her Parents thinking that the Midwife had not done it sufficiently, called a Chirurgeon, who, with equal ignorance, to mend the matter, cut both the ligament and the vessels of the Tongue, from whence the blood fell into the *Aspera Arteria*, and killed the Child in three days. When the Child was dead, the Nurse began to complain of a Swelling in her Breasts, from some Curdled Milk, and her right Breast being ill treated, degenerated into an exulcerated Cancer. ¶ A Girl new-born when her Tongue was cut, was not able to suck the Milk for Pain: And the Milk curdling in the right Breast, she laid the Child to the left for a while: A little after she observed in her Daugh-

ter the *vertebrae* of the Back distorted, towards the right-side, to which distortion, that could scarce be amended, the laying the Child to one Breast gave occasion.

Maculae, *Nevi*, or, Marks and Moles.

LXXXIV. I think Spots and Moles contracted in the Mothers Womb, may be cured; and I reckon those which Children bring into the World with them not altogether incurable, unless they be near the eyes; But in cutting Tubercles and Spots we must be very careful that they be all cut out, and that nothing of the skin or flesh, which is coloured, remain: for, they use to grow again.

LXXXV. *Georgius Segerus Ephemer. German. ann. 3. obs. 198.* disapproves of the way of taking off those Spots, by anointing with the blood of the Secundine. He says, that a Maid had the Back of her left hand, almost all of a fiery-red colour, by reason of the Mother's apprehending a sudden Burning, when she was with Child; the fright making an impression on her left hand. She, by the advice of an old woman, had besmeared the discoloured place with the blood of a Secundine; but it was so far from taking off the Spot, that it caused a great Inflammation, with much swelling and pain, which the Chirurgeon had much ado to stop, the Mark remaining notwithstanding.

LXXXVI. The best way of removing the maternal Marks, is by Section, which is easie, if the Tumour can be tied about the root with a thread, and such things applied, as may commodiously intercept, or make revulsion of the affluent humours. But we must have a care, that no Artery, nor any great Vessel, especially a Nerve, be hurt; for if Nature permits the loss of the Nose, an Ear, or Eye, without danger of Life, why may she not use the same liberty in her spurious productions? A Child was brought to me, over both whose Eyes, and all its Forehead, there were soft red excrescences. I undertook the Cure, and I quickly cured the Child of them all with good success. And this is not the only Swallow I have seen.

Obstructiones, or, Obstructions.

LXXXVII. Whether is it necessary to give Purges before Aperients to all that are troubled with Obstructions? Which many Physicians religiously observe, without any distinction: Whereas it is evident from the *methodus medendi*, and from certain experience, that obstructed Bodies rarely admit of purging Medicines before the obstructions be a little opened; because Purgatives draw the disturbed humours to the parts affected, far more than other Medicines, whereby the Patients are far more hurt; for the parts so affected can neither receive them, nor suffer them to pass through, which uses to prove grievous; besides, they often vomit up their Purges, or the Purges do not work, and they bear them ill, and sometimes a Jaundice follows. We must conclude therefore, that for the elder sort, it is both usefull and necessary to Purge; because usually there are excrements gathered from a bad course of Living, which, unless you Purge before you give openers, you will do far more harm. For all that are troubled with obstructions are voracious, especially the greater, and Females. Moreover, you must Purge those bodies, in which the juices are not distributed, because of obstructions, do redound, and wander to and again in the passages of the Ducts, of which nature these juices are. In all which, but with prudence, we must take care to Purge with such things, as the region, in which these superfluous humours are, and the nature of the humours do require, so the Medicine draw not the humours from far, nor be given in a large quantity; for this would be vomited up again;

again; and the other would draw to the parts obstructed; which, because they are obstructed, cannot receive these juices, and it may be feared, that the body may be disturbed, and grow worse. But in Children, and in all others, who abstain from bad and abundance of food, it is not always necessary to purge their bodies, but either having first made them vomit their crudities, or given Clysters, or Syrups, that are moderately extergent and concoquent, we may safely give opening Medicines, especially when for some days before, a spare and a legal course of meat and drink has been insisted on, and when the Medicine has Steel in it; for that Medicine exerts its virtues, and operates only in the parts, where it is received, and not in those that are remote, as other deobstruents do, which pass to the organs of Urine, and to the Womb: for it tends downwards to the belly, and cleanses those ways, although by its sulphureous faculty it communicate its virtues to other parts, without any damage. But if there be much excrements in the first region, or for some other reason, or to satisfy the vulgar, make no matter of purging by turns; when you give a deobstruent Medicine, every fourth or fifth day. For, to purge all indifferently, before taking of deobstruent Medicines; or, to purge none at all, is erroneous.

Mercatus.

LXXXVIII. It is sufficient for such as have a cold Belly, and abound with crudities, to give a little Honey of Roses seven or eight days before taking of the foresaid Medicines, especially if you add a little of the decoction of Cinnamon, Sassafras, or Fenil, with a draught of very hot water. And then I use to recommend exercise the same days early in the morning. And Fomentations will be of great use, which may be applied every third day to the Belly, and parts obstructed, of a decoction of Capers, Wormwood, Dodder of Time, Chamæmil, &c. If the Liver be out of order, the taking of Syrup of Cichory, *de duabus radicibus cum aceto*, with Water of Grafs, or Sowthistle, or *Scorzonera*. Nor will it be improper to add an ounce of Water of Rheubarb, that something may be cleansed, and not purge violently. But if you have a mind to open the Spleen, it will be proper to give Syrup of Hops, Liverwort, and *Byzantium*, and Borage, with Water of Tamarisk: And for those that are so held, I do not disapprove of mixing something purgative withall, such as a decoction of Pennyroyal; or an infusion of 2 drachms of the pulp of the Seed of *Carthamus* in a rag: for whom also Fomentations applied to the region of the Spleen will be good.

Idem.

LXXXIX. When the Body is prepared, the Question is, Whether it be always convenient to open obstructed Bodies with Medicines, which have Steel in them? Or, Is it sufficient in some to use those things which the Ancients recommended for this purpose? In which case indeed I think it is sufficient for them that cannot use vehement exercise, and it is confirmed by many experiments, to take Medicines, which have no Steel in them; for Steel Medicines require laborious exercise, and the others not. The virtue of Aperients, and the form of the Medicine, supplies the defect of Exercise, or a very little suffices. Whence it is evident, that these aperients are more proper and safe for Children, unless the obstruction be so old and stubborn, that these will do no good, then the urgency of the case forces us upon chalybeate Medicines.

Idem.

XC. And we must show, how we prepare and give Chalybeate Medicines. I advise, in this tender age, to give some aperients without Steel for several days; but if they do no good, then we must be necessitated to give things with Steel in them: If therefore we must begin with them, let the body be exercised some days before, giving one spoonfull of Honey, and drinking a little water after it. Chalybeates are made, either, 1. In a

potable form, in manner of Syrup, or 2. In form of an Electuary, or 3. In a solid form. You may make a Syrup of the froth of the Steel, which arises from a decoction of the Limature, several times washed, made in water of Grafs, Hops, Hartstongue, adding to the water and the froth, juice of Apples, Cichory and Hops, with Sugar; or, Take of water of Tamarisk, Grafs, Hops, Dock-root, each three ounces. In these, quench half a drachm of filings of Steel red-hot; heat the like quantity of filings of Steel again, and quench them in the same water, and doe so five times with new Steel. Give 1 ounce of this water to Children, and make a Syrup of it with juice of Hops, Borage and Cichory, and give one ounce and an half. An Electuary may be thus made; Take of Quodiniack of *Scorzonera* three ounces, Syrup of Maiden-hair 2 ounces, Powder of Bezoar-stone 1 Scruple, Powder of *Diamarg.* and *Triasant.* each 2 scruples. Mix them. But I must tell you, it is necessary, for a few days, between whiles, to give a little Rheubarb-water (which is thus made; Take of water of Hops, Grafs, Maidenhair, or Cinnamon, two pounds: Infuse three drachms of Rheubarb powdered) with Syrup of Cichory, or *Scorzonera*, or three or four spoonfulls of Syrup of Cichory with Rheubarb: for it wonderfully carries off the superfluous humours of the belly and mesentery by stool; especially, if you add a little of the decoction of Seed of *Carthamus*. In taking of which Medicines you must observe this order, that the Child, either before taking of this Medicine in a solid form, drink a draught of diuretick water warm, or after it. And a thing which I rather approve of, is to sleep a little upon it, as long as may suffice, to dissolve the Medicine, and then to use exercise. ¶ *Specificum Intestopham*, used much by the Physicians of *Schaffhausen*, will answer all intentions; Take of White Sugar-Candy two ounces, Volatile Salt of Soot half an ounce, Root of Florentine Iris 2 drachms, Root of *Aron* prepared, *Diaphoreticum Joviale*, *Diaphoreticum Martiale*, prepared Crabseyes each 1 drachm. Mix them. Make a fine Powder. If you add Anniseeds, Nutmegs, or Cinnamon, each half an ounce, you will have a Powder, inciding and dissolving viscid humours, tempering and absorbing the acid and austere ones. The dose from five grains to half a Scruple, in some Syrup, morning and evening.

Idem.

M. Th. Zwinger.

XCI. In Children, that are troubled with obstructions of the Mesentery, if they be not lean, nor cholerick, nor have a hot Liver, and be not thirsty; but have a soft flesh, a cold Stomach, squeamish and inclined to Vomit, full of crudities; and if the obstructions consist of Condensated Phlegm, I think it very wholesome to give a little Wine, namely, as much as is sufficient to recall the Heat into the Bowels, to attenuate gross excrements, and help the Obstruction of crude ones, whereby Obstructions and Accidents are far better cured, than by any other remedy, which I find by faithfull experiments and instances. But if you give it, once a day is enough, not mere Wine, but mixt with a little boiled water.

Mercatus.

Oris Inflammatio, or, An Inflammation of the Mouth.

XCII. Whether is Honey of Roses good for an Inflammation of the Mouth? It is affirmed, because Medicines wherewith it is mixt, have, in regard of the Honey, an absterive faculty, and, in respect of the Roses, a cooling one. But, some suspect the taking it. 1. Because of the hot, fiery quality of the Honey. 2. Because it is readily turned into bile. 3. Because it is rather proper for Phlegmatick Diseases. I answer, 1. The hot quality of the Honey is tempered by the Roses, by reason whereof it is cooling, as well as detergent: Wherefore, 2. It is not so easily converted into Bile, as if it were

Horstius. were alone. And, 3. An afflux of Phlegm is joined with it.

Pavores, or, Frightfulness.

XCIII. Whether is Wormwood good for frightfulness? It is affirmed, by reason the juice tempered with Sugar is proper for the antecedent cause, namely corruption of Meat in the Stomach. Nor is it any hindrance, that Wormwood, as they say, affects the head, and by heating, may increase the exhalations, and may cause sleep before the time, which causes this evil. For addition of Sugar corrects the first mischief, when it is made into a Syrup. Therefore, 2. If it be taken after a right manner and season, the other mischief need not be feared. 3. Nor need unreasonable sleep be feared here; because it corrects the cause of it.

Scabies, or, The Itch.

XCIV. Let Mothers have a care that they cure not the Itch in Children, whatever part of the body it be in, unless it corrupt the eyes, ears, nose, and such parts. My eldest Son, till he was seven years old, had not one speck of his body; wherefore I often foretold, that some sudden and mortal disease would seize him. And indeed, being taken with a stoppage of Urine, he died the seventh day of the disease, of a great inflammation of the Kidneys and parts adjoining, which turned to a Gangrene. Nature, to wit, not being able to purge the body of vitious humours by the Itch; they, in the seventh year, as by critical expulsion, fell suddenly from the head, breast, and other parts, upon the Loins. In my practice I have met with several diseases, internal and external in Children, in whom, either Nature had not expelled the Itch, or it had been cured violently. Therefore let the honest Physician, abstain from Medicines; And if there be a necessity, let the Pain of the Itch in Children be mitigated only with fresh Butter, or with it waht in Rose-water, or with Creme. ¶ Children are very often taken with an Itch in their hands and feet, when the rest of their limbs are untouched, by reason of their voraciousness, which, if you should heal with Licharge, Quicksilver, Oil of Bays, and a little Brimstone, as Empiricks doe, you may presently cure them of the Itch, but you will put them in present hazard of their lives, because you partly hinder the circulation of the blood, and partly repell the excrements of the third concoction, as when you anoint on the cutaneous veins and arteries.

Simon Pauli. ¶ In this sort of Ail, the Parents always desire help of Physicians, or old Women. But if any one will but consider it seriously, beginning with the nature of the thing, he will find nothing more needless; than a Medicine for it; for, by applying any, all we doe, is but to weaken the Childrens strength, so that the recrements being kept in, grow more furious, and, it may be, fall more violently (as they often do) upon the principal parts. Wherefore, I judge the cure of this present Ail, and the care of the internal recrements, must be committed to Nature onely, because she alone will insensibly, by little and little, and most securely separate those vitious recrements from the nutritious substances, and will insensibly also transmit what is amiss into the ignoble parts, that is, into the Skin nearest to where, they are most prevalent. And when she has bred much good aliment, and very little bad excrement remains, she takes care to dry up the foulness transmitted to the Skin, and makes it separate and fall off, the Skin remaining whole and sound underneath, which will receive no more, because there is nothing remaining to be separated; and if there be anything, it is either destroyed in the place, or the Skin being whole, digests and dissipates it, and permits it to go out

freely, without making any abode there, so as to turn to the Itch, as it did formerly. By which prudent Patience alone, I have known several Children restored to their perfect health and beauty; whereas I have seen others ruined, by using unreasonable and useless remedies.

XCv. But let no Man think, that it may not be holpen by any means, nor in any case: Let a Man consider, that if with the recrements there be any thing of the Venous kind, the abundance whereof has with it heat, and falling down with the recrements, signalized the Itchy parts with inflammatory dispositions and redness, especially if there be a Fever; then indeed we must cure with cupping and scarifying the Armes and Shoulders, or, for greater revulsion, the Thighs; to draw to them what is redundant in the body; which when done, you must give the Child and Nurse attemperating things. But, if it appear, that the Venous kind has, besides the heat of blood, something bilious, salt; or disaffected, it will not be amiss to Purge gently: This one thing nevertheless observed, that you never attempt to apply anything to the Itchy part, since it is certain, that seldom any thing does good: for oftentimes you may render the part more tender and soft, so that if there be any thing in the body, the Skin more easily receives it, and when it is received, makes the Itch worse; though the scabs and pustules, that were there before, be fallen off.

XCvi. But if the pustulous Itch increase so, that it will neither give way to change of Age, Diet, nor Medicine, but by an invincible Itching, and for fear of a Leprosie, force us to these greater remedies, especially if the Patient be in danger of a Consumption, then we must take care, by other Medicines, which, besides that they Purge radically, do substantially moderate and temper the Liver, and repair it with new nutrition, and which also have the faculty of rarefying, purging and cleansing a filthy thick Skin.

XCvii. But let not any Man think, that there is no time when we may apply things to the Itchy parts, that the Scabs may either ripen, or dry and fall off. And let a Man consider, that it must be done then especially, when it appears the Disease is towards the declension, and less Scabs and Pustules break out, and what is broke out more easily falls off; It is a sign indeed of paucity of matter, and of the vigour of the faculties, because it wastes more insensibly, and breeds less, or less remains of what is contracted from the Nativity. At which time Nature must be helped with things that neither repell nor draw, but onely soften the Scabs, dry up the fretting running places, and absterge the foul.

Scrophule, or, the King's Evil.

XCviii. Great Prudence must be used in treating Children in the King's Evil. 1. Gentle things must always be used. 2. Violent Medicines must be avoided, because there is danger of raising a Fever, and lest their tender flesh should be hurt. 3. The Swellings must be treated neither with fire nor the knife, which are near the Arteries, or great Nerves, especially about the Neck, lest the rever-five Nerves be hurt.

Sirasis, or, Head-moldshottennes.

XCIX. I am compelled to take notice of Avicenna's mistake concerning Childrens Sirasis. He took all that Rhases and Paulus wrote concerning Childrens Sirasis, and put it word for word into his Chapter of the Erysipelas of the Brain, and defined it to be an Erysipelas of the Brain, which Diseases are quite contrary; for an Erysipelas is an Abscess, with inflammation coming of yellow Choler, which, if

it seize the Brain, as *Avicenna* thinks, there will be a Fever, and a *Sphacelus* of the Brain, which usually kills the Patient on the third day, *Casp. 7. §1.* Each of which things is not competent with a *Siriasis*: for it is a far milder Disease and heat of the head than an *Erysipelas*, and it usually takes Children in the heat of Summer, because of pituitous blood, or phlegm it self putrefying about the membranes of the Brain, and inflaming the Spirits in the Arteries with a gentle Fever. You will Object, That the same remedies, with which *Dioscorides* and *Paulus* extinguish the Heat of a *Siriasis*, since they are cold and moist, will doe an *Erysipelas* as much good, which is a hot and dry Disease. But you are mistaken; for, upon the account of the concoction of the Disease, which is an alteration, causing the Putrefaction to cease, the substance remaining, they require the same Medicines. If indeed, by applying cold things to the *Sinciput*, the Arteries of the Temples and Wrists, and Forehead, in the conceptacles whereof the *Siriasis* lies burning, you can extinguish or alter the external heat in the membranes of the Brain and Arteries, which might kindle putrefaction, certainly you have prevented it, and concocted the Disease. And, this very thing you may doe, with the same remedies, in the cure of an *Erysipelas*. But, as for what concerns the cause and substance of the Disease, there is need of far different remedies, which the substance of the Disease, and its cause, will indicate to you. First, A cold and moist Diet was ordered the Nurse; and after I had applied Nettles pounded in a Mortar, with a little *Unguentum Populeon* to the Arteries of the Temples and Wrists, and had renewed them every hour, the Heat of the *Siriasis* was extinguished in less than two hours.

Languis.

Mercurialis.

Ideri.

C. Outwardly almost all commend the Yelk of an Egg, with Oil of Roses. The Juice of Heliotrope is admirably commended by *Dioscorides*, and others. Juice also of Nightshade and Lettuce is good, but especially the Juice of Citrulls, and of Gourds. But we must take notice, not to surpass in these cooling Medicines, lest while we avoid Heat, we fall on the Ice, that is, lest of one bad Disease another far worse should be made.

CI. There is another thing also to be observed, that these Medicines, as all Men advise, be continually changed, and that they be always used warm in Winter time, and actually cold in Summer: Because if they be kept long on, they grow hot and dry, and afterwards doe more harm than good.

Tuffs, or, a Cough.

CII. That a Cough sometimes arises without any great fault in the Lungs, because of Morbifick matter falling on the Pneumonick Nerves, the History of a Girl, who was ill of Convulsion-fits, and of a grievous and continual *Vertigo*, does shew: To whom, when a fomentation of a Cephalick Decoction was applied to her Head, presently her Swimming ceased, and instead of it there came a dry Cough, without any Spitting, which troubled her night and day. Which without doubt happened, because the spasmodick matter was forced out of the Brain into the origination of the Nerves. This merely convulsive Cough seldom occurs in adult people; in Children it is very frequent, and sometimes epidemick: which when at first it has been moderate, afterwards it grows violent and convulsive. So that in Coughing the Diaphragm being drawn upwards, and kept in a long *Systole*, or often repeated, the Lungs are much straitned, and greatly hindered in their motion: In the mean time, because their Breath is stoppt, and the blood is kept about the heart, and therefore stagnates in other places, the Patients are in danger of choaking, and often contract a livid and dead countenance. In this case,

besides spasms, raised by straining to Cough, about the Heart, oftentimes the Stomach sympathizes, and casts all up that is in it by Vomit: Nay, I have known in some young Children; that this Disease has fallen now and then on other parts, and has raised Convulsive motions in the Face, Eyes and Limbs, and sometimes has proved mortal. The Disease is difficult, and usually very long in cure. The principal indications will be to purge the ferrous and sharp humours, drowning the Lungs, out of the blood and bowels, that their tendency to the Brain, and sometimes to the Breast, may be prevented: And to strengthen the Parts, that they may not easily admit the superfluities of the effusing Serum. To these ends, Vomits and gentle Purges are almost always good, and sometimes must be repeated. Blisters are often usefull: yea, if the Disease be stubborn, an Issue may be made in the Neck, or Arm, or about the Armpits, Drink and liquid Aliment must then be taken in less quantity than usual; and instead thereof a Diet-drink of *Sarsa, China*, Sanders, shavings of Hartshorn, and diuretick and antispasmodick ingredients may be used. In this case, some remedies are cried up, as Specificks, such as Cup-moss, given in Powder, or boiled in Milk, and so given frequently every day: A decoction, or Syrup of Castor and Saffron; Decoctions of Root of Peony, Mistletoe of the Oak, and Hyssop, have done good to many: Water of Black Cherries, Saxifrage, and Water of Snails distilled with Whey, and proper ingredients are often willis given with success.

CIII. Whether in Childrens Cough may the Breast be anointed? The Negative seems probable,

1. Because all Anointing stops the Pores of the Skin. 2. And the virtue of the Ointment reaches not to the inner parts. 3. By rubbing of the Ointment on hot the fluxion to the part affected is greater. But I hold the Affirmative; because such Liniments have an emollient, digesting and dissipating faculty. Therefore I answer to the first, That Anointing actually cold, stops the Pores of the Skin; but not that which is actually and potentially hot. 2. It is sufficient to help Nature, and to promote the discharge of the peccant matter outwardly, by occult transpiration. 3. It is granted, that some attraction is made; but it is to the exterior and sound part.

Horstius.

CIV. In Childrens Coughs, which our Country people call the Hooping Cough, Blood-letting gives great relief, and far exceeds all pectoral Medicines.

Sydenham.

Vare Tibia, or, Crooked Legs.

CV. Oftentimes Children about two years old, when they begin to go, are crook-legged, for which their careful Mothers take the advice of Chirurgeons; and they try to set their Legs and Thighs streight with divers Engines, but to no purpose; because naturally, and of their own accord, when they are three or four years old, the Legs and Muscles grow strong, and the Parts return to their natural state.

Formis, obs.

Ventris Dolor, Tumor, Pain, or Swelling in the Belly.

CVI. What remains of the Navel-string after cutting, mortifies, and in four or five days time falls off of it self: And hence, unless you put a linen rag three or four times double about the part, which contracts great Cold, pains in the Belly arise, which are ascribed to other causes. It is a sign this is the cause, for they abate and cease by applying heating things.

CVII. Children are often troubled with inflammation of the Belly, from crude Milk, which is neither well Purged by Vomit, nor Stool. It is indeed

indeed Crudity proceeding from abundance of Food, which exceeds the strength of the Stomach, which, unless it be quickly prevented, degenerates either into tedious fevers, or into a looseness, reaching and vomiting, watching and restlessness: There attends this Disease a gentle Fever, or celerity of Pulse, shortness of Breath, a leaden or pale colour of the Face, and swelling of the Eyes and Face. In which case we must be more solicitous for discharging the abundance, than for strengthening the Stomach or alteration. I indeed endeavour to diminish the matter by Clysters, Suppositories and parsimony of Milk or of other Food. If the Disease go not off presently, we must not stand dodging, but give a gentle purging potion. After which I order such things to be applied to the Belly as have a virtue to attenuate, incise and make lax what is in the Belly, that it may the more easily go off.

Mercatus.

CVIII. In children, yea, and in grown people there is often a hardness and inflation of the Belly, the cause whereof is the hardness of the Mesaraick Glands, and so there is onely passage for the thinner Chyle to the great lacteal Vein, upon which the flesh of the Muscles grows limber, the Body is rendered heavy and tirelome, yea, and at length a Fever and Consumption arises. I use to remove the Disease by this Liniment without any trouble; Take of Unguent. Alth. compos. 1 ounce, Arthanit. Martiat. each 2 drachms; Oil of white Lilies, Chamæmil, each 2 drachms. Mix them. It is good to chew these Trochiscs all the time of the Disease; Take of Steel prepared, Crabs-eyes prepared, each 1 scruple; Tartarum vitriolatum half a drachm, Lapis Prunellæ 16 grains, Spec. Aromat. Rosat. 1 scruple, white Sugar 2 ounces. Mix them. Make Trochiscs. Purgings in this case must be celebrated onely with Cassia, Cream of Tartar and laxative Syrups; for the Glands will not bear stronger Purgatives.

Barbette.

Vermes, or, Worms.

CIX. According to Galen's judgment, 4. Meth. the principal scope in curing of Worms is, to get them out of the Body: But because they cannot easily be got out while they are alive, therefore it is necessary first to kill them, or so to stony them that they cannot resist the Medicines. And the things that kill or stony them are all bitter, sharp, inciding, astringent things and sharp and oily ones.

Mercurialis.

CX. Because these Animals must be cheated, and are delighted with sweet things, the onely way is, always to mix delectable things with such as kill them; and therefore they doe very ill, who give bitter or fowre things alone: for the Worms will not suck plain Poison. But if the Poison be mixt with sweet things, ludificatur lumbrici, as Lucretius says of children, and therefore they draw the Poison with Honey and sweet things. Wherefore Medicines that are given for the Worms, must always be mixt with Sugar, Milk, Honey, or Honey and Water. For my children at home I order an Oxy-mel to be made of the Decoction of Honey, the sharpest Vinegar and Wormwood: For such an Oxy-mel admirably preserves children from the Worms.

Idem.

CXI. In those Medicines that are given by way of Clyster, always sweet things must either be given alone, or must prevail above the rest: The reason is, because these Animals being drawn by the sweetness, come down to the lower parts. On the contrary, in Medicines that are taken by the mouth, the sharp or bitter things must prevail over the sweet: The reason is, because if there were more sweet than bitter, these Animals might easily be drawn into the Stomach, and could not well be killed.

Idem.

CXII. It is worthy observation, that Medicines accommodated to the killing of Worms must by no means be violent: for, besides that the Stomach

is offended by them; the Worms, being disturbed, grow more enraged and cruel.

Idem.

CXIII. The onely time to take all Medicines is, when the Stomach is empty, because if Medicines be given when the Stomach is full, their virtue, which is otherwise weak, is dulled and almost extinguished.

Idem.

CXIV. There is no Medicine which is so generally proper for killing of all Worms, nor so present a Remedy as that they call Coral wort or Seamos. For Mountebanks use this Medicine, and they doe Wonders with it: so that I have seen an incredible quantity of humours sometimes voided with this onely Medicine.

Idem.

CXV. Our Countrey Women think that all children have the Worms; But when none are voided, they say, they are turned to putrid humours; And they are not much out; for as Worms inclosed in a Vial glass, and covered up in warm Dung, do presently turn to slime, why may not the same be done in our Bodies, whose heat answers to the heat of Dung, when the Worms are killed with bitter Medicines?

Pacheguus ad Riv. obs. 17.

CXVI. Sometimes Patients have a Fever with the Worms, and sometimes they have none. When they have a Fever, the coolest Medicines must be chosen: When they have no Fever, we may use hotter things.

Mercurialis.

CXVII. And it is sometimes necessary to kill the Worms, and stop the Looseness which the Worms cause. Wherefore we must use deterfive bitter things, and not astringent ones; lest the Worms, when they are killed, be retained, and putrefie. Let therefore Clysters be made of a Decoction of Lentils or Lupines, and a Decoction of Colewort, to which we may add Roses, Myrobalanes, or such things.

Rondeletius.

CXVIII. It may be queried, Whether Medicines that evacuate insensibly, be proper in these cases, as among others a Decoction of Guaiacum? Without doubt, if we consider the place where the matter of Worms resides, the use of such Medicines will be no way convenient; for this evacuates matter in the habit of the body; Worms are bred in the Guts. But notwithstanding, since the Wood has a Bitterness in it, and the Decoction of it is sharp and very bitter. I think it an usefull Medicine, for that it not onely by drying may consume the crude humours of the Stomach and Guts, but is also able by its great bitterness and acrimony, to kill these Animals. And therefore a Decoction of the Wood may be usefull both for prevention and cure.

Mercurialis.

CXIX. Galen indeed forbids Treacle to children, because of the thin Texture of their body, and the abundance of Heat; for fear of dissipating the Spirits. Yet I saw at Rome the excellent Dr. H. Savianus give it to children of two years old. And I in imitation of him have given it several times to my own children, when they were troubled with the Worms. Wherefore I think the use of it need not so much be feared.

Jordanus, de Peste Trad. c. 7.

CXX. Quicksilver is good for the Worms in children, but it is after they are three years old: The dose for these is three grains: For the first seven years, seven or eight grains: For the elder sort, half a scruple. They that are of a soft and very tender habit of body can scarce bear it; but they that are of a fat and gross habit, do easily: For those in a Fever, it is given in Grass-water; for them without, in Wine. It is given alive, not killed; for so it sticks to the Stomach and Guts, and causes cruel Symptoms: But it must first be washed in very sharp Vinegar, and then strained through a thick Leather. Brassavolus, Matthiols and Frisimelica, used it so. Water wherein it has been steeped does the same, and brings no inconvenience.

Augerius.

CXXI. I know nothing that preserves children so well from Worms, as frequently to mix Aloes with their Meat. It may be done by gilding small Pills,

Pills, which for the smallness are scarce sensible. Give four or five of them according to the nature of the child.

Augenius.

CXXII. Because children usually are very subject to Worms, which are easily bred of Crudities, caused by cramming and corruption of the Food: Therefore some Medicine, which yet may not cause a worse mischief, must be made use of; for strong things, especially in dubious cases, must never be used. Let therefore four ounces of water distilled off the Juice of Goats-rue suffice; or a draught of Rose-water, with Juice of Citron or Lemon; or Broth altered with Sorrel; adding the Juice of Citron.

Fortis.

Vigilie, or, Want of Sleep.

CXXIII. Want of Sleep in children is a Disease different from want of Sleep in old people; because it is an absurd thing to think that this can rise in children from that cause, namely, because of Driness, which causes want of Sleep in grown people. Therefore it is well judged by all Physicians, when children cannot sleep, that it proceeds from nothing else but from Meat corrupted in the Stomach, from whence while sharp Vapours are constantly carried to the Brain, they piercing the Membranes hinder Sleep; therefore the whole stress of the Cure lies especially upon correcting the Stomach, that it may not corrupt the Meat, and that

Mercurialis.

Sleep may be provoked by all means. CXXIV. Whether is Saffron good in want of Sleep? It seems not convenient, because it heats and dries. 2. It excites the Senses. 3. It causes a mobility of Spirits; wherefore it is said to refresh the Senses. But note, it must not be prescribed alone in this case, but mixt with a cooling Syrup, to which it adds penetration. Therefore, 1. It heats and dries alone, but mixt with other things, it procures Sleep, by raising gratefull Vapours. 2. Therefore it only excites the Senses by it self. 3. With hot Cordials it revives the Heart by introducing a mobility of Spirits; but not, when mixt with cold things.

Horstius.

CXXV. Things to procure Sleep cannot very safely be given children, because they dull their Wits. Nurses therefore doe very ill in giving them Syrup of Popy, that they may provide for their own ease. Hypnoticks should rather be given to them than to children; but they must be moderate, as sweet Almonds, Lettuce, Popy seed, &c.

Sennertus.

Umbilici Inflammatio, Tumor, or, An Inflammation or Swelling of the Navel.

CXXVI. In a Swelling of the Navel from the bursting out of a Gut or the Cawl, when external Remedies doe no good, we must proceed to cutting or burning. About cutting the same way almost is laid down by Celsus and Paulus. But we must remember what Celsus says, that Sucking children must by no means be cut, but more adult children. Besides, the bodies of all children are not fit for cutting; but such as are of a good habit of body, without any Itch or Breaking out: For if bodies of a bad habit and ill humours, be cut, they are difficult to heal; yea, they are in danger of a Gangrene. Besides, we must observe, that every season is not fit for cutting, but only the Spring; nor

Mercurialis.

Autumn, Winter, nor Summer. CXXVII. In an Inflammation of the Navel, Oil of Roses with Oil of Worms is conveniently applied to the Navel, till the Inflammation abate. Which yet is suspected by some, because it uses to be otherwise prescribed in cold Diseases of the Nerves; wherefore it may be feared that by its heat it may make the Inflammation greater. But observe, when they are mixt together they temper the Inflammation: though it alone may cause an Inflammation.

Horstius.

CXXVIII. Sometimes the Navel in young children grows as big as an Egg, because it has been ill cut or bound, or ferous humours have flown thither, or because that part has dilated it self more than it should by crying and the gripes. Sometimes they bring the swelling joined with an abscess from the Womb with them. But the Chirurgeon must no way try to open it; for upon opening, the Guts fall out, as I have observed in many.

Paracelsus.

CXXIX. Sometimes the Navel sticks out with a carnosus substance growing to it, which fault, though it seldom happen in children, yet it is difficult, if not impossible to cure, if it grow. At the beginning the breeding of flesh may be hindered; for then only it is capable of cure. At the first coming you must scarifie the Legs, purge gently, and then apply Repellents and Strengtheners to the Part. When this is done, I do not advise to proceed to caustick Medicines, as Authours advise, in the *Scrotum*: for it is enough in children to waste by degrees what is softened and attenuated. But consider, in this Disease you must proceed alternately, viz. first you must use Repellents, and afterwards things that dissolve and digest; but if you doe no good with these things, believe the Disease is incurable, unless perhaps something exulcerate of it self, to which something may be applied, that may eat the flesh by little and little, having a care that no Vein or Artery be touched; for fear of an Hæmorrhage.

Mercator.

CXXX. And the Navel sticks out with blood or arterious or venous spirit, at which time have a care you make not bold through any persuasion to open the Navel, or scarifie it; but you must cure it only as an Aneurism or *Chemosia* with Repellents, Astringents and Plaisters good against a Rupture.

Idem.

CXXXI. Among all things that are good for a Rupture of the Navel, I reckon this best, which I ordered to be made for the sake of a great Prince; Take of new Wax three pounds, Resin, *Colophonia*, Tar, Oil of Eggs, each two ounces; Dragon's blood three drachms, Turpentine two ounces, Root of Water-lily and its Flower, each half an ounce; Root of Comfrey one ounce, *Cypress* nuts half an ounce, Galls one ounce, Bole Armenick half a drachm, Bark of Frankincense-tree half an ounce, Aloes one ounce, Bloud-stone half an ounce, of both Litharges two ounces and an half, Mastick, Mumy, Myrrh, each two drachms; *Carabe*, Pomegranate Flowers, Earth-worms burnt, Red-roses, each two drachms and an half; *Galbanum*, Ammoniac, each four drachms. Make a Plaster according to Art.

Vomitus, or, Vomiting.

CXXXII. Vomiting in children comes one of these two ways: 1. When they suck as much Milk as their bellies will hold, but cannot digest it, they presently strive to ease themselves of their burthen and trouble, and then, after sucking, they cast up what is grievous, and concoct the remainder well. This Vomiting proceeds from abundance of Milk, and strength of the Stomach, and therefore is for the child's good. But then they vomit in another manner, to wit, when they have not sucked much Milk, nevertheless, as soon as they are taken from the Breast, they vomit and vomit again, not once or twice, but oftner, till there is no Milk left in the Stomach. And as the first find no harm from their Vomiting, but grow and thrive, and live merrily; far better than on those days they do not vomit; so these last, after their Vomiting, are lean, consumptive, and do not thrive. This Vomiting is always morbid, either because of the nature of the Milk, contrary to the child's nature, acid, salt, or bitter, which presently after sucking it abhors, and discharges by Vomiting; not resting till it be free from all the inimicus aliment: Or, 2. Because the child is of a Stomach

mach so sensible, weak and easie to vomit, because it is no less altered by its familiar food, and with a great irritation endeavours to expell it; till it be eased of its trouble. If the child vomit by reason of the Milk, it refuses the Breast, and cannot suck, avoiding as it were the ingratefull aliment. If it be the fault of the Stomach, it will exceedingly crave the Breast, will suck greedily, and will be pleased with its aliment, but presently nature rises against it, to discharge it, not because the aliment is bad, but through some fault in the Stomach, which incites it to this bad office. If it be abundance of Milk, it is easie by abstinence to moderate the Nurse: If there be a fault in the Milk, I reckon it an error to amend it by Physick or Food, but always chuse rather to change the Nurse for a better, and that presently, than to waste time needlessly: If the fault be the Stomach's, you must consider, 1. Whether any thing amiss be retained in it, which being disturbed by sucking, provokes the faculty to excretion: Which you may know, because presently after sucking of Milk the child is restless, and cannot sleep, till at several times all the Milk is discharged; then it falls asleep and is quiet. In which case it will be convenient to purge the child's Stomach with some gentle Medicine, as Honey of Peach-flowers, Roses, &c. which being done, you may boldly both strengthen the Stomach inwardly and outwardly, and stop the Vomiting, especially if the Stomach appear to be lax, because also the Milk passes by stool but half changed: But you must not insist long on these things; for children are easily troubled with obstructions.

Mercatus.

CCCCXIII. This must be observed in giving Medicines to strengthen the Stomach, that they may be given in the morning and before dinner; Yet reason tells us, that they will be far more beneficial to the Stomach before Supper and near Sleep; for Sleep does help much in all vegetable actions, except evacuation of the Belly.

Inflammatio, or, An Inflammation.

The Contents.

Its Generation and Cure. I.

It is cured at first by making the humours fluid. II.

We must not purge in the beginning. III.

Repellents are hurtfull. IV.

Especially in any place near the Emanatories. V.

The benefit of Scarifying. VI.

When it is proper? VII.

It must not be applied to all places. VIII.

Hard Plasters must not be applied. IX.

The Cure of an Erysipelatous and an Oedematous one. X.

The Physician must labour to know an internal one. XI.

Unguents are not very proper. XII.

I. **A**S, 1. All the blood is carried by the Arteries from the Heart to all and each of the containing parts of the body, both for their vivification, nutrition and increase; and for the separation of all the humours or contents usefull and useless, some way or other, from the rest of the mass; So the same, after this multifarious benefit, multifariously conferred on both bodies, being residuous and surviving, but deprived of some part of it self, or effete, is again carried by the Veins from all and each of the same containing parts to the Heart, there to be renewed by the mutual mixture of various concurring parts, and by their effervescence and vital rarefaction afterwards. 2. And this reciprocal flux and reflux of the blood is called now the Circulation of the blood. 3. But the Blood is sometimes hindered in its reflux, when it either stagnates, and stops in its Vessels and Passages, or is pou-

red out of them, whether it be into the Substance of the adjoining parts, or into the Cavities of the body; or whether it happen out of the Body.

4. The Blood stagnates in its Vessels, either through an excessive *Plethora* called *ad Vasa* or as to the Vessels; or by reason of their narrowness, caused either by their compression or obstruction.

5. The Veins are compressed so as to hinder the reflux of the Blood, sometimes by hard tumours adjoining; sometimes by bands about the parts, which straiten both the Veins and Arteries. 6. The Veins are stopt sometimes by the Blood it self or Phlegm coagulated and concrete in them; sometimes, though rarely, by a Stone bred in them and increased by degrees.

7. By Veins I understand, as most do, the cavernous substance of each part, by which the Blood, for the most of it, passes out of the Arteries into the Veins. 8. The Blood is coagulated both by the extreme cold of the Air or Water affecting the Parts very much; and by powerfull astringent or austere Medicines, communicated to the Blood either inwardly or outwardly, and congealing it.

9. Phlegm is coagulated in the said Vessels by the same causes; but most frequently by the cold of the Air, Water, Drink or of other things suddenly seizing the parts that were hot before either inwardly or outwardly, thickning and curdling the Phlegm, especially the viscid, which has by some cause or other been dissolved in the small Gut, and carried thence into the Blood, and dispersed every way with it.

10. Where note, the more causes concur, and the more peccant they are, so much more easily, quickly and plentifully is the said Phlegm dissolved, and carried to the Blood. 11. And the Blood stagnating in the said Vessels, and gathered by little and little, distends them more and more, and so indeed, that sometimes they burst, or afford a passage for it some way or other; upon which there happens then an effusion of the blood out of its vessels, whether it stick in the substance of the adjacent parts, or be gathered in some adjoining cavity of the Body, or be all poured out of the body.

12. The Blood as yet inclosed and remaining in the capillary vessels, and it may be also in the sinuous substance of any part intermediate to them, or poured out of its said usual passages, but open and patent into the porous substance, whatever it is, of the parts themselves, and especially the carnos or membranous, or into their interstices, and gathered in a moderate quantity at least, does of it self presently grow hot, and produces a troublesome sense of Heat in the sensible part, and being by degrees corrupted, it uses to turn into *pus* or *sanies*. Wherefore the first mutation is called an Inflammation, as the latter is called an Abscess or Imposthume.

13. And, I think, the Blood grows hot, or breeds an Inflammation, inasmuch as its spirituous, and more volatile and subtile parts, which used to temper the acid and saline ones, presently begin to vanish, when it stops in its distinct vessels, or in any other place, that is, stagnates. Upon which both of them being made more sharp do fight one with the other, and raise a hot effervescence, by reason of the oily parts of the blood, and by little and little so corrupt the blood, that it turns to *pus*, which varies according to the variety of the corrupt blood.

Sylvius de
le Boë.

¶ For the Cure therefore of the Inflammation, and of the Abscess that would then follow, it is requisite, 1. That the Compression or Obstruction of the vessels be removed. 2. That the motion of the stagnating or stopping blood be restored. 3. That the Blood poured out of its vessels may, if possible, be removed thence before its supuration. 4. If it cannot be removed, and so supuration cannot be hindered, that it may be matured and promoted. 5. That discharging the *pus*, when bred, may be hastened. 6. That cleansing and consolidation of the Ulcer may quickly be finished. As to the first Indication and Obstruction, see *Tit. de*

X x

Pleuri-

Pleuritide, BOOK XIV. where one thing should be added concerning Externals, that volatile Salts may be here used outwardly with great success, if at the time of using they be mixt in a small quantity with Fomentations, Cataplasms, Unguents, &c. For the second Indication, Sudorificks are good, as by their help the blood is not only made more fluid, but moreover it is actually put in motion, being more and more rarefied by the volatile Salt that is in Sudorificks. And Venæsection, inasmuch as the next blood comes into the room of that which is let out, and so more room being made for all the blood, it moves both quicker and stronger; wherefore that which stagnated and stopt first in the Vessels, now that the *Pletthora* is removed, stops no more, but renews its interrupted motion. For the third Indication, these things given inwardly hinder the coagulation of the blood, Crabs-eyes, *Antimonium Diaphoreticum*, Mummy, *Sperma Ceti*, *Galbanum*, *Sagapenum*, *Opium*, &c. The Part affected may be anointed with *Unguentum Martiatum*, *de Althæa compositum*, or any other Aromatick, May Butter, and Butter prepared with the Juice of aromatick Plants, adding sometimes aromatick Oils distilled; Among Plasters, this *de Spermate Ceti* is highly commended; Take of white Wax four ounces, *Sperma Ceti* two ounces, *Galbanum* dissolved in Vinegar one ounce. Mix them. Make a Plaster or *Sparadrap*. Which not only preserves the Blood in all external parts of the Body, but Milk also in the Breasts from Coagulation; yea, it dissolves and discusses it, if but gently coagulated. The fourth Indication is satisfied by emollient and maturating Medicines: But when pituitous and viscous Humours are mixt with the Blood, sometimes the Bulbs of Onions, Squills, &c. must be added to them, sometimes *Bdellium*, *Galbanum*, Ammoniack, and the like, liquid *Stirax*, Wax, Turpentine and Honey. Where a great Heat is in the inflamed part, and the Patients cannot bear fat things, we must carefully avoid all Oils and oily things, and I have always observed Butter-milk to be good, in which if a Decoction be made, a Cataplain of it will egregiously temper the Heat, and hinder an *Erysipelas* from following the Inflammation. For the fifth Indication, we must not procrastinate the getting out of *pus* when it is bred. For the sixth Indication, when way is made for the *pus*, we must proceed to cleansing and healing of the Ulcer. For which end I have often seen the effect of *Balsamus Sulphuris Terbinthinatus* with admiration.

Idem.

II. Humours sticking in the Flesh, which are plainly extravasated, cannot run because of their thickness. Let the Physician therefore make them fluid with hot Medicines. Thus an *Erysipelas*, thus every Inflammation is easily removed in the beginning with Spirit of Wine. Yea, if any one ill of a Quinsy, in the beginning of the Disease gargle himself with Spirit of Wine, all the Inflammation of his Throat will cease in three hours time.

Walrus.

III. The Golden Rule, laid down by *Hippocrates*, *A. acut. 12.* and received by *Galen*, must be called to mind in all Inflammations. *Whoever in the beginning of Diseases do endeavour to carry off what is inflamed by Medicine, they do not only get nothing away from the inflamed part, since a crude Disease will not yield; but they do also consume and waste what resists the Disease and is sound; and, when the Body is brought low, the Disease is stronger, which, when it has conquered the Body, has no Remedy.*

IV. But I cannot commend common Repellents, so highly extolled by some in the beginning of an Inflammation; for they are commended only out of prejudice, and the Cure is far more happily performed without them. For though many Patients be cured, to whom in the beginning of an Inflammation Repellents are applied, yet they are not cured by that application, but because other discutient and emollient things were joined with them: for it has been often observed, that by applying

Repellents alone, or in too great a quantity with other things, much harm has been done to Patients, yea, sometimes a Gangrene it self has been raised in the inflamed parts; of which there is no fear, if in our method Repellents be wholly omitted, and the things recommended by us used.

Sylvius de
le Boë.

V. A Woman was struck on her shoulder with a Cane by her Husband, which made the part swell: a Cataplain of Bole Armenick, Barly-flower, Vinegar and the White of an Egg was applied; there followed a Fever, a Pain of the side, a Cough and Difficulty of Breathing. From which I could gather that the matter had run to the Breast, because of the unseasonable application of repelling and cooling things. Whence it is manifest, that *Hippocrates*, *6. Aph. 25.* said right, that it is bad for an *Erysipelas* to turn from the out parts inwards, which holds good also in Inflammations and other Abscesses, especially in the Emunctories and parts near them.

Hildanus.

VI. Many of our Physicians deny that an inflamed part can safely be scarified, holding that more blood runs to the part affected, and therefore think it can doe the Patients no good, which nevertheless I think is vain, when the Body is first well evacuated. For who can doubt, in all Inflammations, or Fluxions of humours, arising from fullness, that two evacuations are indicated, the one of the whole called universal, and the other of the part, upon which the humour falls? In which distinction of evacuations in these Diseases as the universal evacuation of the whole is especially necessary, so afterwards the particular of the inflamed part; for the former respects the Cause, and this the Disease it self. Yea, it is certain that *Galen* commended the use of Cupping-glasses in them, in whom the humour, by the strong attraction they make, might be abundantly drawn to the part affected, and one might suspect the Inflammation or Fluxion might be increased thereby.

P. Alpinus:

VII. As to Scarifying, which *Galen*, *cap. 95. artis parvæ*, thinks may be used, we must observe diligently whether the matter can be changed into *pus* or no: For if Suppuration may be hoped for, there is no room for Scarification: But if the matter cannot be changed into *pus*, and yet there be no hope of discussing it, Scarifications and Cupping-glasses may be applied: for they are an efficacious Remedy to evacuate what is deep within; and which would turn to a *Scirrhus*. Therefore they must by no means be used in the beginning, but when the body has been evacuated, and the Inflammation is stopt, so that there is no fear, that the pain of Scarifying can cause a new Fluxion. And they must be applied then only, when we have a mind to draw out what remains after the use of other Remedies.

Sennertus.

VIII. Yet Scarifying is only proper in those places which can otherwise bear it; for if an Inflammation arise in a part, to which Scarifying otherwise cannot be applied, no man can be so rash, as to apply Cupping or Scarifying to it, for evacuation of the rest of the matter.

Idem.

IX. Tenacious and hard Plasters are not proper for an Inflammation, because they hinder the blood from passing freely to the place, and from turning into *pus*. *Galen*, *13. Meth. c. 5.* shews why hard Plasters must not be used for Inflammations; because they draw together the remainder of the Inflammation, and cause an Inflammation again in the sick part. They weaken the part, because they hurt it by their hardness, and they cause pain while they are pulled off, by causing whereof the humours run thither, and an Inflammation is caused again in the part affected. Moreover they draw together the reliques: for they hinder the blood from going out of the capillary Veins, and if it go not out, it will cause an Inflammation at another time.

Sanctorius.

X. In Erysipelatous Inflammations, which usually invade the Limbs, and put both the Physicians and Chirurgeons to much trouble, I have found no-
thing

thing better at any time, than the following Remedy, which a certain German Chirurgion communicated to the Excellent *Spigelius* for a great secret, as certainly it is; Take of a *Lixivium* of the Ashes of Vine branches 1 pound, Nitre one drachm and an half, common Salt 1 drachm, Vinegar of the best Wine 1 ounce. Make a mixture. Which, after Universals taken up in a double *Splenium*, and tied strait to the part affected with Rowlers, does in two or three days at most wonderfully disperse and waste tumours, which even threaten a dangerous Gangrene.

Sculetus.

XI. *Hippocrates*, in his Prognosticks, has set down many signs of an internal Inflammation in the Belly turning to a Suppuration, which it highly concerns a Physician to know: And this is one of those things wherein skilfull Physicians do especially excell the unskilfull: for many die slowly of internal Inflammations, turning to Suppuration, when they have been thought to have been cured of their Disease, and have been dismissed by their Physicians. For after *pus* is made, and the Pain and Fever are greatly abated, many are thought to have come to an end of their Disease, and to security, who have *pus* gathered inwardly in some Imposthume. Some of whom by the benefit of a strong Nature are cured by breaking of the Imposthume and voiding the *pus*: Others die consumptive, when the *pus* putrefies malignantly, and with it the internal parts, or of a constant Fever, which putrid Vapours, carried from the part to the Heart, do cause: Or the Imposthume breaks, but too late, and when the strength is too low to bear a discharge of the *pus*. Therefore it behoves us much to know the signs of an internal Inflammation turning to *pus*. And many do not know them, because they are not able to discern internal Inflammations, and laying aside all care of latent Ails, they consider nothing almost but what they can comprehend by their Senses, without any ratiocination how to know the parts affected, and to be able to distinguish them from other dolorous Diseases, or the great from little ones: For whether they will cause an Abscess or Suppuration, I know from three things, the Place, Magnitude and Manner of the Inflammations themselves. For Inflammations of hot parts, unless prevented by discussion, do suppurate more than those of colder parts; and therefore, as it is said in the Prognosticks, Swellings in the Belly do imposthume less than those in the Hypochondria, and they least of all, that are below the Navel. Moreover small Inflammations, most of them, are dispersed, especially if they be in hot places: Great ones in hot places indeed do suppurate; in cold ones they remain crude and invincible. As to the manner, they that are round and eminent, circumscribed in a proper place, and gathered into one, signify there will be Suppuration: But they that are extended and broad, and dispersed, do not often suppurate. If they be small, or of thin matter, they disperse: If great, or of thick matter, they have a Crisis by bleeding or by some evacuation, if the event of them be good.

Wallenius.

XII. Unguents are not so proper for Inflammations, unless to promote Suppuration, wherefore Unguents are forbid in an *Erysipelas*, though there be some, by name *Rondeletius*, who prescribe Unguents in this Disease. It is certain also that Ointments improvidently applied to external Inflammations, have often caused a Gangrene. And therefore in Quinies they are not generally so proper as you may find them in Books.

Wedelius.

 Medicines.

I. THOUGH Blood do not abound, if the Disease be inveterate, Blood must be taken out of the *Vena poplitæ* or *malleoli* of the side affected, without all contradiction, because by Bleeding in this Vein a great derivation is obtained; but because it is very difficult to open the *Vena poplitæ*, instead thereof a certain Vein was found by the Chirurgions of Rome, within these few days, which a little above the Heel runs towards the Ankle, to the outside: It is truly a branch of the *Vena poplitæ*, if it be opened, and eight or nine ounces of Blood taken thence, in the very same hour, which is wonderfull, the Pain of the Sciatica, be it never so inveterate, ceases. Bleeding also with Leeches in the hæmorrhoid Veins is admirable good for the Sciatica: for there is a great consent between the Veins of these two places. ¶ *Mr. Puri* of *Newemburg*, a Man of Sixty, sanguine, and, as he himself said, one that took a course to breed much blood, had been confined to his bed six weeks, by the violence of the Sciatica in his left Hip. All the time he kept his bed, he thought there was no need of a Physician, and therefore he sent not for me. At length, being tired by the diuturnity and violence of the pain, he called me. I presently order the most turgid Vein of the opposite Foot (and they were all very turgid) to be opened, the Blood ran full stream, black and thick, to about a pound, with so much relief, that the next day he left his Bed; and the third day after bleeding, his Chamber. I can give a fresher instance of the efficacy of bleeding in the Sciatica; while this is printing, in the Month of April, anno 1681. I am called to a lusty Man about 28 years old, of a sanguine and bilious complexion, well set, and a stout Souldier: He had been confined 15 days to his Bed by a painfull Sciatica in his left Hip: About 18 days before, he had by the advice of a Chirurgion, for revulsion (as he said) opened a Vein in the Arm, but to no purpose: I reckoning the Disease came from abundance of blood settling there, having first loosened his Belly, order a good quantity of blood to be taken out of the opposite foot, and likewise out of the foot on the same side, with so good success, that the next day he went about his business. Anointing with *Unguentum dialthææ*, Nitre and Oil of Elder, which used to doe others good, exasperated his pain.

Zecchius
cap. 43.

II. Many prefer Vomits before Purges, because they evacuate the humours by a way remote from the part affected. *Rondeletius* prefers *Asarum*. ¶ *Sciatica* Pains will not bear purging; for thereby the humours fall more on those places. ¶ But *Sennerius* thinks this must be understood of insufficient purging.

Crato.

III. Sharp Clysters may be given, even to bring blood; for so I have seen them doe some good in the Sciatica.

Crato.

IV. Issues are made in three places in the Leg, in the inside, outside, and hind part of the Calf. Here *Spigelius* used to make an Issue in the Sciatica, with good success, because the *Vena Poplitæ* runs that way. ¶ I must greatly commend a Caustery below the Knee, on the outside of the same side that is affected, for derivation sake.

Clandorpi-
us.
Zecchi-
us.

V. In the Joint of the Thigh, about the cavity of the *Ischii*, the Gout is bred, which they call the Sciatica. If the Humour run into the Acetabulum, and force the head of the thigh-bone out; this Disease, in fight, proves difficult of cure, and will, at length, cause halting; if the Humour fall upon the origination of that great Nerve, which creeps along the back-part of the Leg, a bastard Sciatica is caused, in which a sharp pain reaches, not onely to the Hips, but to the Thigh, the Calf of the Leg, and to the very Foot; that is, whenever the Nerve derived from the Hip affected does reach, as *Kerue-
lius* says; and therefore Pyroticks must be applied to the bending of the Buttocks, and an Epispastick Plaster must be applied there also.

Riolanus.

VI. A falling into a pain of his Hip, and having tried every thing to ease him of his torment, determined to proceed to red-hot Irons, as the last remedy of this inveterate Disease. The courageous young Man gave the Chirurgeon leave, not onely to burn the Skin of his Hip, but to run the Iron through the flesh to the very bone: Endeavouring this way to get out the matter, lying under the *Periostræum*. The Patient bore this red-hot Iron with an excellent resolution of mind; and this cruel Medicine cured him of his Ail, by the continual running of the profound Ulcer, which was kept so long open, till all the matter was evacuated, and there was no fear of a relapse.

Tulpius.

VII. A very fat Man, being taken with the Sciatica, neglecting Universals, ordered himself to be bled in the Foot: And the pains of his Sciatica increasing, made him suspect, that the young Chirurgeon had mistaken the vein. Wherefore the Patient hoping to amend the mistake, and for a mitigation of his pain, called an elder Chirurgeon, who let him blood in a branch of the vein that was opened before: And his pains increasing again, he took the advice of a Physician, who having given him divers things in vain, ascribed the Disease to Witchcraft. By my advice, the Chirurgeon spread three ounces of *Emplastrum vesicatorium Horstii*, on a large piece of Leather; after twelve hours he clipt the Blister with a pair of Scissors, and when a pound of yellow liquor had run out, he applied a Cabbage-leaf anointed with fresh Butter; And this was the first time he could lie on his back and sleep, after he had been four Months without sleep. When the Sore was healed, I prescribed him 1 drachm of *Extractum Esulæ Rulandi* in Wormwood-wine, upon taking of which, the Patient voided much Serum and Bile. To draw out the reliques of the humour from the place which was tolerably pained, at last, *Emplastrum Ischiadicum Noribergensium* was applied; and when after three days it was removed, a Vesicatory, the Patient not minding, was applied in its room, which having drawn a great quantity of viscid liquor, did mitigate the pain so much, that the Patient, when the Ulceration of his Hip was cured, could, between his Wife and a Stick, walk from Table to Table gently. And by continuing the use of *Petroleum* for three months, the contumacious pain wholly vanished.

Aculetus.

VIII. In the process, and when the Body is perfectly purged, Cupping glasses, with much flame, must be applied to the Hip, according to *Paulus* and *Celsus*; for *Galen*, l. 10. de loc. c. 2. has observed, that they manifestly doe good for settled Humours.

Parti.

IX. Although, upon account of the place affect-

ed, every pain in the *Ischion*, may be called the Hip Disease, or Sciatica; yet that properly deserves the name of which *Hippocrates*, l. de affect. v. 25. treats, The Hip Disease is, when pain seizes the joint of the Hip, &c. That is, wherein the Pain is violent in the joint of the Hip, at the top of the Buttocks; and at the muscular eminence under the Buttocks; and when the Disease is confirmed, it reaches to the lower part of the Hip, and along the Leg to the very foot. He says, this Disease grows, when Bile and Phlegm falls by a sanguiferous Vein, and congeals the blood therein, and renders it morbid: whence it comes to pass, that the pain infects more parts, and far distant one from another; because, wherever that morbid blood settles, there it causes pain. So *Hippocrates* advises to use remedies, which, by softening, may dissolve and thin the concrete blood. Whence it appears, how much they are mistaken, who refer the extension of the Pain to the Nerves, which are branched that way by the Spinal Marrow. I know this opinion to be very true, by what I have observed in a certain Man that was sick of this Disease, in whom, while he was affected with the violence of the pain (which came by certain paroxysms) all the veins disseminated along the out-side of the Hip and Leg, swelled in a wonderful manner, and when the pain abated, they fell immediately, and there appeared no sign of them. The Cure laid down by *Hippocrates* is proper for this sort of Sciatica. For by softning and heating he dissolves the blood congealed by the efflux of Bile and Phlegm; and at the same time allwages pain: He loosens the Belly with Clysters, and at one and the same time he dissolves the blood settled about the region of the Hip, and by degrees derives the antecedent matter by the Belly. When the pain is allwaged, he gives a Purging Medicine, to carry off the Bile and Phlegm that cause the Disease: Which he durst not doe before, lest the matter being agitated and disturbed by the Medicine, should be caused of the violence of the pain, run more to the part affected, than would be evacuated. Then he gives Asses Milk, by means whereof the habit of the body may be tempered, and the Humours may be made more gentle. He gives it boiled, that the fluxibility of the Humours may also be taken away. Our people give a decoction of *Guajacum*, or something like it, which may thin and sharpen the Humours, and render them fitter for motion, not onely in this, but in all other Gouts. Then, upon the account of the Pain, he gives Medicines, whose Nature, it is not well known what it is: It is likely they consisted of various things, partly of Diureticks, partly of Strengtheners, and chiefly of stupefying and incrassating things, which were called Medicines for pain; analogous, to which are Treacle, Mitridate, *Philonium*, *Pilul. de Cynogloss.* &c. the heat and driness whereof I correct by diet. The cure of this Disease is so exactly performed by these things, that I reckon all other Medicines needless.

Martianus,
comm. in c.
um locum.

X. If one should use the foresaid cure for all Sciaticas, it would not answer the end; for a different cure is proper for a Sciatica caused by a fixt matter, from that which is proper for one, when the pain runs hither and thither. For as the principal intention in the fixt Sciatica, is, that the matter may be dissolved and got from the joint; so in the other, the principal intention is, to evacuate the Humours which run to the part, and to check their motion. And *Hippocrates*, considering all these things, insists on a far different cure of this Disease, lib. de affect. intern. from what he uses here. For there he gives the sharpest Clysters; here he gives emollient ones: There he orders the Joint to be frequently stirred, which is not necessary when the matter is not fixt: And he orders burning upon the Joint, which has no place in the case preceding, except when the Pain fixes pertinaciously in some one place: Nor does he reckon it always necessary upon the

the joint, but where the pain fixes, and it flies sometimes in one place, sometimes in another. And he burns with raw Flax and Fungi: Concerning which, see Book XIX. Tit. de Cauteriis.

XI. Mr. N. was tormented with a cruel, and almost incurable pain of the *Sciatica* in his right Hip. Divers and very violent Purges were given him; Blisters were drawn, Opiates given, a Vein opened in the Foot, but all in vain; supposing the pain arose from a cold cause, and thick phlegmatick humours. But observing that his Stools were very choleric, and that there was a pulsatile pain and inflammation in the *Abdomen*, I altered my method of cure, betook my self to coolers, and advised drinking of the Waters; hereupon the cure went on with great success, so that in two days the inflammation was gone, though the pain was not quite abated. And when I observed the pain was vagrant, that it sometimes caused a straitness about the *Mesentery*, and sometimes fell from the Hip into the Leg, I supposed the Disease came from abundance of thick and hot blood, which trying to get out, and not being able to do it, creates so great trouble; therefore I advised (and the rather, because I understood, that he had formerly been subject to the Piles) the applying of Leeches. My advice was followed; five Leeches were set to the hæmorrhoid veins; which, when they were full of blood, being besprinkled with Salt and Ashes, they discharged about six ounces of blood. The blood looked red and very thick, void of all Serum. After this, the great pain, invincible by other things, vanished.

XII. The *Sciatica* is sometimes bred of Bile and hot Humours, which indeed may be known, when the Pain is very sharp, and pricking, and the fits are sharper every other day: the party is lean, of a choleric constitution, young, the Countrey and season hot, the pain is exasperated by hot things, and bilious diseases have preceded: Then Medicines must be directed for Bile and a hot intemperature. Therefore then there will be convenient Phlebotomy, Purges for Cholera, sometimes gentle, sometimes strong, adding Diagrydiates, that the morbid matter may be carried off; cooling Juleps, emollient and cooling Clysters, Milk, Bathing, &c. Always taking care to avoid aperients: Incaustics should rather be chosen, such as are proposed in a hot and thin Catarrh; Narcotics, Laudanum, given both at the Mouth, and in Clysters.

XIII. *Hippocrates, lib. de affect.* mentions a *Sciatica* from the driness of the Joint. By Driness, do not understand a dry intemperature of the solid parts, constituent of the Joint it self; but a consumption of its glutinous humidity, whereby it is naturally nourished, and made supple for better motion; If it happen that this humidity be dried up by any cause, then the motion is hindered with pain. *Hippocrates, l. 3. aph. 16.* tells us, that such Diseases come in dry constitutions. He that will cure these Diseases, every external and preceding cause being removed, let him endeavour the restitution of the natural humidity: let him prescribe a Diet actually and potentially cooling; a Bath of Water, with Sheep's Head and Feet, Mallow, Marshmallow, &c. boiled in it, walking gently, and emollient Ointments. Let all sorts of evacuation be avoided.

XIV. A Porter, in violent cold weather, stood with his Legs in Water, for several hours; upon which, a violent pain reaching from his Hip down his Thigh and Leg, took him, so that he could not go. After a Clyster had been given him, he was bled in the Arm on the same side; the next day he took a strong Purge; for three days following he took every morning of *Spiritus Theriacalis* 8 drops in *Carduus Benedictus* Water, which Sweat him violently, and his pain was taken away.

Medicines especially made use of by eminent Physicians.

1. The Herb *Sciatica* Cresses perfectly cures this Disease.

2. One was afflicted with an intolerable *Sciatica*; he applied Nettles boiled in Beer for a Cataplasm, and he was rid of his pain to a miracle.

3. I have not found a better Medicine, than a Plaster of Pitch and Brimstone. Rub the place with Juice of Onion, then strow on it Powder of Pepper and Nitre; and tie on a Sponge, wet in a Decoction of Cumin and Calamint in Wine.

4. This is experienced; Whip the place with a Nettle till it be red, and wash it with Spirit of Wine.

5. St. John's-wort drunk for forty days, cures the *Sciatica* admirably; and if two drachms of its seed be drunk, it Purges the Belly, and cures the Pain.

6. Root of Reed bruised and applied to the pained place, is admirable good, as also Ashes of Reed.

7. Cowes Dung, made hot, and applied, does much good.

Iſchuria, or, Stoppage of Urine.

The Contents.

In a legitimate one, which is best to use, a Catheter, Section, or, an Escharotick? I.

One arising from an Inflammation of the Perinæum does not admit of a Catheter. II.

Giving of Clysters sometimes cures it. III.

The Catheter must be dextrously put in. IV.

It is hurtfull, where the Bladder is inflamed. V.

When it is inflamed, we must use coolers, and repellents sparingly. VI.

Medicines.

I. IF a stoppage of Urine can be removed by

no safe Remedy, but see it be proper, that

is, that the stoppage be not made above the Bladder,

there arises a Question, Whether a Catheter

must be forcibly put in, or the place must be cut as

for the Stone, or an Escharotick Medicine must be

applied, and then a hole made? For always, in

deplorable cases, any way, though not safe, if there

be any hopes in it, may better be tried, than the

Patient be certainly suffered to die. From a

Catheter,

Catheter being forced in, Pains, Ulcers and Inflammations use to arise: An Escharotick Medicine works slower than the occasion requires: Cutting is uncertain, Therefore it is of great moment, that the Lithotomist be skilfull, and the body clean, and it must be considered how full of blood he is, and regard must be had to every excess, yet I saw a Caruncle perforated with a Catheter in N. and good success of it, although much blood and corruption came from it. But if there be a *Callus*, Section is quickest, in unskilfull Artists an Escharotick is safest.

Cardanus.

II. One was much wounded in the *Perineum*, and an Inflammation arose in the wound, he could not make water; but his bladder seemed manifestly to be full and stretched; and lest the Inflammation should be irritated, I would not use a Brais Pipe; but I thought it sufficient to pour warm water on it, and to anoint it with Oil; and when we had treated him so for three hours, the Swelling being not a little relaxed, and the Pain not tormenting him so grievously, I bid him try to make water, in the mean time while we forced, and pressed the Swelling of the Bladder downwards, the young Man made water. And in people that are so taken, the cause of the stoppage of Urine is easily discerned though in others it be not so easily discerned.

Galenus 6.
de loc. aff.

III. The Urine is also stoppt, when there are hard Excrements in the Guts; for the neck of the Bladder is pressed thereby, which being pressed, the Urine stops: And therefore, after a Stool, the Urine comes, when the *Intestinum rectum* is free. One sixty years old, when the passage of Urine had been stoppt three days, and he could make no water, was relieved by a Bath, and after that a Clyster: for when the Excrements were softened and voided, the Urine came. And so he was eased in a few hours, who had been grievously troubled with a suppression of Urine for three whole days.

Dodonaus.

H. a Moini-
chen. obs.
27.

IV. In stoppage of Urine, a Catheter, not dextrously put in, causes most grievous Symptoms; Inflammation, Convulsion, &c. By an error herein I have known sometimes a Suppuration arise in the *Perineum*, which has at length degenerated into a Gangrene, not curable by Art.

V. When Urine is stoppt by an Inflammation of the Bladder, the putting in a Catheter is not without danger; for when it is torn, the Inflammation increases, and when this ceases, an incorrigible incontinence of Urine follows.

Sculetus.

VI. When there is a violent Inflammation of the Bladder, which stops the Urine, we must not use very cooling and repelling things; but before it is stoppt, we must use Repellents for a little time.

Heurnius.

VII. A Man of Seventy, after he had rid some Miles on a trotting Horse, fell into a stoppage of Urine, in which he voided his Urine with difficulty, and drop by drop. When I was called, I observed a tension and hardness in the region of the Bladder, with pain, which was felt onely by pressing it: Besides, the Patient had pains in his Breast, Back and Shoulders, so that he could scarce stir himself: The season was Rainy, and the Wind Southerly. Therefore I guessed all this came from a Catarrh, and that the Humour fell upon the body of the Bladder, and there caused a certain Tumour, by which the Sphincter of the Bladder was compressed, and the passage thereof straitned. Therefore for diversion and evacuation of the fluent Humour, I prescribed a purgative and temperate Apozeme for three days: I drew a Blister behind in the Neck, and applied an emollient and dissolving Fomentation to the region of the Bladder, with a liniment of the same virtue. By the use of the Apozeme his Urine came better every day, so that in three days he made it more freely, and in greater quantity: Afterwards a Bolus was given of Turpentine and Liquorice powder for three days:

A fomentation was applied, an emollient and a more dissolving Clyster was given; A Cataplasim was applied of the residence of the Decoction, with Flower of Beans and Fanugreek, Oil of Dill and Chamæmil, and he was cured with these things.

Riverius.

VIII. One in a stoppage of Urine had his Bladder swollen very much; and when no other remedies whatever would doe good, a Chirurgeon of Paris thrust a Lancet into the very Bladder, through the midst of the Pyramidal Muscles of the Abdomen, which they call *Fallopiani*: But this must never be done, unless the Bladder swell, since otherwise in adult persons it rises not above the *Os pubis*.

IX. A young Man, healthy in all other respects, at first made abundance of troubled Urine for two or three days, and then fell into a suppression of it for five whole days. All Medicines were tried, when Galenical ones would not doe. Thus, when the poor wretch was very much tormented, the unskilfull Physician thought he should doe him a great kindness, if he could procure sleep by stupefying things. And he did it effectually; for immediately upon taking one drachm of *Philonium Romanum*, he fell asleep, and never awaked any more. For Narcoticks increase the Disease, bring a Palſie on the Bladder, and fill the Brain with Vapours.

Rumlerus
obs. 58.
Velschius.

X. Some tye Cotton-wooll to a Silver-wire (which must exactly fill the hollow of the Pipe) and put it into the hollow of the Catheter, and force it with the Pipe into the Bladder. When the Pipe is got into the Bladder, they draw the Cotton-wool tied to the Wire, out of the Pipe, and so draw out the Urine, as by a *Siphon*. But a Cotton is not necessary, because the Urine comes freely by a Spring with holes in the sides; Nor a Wire, because for the foresaid reason it does more harm than good: for while they draw the Wire out of the Pipe, they often draw out the Pipe too, which will be a greater trouble to get in again.

XI. We must have a great care, at that time, when Urine is grievously stoppt, that such things be not taken, as Physicians give to stop Urine: Which, because they are hot and sharp, and sever the serous blood from the gross, do carry much matter to the Bladder. Wherefore they use to put such in mortal and grievous hazard, who, when they have a weak expulsive faculty, use to sollicit it by all means they call Diuretick. And, as grievous and capital an offence as this is, Physicians commonly commit it in stoppage of Urine, by using Diureticks, to move and expell Urine.

Solenander.

XII. A Man of Fourscore was taken with a suppression of Urine, upon his two much drinking of new Wine, and in two months he died: When his body was opened, a great *scirrhus* was found in his Bladder before the neck. But this was observable in him, that though a Catheter were got in with great difficulty; yet I could more easily get into the Bladder with a thick one, which was almost as thick as a Swan's quill, than with a small one. The reason is, because when the Urinary Duct about the neck of the Bladder, yea, and the Sphincter it self was swelled by reason of the *Scirrhus*, a coarctation and straitness of the Urinary Duct in the *Perineum* must of necessity follow. Therefore it is consentaneous to reason, that a little small Catheter could not dilate this narrowness, which a thicker could easily doe.

Hil Ianus.

XIII. Sometimes we can neither prevail by Medicines nor Catheters, so as to be able to get out the Urine, which has stoppt many days, because of some fault in the Urinary Duct, the Man continually haſting to his end. Why therefore should you think it hard, by a dextrous incision, to make a small hole, where they cut for the Stone. *Articulus comm. ad Rhazen. c. 103.* laid down this cure. Which thing, in the extremity of the Patient, and in cases, when other remedies will doe no good,

Severinus. I would advise you not to reject, nor speak ill of.

XIV. *Cardan. com. 43. aph. sect. 7.* testifies, he saw a case succeed very well, when a Caruncle in a certain Man was perforated with a Catheter, though much blood and corruption ran out of it. And I experienced the same in a Barber, who had been two days ill of a stoppage of Urine: For while I thrust a Catheter against the renitent Caruncle, first a little blood came, and then abundance of Urine, and he finds himself well to this very day.

Idem.

XV. A Boy eight years old was ill of the Small Pox; he complained of a stoppage of Urine: We were puzzled what should be the cause: We saw the Small pox on the end of the *Penis*, and we thought there might be some within: We gave inwardly things to provoke Urine; We were then hindred from Bathing and Fomentations by the Small Pox. When we could do nothing, I look on the *Penis*; I saw something white in the Orifice; I took it for a Small pock full of Pus: I take a Needle, I find it hard, I move it, and when moved, I get it out, it proved a Stone, and the Urine came. It had been forced thither by expelling Emulsions, that are used to be given in the Small pox, which are also Diuretick.

Wincelerus,
Mysc. cur.
ann. 74. obs.
36.

XVI. An Infusion of *Cantharides* is a remedy for a stoppage of Urine, the happy success whereof I have several times experienced. Let a scruple of *Cantharides* in powder be infused in three or four ounces of Rhenish-wine, or of Spirit of wine for some days; then let it be filtered through a brown Paper, that nothing of the substance of the *Cantharides* may be mixt with it. Let one Spoonfull of this liquor thus strained be mixt with other seven spoonfulls of Wine or Beer. And, of this mixture let one Spoonfull be given the first day, two the next, and so on.

T. Bartholi-
nus, cent. 5.
hist. 82.
Ep. 34. cent.
4.

XVII. N. A Nobleman, Sixty years old, sanguine, of an athletick habit, when he travelled in the heat of Summer, quenched his thirst, contracted from the Heat, with abundance of drink. Four days after he came home, he fell into a perfect Iſchuria, which was variously opposed by an old Physician, yea, a Catheter was put into his Bladder. I was called, I asked him, whether he felt any pain in his Loins or *Pubes*, or if he had been troubled with the Stone in the Kidneys? He said No. Hence I gathered, the Iſchuria proceeded from no fault in the Kidneys, or Bladder; but rather from an obstruction of the Emulgents, which a multitude of Humours had caused, by reason whereof, the Vessels being too full and distended, could not contract themselves for expulsion; Which appears in the Bladder, distended beyond measure, by too long keeping the Urine, which sometimes very difficultly voids the Urine, through want of contraction. I insinuating on this opinion, proposed Phlebotomy to be celebrated with a liberal hand, to take away the plenitude of the Vessels: And one pound of blood was taken away. Scarce an hour was over, when the Patient perceived the Urine run by the Ureters from the Kidneys to the Bladder, and he foretold he would make some quickly: A little after he called for a Pot, and when he had filled that, more were brought; so that in an hours time he made several pounds of water. Thus he was perfectly cured, and would not take a Hydragogue, which was prescribed him the next morning.

Riverius.

XVIII. For such as by long holding their water, or drunkenness, cannot make water, though they strive to do it, I have found out an easie way, and have practised it several times with great success, by putting a Wax Candle, such as Shoemakers use, through the *Urethra*, into the cavity of the Bladder, if it be first made blunt at the end, and anointed with Oil. I use this instead of a Catheter, which,

because it cannot be thrust, into Males especially, but with much difficulty, or pain, in imitation of it I have tried this Candle, and have observed the success to be excellent. Which Artifice is so much more to be valued, because this is always in readiness, and such a Candle may be used by any one; whereas a Catheter cannot be put in but by a skilfull hand, and then indeed with trouble.

Sylvius de le
B. 6.

XIX. I think sometime the suppression of Urine may be owing to the blood for its cause, that is, when this is so affected, and so confused, and mixt, as to its various parts, that the Serum cannot be separated in the Kidneys. Which perhaps falls out oftner, than the Caruncles of the Kidneys are indisposed, especially when no fault is observed in the Kidneys, though they be most found fault with. And certainly, that the blood may be so affected it self, that the serous parts, which minister matter to Urine, are so intimately mixt with the rest, that they cannot easily be parted, many things seem to persuade me, whether a Man consider the Symptoms, then urgent, or weigh well the method of cure by volatile Salts. For, to say something of volatile Salt alone, and not without good reason, because of the manifold experience I have of its virtues; it is certain, that it has the faculty of dissolving any viscid humour, from which the vitious connexion of the Fluid parts, as well as the Solid, has usually its rise: Now when the viscid humour is dissolved, the parts of the blood may more easily separate, when they are not so intimately conjoined one to another. But, if any one think, if the suppression of Urine, which is so often mortal, must be ascribed to a viscid humour in the blood, which hinders the separation of its parts, that then the obstruction of the Caruncles in the Kidneys, whatever it is, may not inconveniently be derived from the same viscosity, hindring the secretion, or transcolation of Urine, and causing a suppression of it, I shall not contend with them, but do rather think, that both causes should be joined, and often are joined; so that by the viscosity of any humour in the blood, both the rest of the parts of the blood may be intimately tied one to another, and so be made less fit for their separation, and the pores of the Caruncles may be obstructed, and so the transcolation, secretion, and excretion of Urine may be abolished.

Idem.

XX. I have often removed small stones, got into the mouth of the Bladder, by putting in a Wax Candle, the way I mentioned before, *Section XVIII. Idem.* and so I have cured the stoppage of Urine.

XXI. When there is suspicion that a Stone sticks in either Ureter, unless by turning the body, the head downwards, and then by shaking of the body, the Stone be got back from the Orifice of the Ureter, this disease must be held for desperate.

Idem.

XXII. Oftentimes the cause of the stoppage of Urine is thought to be in the Kidneys themselves, inasmuch as the Natural constitution of the Kidneys, and of the Caruncles in them, whatever it is, and the disposition requisite for separation of the Urinous Serum from the rest of the blood is spoiled, so that the secretion ceases. Here we must make haste to cure it, while there is some hope. This Disease may be cured chiefly by taking Diureticks, especially volatile Salt of Amber, and other Aromatick volatile Salts: By means whereof so grievous, and often so mortal a suppression of Urine, wherein the sick are sick at the heart, is not onely cured, but prevented.

Idem.

Medicines eſpecially made uſe of by eminent Phyſicians.

Bikkerus.

Crato.

1. Syrup of Cryſtal is admirable in this caſe, which is made thus; Take of prepared Cryſtal a ſufficient quantity; diſſolve it in juice of Lemons. Boil the Solution with Sugar into the form of a Syrup.

2. This emulſion is excellent; Take of Seeds of Purple Violet half an ounce; with a ſufficient quantity of Speedwell-water, make an Emulſion.

3. Fried Pellitory of the Wall applied, is an eſſential Remedy. Jac. Sylvius.

4. Root of Knotgrafs drank with Water is very good; as alſo the Seeds and Leaves of Trefoil boiled in Water and drank. I have often experienced the Powder of the Jaw-bone of a Soufed Pike.

Varignana.

5. Let two or three heads of Garlick be boiled in White-wine; add a little Treacle and Mithridate. Give an ounce and an half in drink. It preſently provokes Urine.

Villanova-nus.

A GUIDE TO The Practical Physician.

BOOK X.

Of Diseases beginning with the Letter L.

Lepra Arabum, or, The Leprosie of the Arabians.

The Contents.

*When Bleeding is proper ? I.
What such the Purges should be ? II.
Whether Hydroticks and Diaphoreticks be proper ? III.
Whether Vipers flesh be good ? IV.
Whether Mineral Waters be proper ? V.
Cured by Gelding. VI.
Contracted by long taking of Guaiacum, cured with cooling things. VII.
Asses Flesh cures it. VIII.
Cured by eating Cucumbers. IX.
We must sometimes desist from Medicines. X.
Cured by Salivation. XI.*

I. **T**HE Leprosie must be cured a far different way from what it was of old. For when it is distinguished from what antecedent matter it proceeds, and how long it has lasted, whether it be beginning or inveterate, Remedies must be insisted on according to the diversity of the humour which caused it. One beginning, in which the signs as yet appear but obscurely, in whom no Exulceration, nor any Swelling appears, and about the Face especially, will be cured by Bleeding first, then by taking an Electuary made of cooling and lenient things; it will be cured also by frequent use of Baths hot and cold. But that which has manifest signs, as where Exulceration of the Nostrils, and fleshy Tubercles appear, when the Blood comes out at the Nose, must be no more cured as one beginning: For in this, Blood must not

be let in the greater Veins, lest the Blood, that is as yet laudable, contained in them (which we ought to preserve with the greatest care) should be let out: because it is a curb to all the Humours, by its temper tempering all the rest, and reducing them to moderation. Wherefore since there is but a little blood in a Leprosie, it ought to be saved by all means possible.

II. Such Medicines must be used for Purging, as particularly purge the peccant humour. Such therefore are not sufficient as purge any humour indifferently, as Antimony chymically prepared, which by vellicating or rather ulcerating the Stomach, evacuates what humours it finds. If this be given, it must be at first, before other Medicines, to diminish the abundance of Excrements. The Dose may be three, four, or five grains, according to the Patient's strength, with half an ounce of Sugar of Roses; and this must be taken, when the Stomach is full of meat, and the Body (according to Hippocrates his rule in taking Hellebore) well stirred before. Afterwards a Syrup may be taken which may correct the error of the Antimony, and may purge the humour particularly, made of Borage, Cichory, Endive, Scariola, Lettuce, Violets, Lentils, Polypody, *Carthamus*, Senna, Dodder of Time, which must be used for several days, that the antecedent matter may be carried off by continual and frequent purging, and may be averted from the flesh and habit of the body by the inner parts.

III. Our Practitioners are much to be blamed, who having first given gentle Purges, do by sudorific Medicines and by opening and inciding Syrups, send the matter to the Skin, whereas the Disease is in that part; for this is to carry the excrements to the part affected, and to increase the Disease; it is better therefore to derive the matter by the Inwards. This is a Disease of the outer parts, of the Skin especially; In such cases let the excrements

Rondeletius

Idem

of the body be retracted, and be purged by the belly: let them be expelled from the external parts to the internal by bathing in cold water: for since it is a Disease in the Skin and the Flesh, the excrements must be kept away.

Idem.

IV. *Palmarius* upon *Fernelius* his authority and his own experience disapproves of *Vipers*; because he gave them to leprous persons, without any benefit. *Poteries* says he has used *Vipers* in Leprosies, without any benefit, though taken a long time. He says indeed, an old Itch has been cured by taking them for a long time.

V. Many send their Patients presently to the natural mineral Waters, but because they dry much, much harm often arises from them, especially in the beginning of the Disease, while heat and driness are prevalent; and a Bath of cold water is more proper.

Sennertus.

VI. It is proper to hinder exsiccation, because the essence of it consists in driness. The blood is ferrous and salt, and therefore cannot be assimilated to the parts nor nourish: for the end of nutrition is assimilation. Therefore Women, Children and Eunuchs are seldom troubled with this Disease; for they are moister, and so better resist driness. *Aëtius* says many have rid themselves of this Disease by being gelded. By this means I cured a young Man this year, who was begun and gon a little in this Disease.

Rondeletius.

VII. A red-haired young Man and cholerick came to me, with his skin torn into deep clefts all over his body. All my life time I never saw a Man more leprous: He had taken seven courses of a decoction of *Guaiacum*, forty days at one course; upon which he fell into a perfect Leprosie. He having a very hot Liver naturally, which was turned almost to ashes with so many hot Potions, I prescribe him the use of Mountain Crystal prepared, to take half a drachm every morning with Juice of leaves of Water-lily, Currants and Barberies (industriously avoiding Sugar and sugared things) drinking after it some Whey, with a little *Sal prunella*. Then I laid him on a straw bed, deep under a Mill, to receive upon his body the dropping of the very cold water, not heated either by motion, or the heat of the Sun. And when he had done this for an hour and an half before Supper several days, he grew sound and very well.

H. ab Heer, Obs. 22.

VIII. Mr. *Schipanus*, a Physician of *Naples*, told me that Prince *Caraffa* used to eat the flesh of the Foal of an Ass for the Cure of the Leprosie. Some think Asses flesh causes it, as *Ballonius*, l. 2. *Ephem.* p. 187. This indeed is hard of concoction; but the Flesh of the Foals is better and more tender, which therefore *Hippocrates*, 2. de v. rat. says does quickly pass: And it may be for that reason it cures the Leprosie; or by its tenacious aliment it amends the fault contracted: for, according to *Pliny*, l. 18. c. 17. Asses flesh is good for consumptive persons.

T. Bartholinus, hist. 33. cent. 6.

IX. One that was troubled with this took several Medicines to no purpose; he took white Hellebore. At length he recovered by taking Cucumbers. He ate them pickled all the year round.

Hentnius.

X. The Leprosie, above all other chronic Diseases, requires variety and vicissitude of Medicine: And in this Disease, if in any, a truce and intermission from all Medicines must often be allowed the Patient. Then the same things must be repeated, and new ones added. For scarce ever any Man recovered, who relied on one only Remedy, though never so generous.

Palmarius.

XI. In the year 1675. in the month of September, an Italian by Nation was suspected of a Leprosie. Abundance of Scurf fell all over him, he was hoarse, had a stinking Breath, and was very lean. He had taken a vast deal of Medicines; at length Salivation was prescribed him, but a Diet first of *China* and *Sassa*: And in a short time he perfectly recovered, though the Disease had got a head.

Lepra Græcorum, or, The Leprosie of the Greeks.

(See Habitus Affectus, BOOK VIII.)

The Contents.

Only the great Remedies are proper. I.
The Blood must be sweetned. II.
Waters coming from Iron effectual. III.
To whom a decoction of Woods may be given? IV.
Chalybeate Medicines alone not efficacious enough. V.
Whether Salivation doe any good? VI.
If it come upon a Dropsie, what must be done? VII.
The excellency of eating of Cucumber. VIII.
Purging Waters are good. IX.
Vitriolate Waters are good. X.
What sort of Medicines made of Vipers are good? XI.
The Cure of an Itch that accompanies the Venereal Disease. XII.
Topical Medicines alone doe no good. XIII.
Whether sulphureous Baths be proper? XIV.
Liniments must be applied by degrees. XV.
Those made of Mercury suspected. XVI.

I. THE material cause of the Scab, or of the Leprosie of the Greeks is not merely a cutaneous humour, because of Infection taken from without, or because it is depraved and degenerated from its crasis upon other occasions: but the Puslules at first arising about the beginning of the Disease seem to arise from hence, that some acidosaline Concretions (like Tartar in Wine) do happen in the mass of blood, which when they cannot be conquered nor dissolved, are driven here to the Skin, as in the other case to the sides of the Cask. In respect of the conjunct Cause there are two special Indications of Cure, namely, that the Impurities of the bowels and humours may be quickly purged, and that the acidosaline Dyscrasies of the blood may be regulated: for which ends Medicines both evacuating of divers kinds, and altering, use to be prescribed. Yet because not all, but only the great Remedies in a manner are used, we shall therefore subjoin in this place, those that are most usefull, and are found to be most beneficial. First therefore, when universal Purgation and Phlebotomy have been used, the following Infusion or cathartick Tincture may be given, six or eight ounces whereof may be given and repeated once in six or seven days; Take of root of sharp pointed Dock dried, Polypody of the Oak, each half an ounce; *Senna* ten drachms, Dodder of Time six drachms, Rheubarb, Mechoacan, each half an ounce; yellow Sanders 2 drachms, Celtick Spike half a drachm, Salt of Tartar 1 drachm and an half. Put them into a Glass with 4 pounds of White-wine; keep them for use; pouring off as much of the clear liquor as you shall have occasion for. You must add two pounds of Elder-flower water.

Willis.

II. For sweetning of the Blood, and washing its Salts, Whey either simple, or with fumitory, Cichory, or sharp pointed Dock infused in it, may be drunk, two or three pounds of it every morning, for twenty or thirty days, if it agree with the Stomach. And besides, a Dose of the following Electuary may be taken morning and evening; Take of Conserve of root of sharp pointed Dock 6 ounces, Crabs-eyes, prepared Coral, each 2 drachms; Ivory 1 drachm, Powder of *Lignum Aloes*, yellow Sanders, each one drachm and an half; *Sal prunella* two drachms, Vitriol of Mars one drachm and an half, Syrup of Juice of Wood-forrel what is sufficient. Make an Electuary. The Dose two ounces.

Idem.

III. For the very same reason that Whey, Iron-waters also are prescribed in this Disease, and they often

often doe good: for when all other Medicines have been given to no purpose, I have often cured a grievous Scab, which has almost been leprous, onely with these Waters. Moreover, for the more efficacy, *Sal prunellæ*, or *Vitriolum Martis*, or a little of the foresaid Electuary may be given conveniently.

Willis.

IV. In some that have too much *Serum*, and ase of a watry constitution, when drinking of Whey or the Waters are not so proper, it may sometimes be convenient to give a Decoction of the Woods at medical hours; and moreover, to take them constantly for their ordinary drink; Take of Wood of Willow half a pound, root of *Sarsa parilla* 8 ounces, white Sanders, Wood of Mastich-tree, each 2 ounces; shavings of Ivory, of Hart's-horn, each five drachms; Tin, crude Antimony, each four ounces tied in a Cloth; Liquorice one ounce. Infuse them and boil them in sixteen pounds of Spring-water half away. Keep the Colature for use.

Idem.

V. Chalybeate Medicines, because they are reckoned among the more efficacious Remedies, must seldom be omitted in these Diseases, though they are not often given with much success: for most Preparations of Steel, in which the sulphureous Particles prevail; inasmuch as they ferment the Blood and put it into critical effervescencies, do rather increase than diminish the impetiginous eruptions; nevertheless, the Salt, Syrup, Tincture and virriolick Infusions, as they fix the Blood, and check a little the efferations of the Salts, do suit well enough the Intention now proposed; but those that are not so strong can doe little good against so Herculean a Disease.

Idem.

VI. Wherefore when these and most other Remedies will doe no good, many commend Salivation as the stoutest Champion, and the onely one able to cope with so stout an Enemy; But the event does not always answer expectation: for I do confess, I used this Remedy for four persons who were troubled with a grievous Itch, which was obstinate to all other Remedies, without any benefit. One of them by anointing with Quicksilver, and the other by Pills of Solar Precipitate bore plentifull Salivation for about twenty days, in which time all the Scurf and Wheals vanished; nevertheless, to confirm the Cure, a diuretick Drink of a decoction of *Sarsa*, and often Sweating, and convenient Purgings between whiles, was continued for a month: And yet for all this, when this course was at an end, and when no signs of any Itch appeared, within another month, the Disease began to bud out again anew, and in a short time grew to its wonted maturity. Moreover, when one of these had repeated this Medicine, and another after two Relapses had a mind to try it a third time, both of them, after they had undergone so much, despaired of any Cure. Whence it is evident, that the Venereal Disease, though it be extremely malignant, and cause most foul, cacoethick Ulcers, that eat the Flesh and Bones, may more easily and certainly be cured than the Itch. Wherefore not undeservedly did the most famous Physicians of old reckon this Disease, when confirmed, and brought near to a Leprosie, to be very difficultly, if at all, curable.

Idem.

VII. And an event no whit better attends this Disease, when it comes upon an inveterate Scurvy; perhaps indeed the Intentions of cure may be more certainly gathered, when the Scurvy is the basis or root of this Disease, to wit, to take the primary therapeutick Indication from thence, and insist chiefly on antispasmodick Medicines. But even of this sort those that are sharp and hot, as Scurvy-grass, Water-cresses, Horseradish, Pepperwort and other things that incite the Blood too much, as they dissolve the *Crafs* of it more, and force the coagulating Tartar in more abundance to the Skin, they are always found to doe more harm than good. And

for this very reason the use of Baths, or Bathing in hot waters, which evacuates by abundance of Sweat the Humours of the whole body, and cleanses the Pores of the Skin, though it may seem very good in this Disease, yet it is so far from relieving, that the Breaking out is usually increased and exasperated thereby: For I have known several who, not being very itchy, have gon to Bathe, and there bathed in the hot water, and have returned from thence quite leprous. Wherefore whenever this Disease is a supervening Symptome of the Scurvy, let all sharp and elastick things be avoided, and onely the more temperate ones be given, endued with a nitrous, or virriolick, or a volatile Salt. The nitrous Salt is predominant in *Crysalum minerale*, some Juices of Herbs or Decoctions, and in some purging waters.

Idem.

VIII. The Cucumber is endued with a nitrous virtue, and by experience is found good against this Disease, wherefore instead of Sallet it may be eaten plentifully and often. Moreover, let three or four of them be cut into Slices, and be infused in four pounds of Spring-water cloie for a night; to the clear liquour poured off add of *Sal prunellæ* two or three drachms. The Dose half a pound three times or oftner in a day. For the same purpose also Decoctions of the leaves and fruit, made in spring water, are proper.

Idem.

IX. Some cathartick mineral waters, especially North-hall waters, if you make an *Analysis* of them by evaporation, do manifestly shew the nitrous Salt wherewith they are impregnated. And I have several times found, that the constant drinking of about four pounds of them every day for a pretty while together, has done good in a slight Itch.

Idem.

X. But Waters impregnated with a virriolick Salt, such as the *Spaw*-waters, do far excell these nitrous ones and any other Medicines, and doe far more good in curing the Itch. To such as have not an opportunity to take them I give common water, impregnated with our Steel, and so exactly resembling *Spaw*-waters, for this Disease, and with good success. Because of their mineral Salts or at least some Mercurial Particles in them, Tin and Antimony are in Vogue for curing the Itch, and several use to prescribe them with other Medicines. Raspings of Tin and Powder of crude Antimony may be infused in Beer for the ordinary Drink, and they may be put into a Decoction of *Sarsa* and the Woods, for this Disease.

XI. The Viper and its Preparations do sufficiently set out the excellent virtue of a volatile Salt in curing the Itch, yea the Leprosie it self. *Galen* reports, that this Medicine for this Disease was found out by a casual experiment. Hither also may be referred the analogy taken from the nature of the creature, whence it is gathered, that it does good in this Disease; for since the Viper every year casts its scaly slough, therefore any one might think that its parts would be good to cast off the crusty skin in the Leprosie. But not to attribute much to such things, since it is apparent from frequent observation that viperine Medicines are good in the Itch and Leprosie, the reason of the Cure must be ascribed to the volatile Salt, with which this Animal abounds: For the Particles hereof do destroy the fixt and acid Salts, which are prevalent in the diseased, and dissolve their Combinations. Notwithstanding, the Salt, Spirit and Oil chymically extracted from Vipers, by reason of the empyreumatick and exceeding elastick Particles which the Fire produces, are not at all proper in this Disease; as neither the Spirit nor volatile Salt of Hart's-horn, Soot, Blood, and the like Ammoniack Spirits, because by exagitating the blood and humours, above measure, they cause their *Crafs* to be more dissolved, and drive the corruption more to the Skin. Wherefore the simpler Preparations of Vipers, as a Decoction of their Flesh in water, Drink impreg-

Y y 2

nated

nated with their Infusion or Decoction, their dried Powders and Electuaries made of them, may be advantageously prescribed against this Disease. Moreover, not only the Flesh of Vipers, but of other sorts of oviperous Snakes, boiled and eaten for food, often doe abundance of good.

XII. The Itch, or scurfie eruptions of Wheals in bunches, is so frequent and familiar a Symptome of the Pox that the first thing I ask such as are ill of this Disease is, Whether they be not conscious of some latent malignity? And if I find it so, I let alone all Specificks for this Disease, and Antiscorbuticks, and immediately proceed to a Decoction of the Woods, which if it doe no good, I proceed to Mercurial Medicines. And indeed by this method I have with ease and speed cured several, who were reckoned impetiginous and leprous, after they had been long treated to no purpose with remedies appropriate to these Diseases, and miserably tormented.

Willis.

XIII. The second curatory Indication, respecting the Disease it self, and the primary Symptome, to wit, the scurfie Eruptions and Wheals, prescribes topical Remedies to be applied to the external Skin, for the Cure of these Ails: For which end Baths and Liniments especially are good; which yet, unless the procatectick Cause, i.e. the tartareous disposition of the Blood be first purged out, doe seldom, if ever, any good of themselves. Among all which, Baths or Liniments made of Tar are by far the best; so that indeed they onely should be used, but that they smell so strong. Therefore it is usual, for Baths to use water kept in Tar-barrels for a while, and impregnated with the Infusion.

Idem.

XIV. Sulphureous Baths, both natural and artificial are not proper: for that the former often doe harm, frequent experience testifies: yea, all Bathing whatever must be used with much caution; for inasmuch as this administration stirs and heats the blood, it is in danger (as I said before) to dissolve its Crasis farther, and to force the corruption more to the Skin.

Idem.

XV. Liniments, whose use is safe and proper, are of three kinds or degrees, gentle, moderate, and strong. 1. In a slight Itch, where the Eruptions and Wheals are few and small, fasting Spittle is commended, also the liquor that sweats out of green Wood, when it burns, also bare rubbing with Dock roots bruised and steeped in Vinegar; Take of Oil of Tartar *per deliquium*, Oil of Nuts or of bitter Almonds, each equal parts. Make a Liniment. Use it twice a day. The second sort of Liniments use to have Tar in them; Take of Ointment of Roses six ounces, Tar two ounces. Melt them together and mix them. Take a piece of fat Mutton, lard it with pieces of the root of sharp-pointed Dock, rost it on a Spit. Baste it with Tar continually dropping upon it. The dripping of both must be saved for an excellent Ointment for the Itch. The most effectual Liniments against this Disease are Mercurial ones, which are made of Quicksilver or Precipitate. A Receipt for the first is this; Take of Quicksilver killed with an Acid one ounce and an half, new Hogs-lard six ounces. Incorporate them well in a stone Mortar or a glass one. For the other; Take of white Precipitate three drachms, Ointment of Roses three ounces. Mix them. Anoint the parts most affected.

Idem.

XVI. The use of these in this Disease ought to be much suspected; for if Salivation should be raised, a vast quantity of matter impacted in the pores of the Skin would be moved, which if it should fall too much at once on the salival ducts, and should gather about the Throat, it would endanger choaking.

Idem.

Lethargus, or, A Lethargy.

The Contents.

Whether Blood-letting be convenient? I.

Medicines.

I. *Galien*, 13. *Meth.* 21. approves of Bleeding; and most men follow him: for so a proper revulsion of the Humour is made, that it flow not to the Brain, which being affected with heat and pain, is easily susceptible of the fluxion and draws, whereby the Inflammation of a Noble Part is prevented.

II. I think the jugular Vein should rather be opened than one in the Arm, because by this means the blood being much gathered in the *Sinus* of the Head, and it may be stagnating, will more easily be reduced to an equable Circulation.

III. Though a continual Fever accompany this Disease, yet the Physician need not be over tardy or timorous, when matter tending to the Head is very urgent. For it is more advisable to evacuate it, when it is in motion, than when it is fixt in the Head, and settled there: And the danger permits a man to try something. And if it happen that the Lethargy come upon a *Crisis*, the Humours which produced the Disease running to the Head, and if the precedent Fever abate, then we need not much regard the whole or the Fever, but we must have respect to the Head, and prepare the matter settled there.

Scenertus.

IV. Before you pitch upon purging Medicines, consider whether the ascent of the Humours to the Head come rather from Bile carrying the Phlegm, than from the abundance of Phlegm it self: for if the first, although the Disease seem phlegmatick, you must purge with Colagogues, for exclusion of the Bile, which carries Phlegm to the Brain. *Oribasius* saies, that nothing is so good for purging of Phlegm, which Bile mixt with it has carried to the Head, as Scammony given with Castor. If you find Phlegm predominant, as in most spurious Fevers, and when a Lethargy begins, you must doe the business with Phlegmagogues.

Mercatus.

V. Here we must consider whether we must purge or vomit in the beginning. I know this is variously controverted among Authours; and I have known it practised with various success, which things considered and compared one with another, I will briefly give you my opinion. If the Lethargy come from Surfeiting or Drunkenness, or from taking incongruous things and Narcoticks, a Vomit must be given presently: Wherefore let Salt of Vitriol be given with Wine and *Ozymel* of Squills; or in strong persons an Infusion of *Crocus metallorum* or *Mercurius vitæ*, with black Cherry water; and afterwards, if it work not of it self, Vomit must be provoked by putting a Feather down his Throat. But if the Lethargy come upon a Fever or other cephalick Diseases; or if it be caused primarily, or by it self by some predisposition laid in the Blood and Brain before, Vomits and Purges given at the beginning, while the matter is in flux, often use to doe more harm than good: Inasmuch as, when the Humours are in motion, they disturb them, and when they cannot be brought under and carried off, they drive them more into the part affected.

Willis.

VI. If

VI. If the Disease continue, and the Patient can hardly be awaked, the use of Sternutations is very proper; yet we must not persist continually in them, lest they thin and move the Humours too much. At the beginning of the Disease especially, we must abstain from them. They are bad also when the Fever is high. They may be used when the Lethargy begins of it self, or when it takes one lying in bed, and in the declension.

Sennertus.

VII. I have known the most good from a Blister, above all other Applications, when it has run well all over the Head. I saw two Lethargick persons cured chiefly by this Remedy, after the Disease had continued a long time, and had not onely destroyed the memory, but much impaired the understanding: For because the excoriated places in both of them would not easily heal, they ran a great deal of thin Ichor, namely, every day about half a pound.

Willis.

VIII. Fumes which some use to raise the lethargick, are not proper in this case, because they fill the Brain much: It is better to make a Decoction of Pennyroyal, Rue, Mother of Time, Hyssop, wild Majoran, boiled in Vinegar, adding a little Castor, and to receive the Steam of it at the Nostrils.

Sennertus.

IX. The Ancients held the Cause to be Phlegm gathered in the Head, which by its Moisture and Cold caused the Stupefaction, and by its putredinal heat waking; But this is impossible. The Cause is rather a narcotick Vapour, elevated in the concomitant Fevers, whether a quotidian, continual, bastard-tertian or semi-tertian. Or if it came without a Fever, it is phlegmatick Blood, that causes the Inflammation: For, as *Forestus* observes, there is often such an Inflammation as turns to a Gangrene. And so the Cause of the Lethargy is twofold. *Hippocrates*, *l. de Morb. sect. 3.* places the seat of the Lethargy in the Lungs, and he judges that it does not much differ from a Peripneumony, affirming that the Cause of a Peripneumony is bilious blood; of a Lethargy pituitous.

X. The Ancients used strong and hot Preparatives as well as Purgatives, so that it appears, they little regarded the concomitant Fever; and it was on this ground, because they thought the Fever was onely symptomatick, and followed the Putrefaction of Phlegm in the Brain, which being removed, the Fever ceases. But seeing the Fever is not onely symptomatick, but narcotick Vapours ascend from the febrile matter into the Head, and the Heat puts the Phlegm in the Head into fusion; or Phlegm runs out of the whole Body into the Head, the Fever ought not to be neglected: And according as it is more intense or remiss, so Medicines, which are otherwise good in a *Carus*, must be so tempered because of the Fever, that the danger, which otherwise is imminent, be not doubled, when the Fever is increased with such Medicines.

Idem.

XI. Because of the cruel nature of this Disease I propound a new sort of Remedy, i. e. an Issue or Seton in the Neck; in those Lethargies, that is, which are of long continuance, or come by Fits, because such are the Forerunners either of an Apoplexy or an Epilepsie. Therefore in a *Carus* or *Catalepsis*, I reckon an Issue in the Arm a good Remedy, both for Prevention and Cure: But in a Lethargy, because it is an Inflammation, and short Disease, certainly it can doe little good; as neither in such comatous Diseases as have a concomitant Fever, or are caused by Sympathy.

Mercatus.

Medicines especially made use of by eminent Physicians.

1. Savory often infused in Vinegar, and applied to the Head, or drunk with Wine, raises the most Lethargick persons.

Altomari.

2. Give Spirit of Citron, and it will afford present Remedy.

Hæserus.

3. Castor in the Cure of a Lethargy is preferred above most other Medicines.

Sennertus.

4. A Squill sometimes alone, or Mustard bruised with Vinegar, laid in manner of a Cataplasim to the Hips, is able to raise any Man from a dead sleep.

Trallianus.

5. One ordered a Hog to be hung by the Heels before the Patient, who hearing the continual noise and crying of the Hog that hung by him, was so terrified, that he could not sleep. ¶ Another ordered the Patient's Head to be shaven, and to be anointed with Honey, and the Flies so troubled him, that he was not able to sleep: And so he was cured.

Villanovanus.

Medicines.

I. IN an Inflammation and other Diseases of the Spleen, which a gathering or preternatural motion of Blood to that place does cause, Blood-letting is therefore prescribed, that the abundance of Blood gathered in the Spleen may be diminished, and that what still runs to the same part may be retracted to the opposite parts, and as far distant as may be: For so a Cure is used for the said Diseases, according to *Hippocrates* his rule, by Contraries. But this Contrariety, whether you evacuate, or especially if you make revulsion of the blood, which runs in abundance to some part, must not be reckoned by the resititude, as they talk, or rather (to speak more properly and truly) by the continuity of the fibres of the vessels common to those parts: This is the *Kat' isyn* of *Hippocrates*; for revulsion can scarce be made by an absolutely straight way, because the Blood must of necessity pass through the windings and turnings of the vessels. The resititude

itude therefore, or continuity of fibres, and community of Vessels must be regarded: for without the community of Vessels, it cannot be said that there is a rectitude, or continuity of fibres. Yet I cannot but admire how so many excellent Physicians, from Hippocrates to this very age, could think they understood, in what manner revulsion was made from the Spleen by bleeding in the left Arm, since the rectitude, that is required, cannot at all be found here, the Liver hindring that, in which the capillary branches of the *vena porta*, and the *vena cava* are wonderfully implicated, and are connected by their small ends, or do mediately communicate. Whoever considers this accurately, will easily discern, according to *Galen's hypothesis*, who will have the blood carried from the Liver, by the Veins, into all the parts of the body, that revulsion is not better made by bleeding in the left Arm, than in the right: For, according to this *hypothesis*, revulsion cannot be made of the blood from the Spleen, unless as it is drawn from the Liver. But blood is easier drawn from the Liver by Venæsection in the right Arm, than in the left: for *Galen* and his followers prescribe it. From these things it manifestly follows, that these great Men either ineptly rejected the Circulation of the blood, or ineptly prescribed bleeding in the left Arm, for making revulsion from the Spleen. If a Circulation of the blood be admitted, it is easy to demonstrate, that bleeding in the left Arm is the most commodious for evacuating of the Spleen, when it is distended with too much blood, or for revulsion from it, when the blood runs over-much to it. For when this is opened, it is the same thing as if the Artery were cut, whence the opened vein receives its blood; for the blood is the same, and comes from the same fountain. And who knows not that the fibres of the Arteries are continued from the Splenic Artery by the *Aorta* to the Artery of the left Arm. The rectitude therefore, or continuity of fibres is observed, in the said Venæsection, admitting the *Hypothesis*, that the blood is distributed by the Arteries to all the parts of the body. And therefore bleeding in the left Arm is proper, either to evacuate the Spleen, or to make revulsion of the blood, when it runs too abundantly to the Spleen.

Bayle, Probl.
Med. 8.

II. Leeches applied to the end of the *Intestinum rectum* are reckoned to empty the Spleen of its feculent blood, the cause of obstructions, with great success; and it is believed there is no way more commodious for it. But Spleniticks have no reason to weigh Anchor upon a credulous Gale of this perplexed hope: Nothing can be communicated from the Spleen to the Seat by any Veins, Experience refutes it.

Rolincius.

III. He does not much amiss, who sometimes opens the black Veins upon the Spleen, because it has been known, that a long and contumacious Disease has been often cured thereby: But if ought dissuade you from bleeding in these Veins, you may set Leeches or Cupping-glasses with scarification to them.

Hollerius.

IV. Some of the most learned Physicians make an Issue or a Seton in the Region of the Spleen, and Vescicatories also, for the Diseases thereof, especially *Ætius* and *Aretæus*; yet I should not easily persuade the use of them for fear of an Inflammation of the part, which is oftentimes pained, and may endanger the Patient. ¶ But he speaks there of an obstruction of the Spleen: And if there be a *Scirrhus*, and that a contumacious one, *Capivaccius*, l. 3. c. 26. says, it is a most effectual remedy. ¶ *Saxonia, Pract. Præleß.* l. 2. c. 28. convinced by his own experience, maintains, that it is very good to burn in four or five places over the Spleen. ¶ And *Hippocrates*, l. de int. aff. 1. 35. is not against this remedy, who burns ten places, and those very large, upon a swelled Spleen, with *Fungi* dipt in hot Oil. ¶ *Forstius*, conf. 43. cent. 3. with *Ætius* and *Paulus*, commends

Silvaticus.

Sinapisms, as reviving the heat of the Part. But he adds, I know not for what reason *Aretæus* persuades himself, that he can mollify the hardness by fire. I should, with *Hippocrates* and *Ætius*, admit of burning; but all will be vain, if there be a *Cachexy*, and if black choler abound; for in such the Ulcers might easily turn cancrus.

V. *Hippocrates*, lib. de affect. n. 21. approves of Vomiting in diseases of the Spleen; and there he has respect to the antecedent cause contained in the Stomach; for the Splenitick abound with much crudities, which the Spleen draws, upon which it swells. When therefore the Stomach is emptied by Vomiting, Matter is substracted from the Spleen, a future occasion of obstructions. The Spleen itself will be eased by Vomiting, because the Gastrick Arteries discharge their filth into the *Coeliack*. And though the black humour be not very sequacious, because of its gravity; yet it may be drawn from the *Mefaricks*, and parts where it sticks pertinaciously, by the agitation and violence of the Vomiting, and may afterwards be voided downwards.

VI. *Hippocrates*, l. 4. acut. v. 396. excludes the Splenitick from Purgings. By the Splenitick in that place are meant, they that have a hard Spleen, and the Ancients, and *Galen* himself, 6 *Apoph.* 43. took it in the same sense. *Hippocrates* prohibits them purging, because the matter, which has been long settled in the part, will not give way to a Purge, and what is contained in the rest of the Body, being disturbed by the Medicine, runs to the part affected, and increases the Swelling. And certainly, to confess ingenuously, when I have been forced by the common custom, to give Purgings, even violent ones, in inveterate swellings of the Spleen, I know not one that was helped thereby: So that is no wonder, if those ancient Physicians, whose cures, *Galen*, *Ætius*, *Celsus*, and others, have celebrated, used in this case only Diureticks, and such things as extenuate and mollify the Spleen, and make no mention of purging, as you may see in *Galen* 9. de comp. med. *Ætius*, *P. Martianus* comm. in loc. *Celsus* and others.

VII. Why a Clyster rather purges the Spleen than the Liver, this seems the reason, Because it passes not beyond the *Colon*, but operates only on it and its vessels, as the *Mesentery* and *Hæmorrhoidal Branch*, which tends to the Spleen, and by which the humours are evacuated out of the Spleen.

Walaus.

VIII. We must know, that the Spleen will bear strong Medicines, as *Hippocrates*, lib. 2. *Morbis.* first Fortis. of all observed.

IX. Whether in Diseases of the Spleen must we evacuate by Urine? Many make a question of it, upon *Galen's* authority, 13. m. m. cap. 17. where he says, the Spleen must be purged by Stool, and not by Urine. It is clear from an Anatomical reason; for there comes a remarkable branch of the *vena porta* to the Spleen, by which the matter must be transmitted to the Liver, and thence to the *Cava*; and out of that to the Emulgents. And if some be cured by plentifull Urine, as *Bion*. 2. *Epidem.* 2. either *Hippocrates* takes notice of it as a thing very rare, and done by occult ways; Or indeed by using emollient and dissipating Medicines, and Purgatives, when much feculent matter remained in the Veins, whereby the humour might be fed, when it was discharged by Urine, it was rather a pretension than cure. Which the Physician may imitate, when he knows that the Urine is black, thick and feculent; for then he may safely use Diureticks, to evacuate the antecedent matter by that part. But it is apparent, that the Spleen does often discharge it self of lixivious saline drops, and of tartareous sandy crudities, while they are attenuated and voided by Urine. Thence the Physician takes an occasion to give Diureticks to those that are ill of the Spleen; and when *Hippocrates* lays down the Cure of the Splenitick, lib. de affect. he says, they must be purged by Urine. It

is false also, that there is no manifest way from the Spleen to the Kidneys and Bladder; for there are more Arteries, yea, five times as many as there are Veins, arising from the Coeliac: Whereby there is an easie passage to the Emulgents; but besides, the Lymphatick Vessels, tending to the Kidneys, are dispersed through it: Hence *Galen*, 2. ad *Glauc.* cap. 2. says, the Kidneys and Spleen are evacuated by Urine. It is false also, that Diureticks must be given, onely for Preservation, and the antecedent matter's sake; for it has been often observed, that Hypochondriacks, and the Splenitick, have voided very black Urine from the Spleen it self, and places about the Spleen, by the Emulent Arteries, with *evpoeia*, or good tolerance: *Valerius Exercit.* in cap. 40. *Hollerii*, says, he knew a Religious Man, whose Spleen swelled three or four times in the year, especially in the Autumn, he had a pain in his Hypochondria; he was black all over his body; at length, when he had made Urine as black as Ink for five or six days, he grew well. ¶ I observed this also in a Lawyer, one Mr. de Harfy, who was very Splenitick, and voided Urine by fits, very like Ink both in colour and consistence, which we cured by Diuretick Emulsions. And *Fortis*, cent. 3. consult. 48. approves of the same.

X. *Gaspar Hofmannus de usu Lienis*, cap. 16. writes, that nothing is better than Diaphoreticks in Diseases of the Spleen, according to *Hippocrates* and *Vallesius*. The Woman, whom *Hippocrates* first cured in Crano (6 *Epidem.* Sect. 3. v. 5. *Fæf.*) who was taken with a burning Fever, and had a hard Spleen, was critically cured by sweat; on the tenth day she sweat upwards, and on the fourteenth day downwards. *Vallesius* 3. in 2. *Epidem.* 20. iii. in 3. *Epidem.* agr. 3. ii. in 6. *Epidem.* 32. shews, that Sweats are frequent in Melancholick Spleniticks. For in them the Spleen discharges it self of the luxuriant saline dregs, and tartareous crudities, of which there is great store.

XI. Harts-tongue, or *Phyllitis Dioscoridis*, is of an Astringent, and as *Galen*, 8. *simpl.* speaks, of a bitter quality, for which *Galen*, as well as *Dioscorides*, commends it for Dysenteries. On the contrary, Spleenwort, according to *Galen*, 6. *simpl.* 61. is of subtiler parts. Who therefore, may some say, would commend Harts-tongue for Diseases of the Spleen, for removing of which, we see Harts-tongue Beer, used both by Physicians and the Vulgar, all the year long, than which, nothing is more valued? I answer, The Spleen is a part most fit to imbibe humours like a Sponge, inasmuch, that it often grows hard, by too much repletion, which requires strengthning. If therefore Universals have been premised, Aperients given, if Tamarisk, Capers, Gentian, *Aristolochia*, &c. have been used, nothing certainly can be given more seasonably to a Splenitick person, than Harts-tongue Beer. Not to open the obstructions of the Spleen; but when they are opened, to strengthen it, and defend it from new inconveniences and injuries.

XII. Idleness, according to *Celsus*, increases this Disease. And *Aëtius* saw some, that were cured of it onely by walking and running.

XIII. The place for application of Externals is the left hypochondrium. And they observe these places below, so that the fingers may be put into the empty spaces under the Bastard Ribs, or they reach forward, toward the middle of the Abdomen, and observe, by the touch, whether they be soft or hard. But in its natural site, though it swell out a little, it cannot be felt neither below nor before; for it has a higher situation. The Application about that place is in vain. But in a preternatural state, when it swells, either downwards, or forwards towards the middle of the Abdomen, Topicks are convenient in that place, and one cannot err in the place of application. A *Stillicidium*, Embrochation, or Fomentation with a Sponge, is convenient. A Bag filled with Spices, and boiled in Wine, penetrates

less. Liqueurs applied in a bladder are less effectual than a Bag; because the virtue is intercepted by the Membrane. Boiled Herbs themselves, though they be troublesome, are more effectual. Plasters, though they seem to stop the Pores, yet by their long lying on, they make up that inconvenience.

XIV. In an Inflammation of it, after a Vein is breathed, presently some repelling thing must be applied; but it must not be very cold nor astringent, lest the humour be condensed, or fixed more in the Spleen, and it be hardened, but some inciding thing must be mixt, as Vinegar.

XV. *Sennertus* advises to abstain wholly from Purgatives, except in the Declension: for though the Spleen will bear strong Medicines, yet then there must be no Inflammation, which would grow worse upon Purging.

XVI. The same method of cure must be followed in an Inflammation of the Spleen, as in the Inflammation of the Liver, if the following differences be observed. 1. That when the Spleen is inflamed, blood must be let in the left Arm, but not so often as in an Inflammation of the Liver. But what is received from Authours about opening the *Salvatella*, which they say peculiarly empties the Spleen, is superstitious, and now almost left off in practice. But it is best to open the Basilick Vein, to satisfy all Intentions. 2. As for Topicks, which in an Inflammation of the Liver are applied to the right Hypochondrium, they must here be applied to the left. 3. In the use of the said Topicks, we need not be so careful about, nor so long continue Astringents; for since the Spleen is no principal part, we need not be so studious about strengthning of it.

XVII. When the Fever, Thirst and Pains are asswaged, if there be any swelling or tension remaining in the Spleen, the Cure must not be left off, though the Patient imagine himself to be perfectly well, for it might easily turn to a *Scirrhus*.

XVIII. *Crocus Martis aperitivus* is good for opening obstructions of the Spleen, if it be made with the Acid of Sulphur, which is most effectual, if two or three grains of it be given with a Purgative Vehicle, to wit, with *Pilula de tribus*, or extract of *Senna*, drinking a deobstruent decoction upon it. But because by long practice I have observed it spoils the Stomach. I had rather give *Circulatum aperiens*, which Medicine contains in it *Sal Martis*, *Sal urine pueri*, and *Sal Tartari*, to which rectified Spirit of Tartar is put, and all of them circulated forty days continually in a Pelican, and so it becomes a most efficacious Aperient. The dose whereof is about half a drachm in distilled water of Fumitory and Agrimony, for fifteen or twenty days.

XIX. They who in Spleniticks begin with Aperients, and not with Astringents, are mistaken, because they set more by the preservatory Indication, than by the Vital, which by no means should be done in flaccid parts, such as the Spleen is. We use in them Chalybeates, Tamarisk, *Scolopendrium*, &c. which are all strengthners. When the Spleen is strengthned, it is rendred more able to expell the excrements. And the same Astringent virtue defends the Spleen from the flux of the humours. Therefore *Galen* 2. *Metb.* 16. says, that Astringents must be put in Medicines for the Spleen, because all Aperients, destitute of an Astringent faculty, puff up the Spleen; as sweet and sugared things do te-

XX. Issues in the left Leg, though they do not evacuate the gross humour; yet by voiding the ferocities, they preserve from Melancholick Diseases, and from trembling and palpitation of the Heart, as *Aëtius* and *Fernelius* have observed.

XXI. Antiquity formerly attributed a stinking Mouth, putrid Gums, bleeding, and sore Legs, to a great Spleen. But they distinguish badly between a Disease

a Disease of magnitude augmented, and an Ulcer, or a part vitiated with putrefaction: For the Spleen labours of both Diseases; but the signs mentioned by the Ancients do rather indicate putrefaction, than magnitude augmented: for when black choler putrefies about the Spleen, not onely the mouth is corrupted, but *Varices* also break out, and the Legs grow sore with Ulcers. A Child was ill kept by its Nurse, in stead of Milk she fed it with other gross food, it gathered from that much tough and viscid humour, so stuffing the narrow Veins of the Mesentery, *Pancreas* and Spleen, that this last part was much swelled, distended all the *Abdomen* and Loins, and made the whole body lean. But when the obstruction was removed, and some of the humour abated, the distended Spleen did so manifestly decrease, that it clearly appeared, this Swelling came not so much from a bad conformation, as from abundance of food, which being subtracted, the Child did thrive again, nor did ever any of those signs appear, which *Hippocrates 2. Prorrh.* ascribes to a great Spleen.

Tulpius.

XXII. The Spleen swells, not because of abundance of melancholy, but rather because of wind gathered and retained about these parts. Medicines therefore must be made of things astringent, and that discuss Wind: for Astringents hinder its inflation and swelling, and discuss, what is already received.

Rondeletius

XXIII. Cupping-glasses may be frequently applied to the Spleen, presently after emollient fomentations, which, as I have always observed them to doe good dry, for moving the matter, and heating the part, so I durst never use them with Scarification, lest the humour, when the moisture was exhausted, might turn Scirrhus.

Fortis.

XXIV. Whether may bloud be let in a Scirrhus of the Spleen? *Galen. lib. de car. p. f. m. c. 16.* commends Bleeding, and admires, why the Ancients omitted it in this disease. I think either may be done. For when the Scirrhus has injured the whole body, and there is a beginning of a Cachexy and Dropsie, venæsection, yea, and all manner of Bleeding must be omitted. When the rest of the parts of the Body are well, a vein must be opened in the left Arm, if strength be good, if not, in the left hand.

Saxonia.

XXV. After we have been carefull in purging, we must proceed to strong attenuants and aperients, in which some give the Broth of an old Cock with Steel, but because we have observed this to doe little or no good in Scirrhus tumours, we rather use a decoction of *Sassa-parilla*, which is held to be admirable against hard tumours; Take of *Sassa-parilla* well cut two ounces, the middle rind of a Willow 1 ounce, Bark of Caper-root half an ounce, Smith's water three pounds. Mix them. Make an Infusion for 24 hours, then let them boil half away; towards the latter end of the boiling add of Spleen-wort, Dead-nettle, each one pugil. Strain it for three doses to be taken in the morning after this Bolus; Take of Trochiscs of Capers one Scruple, *Crocus Martis aperitivus* three or four grains, Vinegar of Squills what is sufficient. Mix them. Make a Bolus. Continue taking thirty or forty days. Every fifth day this must be taken; Take of *Pilule de tribus*, Extract of Senna each half a drachm, Extract of Hellebore one Scruple.

Fortis.

XXVI. A Man about fifty years old had a great Swelling in the left Hypochondrium, unequal and hard, as big as ones Arm, reaching towards the right side, according to the usual site of the Colon. The Physicians ascribed it to the Spleen, together with other symptoms of the Hypochondriack disease. I prescribed the following Liniment and Plaster to be applied over all the upper region of the *Abdomen*, beside Pills made of Gums, by means whereof the Tumour was softened, and in a great measure removed. Take of Ointment of Marsh-

mallows compound, Oil of Capers, each 1 ounce, *Oleum Philosophorum* 2 drachms. Mix them. ¶ This is the description of the carminative Plaster; Take of Gum *Galbanum*, *Bdellium*, Ammoniack, each half an ounce, *Olibanum*, red Myrrhe, each 2 drachms, Thebaick Opium one drachm. Dissolve them in Vinegar of Squills, and when they are inspissated again, add of yellow Wax, *Colophonia*, each three drachms, Balsame of Peru, *Oleum Philosophorum* each one drachm, Earth half a drachm, Carroway distilled half a Scruple, Venice Turpentine what is sufficient. Make a Plaster according to Art. Spread it on Leather, and take measure of the swelling with a paper, and cut their Plaster accordingly, and apply it.

Sylvius de le Boë.

XXVII. It is an old tradition, that the Spleen may be cut out from Runners. But its noble uses disswade that, it being employed in deparating the acid bloud; and there is fear of an Hæmorrhagy, for it abounds in Veins and Arteries. Besides, it is so close tied by the membranes of the *Peritonæum*, and the communication of Vessels to the parts adjoining, that it seems impossible to take it out, without hazard of Inflammation, and endamaging the parts adjoining. Yet it were to be wished, the cause of so many evils could be extirpated. But in my opinion, we should doe little good, because the fault lies in the bad humours, which, when the Spleen were taken away, could doe the same mischief to another part. However, in a Scirrhus, cutting of it out would be of use, because the weight of it is troublesome, and often causes a Dropsie. *Fioravanti* tried it, who cut the Spleen out of a Woman's Belly, which weighed thirty two pounds, and so delivered the Woman from a Scirrhus, which would have killed her. Since *Fioravanti*, none durst venture on the operation in Man, though in Animals, whose Spleen is less and looser, it has succeeded well.

T. Bartholinus, cent. 4. hist. st.

XXVIII. *Petrus Affelinæus*, when he practised Physick at *Castel-franco*, observed, that the Country people there had a strange, irrational operation for a Scirrhus of the Spleen, whereby nevertheless the Patients acknowledged they found benefit; and, among the rest, a certain Knight of Malta, who, in his presence, suffered the operation to be performed in this manner; The Patient lay stretched out on a Table, a clean Paper was laid on his Spleen, and they set a very keen Ax to it, which they hit twice or thrice with all their force. The blow put him to much pain, but the Paper was untouched, and one might feel the Scirrhus cloven into two parts. And by this means those that have used it, think they hinder the increase of their Spleen. *Aquapendent* mentions this diverberation, who thinks it absurd, as also do *Cardan*, *Masfarius*, *Riolanus*, and others.

Vellscius.

XXIX. The site of the Spleen is sometimes changed, when, its ligaments being made lax, it hangs down, or when, they being broken, it hangs forward in the *hypogastrium*, which I saw four times. Then it deceives unwary Physicians in form of a Mole, or of a Scirrhus Womb in Women: In Man in form of a glandulous Tumour, like a *Steatoma* lying in the Mesentery. Sometimes one would think one of the Kidneys were slipt thither. But they are easily distinguished. A sign of the Kidney being slipt is a round Tumour; of the Spleen's falling an oblong Tumour, and a vacuity in the left Hypochondrium. But if the Tumour be moveable, as it is at the beginning, both the Spleen and Kidney is easily restored to its natural place again: Otherwise, after six months time, it sticks so fast to the *Peritonæum* forwards, to the bottom of the Bladder and the Guts; and, in Women, to the Womb, that it must of necessity putrefie there: Which it will doe the sooner, if you use emollient Medicines; you may prolong life, if you let bloud often, and keep up the Swelling with a Truss. Whether, if the Spleen be out of its natural place, or

Sip

slip forwards to the *Hypogastrium*, may it be burnt with a red-hot Iron? It is a very hazardous case, although old Veterinary Authours write, that so the Spleen may be wasted in Horses and Slaves, those cheap Souls, in whom they thought it good and lawfull to experiment this most cruel Remedy.

XXX. Take of Mandrake-root a quarter of a pound, cut it into pieces, and boil it in Oil of Linseed, *Sesamum*, or Almonds, adding a little Vinegar. Bruise them, and pass them through a Sieve; add to them of *Opoponax*, dissolved in Vinegar of Squills two ounces, *Stirax*, Myrrhe, *Bdellium*, Seeds of *Alkekengi*, each half an ounce, new Wax, or *Propolis* and Turpentine what is sufficient, Saffron two drachms, Celtick, Spike, *Schoenanth*, *Afarum*, or *Vitex*, each one drachm. Mix them. First foment the Spleen, and then anoint it. It has so emollient a virtue, that it will soften Ivory.

Medicines especially made use of by eminent Physicians.

For Obstructions.

1. Juice of Tamarisk drunk in Wine is highly commended. ¶ An Asses Spleen is good against inveterate obstructions. ¶ Germaner is a good Medicine also.

2. Tincture of Spleenwort cures all Diseases of the Spleen.

3. A Decoction of Fern is effectual in this case.

4. Gum Ammoniac dissolved in Vinegar does especially dissolve the Spleen.

5. Deadnettle taken any way is good for a hard and obstructed Spleen.

6. Root of Dwarf-Elder boiled in water till two parts in three be boiled away, cures admirably, as I have experienced.

For a Scirrhus and Hardness.

1. For a hardened and obstructed Spleen I had always success according to my desire, by giving a decoction of Roman Wormwood to drink in the Morning; and it succeeded always better, if Smith's Water were given after Meat.

2. Powder of an Asses Spleen, or a Wolf's Liver, and the Ashes of a Bat given to two drachms in Wine, or in *Oxymel*, or Vinegar of Squills, is very efficacious. ¶ But the most effectual remedy is drink prepared with Steel and other things.

3. *Spiritus Vitrioli Tartarificatus* is admirable good; ¶ Also a Plaster of Juice of Hemlock, and of Juice of Mandrake is good, if they be mixt with Gum Ammoniac.

4. Juice of Crow-Garlick dried and powdered is admirable good; Take of this one scruple, Gum Ammoniac dissolved in Vinegar of Squills half a drachm. Make a *Bolas*: give it four hours before Meal, and drink half an ounce of *Oxymel* presently after it. ¶ Among compound Medicines, this is an effectual one; Take of Heath-Berries half an ounce, White Pepper, Syrian Nard, Gum Ammoniac, *Thymiana*, each two drachms. Powder the dry things. Dissolve the Gum Ammoniac in Vinegar of Squills. Mix them. Make Trochiscs of a drachm weight, Give one of them with *Oxymel*.

Lienteria, or, A Lientery.

Whether we must Purge upwards or downwards? II.

Astringents applied, are not always beneficial. III.

Whether Milk may be allowed? IV.

If it proceed from a Dropsie, it must not be stoppt. V.

Medicines.

I. There is a great difficulty about things that prepare the thick matter: For on one hand Writers propound *Malsa*, Honey of Roses, and *Oxymel*; but every one of these things incides and loosens the Belly, and so they are all suspected. Such things therefore must be chosen as both incide and heat, dry and astringe: These things are commended among the rest, Vinegar of Squills, Syrup of Mint; and of Wormwood. But above all the rest, *Sal Theriacale* is commended, or Salts made and extracted from hot Stomachick Powders, as Salt of Wormwood, Mint and Spike; And if they are not to be had, it is easie to make *Lixivia* of their Ashes, and how available *Lixivia* are in absterfion and drying, *Galen*. 2. de antidot. c. 7. shews. A *Lixivium* may be made of Stomachick Ashes, by burning Wormwood, Mint, Coriander, Spike, *Schoenanth*, Pennyroyal and Calamint. One ounce may be given either simple or mixt, with Vinegar of Squills, or Syrup of Mint, or the like. After Absterfion, the Stomach must be heated, adding Astringents, among which one drachm of Coriander powdered, with Odoriferous Wine, is very good. Opiates also may be given; as *Philonium* about half a drachm: for when sleep is procured, the Meat is kept, and so it is concocted.

II. The Matter, which is contained in the Guts, must be evacuated by Stool: And what is contained in the Stomach, by Vomit.

III. If the Flux arise from some fault in the food, or from the violence of a Purge, Astringents must be avoided, lest the Humours being repelled from without, return inwards: for it will stop by changing the diet, and by taking off the Acrimony of the Medicine.

IV. Milk seems hurtfull, because it loosens the Belly, which is already loose. 2. Because of its cooling virtue, which is suspected, where the concoctive faculty is weak. But we must observe, that Milk is good for that sort of Lientery, which thin and sharp humours do cause, by irritating the expulsive faculty, they being tempered by taking it; or when the inner coat of the Stomach is excoriated in its superficies, for which reason the Meat creates trouble and mordication, so that it cannot be retained, in which case the taking of Milk is most convenient. 1. Because we must take care to give food, which is easie of alteration, because the Meat cannot stay long in the Stomach and Guts, for the weakness of the retentive faculty; But Milk is such, and, as *Galen* 6. de plac. testifies, it may be converted without Alteration. 2. Because in regard of its caseous substance; which abounds in it, it is a little stopping. Observe, 2. Milk must not be given raw, but boiled, that the serous part flying away in boiling (which by its nitrous, deterfivive faculty, does harm) onely the caseous may remain, which is the fitter for Nutrition.

V. If the Flux arise from the Dropsie, it must not be stoppt, lest perhaps Nature, trying to disburthen her self that way, should be forced to some principal part. It is better to strengthen the Stomach, and to refresh it with good Diet.

Medicines especially made use of by eminent Physicians.

1. The Seed of a Head of Popy bruised and given is very good. ¶ Also sowre and unripe Mulberries, dried and powdered, and given in drink, gives great relief.
2. A Hen's Gizzard dried, and powdered, and given in drink, is admirable good. ¶ One, after he had tried several things, was cured with this Eleſtuary; Take of Sugar of Roses 6 ounces, the best Treacle 6 drachms, with Marmelade of Quinces, make an Eleſtuary. ¶ I cured one of a desperate Lientery with this; Take the Yelk of an Egg, ſrew the Powder of one Nutmeg on it, roſt it upon a Tile. It cured the Flux, and the party recovered.
3. Diſtilled Oil of Mint, with Quince-wine, and Cinnamon water, ſtops this Diſeaſe.
4. If the Diſeaſe continue long, Rhenbarb, eſpecially prepared with Roſe-water, is of great efficacy.

Bartholinus.

Mindererus.

I. A Nobleman tried the ſingular effect of Leeches in a moſt contumacious ſwelling of the Tongue. One half of the Tongue was hard, from a deſluxion of black choler, ſo that it ſtuck immoveable in the mouth, like a piece of a dry ſtick. The beſt Medicines were uſed for it, but unſucceſſfully, for three weeks. But the thick and viſcous humour was drawn out by Leeches onely applied to the Tongue, which the Phyſicians had diſſwaded, and the Patient recovered.

II. A Maid at Liege had a large thick Tongue, as big as ones hand, ſo that ſhe could ſcarce contain it in her Mouth. The Phyſicians cured her, by cutting off what was ſuperfluous at the end, till they had reduced it to the uſual bigneſs. This I had from the judicious Johannes Walæus.

III. In the heat of the Tongue a Gargarism is not ſufficient, but ſomething that is far is requiſite: for, though it be never ſo well waſhed, it preſently grows dry.

IV. The Wounds of the Tongue, that are made tranſverſe, are uſually reckoned incurable, becauſe of its mobility, moiſture and great laxity; yet I would adviſe (unleſs it be quite cut off) to try to cure it; for ſuch wounds are not wholly incurable. I had a Girl three years old under cure, which falling to the ground with her Tongue out, cut off almoſt all that part of it which was between her teeth, and had quite cut it off, but that ſhe wanted two of her teeth. When I was called, I thought to have ſowed the parts together, but the Girls impatience would not permit me. Therefore I managed the cure with the things following; Take of Leaves and Flowers of Privet, Plan-

tain, red Roſes, each one handfull, Rinds of Pomegranate and its Flowers each half an ounce; boil them in two pounds of Chalybeate water, to the conſumption of a third part. Add to the colature of Acacia two drachms, Syrup of dried Roſes two ounces. Make a Gargarism: ſhe often held in her mouth Syrup of dried Roſes, Quinces, Currants, and rob of Quinces, ſhe uſed liquid Meats: by theſe things ſhe was cured, without any impediment to her Speech.

Hildanus.

V. The Ranula (or Swelling under the Tongue) put a young Man to ſo much trouble, that he could ſcarce ſpeak, nor could he well ſwallow or take Breath. The Chirurgeon determined to get out the Phlegm gathered there with a Penknife; but it was grown ſo hard, it would not run: And therefore he changed his mind, and conſumed it with a red-hot Iron, hindring it withall from returning. But if the matter of the Ranula be ſoft and ſequacious (which is eaſily diſcerned by the touch) let burning alone, and cut onely the top of the Skin, and the limpid viſcid matter, like the White of an Egg, will either run out of it ſelf, or may be ſqueezed out with the finger. ¶ In a Boy Veſtingius cured it with an Aſtringent drying powder, of Cuttleſh bones, Spodium, Coral, Tartar, Pomegranate Flowers and Roſes. ¶ P. Marchetti cut out the Tumour, and took out the Bladder whole, with admirable ſucceſs, applying Juice of Celandine.

Velfchius.

VI. The Wife of N. was ſubject to Catarrhs, which fell chiefly on the Jaws: Sometimes the matter falling under the Tongue, did ſo fill and dilate the place, that a true Ranula appeared: And becauſe there was bloud alſo (for the pain, pulſe and colour, did ſhew that) I reſolved to promote ſuppuration, which happened within ſeven days, upon which ſhe could ſpeak and breathe better. But firſt of all the Pus ran fetid, and then pure. I ſaw two other Ranula opened with a Knife, out of which matter came like the White of an Egg; whence alſo it appeared, that they derive their original rather from a cold than a hot matter. Then we diſputed, whether Ranula uſe to grow again? But this is confirmed by experience. I thought it therefore ſafeſt to cure by ſuppuraters, becauſe that way the Bladder is taken away alſo.

Salmuth,
cent. 1. obſ.
36.

VII. If the Ranula, or Tumour ariſing under the Tongue cannot be cured by diſcutients, which rarely falls out; we muſt proceed to opening, which muſt not be ſmall. Becauſe the matter contained in the Bladder will gather again, and fill the Bladder (there being alſo a great laxity and ſoftneſs of the part, whereby it is fit for reception) but Section muſt be made along the top of the Tumour in each Eminence, that all the matter may run out at once. ¶ A young Woman, after an Epidemick Fever, had a ſwelling under her Tongue, as big as a Pigeon's Egg, round, hard and red, ſo that with much pain the Tongue was driven back, and her ſpeech and ſwallowing hindered. The Chirurgeon wiſely avoided opening of it, becauſe the abſceſs was not as yet ripe, and if it be opened all red, it may indanger either an Inflammation or a Cancer. In the mean time the body was prepared in a due method. When ſix weeks were paſt, I ſaw the Ranula pale, and with my fingers on each ſide, I found it was ſuppurated, and that the matter fluctuated in a thick coat, wherefore I adviſed opening of it. The Skin was broke with a gentle incision of a Penknife, where it was obſerved to be free from Veins; preſently as much matter, like the White of an Egg, came out, as a large Spoon would hold. The Ranula fell; in a few days after, a new incision was made on the other ſide, and there came out the like quantity of the ſame Liquour, and ſo ſhe recovered her Tongue and Speech; and ſhe ſwallowed as formerly.

Riverius.

Bartholinus,
cent. 1. liſt.
89.

VIII. A Minister of God's Word could not Preach any more, for the Laxity, or half-Palfie of his Tongue: Several things were tried in vain. At length this Mixture did the business; Take of Mithridate one drachm, Extract of *Acorus* one scruple, Powder of Root of *Aron* 2 Scruples, Effence of Castor six grains, Oil of Cloves four drops. Mix them. He had this mixture always in readiness; and if he hæstated in Preaching, he betook himself presently to his Mixture, and finished his Discourse. At length he died Apoplectick.

IX. By accident many things were found of old, and do also come to light at this day. It happened that one, who had a great piece of his Tongue cut off, on a time drank out of a Wooden Dish with the Reapers in the field, and when he was tickled by some that stood by him, he suddenly broke out into articulate voices, who admiring the novelty, put the same dish to his head again, in the same posture as before, and spoke so as he could be understood of all. He carried it about him for a while after, and used it for an Interpreter of his mind, till he got another Wooden Instrument ingeniously made him, which he wore about his neck always, and expressed his mind by it. See the Figure of the Instrument in *Paræus*, l. 22. c. 5.

Medicines especially made use of by eminent Physicians.

Benedictus. 1. The White of an Egg with Mucilage of *Pssyllium*, and Syrup of Roses or Violets, boiled a little with Seed of Purlane and Ivory are very good for a hot and dry tongue.

Wittichius. 2. Take Oil Olive 1 Spoonfull, Vitriol the quantity of a Hazle-Nut. Mix them. Anoint the Tongue, it cools exceedingly, and preserves from putrefaction.

Rhodus. 3. In the swelling of the Tongue *Galen's* remedy is excellent; Hold Juice of Lettuce in the mouth. It has been often tried.

Grulingius. 4. Spirit of Black Cherries restores the lost Speech, to a Miracle.

I. THE Pox, unless it plainly shew it self

by tubercles and pustules, which use to break out here and there all over the body, but especially about the forehead and the obscene parts and thighs, and most about the knees, is often occult, and does easily impose, and makes the Cure bad, if it be new; and difficult, if it be inveterate. An accurate judgment therefore is needfull. And all depends upon the Confession of the Patient himself. The Physician therefore must sift the Patient. For, besides those manifest degrees, which *Fernelius* makes to be four, there are others also, which are difficult to be known, because of the Symptoms common to other Diseases. But the lying with a Whore may serve to signifie all; and if the Patient confesses this, be the Symptoms never so common, yet he may very well be cured as an infected person.

II. Stoves are not onely used in the Cure of the Pox, to promote it, but even before the Cure be undertaken, if, because the signs are not so plain, we doubt of it. And we may know it is the Pox, and be the more assured of it, if after sweating several times in a Stove the latent seminary of

Platerus. it be drawn to the skin, and then shew it self in spots, pustules and other symptoms.

III. It is my advice to bleed often, and in divers parts of the body, and in those chiefly which are most tormented; because the seminary of this Disease resides principally in the blood in the veins, which disperse themselves far from the Liver, and in them chiefly that are next the parts infected. And you must either let blood in them, (if possible) or in parts next to them. Hear you, when the Disease has fixt it self in the body, you may not here, as many rashly doe, make revulsion of the peccant humour to contrary parts, like as in Inflammations, which are onely raised by abundance of blood: for in these, though you retract what is next to the part affected, it cannot infect the rest, because it is not yet putrefied: But in the Pox it is far otherwise, and in all other Diseases which a pernicious juice causes or foment.

Botallus. IV. Some, not confiding in specifick Alexipharmacks alone, will have common ones added. *Fernelius* gives half a drachm or a drachm of his Electuary, or alexipharmack Antidote, before the Patient drink the first draught of his Decoction: *Palmarius*, in imitation of him, has contrived two Antidotes: And *Rondeletius* commends his Treacle-water. *Ant. Minodaus* thinks Treacle is the best Alexiterick against the Pox. But, as I do not dissuade the use of these things, because it is the custome, when Poison is taken, and it is not known what it is, to give Treacle and other common Antidotes; So I would not persuade any Man, to rely onely on these Medicines, and neglect the proper ones. And indeed I observe few Physicians doe it, because Experience has convinced them; that this Disease cannot perfectly be cured without *Guaiacum* and such things. Nor does it therefore follow, because some that have been ill of an incurable Pox, could not be cured by *Guaiacum*, that more confidence may be put in those other Medicines: For they that could not be cured with these proper Alexipharmacks, would much less have been cured with common ones.

Sennertus. V. They that had the Pox, were formerly so tormented, that the Remedy was worse than the Disease: But now they may easily be cured by the following Remedy, with Sweat and Salivation, though they neither be confined to their Bed nor to their Chamber. The way is this; Take of Antimony and *Sarsa Parilla*, each six ounces; let the Antimony be tied in a rag, and put into six gallons of water, with the *Sarsa* and 40 Nut-shells and husks. Boil them to a third. Let the Patient take the Decoction thrice a day, morning, noon and night, a draught of it a good distance from meals. The Antimony will serve four times.

Borellus, cent. 2. obs. 96. VI. Though there be several Alexipharmacks for the Pox, yet some are more efficacious than others, and one has one quality, another another, where-with we may satisfie sometimes one intention, sometimes another: And therefore seldom one of these alone, but often several of them are used. Indeed, if the Disease be simple, and none of the *Viscera* be out of order, and if there be any notable intemperature in any part, which may hinder the use of *Guaiacum*, it is the best of all, as it resists both by occult and manifest qualities. But if any other Disease be joined with it, it is often good to add *Sarsa* and *China*. Concerning Alteratives, which use to be added, we must have a care, lest by adding *Cichory*, *Endive* and cooling things (which are added to abate the heat of the *Guaiacum*, which yet need not so much be feared) Sweat, which is the main thing requisite, and which does more good, than a little Heating does harm. Therefore, laying these aside, to say something of mixing Alexipharmacks, if the constitution of the Patient be very hot and dry; if the humours fall impetuously from the Head upon the Lungs or Breast, or other parts, *Guaiacum* cannot conveniently be given

alone, because it heats and dries the parts more, and by its heat does melt the humours and put them in motion: But then *Sarsa* is safer, and *China* is yet more convenient, which both tempers the heat, and has an astringent virtue, whereby it stops fluxions. On the contrary, if strength be low, and the Eyes weak, *Sarsa* is not proper, because it loosens the Stomach, and makes the Sight dim. If there be a great Atrophy (so it have not its rise from the Pox, for then this, as being its Cause, being removed, the Leanness also ceases, and the Body begins to thrive better) *Guaiacum* and *Sarsa* are not safe: But then *China* is far more beneficial, as being a thing that substantially moistens. Some commend *Sarsa* above all other things for a Consumption. Some have ventured to write of *Guaiacum*, that a Decoction of it nourishes as much as Chicken-broth; but they exceed; for though it may impart some alimental Juice to the Decoction, yet no Man in his Wits will deny that there is more nutriment in a Chicken. If any upon taking it have grown more corpulent, it must be by accident, by taking off the violence of the Pox, which hindered nutrition. So if grievous Pains infect the Patient, or if there be gummatous Tumours or great Ulcers, *Sarsa* is proper. Thus, according to the constitution of the Patient, and the nature of the conjunct Diseases, sometimes we must use one Alexipharmack, sometimes another; and sometimes it is good to put them all in, in a greater or smaller quantity.

Sennertus. VII. We must not try Evacuation by the Skin, before the Body be discharged of the excrements, lest there should be an attraction of more than can be evacuated by the Skin. Which if it be done, the Disease will either not be cured, or come again quickly, or grow worse. I have known several, who after Inunction and Diet-drinks have had either Pains or *Exostoses*, because the matter was attenuated, melted, and drawn to the out parts, but not evacuated. Wherefore I reckon these bodies must be much or frequently evacuated in the beginning. But if we may not evacuate so much, certainly a Purge must be given after three times Anointing, that what is dissolved, may be evacuated.

Rondeletius. VIII. Some reckon that *Guaiacum* best, which is white, because the younger it is, the whiter it is; the elder it is, the blacker it is; and the elder, the drier; but what is not so old, is moister and abounds more with Juice. But since there is a twofold moisture in living Creatures, one primigenial, the subject of the innate heat or spirit, and apt to take flame; another alimentary, watry, and not so apt to take flame, the Virtues of this Wood are not to be estimated from the alimentary and watry moisture, but from the innate heat and primigenial moisture. Which, in the first age both in Infants and in Plants, since it is drowned in much moisture, many actions are weak in the first age, which afterwards, when that moisture is a little wasted, and the heat made more lively, do in the progress of their age grow stronger; and this Heat, the principal Instrument of all actions, uses to continue in full force, till the flower of their age and their *anum*. Therefore though in *Guaiacum* the innate heat and radical moisture be always the same, upon which its Virtues do depend; yet because in the young Wood the virtue is drowned as it were and checked with the abundance of moisture, the young Wood is not so effectual as that which is well grown and of a confirmed age. And therefore for the Cure of this Disease you must not chuse the Wood that is yellowish or of a Box colour, and is either not ripe, or is cut from the boughs, and not so efficacious; but the black must rather be chosen, as being the most resinous, and abounding in that fat and balsamick faculty, in which the virtue which is adverse to the venereal Virulence does most reside. It is good therefore to distinguish the age of this Wood, that

that the most effectual way be taken. For that which is black within, but is cloven lengthways, as with Lines of a brown colour running round, is effectual indeed; but it is either cut from boughs of the Trees, or it is not come to full maturity; and therefore not so efficacious. For the reason, why such Lines appear, is, because the fat substance, that resides most in the middle of the Trunk of the tree, does not yet so abound as to fill all the inner parts of the Wood. But that which is all black in the inside, and white only in the *superficies*, if it be found, ponderous and odoriferous, and if it vellicate the Tongue with a small acrimony, and be intermixed with no Lines, or with such as are full of Resin: Therefore when it burns, beside the gratefull scent it has, it gives also a black Resin; This, at its full maturity, is cut from the Trunk of the tree, and therefore is very effectual: But if it be full of Lines and Holes, and be good neither in smell, weight, nor acrimony, nor when it is burnt, sweats a Resin, it is a sign that it is old, and its Virtues are grown dull.

Sennertus.

IX. L. *Septalius*, lib. 7. *Animadu. numero 204.* reprehends them that deny, a Decoction of the Wood may be made in Wine alone, because nothing is fitter to extract the virtues of Medicines, than Wine it self and its Spirit. And therefore he makes a Decoction with Wine, which he uses in an inveterate Pox; with an ill habit and cold matter predominant. But admit Wine be very proper to extract the virtues of Vegetables; yet this cannot be denied, that the strength of the Wine wasts in boiling, and when the Spirit is exhaled a nauseous Phlegm, not so good as simple water it self, is left. I am of opinion therefore that the Wood should be boiled in Water, and towards the latter end of the decoction the Wine must be added: Or, the Wood at least must be infused a long time in the Wine, or it must be boiled in a double vessel, that nothing waste; but by no means to a consumption of the third part.

Idem.

X. There is a different proportion of the Wood to the Water observed, according to the age, constitution of body, and time of the year: And there are taken to twelve pounds of Water from three to twelve ounces of Wood. For if the season of the year and the body be hot, it is the safest to take a less quantity of Wood, and to be the longer in performing the Cure with safety, rather than to doe injury with a strong Medicine, especially the first days of the Cure, and before the superfluous humours be abated, and the Sweat begin to come with ease, and the Patient be used to the Decoction. And *Eustachius Rhodius*, lib. de *Morbis occultis*, cap. 13. writes, that he has seen Patients, who through this error, to wit, giving too great a quantity of the Wood the first days, have fallen into a Fever, that afterwards they have been forced to abstain from the Decoction, to their great damage.

Idem.

XI. *Fallopins*, lib. de *Lue*, cap. 46. reprehends them that reckon a Decoction made in *Balneo Mariae* is too dilute and weak. And that a Decoction in *Balneo* is better than that which is made in an open fire, he endeavours to prove by instancing in distilled Waters, which are made very good in *Balneo*; seeing there is no aduision in such; but the greater eliquation, which is made in heat and moisture, makes the decoction more excellent. But Experience teaches a quite contrary thing to what Reason proves: For though the best Waters may be made in *Balneo* of some moist Plants, as Roses, Violets, Lily Conval, and the like, when they are fresh (whose virtue consists in a volatile Salt) without putting any Water to them; yet in hotter Plants, especially Roots and Woods, whose virtue consists in the oily part, their virtue can never be got out by the too gentle heat of a *balneum*. The case is the same in many Seeds; But it is necessary to distill by a Copper,

by which, with the vehicle of the waters, the more fixt parts are elevated. Since therefore all the virtue of *Guaiacum* consists in that oily and resinous part, and since strong boiling is required to get it out, the gentle heat of a *balneum* cannot doe it, but boiling in an open fire is requisite, which nevertheless, if there be a convenient quantity of water put to it, causes no aduision.

Idem.

XII. A. *Minodaus*, lib. de *Lue*, c. 4. judges the Decoction must be sweetned especially with Honey; for he thinks that a small quantity of Honey, if it be boiled with it and scummed, does take away the bitterness; and that the Decoction acquires a greater virtue in absterging, attenuating, opening and melting the humours and strenghtning the parts. Which as we allow to have place in phlegmatick bodies: So, since Honey easily turns to choler in cholerick bodies, we reckon it cannot safely be used in hot and dry ones; but we reckon Raisins, Liquorice or Sugar may more conveniently and safely be added, for the taste's sake, and that the bitterness and acrimony may be taken off, we may put them in towards the latter end of the Decoction.

Idem.

XIII. Some for such as have a hot and dry Liver, do, towards the latter end of the Decoction, add a root or two, or a handfull or two of Cichory, Endive or Sow-thistle. But since such Decoctions must be continued a long time, we must have a care lest by addition of such things they be rendred ingratefull and loathsome to the Patient. Again, seeing enough Decoction is made at one time, to serve for several days, and because the putting in of such Herbs makes it worse to keep, to prevent this, we must not put these Herbs to all the Decoction, but onely to about one pound at a time.

Idem.

XIV. The Extract of the Wood in *Saxonia's* judgment, is not strong enough to cure an old and strong Disease; but the Decoction is deservedly preferred before it. However, if any one have a mind to use it, it is necessary to take some liquor after it, by which vehicle the Extract may be distributed all over the body.

Idem.

XV. Chymists fearing lest by a long Decoction, which is made to half or to a third part, the spirituous and subtil parts should exhale and be dissipated, and so the virtue of the Medicine should be diminished, they put some dust of *Guaiacum* in a retort, they pour to it a sufficient quantity of Water, and set the retort in ashes, they fit a receiver, then they put fire under it, first digest it, and then they distill it, to a consumption of half of the Water. Four ounces of the distilled Water are given. But it is the best way, to put the distilled Water again to the rest of the Decoction in the retort: For so all the virtue may be got out. Upon the Decoction remaining in the retort, new Water may be poured, and digested for twelve hours, and afterwards may be distilled; and the distilled liquor may be given instead of drink. And because sometimes it happens, that Children are born with the Pox, or infected by the Nurses, this Distillation, sweetned with Sugar, may be given them for a Julep.

Idem.

XVI. If any Herbs have been added to the first Decoction, the secondary Decoction must not be made of its Remainers, because it would be loathsome; but it must be made more dilute and fresh. Some also towards the latter end of the Decoction add a fifth part Wine; And *Fallopins* thinks this should not be done onely when the Patient goes abroad, or his Stomach is weak, especially if the Decoction be made of *Sassa*. But though some make a second Decoction of *China*, yet *Palmarius* thinks it gives its virtue at the first Decoction; yea, some give the first Decoction at Dinner and Supper; because it is not ingratefull to the Palate.

Idem.

XVII. Some utterly reject Purgatives in the Decoctions, and maintain that they should neither be put in a Decoction, nor used separately from it; because Peoples Bodies use to be well purged, before

fore

fore they come to the taking of the Decoction. 2. Because Purgatives and Sudorifics cause contrary motions. Others would have them mixt, that the Belly may be conveniently kept loose, and the Blood be cleansed. Others will not have them mixt, but will have a Purge to be given once in eight or ten days, which is best. For although the body be purged before the taking these things, yet something may easily remain, and now and then be gathered anew. And Sweat onely carries off the thinner matter, but leaves the thick. Nor this way are contrary motions made, for that day a Purge is taken, no Sudorifick is given.

Sennertus.

XVIII. Though all we Practitioners use the Quaternion of exotick Medicines (*China*, *Sarsa parilla*, *Guaiacum* and *Sassafras*) yet there are not wanting with us both Roots, Woods and Barks, which are able to perform the same as powerfully, easily, safely and pleasantly as these Exoticks, which are now and then deprived partly of their virtues and exotele. And our Country Drugs are such as these; Roots of Prickly Bindweed; Roots of Butter-bur, Bark and Wood of Juniper together with its Berries, Oak-wood, and several such things. Certainly Exoticks are not to be despised, nor home-bred things to be neglected: because, as they are bred in our Soil, so they have the greater affinity with our bodies; and are observed to operate more kindly, yea, and more effectually upon the same, than Exoticks.

Sylvius de le Boë.

XIX. The best way of taking aromatick Decoctions, and other Medicines, that temper the acid Spirit, is to take them often in a day, and in a small quantity, that they may introduce a gradual, and therefore a more laudable change and amendment into the blood: For every sudden alteration, especially if it be great, is dangerous. Nay, we may, and with advantage, mix the same Alteratives with their Food, and give the said Decoctions both at Dinner and Supper, instead of other Drink, to the end, that being mixt with the Food, they may together with the Chyle, which they make much better, be more easily, kindly and profitably mixt with the Blood, and amend it insensibly: As I have often found it, to the Patient's great benefit, when I have done this in the Pox, and in other Diseases.

Idem.

XX. That we may sweat with more success, we must take notice that the same Decoctions, which were given before onely for the alteration of the humours, if Sweat must be procured, must either be given in a larger quantity, or they must be made stronger. Let them be taken therefore in a double or treble quantity; and either at once, or at several times, but at short intervals, i. e. within half an hour. For so, when not onely the strength of the Sudorifics is increased, but the liquor it self also is augmented, the eruption of Sweat will be promoted. But if it be irksome to the Patient to take a great quantity and often, the same Decoction may be made stronger; which may be done, if less liquor be put to it, and if it be boiled a little longer. For by long boiling more virtue is got out of Plants, and especially out of solid Woods, which give their virtues but slowly. It is known moreover, that a Decoction of any thing is made thin and weak with much water, but thick and strong with a little water.

It conduces also much towards promoting of Sweat, if the Decoction be given hot: For all sorts of Medicines penetrate far sooner and more powerfully hot than cold or but warm. Besides, the Heat of a hot Decoction dissolves the viscid Phlegm in the body, and tempers the acid Humours, which must in this Disease be conquered and expelled.

But it is good, that besides the body be disposed to bear Sweating the better, either by composing the body in bed, and covering it with clothes, or by going into a Stove; or by running, or any other violent motion of the body: For as these alone use to cause Sweat; so they cannot chuse but pro-

mote it; yea, when it comes slowly, it is good to take hot broth.

Idem.

XXI. These sudorifick Decoctions work also in many by Urine, especially when Diureticks are taken with them. Diureticks are more conveniently taken with them, if those they call the Opening Roots, or other parts of Diuretick Plants, Berries, Seeds, &c. be boiled with the Sudorifics. For then Sweat and Urine may be promoted at once. And I think no man need fear, that the operation of the one Medicine will hinder the other, since most reckon either Medicine will answer both Indications: For Sudorifics do in some measure provoke Urine, and Diureticks also promote Sweat. Therefore I have no reason to scruple Diureticks in the Cure of the Pox, since there is no difficulty in the case. The Physician ought carefully to observe, whether the Patient, upon taking diuretick or sudorifick Decoctions, incline more to Sweat or Urine, to the end, that evacuation may be most promoted, which is the easiest to the Patient, and from which most benefit may be expected. Wherever therefore we observe a Patient sweats with difficulty, but does void abundance of thick Urine, with a full and laudable Sediment, it is not good to force such an one to sweat, but to expect the chief Cure, from expulsion of Urine onely. And it would not be amiss in such a case to increase the quantity of Diureticks in the Decoction, or for the Patient now and then to take a Decoction of Diureticks alone. For the pituitous humour, when it is conveniently severed from the rest of the blood, either in the Kidneys, or in the Heart, the effluence in its right ventricle being amended, is successfully discharged with the Urine, and passes more easily that way than by Sweat.

Idem.

XXII. Concerning the Decoction of *Sarsa parilla* we must take notice, that they who care not to spare cost, and could have the Decoction efficacious, do onely take the Bark, as being the most efficacious part of the Root, and throw away the inner Pith, as less effectual; yea, some reckon it is cold and a little astringent.

Sennertus.

XXIII. When *China* Root first came to be known, many preferred it before *Guaiacum*: but Experience afterwards abated its fame; And *Palmarius* writes, c. 14. that many to their great prejudice preferred this Root before *Guaiacum*, and that he found by Experience, that with a very spare Diet it was ineffectual for the Pox. And oftentimes the Stomach grows so moist, and the innate Heat is so oppress'd with the Decoction of it, that a grievous Lientery, and a great Crudity often follows, in whom the innate Heat was but weakly. He writes moreover, that it causes the Spleen to swell and grow hard in them that use it long. And he will not also allow it any extraordinary occult quality against the Pox: Because after taking of it, they frequently relapse, who have thought themselves well cured. And *Fallopianus* confirms it, who writes, that he had used this Root three or four times for the Cure of this Disease, and could do no good with it. And if perhaps some one, who could neither be cured by a Decoction of *Guaiacum*, nor by anointing with Quick-silver, recovered his health by a Decoction of *China*, *Palmarius* thinks this to have been the reason, That Nature delights in variety of Medicines, and being tired out with strong things, was at last relieved by weaker.

Idem.

XXIV. Some advise, not to make more of the Decoction at once than can be taken in one day, because when it is cold it easily grows sowre: And therefore they order it to be kept on hot Embers, But Experience has shewn us, that it will last four days. Yet, whenas it grows sowre, that very thing argues, the root has something spirituous and alimentarious in it, which is the cause of fermentation, and thereby of the Sowreness.

Idem.

XXV.

XXV. Besides Sudorificks and Diureticks, Purgatives also must be used in the kindly Cure of the Pox, which must be Phlegmagogues; and here Experience does not a little confirm my opinion, as well as the consent of all Practitioners, which among the common things gives the preeminence to Pulp of *Coloquintida*, and among Chymical things to Mercurial Medicines. Now these things are intended chiefly to evacuate a pituitous viscid humour. Therefore we did not conclude much amiss, that the Venereal Poison was mixt with viscid Phlegm, and that Phlegm did both produce and increase it, and is now conveniently evacuated with it; but it must first be a little corrected.

Sylvius de
le Boë.

XXVI. *Coloquintida*, I say, and most Medicines made of Mercury are very proper both for a pituitous viscid humour, and for curing the Pox, as all experienced and learned Physicians agree. To such as like common Medicines best, I recommend the taking of Pulp of *Coloquintida*, boiled in part of the Sudorifick Decoction, or in some other Apozeme, twice or thrice a week, to carry off by stool the gross and viscid humours which are not fit to be expelled by Sweat through the Pores of the Body. For besides, that pituitous humours blended with the mass of Blood, are very difficultly thrown off by Sweat through the Pores of the Body, moreover much Phlegm is discharged with the Spittle and the Pancreatick juice to the Guts: wherefore it is better to carry it off once or twice a week by stool, than by the continual taking of Sudorificks onely to carry it back to the Blood, and so to render the Cure both more tedious and difficult.

Idem.

XXVII. They that have no mind to take a Decoction of *Coloquintida*, because of its bitterness, may take Trochisks of *Albandal*, which are made of it, in Pills, adding things that may incide and carry off the same Phlegm, especially Gum, *Galbanum*, *Sagapenum*, *Opeponax*, *Ammoniack*, *Bdellium*, *Mastic*, &c. I have often prescribed such Pills for those that were sick in the Hospital.

Idem.

XXVIII. The Phlegmatick humour which is peccant in the Pox may be evacuated indeed by *Coloquintida* alone, but this may be done far more successfully and easily, if Mercurial Medicines be joined with it, or if they be used alone: for Mercurial Medicines use to work far more kindly and powerfully than all common Medicines. Therefore Medicines of Mercury, made both by sublimation and precipitation, are deservedly commended both in purging of viscid Phlegm, and especially in curing the Pox. There are two Sublimates, one they call *corrosivum*, the other *dulce*. Letting the former alone, because of its great acrimony, and great danger of future mischief, leaving that to rash People, I must recommend to every Man *Mercurius sublimatus dulcis*, which is made of the foresaid Corrosive, mixt with crude Mercury, and so sublimed together, after which it arises gentle and sweet, and not corrosive any more.

Idem.

XXIX. Beside the said *Mercurius sublimatus*, as well *corrosivus* as *dulcis*, many sorts of *Mercurii precipitati* are commended, which as they differ in colour, so they do in virtue and manner of operation, whilst some work by stool, others by vomit or salivation. Therefore we must sometimes use one, sometimes another, as there shall be occasion. All of them may be used most commodiously in form of Pills, lest Salivation should be raised before it be required. And whereas here we commend Precipitate for Phlegm, infected with the Poison of the Pox, when we would purge it by stool, you must know, that the most fixt is the properest for this end. For the more fixt *Mercurius precipitatus* is, the less it vomits or salivates, and on the contrary. And among all the Precipitates the *Corallinus* is most commended, which has its name from the elegance of its colour, and is made by abstraction of the acid spirit several times repeated. Such a Mercury therefore variously prepared,

and made choice of according to the occasion, i.e. the different constitution of the Patient, and the various humours found in him, we must use for eradicating of the Pox.

Idem.

XXX. And we must continue so long in taking of Mercurial Medicines, till all the primary Symptoms of the Pox be taken away by means thereof. But we must have especial care that we give them not in too great a quantity; it is best to take them in a small quantity and often, lest by stirring the humours too violently they do more harm than good. For Mercurial Medicines have a strange effect beyond all others; because others usually do their business quickly: But Mercurials are slow in beginning their operations, and long in continuing them, and cannot always either easily or safely be stoppt.

Idem.

XXXI. But the great danger Patients are in from Mercurial Medicines is Salivation, which they easily cause both in purging and vomiting, whereby the Patients are in great danger of suffocation, when the Glands about the Throat are swelled with viscid Phlegm. Prudence therefore is necessary in administration of Mercurial Medicines, which consists especially in a gentle use of them, and an accurate observation of the disturbance which they cause in the Body, before they strongly purge the humours. Mercurial Medicines, I say, use, above all others, to make some singular alteration both about the Region of the Loins, and about the Gums, Cheeks and Throat, and to give certain signs of their following operations. When therefore the Physician hears his Patients complain, after taking Mercurial Medicines, of any trouble about the foresaid parts, he must then carefully observe, whether any evacuation be begun, and whether reaching or any other irritation do promise a speedy evacuation. Which uses therefore to proceed more slowly, because the Mercury is taken up in conquering a pituitous and viscid humour, which must be dissolved before it be expelled. As long therefore as the agitation of the humours proceeds, or increases, so long must we abstain from giving any more Mercurial Medicines, nor must we give any thing more than a little Broth, or some convenient Decoction, by means whereof the viscid humour may more easily be dissolved, and so the operation of the Mercurial Medicine may be holpen. A proper Decoction for this end may be made of Hydroticks and Diureticks, whether it be taken weak, and onely to alter the humour; or stronger, to cause Sweat; or that be preferred, which also evacuates by stool, to the end, the humours that are disturbed, and inclined to evacuation by the Mercury, may be carried more downwards, and less upwards.

Idem.

XXXII. *Mercurius dulcis* is almost a Divine Remedy, in regard of its speedy curing and relieving the Sick, which, when it is well prepared, may be given once in two or three days, with 8 drachms of Lenitive Electuary, for thirty, or, if need be, for forty days together; about twelve grains of it purge a strong Man well, and without any Pain or Salivation. Yet, lest any thing malignant might stick to the Guts, letting alone other Medicines, they must be cleansed every week with *Mel rosarum solutum*, and a Decoction of Tamarinds in Cichory water, with Citron Seeds: For so I remember several, setting aside the Decoction of the Wood, except the second, designed for drinking constantly, have without long and tedious Sweating perfectly recovered, and after that have had very healthy Children. In *Riverius*, cent. 1. obs. 95. a Boy of two years of age, when the Decoction of the Wood would do no good, was cured by giving him 8 grains of *Mercurius dulcis* dextrously, of a Pox which he had got from the Nurse. Another, that was born of an infected Woman, by taking two or three grains of *Mercurius dulcis* with Sugar and Milk, the fifteenth day after he was born for a Month, as *Formis* says in *Riverius*, obs. 26.

Rhodius,
cent. 3. obs.
84.

XXXIII.

XXXIII. N. about 21 years old, a common Whore, was at length pustulous all over her Body, and most horribly afflicted with *Rhagades* and *Gondylomata*, which were exulcerated, about her obscene parts. While therefore I was thinking of a desperate Cure for a desperate Disease, *Mercurius vite* offered it self, with which, for Purgings sake, she began the twelfth day of November, 1625, in this manner; Take of *Mercurius vite* 8 grains, with mucilage of *Tragacanth* make a Pill, after taking of which she had many stools, much matter still remaining, but without any trouble; for which reason the same Dose was given her Novemb. 13. and it only wrought four times. The Dose was increased on the 14th, to half a scruple, it was made into two Pills, and it purged her six times. She having in this manner been pretty well purged, took a Sudorifick Decoction every day twice, with twelve grains of *Sulphur auratum diaphoreticum* for four days. In the last days a caustick Mercurial water was applied. Nov. 19. The Purge was repeated with eleven grains of *Mercurius vite*, which wrought moderately. Nov. 20. The sudorifick Decoction, with an addition of *Sulphur auratum diaphoreticum* was repeated. Nov. 22. She took twelve grains of *Mercurius vite* to purge her, it wrought moderately. Nov. 23. She sweat again. Nov. 24. She took twelve grains of *Mercurius vite* again, and it wrought six times. Nov. 25. The caustick Water was applied again to her obscene parts and other places, where there were deep and foul Exulcerations. Novemb. 26. She purged with this; Take of *Mercurius dulcis* half a scruple, *Diagridium* half a scruple; make it up with Conserve of Roses. On Nov. 27, 28, 29, 30. Decemb. 1, 2, 3, 4, 5, 6, 7, 8, 9. The sudorifick Decoction with the *Sulphur auratum* was continued. On Decemb. 10. She was purged with this following; Take of *Mercurius dulcis* 1 scruple and an half, *Diagridium* 10 grains; it wrought several times. Decemb. 16. She took nothing. On the 17th she repeated the former Dose of *Mercurius vite*; it wrought. On the 18, 19, 20, 21, 22, 23, 24, and 25th days, Nature rested her self, and she seemed perfectly well. But to be sure, on Decemb. 24. she repeated the twelve grains of *Mercurius vite*, and it wrought only thrice. On the 27th the same Medicine repeated gave only one stool. On the 30th she found no operation from it; and so she was perfectly cured of a most grievous Pox.

Horstius,
obs. 10.

XXXIV. Some after universal Purging cure the Disease with these following Pills; Take of *Rheubarb* 10 ounces (10 drachms) *Scammony* 3 drachms; Mix them, pouring on Juice or Syrup of Lemons, of *Quicksilver* tied up in a cloth, so that it may run out in very small grains, 2 ounces and 6 drachms, and may be well killed with the same Juice, and when it is well killed and mixt by often pouring on some of the same Syrup or Juice, add of *Wheat-flower* 2 drachms, *Musk* 1 drachm. Make 5 Pills of a drachm, and gild them well; for, according to *Dioscorides*, Gold does admirably correct *Quicksilver*. Let him take one every day before Dinner, and take them for thirty days. In the mean time, let him take no other Medicine, neither purgative nor applicatory; But let him only drink twice a week 1 ounce of *Fenil-water*, and half an ounce of *Aqua vite*.

Chalmeteus.

XXXV. Though in giving a Vomit for the Cure of the Pox I should not think divers Medicines made of Antimony improper; yet I think they cannot be compared with Mercurial ones, if you do but except *Mercurius Vite*, which is truly an Antimonial Medicine: for it may easily be reduced to a *Regulus* by melting it only with Sulphur. Unless therefore you have a mind to give a Vomit of *Mercurius Vite*, which is an excellent Medicine for the Pox, you may use divers Medicines made of Mercury it self, the Precipitates and Sublimates before mentioned. Among the former the less fixt are to be preferred: Among the latter Corrosive is strongest and most ef-

ficacious, but it is certainly very dangerous. And Precipitates that are less fixt do oftener cause Vomit, than *Sublimatum dulce*, they therefore must be preferred also. In the legitimate use of all which things, we must have a carefull regard to the peculiar constitution of every sick person, and the different operations of Mercurial Medicines consequent to that.

Sylvius de le
Boë.

XXXVI. I know, and that by experience, that not onely the Decoctions of Roots, Barks and Woods, especially the Aromatick, are good for correcting the peccant Acidity in the Pox, but their lixivial Salts also, and especially the volatile, which I recommend to all that practise Physick as things that are good to correct viscid Phlegm, which is peccant in the Pox.

Idem.

XXXVII. Since I think I have proved and abundantly evinced, that the Venereal Poison consists in an acid spirit, but very sharp, mixt with the mass of blood, and as well infecting it as the rest of the humours that are bred of it; it is manifest that the general Cure of the Pox consists in the correction of the acid and sharp spirit. And, because it is wholly preternatural, in the expulsion of it. The correction and amendment of the sharp Acid may be performed by all things that temper an acid Acrimony, as well simple as compound. Among Simples I reckon, 1. Spirituous, volatile things, Spirit of Wine, of Grain, and any other got by distillation after a due fermentation of the mixture. 2. All oily and fat things, as Oil of Fruits and Seeds, by expression, Fat of various Creatures. 3. Lixivial fixt Salts, of the ashes of things burnt, especially of Plants. To which if any will, 4. add watry things, he may for me, though they do not so much temper as they dilute an acid Spirit; in which respect they do conduce, when joined with the three things aforesaid, and they notably infringe the strength of the Acid. Among the more compound things are reckoned, 1. Volatile Salts, arising from a lixivial fixt Salt, and a volatile Spirit, joined either by Art or Nature, such as the volatile Salt of Hartshorn, Urine, of which sort is the Spirit of Sal Ammoniac, *Sal Tartari volatile*, &c. 2. Hither are referred all aromatick Oils arising of a lixivial but volatile Salt, and Oil, e. g. Oil of Amber, Hartshorn, Aniseed, Cinnamon, Mace, Cloves, Majoran, Rosemary, &c. *Galbanum*, Myrrhe, Mastick, &c. 3. Hither belong aromatick Apozemes, made of the aromatick part of Plants especially, boiled with Water, Beer, or Wine, such as we frequently use in the Cure of the Pox. 4. Aromatick Tinctures extracted from the aromatick parts of Plants by Spirit of Wine, whether by Infusion onely, or Decoction, or Distillation. 5. To compound Medicines, which temper the acid Spirit, every Soap may be reduced, made of a lixivial Salt dissolved in Water, and Oil or Fat, by long decoction, which admirably tempers the acid humours, upon account of both Ingredients, especially if it be aptly joined with other liquours, Milk, to wit, and such things. 6. Hither refer Emulsions made of Water and of the soluble, oily part of Seeds. Of all which Medicines for the Cure of the Pox, the most in use are Decoctions of two Roots and of so many Woods, *China*, *Sarsa parilla*, *Guaiacum* and *Sassafras*; to which, both for gratefulness, and for amending the concomitant symptoms and humours, several things use to be added. The Roots indeed temper the acid humour more weakly, the Woods more strongly. Which Woods moreover do yet effectually correct the pituitous humour (with which the venereal Poison mingles and insinuates it self, offending in its too great acidity, which augments it in the body, and makes it more viscid) and so also promote the Cure of the Pox; for daily experience makes it appear, that they are longest and most difficult in curing, in whom a very viscid pituitous humour, known by the name of the melancholick humour, has prædominance. And

And we must persevere so long in the use of Alteratives, and of things that as well temper the sharp acid humour, as correct the pituitous and viscid, when they are found to concur, till you observe them reduced to a good and laudable state, by the functions once being hurt, and now restored: For then, if too great store of them be observed in the Body, they must be carried off and evacuated by proper ways and Medicines. The proper ways for evacuating pituitous and serous humours, are the Mouth, whether it be by Vomit or Salivation; and the Belly, by purging downwards; and the urinary Bladder, by Diureticks; and the Pores of the Skin, by Sudorificks. It is the safest indeed, the pleasantest and gentlest way, to cure the Pox by evacuating the peccant humours with Sudorificks, Diureticks, and things that purge downwards; And it is done sooner, but more difficultly, by Salivation, and sometimes Vomiting, because it is apt also to promote Salivation: And because a Cure cannot always be obtained onely by Sudorificks, Diureticks, and things that purge downwards; sometimes, yea often, we are forced to have recourse to Salivation, both alone, and joined with the others.

XXXVIII. When the Patient has sweat eight days, that the humours may be attenuated, and the body made clean, I reckon nothing is a more present Remedy than anointing with Quicksilver. For by the use of this alone I have observed all to recover; without any danger; yet, stopping the violence of the humours towards the jaws, in the foresaid manner. And this method of Cure is safe, if administered by the skilled in the Art, who must prescribe things accommodate to the supervening Symptoms; erosion of the Gums, swelling of the Tongue and Lips, looseness of the Teeth, &c. which are grievous, yet not to be feared, not one Man (I call God to witness) of many that I have fluxed, dying under Cure. But all of them recovered of the most pernicious Pox; the taking of the Decoction a third or fourth course being in vain. But when the Spitting ceases, and the Strength is recruited, I reckon, the same Decoction must be repeated, for about ten days with Sweat, that all may be evacuated, whatever corrupt humours are remaining in the body after fluxing.

XXXIX. Before Unguents are prescribed, we must diligently consider, whether the Disease be in the Skin, Flesh, Bones, Periosteum, or in the Head, Ribs, Legs or Arms. For if it be in the Skin, it will cause Ulcers or Blisters, or Chapping of the Hands, or Efflorescence of the Skin: If under the Skin, Falling of the Hair: If under the Periosteum, Pains in the Limbs: If in the Bones, Exostoses. Then the consistency of the humour must be considered, whether it be thin or thick: For a thin one buds out in the Skin; a thick one lies under the Skin, the Periosteum, or in the Bone. Then we must consider, whether the humour has corrupted the substance of any part, whether it have made an Ulcer in the Flesh, or a Caries in the Bone. For, according to the difference of these, divers Unguents must be prescribed: For they that cure Ulcers and the Scab, must be gentle, but dry: Things that cure Pain, must be hot and more relaxing: Things that cure Exostoses, must be dissolving and drying. It must be observed, that we must use Unguents a long time: for first, all the sound parts must be anointed, that the humours may be drawn thither: But in the declination, onely the parts affected, that whatever is gathered in the Part may be dissolved exactly. And they must be anointed a long time, that the humour, which lies in deep, may by degrees be melted and attracted, and the thick may be evacuated with the thin: Which few at this day doe, and hence it is, that usually after the use of Remedies, the Disease appears greater, or returns; or that which did not appear before, does then shew it

Rondeletius. self.

XL. Decoctions of the Wood, *Sassa* and *China* must first be tried, especially when the Disease is not much confirmed: For I cannot commend the Practice of some Physicians, who immediately after purging the Body fall to anointing with *Mercury*. But I am not well pleased with this Practice, for it is empirical enough, and void of all reason; and full of a thousand dangers. I tried it sometimes in a Country fellow or two, who were impatient, and desired presently to be cured. One of them could not endure to take Decoctions, and he escaped Fluxing with much difficulty, several Symptoms supervening upon it; yet his body was well purged before, and he drank the decoction of the Wood and *Sassa*, as well as he could, even in the time of Fluxing. Wherefore, as I said, we must not in this Disease presently proceed to anointing, much less to fluxing, but never, unless on urgent necessity, when the Disease is extreme, when other Remedies have been tried, and have done no good, and when there is no contra-indicant.

XLI. We do not without reason commend crude *Mercury*, mixt with Hog's-Lard, and rubbed outwardly on the Joints, because it dissolves the Phlegm all the body over, and then carries it to the conglomerated salival and pancreatick Glands, and causes both a Salivation and sometimes Reaching and Vomiting, and a Looseness. And because the acid Spirit meeting with the Phlegm easily unites and joins it self with it in the Body, they are evacuated and discharged the Body together, and the Pox is cured at one and the same time. And besides Phlegm occurring in humane Bodies, perhaps there is nothing without it, with which the acid Spirit does more intimately and easily mix it self with all its might, than *Mercury* it self. No wonder therefore, when an acid Spirit is naturally mixt with Phlegm according to its very constitution, if preternaturally the same acid Spirit be mixt with it more plentifully and easily, whenever it abounds in the Body. But neither also is it any wonder, if by reason of the same acid Spirit's being both naturally and preternaturally mixt with the Phlegm, *Mercury* it self easily mixes with the same Phlegm, upon which the acid Spirit does presently exert its power, and by uniting it self therewith, does in like manner join it self with the Phlegm mixt with it. And, I think, this is the reason why *Mercury* does good in curing the Pox. And the same *Mercury* provokes a Ptyalism, because mingling it self with the pituitous part of the Blood, i.e. the salival matter, it passes together with the *Saliva* into the salival Glands, and is a cause of the copious secretion of the *Saliva*, which is the cause of a Ptyalism. And when the *Mercury* chancs to cause a secretion of the like pituitous matter in the pancreatick Glands, then there is a plentiful secretion of the pancreatick viscid humour, whereby not onely a Reaching and Vomiting, but sometimes a grievous and very dangerous Looseness follows.

XLII. What was said before of crude *Mercury*, may be said of the Precipitate, or *Sublimatum dulce*; yea, or the Corrosive: For what crude *Mercury* does in carrying the Acid, dispersed in the Blood, to the Glands, the same does *Mercury* both Precipitate and Sublimate by the acid Spirits. For the acid Spirits concentrated in the *Mercury* do cause such an Effervescence in the small Gut with the Bile and Phlegm that either Reaching and Vomiting, or Purging, or both of them follows. For such an Effervescence is required as may disturb and move the humours there confluxant, and may irritate the Guts and Stomach to an expulsion of them. To which Effervescence there always concur acid humours, either contained in the Body and carried to the Guts, or taken from without. And those Mercurial Medicines conduce most to raise a Salivation, which contain least of an Acid in them, as they vomit and purge most, which abound most with a sharp, acid Spirit.

A a a

Ep. Ferdinandus; b. 17.

Sylvius de le Boe.

Sylvius de le Boe.

Sylvius de le Boe.

Spirit. Hence it is, that *Mercurius Sublimatus Corrosivus*, given scarce to the quantity of a grain, Vomits and Purges violently. But *Mercurius dulcis*, made of Corrosive with crude Mercury, may safely be taken to thirty grains, and above, which seldom causes Vomiting, often gives only a stool, and very seldom raises a Salivation. But Salivation is more happily raised with Mercury Precipitate, and not too fixt, to the end, that the virtue on the Mercury being more at freedom, may more easily mix it self with the Phlegm redounding in the Body. Therefore, by reason of the Acid Spirit, mixt with the Mercury precipitate, or sublimate, the same Medicine mixes it self more easily with the Phlegm, by taking of which at times, and intervals, in a sufficient quantity, the corrupt Phlegm of the Body is moved to the Salival and Pancreatic Glands, that it may be thrown out of the Body, and the Pox may be cured by degrees.

Idem.

XLIII. Before Fluxing, the Body must be evacuated, either by Purging or Bleeding; For if much vitious humours abound in the Body, there is fear, lest by Salivating they should run violently to the jaws, and choke the Patient; or flying to the Brain, should cause an Apoplexy or Palsie; Therefore part of them must be first evacuated. If also there be abundance of Blood, it is good to breathe a Vein first. *Fallopins* also, that part of the matter may be consumed, the Inwards may be strengthened, and may not be offended with the Quicksilver, gives a decoction of the Wood for eight or ten days before Fluxing.

XLIV. When an Ointment is made of Quick-silver, killed with Spittle, and with Hog's Lard, *Ess. Arthrica*, Oil of Vipers, and Wax, chafing the Limbs both above and below every other day warm, for thrice or oftner, till purging follow, which must be procured by Stool. When the Mouth, Tongue, Nostrils, and all the upper parts are affected, which might render this remedy suspected; I have often found it very successfull to give every day a Clyster, sometimes Solutive, of *Mel. Rosar.olut.* Oil of Chamemill, and a Carminative Decoction: Sometimes Laxative of simple Oil, by which the Humours may be drawn downwards, a *Diarrhoea*, yea, and sometimes a Dysentery following, which nevertheless we help by Clysters of Milk and Goat's Sewer, as an Episcorallick, to guard and line the Guts.

Sylvesters.

XLV. They that are fumed with Cinnabar, if they then drink Wine (wherewith the Nerves, which were weakened before, may easily be hurt) do often fall into a Palsie. Which often befalls them that have been anointed with Quicksilver.

Platerus.

XLVI. Some reckon that Quicksilver is cold, others, that it is hot: And some endeavour to prove from thence, that Quicksilver is cold, because the Damage done to Mens bodies by it, is cured by the use of heating things, as Sage, Hyssop, wild Marjoram, Clary, Rue, Castor, &c. But these Medicines are not therefore used for preternatural affections from Quicksilver, onely because they are hot, but because they are friends to the Brain and Nerves: And besides, they are good against the Mercurial Virulence by a specifick property. Farther, if they were used, as they are hot, and not as they are good for the Nerves, other hot things, which are destitute of that specifick Virtue, would doe the same.

Sennertus.

XLVII. Some think Sweat should be promoted with Salivation: But if Nature tend to Salivation, it is not good to cause Sweat, lest contrary Motions should be made. However, if nature tend of her self to Sweat, it must not be hindered.

Idem.

XLVIII. We must take care, we do not stop Salivation by Astringents, and that it be not too soon over. It will not be so, if the Mouth be continued Gargling with Salt water warm: It is so far from hindring, that it promotes it rather. But that the Spittle may not be swallowed in Sleeping,

a Nodulus dipt in Brine must be held between the Teeth, so that the filth may run out at the open mouth.

Hartman-nus.

XLIX. When I first began to practice Chirurgery, I was a long time in doubt, whether Women with Child and Children, infected with the Pox, could, without hazard of their health and life be cured by fluxing? The excellent *Nicolas Massa*, did, at length, resolve my doubt, who, *lib. de lue Ven. 17. 3. c. 9.* affirms, it may be done without danger. My own Experience also has confirmed it to be true. A Woman with Child, suckling a Child Twenty Months old, was infected with the Pox, and the Child also. I prescribe her an altering Apozem, and a purging Syrup, which when she took, it purged the Child also. Her Body being sufficiently purged, I ordered her Joints to be anointed gently once a day, even to Salivation; upon which, the Child, though he was not anointed, driveled much Spittle: Wherefore I ordered him to be weaned, that he might not receive any more Mercurial Vapours from his Mother. Thus both the Mother and Child happily recovered: And about six Months after she brought forth a sound Child.

Hildanus.

L. Certainly crude Mercury is a good and safe Remedy for the Pox, mixt with Hog's Lard, or other Unguents and Oils, and anointed outwardly, especially on the Soles of the feet, and Palms of the Hands, and any other Joints: Although Prudence is very necessary if the *Spina dors* be to be anointed therewith; which I would not have done; but when anointing of the Joints is not sufficient, and when no Salivation can be raised, which yet it is not always safe to raise by violence. For the end of anointing with Mercury is Salivation, by benefit whereof, together with abundance of Phlegm, the Venereal Poison is purged out of the whole body.

Sylvius de le Boë.

LI. When the great gland of the Neck, from whence the Salival ducts derive their original, is inflamed, it does not permit the use of Mercury: For a noxious Salivation might be raised by it.

Barbette.

LII. Weakness also in the Nerves prohibits Anointing: for if they that are troubled with the Pox, be subject to Numbness, Palsie, or pains in the Limbs (which yet are not Venereal) Anointing is prohibited; for otherwise the strength of the Nerves would totally be taken away.

Cappivaccius.

LIII. When there is an Ulcer, or any Disease about the Mouth, Inunction is prohibited. And if there be no Disease present in these parts, but has been formerly, if it had its original from the Pox, as an Ulcer in the Tongue, Mouth, or Lips, it does not hinder anointing, because there is no weakness to prohibit it. But if any one, when he had not the Pox, was subject to a Quinsie, he must not be anointed; for it would bring the Quinsie.

Idem.

LIV. When I had caused one to be anointed, so great an inflammation was caused in his Mouth, that he came almost to despair, which, when all other Remedies were in vain, received perfect ease onely from Chicken Broth made without any herbs, the virulence of the Mercury being taken off, as I think, by the benign substance of the Chicken. (See *Sec. XLIV.*)

Pachecus apud Riverium.

LV. *T. Campanella* being sometime consulted by a great Man of Germany; If there were any way to get the Quicksilver, wherewith he had been anointed, out of the Marrow of his Bones, told him, he might certainly doe it, by setting Golden Capping glasses all over his Limbs. And if the German Nobleman followed this advice, it was easie for him to be rid of all his pains, and of his Disease.

Severinus.

LVI. Some teach, that the use of certain natural drying Baths is proper in some sorts of this Disease; which, nevertheless, I have often observed, does no good, but much harm: Unless one have a mind to use them after the cure is exactly finished,

ed, for some refreshment to the Body, that is tired out with Medicines, and to strengthen the Limbs: And then we put into artificial Baths; things that are proper for the Limbs, as *Iva Arthritica*, and such things.

LVII. They that have got the Pox may safely drink the *Span*-waters. For if Metals, by all Mens confession, have a specifick virtue in conquering this Disease, and all the virtue of these Waters comes from Metals; Who can doubt, that these Waters will be propitious to *Adonis* his Boyes? This very way I cured Pocky Blisters as broad as ones Nail, in a Man's Mouth and Tongue. It certainly cures a Venereal *Gonorrhoea*, whatever some Men may think. It is very good for a Dyscrasie of the *Parastate* arising thence. *Solenander*, conf. 37. *Seft.* 3. thought the same. He writes thus; "These Waters are good for *Gonorrhoea*'s and Cancers in the Yard; When the passage of the Yard is cleared with *Unguentum Camphoratum*, the drinking of the Waters will wash, cool and dry the Ulcer, that remains in it, which afterwards, when it is so strengthened, will cicatrise easily."

Meer de A.
aidult.

LVIII. It may deserve the Enquiry, Whether Minerals and Metals communicate any Medical virtue by decoction, to their *Menstrua*, or not, because they are not easily altered in their substance? And it cannot be denied, that they do, by benefit of Decoction, communicate some virtue, though little, to their *Menstrua*, either in some particle of the Metal, Mineral or Stone, or in Smell. For, besides solutions of Metals, Minerals and Stones, made in corrosive Waters, Decoctions also of Glass of Antimony, *Crocus Metallorum*, Tin, Quicksilver, &c. made in fair water, do prove the same, by the virtues which they have, in Vomiting, killing of Worms, and in other Diseases. As for instance, the Antimonial Decoction of *D. D. Lud. ab Hornig*, in which most certainly there is a most excellent hidden virtue against cruel Diseases, if onely crude Antimony, broken into small pieces, be tied in a rag, and a great quantity boiled in Decoctions of Water; but it must by no means be used with Wine. I know that the famous *Zwelferus* never gave an Antivenereal Decoction to any, without crude Antimony tied in a Rag had been first boiled in it: And the following Decoction in the Pox does evince as much. Take of Wood of *Guaicacum* three ounces, of the Bark of the same five ounces, *Sarsa parilla* two ounces, *Sassafras* one ounce, Quicksilver tied in a cloth one pound, Crude Antimony tied in a cloth one pound. Boil them in twelve Quarts of Water to a third, and strain them: The cover of the pot must have a hole in it. Let six ounces of this be given every morning, and sweat either in bed, or in a Stove. The Residue is boiled with water and Raisins, adding a little of the *Guaicacum* and its Bark, and towards the latter end a little Cinnamon (which may also be added to the first) for the ordinary drink. The taking of it must be continued fourteen days. And let the following Pills be given first; Take of *Extractum Catholicon* three drachms, *Arcanum corallinum*, Cinnabar of Antimony each one scruple and an half. Make twenty Pills.

Hofmannus.

LIX. Narcoticks, upon urgent necessity, are sometimes given with very great success, inasmuch as that besides stopping of Pain, they procure Sleep and Sweat, and may, without any harm, as I have often observed, be taken. Upon which account, Treacle does so much good in these pains, both by causing Sweat, and easing of Pain. ¶ Prudence must be used in the Pox, as to the frequency of it, because the thick humour, wherein the virulent quality is inherent, indicates rather attenuation than inspissation. Yet it may be given when night Pains are raging, and also with Alexipharmacks, as with *Extractum Anticephalicum*, &c. A Woman was brought

Platerus.

by Nodes and Night pains to desperation: She took *Laudanum*, for a whole year, twice a day; whereby it came to pass, that at length the Dose being increased by little and little, Nature made this Medicine extremely familiar to her: Afterwards she was ill of a Dysentery, and used *Laudanum*, she took also a scruple of crude *Opium* every day. Thereby, at length, her innate heat was extinguished, her strength decayed, and all her faculties destroyed; she grew stupid, she had a Looseness, then fell into a Consumption and died. *Monsieur de Moent* had an *Exostosis* in the inside of his Thigh, was in great pain, very weak, and dried up with Salivation, yea, and almost quite consumed: He took *Laudanum* often, to cause Sleep, and ease Pain; afterwards he was restored by a good Diet, by many Mercurial Pills and *Anticephalic* Wine, and he perfectly recovered. He was all Melancholick, and amended much after *Sudorificum Joviale*, though he sweat in abundance; but it was from the Mercurial property.

Th. de May.
erne, trad.
de Laudano;
M. S.

LX. Issues are highly commended in the Pox, especially if it be old: for it is confirmed by experience, that they who have Issues, are not subject to the Pox. If the Head be bad, they must be made in the Arms; if the parts below the Liver, in the Legs; if the Womb, in the inside of the Leg.

LXI. In the cure of Buboës, and of any other Symptome, we must not leave off the inward Cure. Yea, it is often observed, that such Swellings, onely by the repetition of Mercury, or of its Oil, do disappear; the Mine of the disease being perfectly taken away by the occult Mineral operation.

Hartmannus.

LXII. Sometimes it happens that Chirurgeons make a mistake in the cure, when after ordinary remedies conveniently used, they think the Patients are not perfectly cured, upon which they cast them into new torments, and at length into an Atrophy and Consumption: When notwithstanding these Symptoms do usually, after a little time, disappear, or are discussed with ease remedies. A certain Nobleman, besides Nightly-pains, and other Symptoms of the Pox, had a Swelling in his Neck, bred of Phlegm and Melancholy: After anointing, all the Symptoms perfectly disappeared, except the Swelling, of which two third parts were discussed. The Patient believed he was not cured; yet the Tumour was discussed in a month's time, onely by applying *Emplastrum de Vigo quadruplicato Mercurio*. Another, after Fluxing, thought himself not cured, because there remained an Ulcer in his Neck about his Windpipe; yet this Ulcer was cured with common remedies within a Month, without any remedies respecting the Pox: One, among other Symptoms, had a great Pain upon his Shin-bone: he was cholerick, and had been four times rubbed, which made him very lean; he used a moistening diet for a Month: afterwards he was rubbed with Mercury all over, whereby the pain ceased; a Pityalism was raised, of yellow, thin and stinking humours for a Month, and then he voided thick Phlegm for fifteen days. At length Incision being made upon the place that was pained before, a *Caries* was found, which, being taken away by an actual Cautery, and a Catagmatick Powder, the Patient was perfectly cured. A Nobleman being cured after the ordinary method, there were great pains remaining in all his limbs, so that he could not stir them without crying out. *Monsieur de Lort* thought the pains proceeded not from the Pox, but rather from a dry intemperature in the Ligaments, that knit the joints and nervous parts. He cured him perfectly with a moist diet, and Bathes, continued a long time.

D. Pomeret
apud River
um.

LXIII. People talk much of a thin diet in this Disease: But because it abates strength much, and keeps it low, it is good in acute Diseases, which, because they last not long, the strength, though

brought low, can continue to the end. But seeing the Pox is a Chronical Disease, and the cure is extended to many weeks, if the strength be brought low by a spare diet, it cannot hold out to the end of the Disease. And the reason why Physicians keep their Patients with Bread and Raisins, I take to be this, Because it is a simple food, and affords good juice: for since variety may easily breed bad humours, and since flesh and fish and such meats, are more easily corrupted than Bread and Raisins, it is good to forbid variety of Meats and Flesh, and to be content onely with Bread and Raisins.

Sennertus.

LXIV. Many commend Biscoe Bread, yea, they allow onely it, which, as we do not disapprove for strong bodies, that are moist, and abound with Phlegm and excrements inclining to putrefaction, rather than with adust ones; so we do allow Bread once well baked, and not too moist, as the best food, and most familiar to all natures. Yea, Biscoe seems to have its inconveniences; for it is not easily concocted, and most people in the Pox have a weak stomach. Besides, these people abound with adust humours, which are increased by Biscoe Bread; on the contrary, they are tempered by the common Bread, as being moi-
 ster.

Idem.

LXV. One had had the Pox sixteen years, with *Exostoses* in both Legs, which pained him so, that he could not sleep all night. I perfectly cured him within a month by bleeding in both the Arms, by purging with an Apozeme, and by a Sudorific Diet-drink of a Decoction of *Guaiacum* and Antimony. Sweat was procured by burning Spirit of Wine. I gave an antivenereal dose once in five days. The *Exostoses* were taken off by applying Blisters, twice or thrice, when they give over running and grow dry.

Riverius.

LXVI. Since it is safer to prevent a Disease, than to cure it, some Physicians, among whom are *Fallopivs*, *Minadovs*, and others, do teach, what way one may save himself from the Pox, though he have to doe with a Pocky Woman. But I think such things cannot be taught with a safe conscience, as incourage so many Men to Lust, when perhaps the very fear of this Disease would have deterred from it. Yet *Minadovs* thinks, they are deceived that teach thus, and he overthrowes *Fallopivs* his foundation, who thinks the Pox is communicated by small serous corpuscles, which, if they be wiped off, the Pox may be prevented. And he shews, that the Contagion does not onely enter by the external parts of the *Pudenda*, but by the internal, and penetrates the Body, and that the infedded vapours and spirits pass by the internal porosityes, and are admitted by the veins; and therefore no Man can promile himself safety from washing, which onely comes to the external parts of the *Pudenda*, or from outward applications, because they cannot take away the inward infection. But the safest way is to keep from Whores, and to remember, that *Whoremongers* God will judge.

Bannertur?

[N. B. The Medicines for the Pox have been so amply treated of all along the Title foregoing, that I shall forbear to recite any more.]

Lumborum Affectus, or Diseases of
the Loins.

The Contents.

The pain must be cured differently according to the variety of the causes. I.

The serous distension of them must be cured with Hydragogues. II.

The pain ceasing by voiding of black Urine. III.

The Description and Cure of a Rheumatick Lumbago. IV.

1. If we would discourse aright concerning pains in the Loins, it is necessary for us to distinguish between the parts constituent of the Loins, and the adjoining parts, that give the occasion. The parts constituent of the Loins, and subjects of Pain, are; the Skin with the fleshy Pannicle; the Muscles lying upon the five vertebrated Bones, on the outside and inside, with the *Os Sacrum*; within the cavities of the *Vertebrae*, the Spinal Marrow, with its Membranes, and a numerous offspring of Nerves, and the membranous ligaments knitting the *Vertebrae* one to another: The parts adjoining, which may hurt by their vicinity or gravity, or by the disposition of the matter, are; the Mesentery joined to the Loins; the lower part of the Gut *Colon*; the two Kidneys, contiguous and sticking to the Loins by their fatty membrane; the Trunks of the *Vena cava* and the *Aorta* lying upon the Loins, and the Vessels arising thence, which are dispersed into the Muscles of the Loins and the Spine, such as the veins and arteries of the Loins, and the Hemorrhoid Veins, which descend along the Loins to the *Podex*; the Spermatick Vessels also turgid with seminal Humour, which, in their passage, impart branches to the Loins; In Women, the Womb with its Ligaments and the Testicles may hurt the Loins; but most in a Woman with Child, because of the weight of the Womb and the Child, which may make the veins and Arteries, that are dispersed through the *Os Sacrum*, to trouble the Loins: The remote parts, which hurt the Loins, are the Liver by the *Ven Porta* and the Mesentery; the Head, when it discharges it self upon the Spinal Marrow, according to *Hippocrates, lib. de Glandulis*, this humour descends by the cavity of the Spinal Marrow to the Loins, and it cannot easily get any farther, because of its division into myriads of filaments. The common causes of Pain must be taken notice of, which are frequently found in the pains of the Loins, as internal rheumatisms of the Humours by the veins, or an intercutal humour falling from the head, between the Muscles and the fleshy pannicle. Oftentimes the branches of the *Vena Cava* and the *Aorta* carry part of the æstuating and exuperant blood out of the greater Chanels into the Loins, and affect them either in the muscular or membranous parts, or in the Spinal Marrow; wherefore the Palsie comes after the Colick, and the Gout turns to the Colick, and in like manner the Colick turns to the *Sciatica*. Besides, external abscesses of the Kidneys, and the affections of the Gut *Colon*, when diffended or exulcerated, are communicated to the Loins. Swellings, Impoathumes and Ulcers, may be formed without and within the Loins. Moreover, the Loins are distorted by a Fluxion or Tubercle. From a Spasim they suffer a divulsion of their fibres. External causes oftentimes cause pain, as falling on the Back, striking with some hard heavy body. If in the beginning of Diseases there be a pain in the Loins, with heaviness and a Fever, it is certain that abundance of hot blood is contained in the great vessels, which being extremely inflamed, except it be prevented in time, may be carried into

into the Brain or Lungs; and that may be done by liberal blood-letting, especially in the foot, to hinder its course. Besides, we ought to suspect pains of the Loins, which continue in Fevers, though blood be often taken away, because the humours lie deep in the region of the Belly, which may commit some violence, unless they be timely purged out. In pains of the Loins Hippocrates bled in the foot. He confirms this in *Coacis*. Pains in the Loins are bad, come from blood; And the hemorrhagies that come from Pain in the Loins, are large and plentiful. He insinuates, *aph. 20. 4.* that Purging is necessary, to empty the load in the belly: And though they that complain of their Loins, have their bellies loose, as Hippocrates writes, that does not take away the necessity of purging. The running of the Hemorrhoids, as it is good for the Kidneys, so also for pains in the Loins, and must therefore be provoked. The perversicacious pain of the Loins, without heat, and an inflammatory disposition, unless it can be discolled by fomentations, after purging and bleeding often repeated, must be carried off by bloody cupping and blisters; or by opening the Skin with a Caustick on each side of the Spine; or with a Bath of fair water, with herbs boiled in it, or an infusion in Bath-waters, and Pumping upon the place affected. For Pains of the Loins are more violent and contumacious, if serous matter be contained within the Muscles to the very vertebra: and they are worse and more difficult to cure, if it reach to the Spinal Marrow. But oftentimes the Symptoms which are thought to arise from parts in the Loins, do not proceed from parts constituent of the Loins, but from parts adjoining, which lying on the Loins cause pain, and transfer their humours to other parts, slowly or quickly, by the veins and arteries, such as the *Vena Cava*, and the *Aorta*, the Hemorrhoidal veins, and the Mesaraick veins, according to Galen.

Riolanus.

II. The Wife of N. was often ill of a serous distention of her Loins, arising from a thin distillation falling violently from the Head, along the Back, towards the region of the Spleen, where, when it had abode two or three days, it at length found its way by discharging it self in abundance of Urine, that was thin and crude. Which distension of the Loins, passed by by Physicians hitherto, I remember I have seen in others, in whom I have seen this painful distension quickly removed, either by a drachm of Root of Jalap, or by fifteen grains of *Diagridium*, and *Creme of Tartar*: The capillary mouths of the *vena sine pari* being undoubtedly opened, which, as it purges *Pus* out of the Breast, and, according to *aph. 54. 7.* phlegm out of the hollow place, which is found between the Diaphragm and the Stomach, so also it expells those serous humours from the Loins by the Bladder.

Tulpius.

III. There came a Woman to me, who made black water, and complained of a Pain in her Loins; And when she began to make black water, her pain ceased; And afterwards she fell into a Nocturnal Fever with shivering; She was of a Melancholick complexion; And I cured her with things that provoke Urine, and she recovered.

Abases.

IV. There is a sort of Rheumatism (See BOOK VI. Tit. de Febre Rheumatismi comite) though it is commonly held not to be of this kind, which may most aptly be called a Rheumatick *Lumbago*, i. e. a cruel fixt pain about the Region of the Loins, reaching sometimes down to the *Os sacrum*, very like a fit of the Stone in the Kidneys, but that the Patient does not vomit. For besides a most cruel and intolerable pain about the Kidneys, sometimes the Ureters all along their passage to the very Bladder, are troubled with the same, but a little less. Formerly this thing imposed on me, as if it depended on some Gravel or gritty matter sticking about those parts, when truly it owed its original to the matter of the Rheumatism, that was peccant and inflamed, which onely troubled those parts of

the Body, not touching the rest at all. This cruel pain, unless it be got away as the former sort, does last as long, and torment as much, so that the wretched Patient cannot lie down, but either leaps out of his bed, or sits upright in it, wrigling his body all manner of ways. Since both sorts of this disease seem to arise from an Inflammation, which both the said *Phænomena* do argue, and especially the colour of the blood that is taken away, &c. they must both have the same Cure. See the place sydenham. before quoted.

- Medicines.

I. **A** Nthelminticks doe their work chiefly, either, 1. By killing the Worms, and they are things that resist Poison: For whether we consider them, as things that are bred by equivocal generation, by means of putrefaction, or of an animated character and seed, or Egg, yet it is certain they are fed in and with putrefaction. Therefore such things are, 1. bitter and balsamick; for, as they do excellently defend the body from Putrefaction, so also they are the principal things in this case, and all bitter things are Anthelmintick; as among compounds, *Elixir proprietatis*, *Pilule Rusi*, &c. And, 2. Acids, as Vinegar, especially acid Spirits, as of Vitriol, &c. not onely because they resist putrefaction, but because they destroy the motion and heat of the Worms; And therefore are good especially to be taken inwardly. Thus onely a vitriolated tincture of Violets did excellently in a Boy, who was almost killed with the Worms. Thus also all Nitrous things kill the Worms, because they are bitter, resist putrefaction, and because of an Acid Salt that is eminent in them: Therefore Soldiers put Gunpowder to their Shirts, to prevent Lice. And 3. Sharp things pregnant either with a Volatile Salt alone, or with Oil. Wherefore Garlick is reputed to be famous for the Worm in the Heart. If any one carry Camphire about him he is never troubled with Lice: also Spirit and Volatile Salt of Hartshorn powerfully kill Worms. And these things do not onely kill Worms by irritating them, but because of their exceeding

G. W. W.
delius.

exceeding Penetration, whereby they are adverse to their Life; and to putrefaction. And 4. Terreous, Alkaline, and other Lixivial fixt Salts, as Coralwort, the Powder of which Empiricks sprinkle on Earthworms, and so kill them; burnt Hartshorn; Salt of Wormwood, and *Cardus Benedictus*, though they doe it not so powerfully; yet nevertheless they belong to this class. 5. Watry things give onely a vehicle to the rest, unless they be signed with some Mercurial Character. All these things destroy the animated seminary, annihilate and greatly resist it.

Idem.

II. Or, 2. By Suffocating, they hindring transpiration, wherein the life of Worms and Insects consists; Such are all oily and fat things, which obstruct the Pores and check Ventilation, and so as it were suffocate, such as Oil olive, of sweet and bitter Almonds. And though these be commonly too weak, and we cannot so well trust these alone for killing of Worms; yet they are of excellent use, to make other things work better.

III. Or by Melting and Destroying, Such things as dissolve, annihilate and corrupt the mucous and glutinous substance of them, and also by their acrimony are as a kind of Poison to them. Such are especially Mercurials. Nothing under the Sun is so much an Enemy to Worms, and to every animated Seminary as they are; for they consume their aliment, and as it were kill them in an Ideal antidote at least, as appears in the decoction of Quicksilver. For it is not onely adverse to them in Substance, though crude it does not so easily expell them, because it easily passes them by. Wherefore it may be ground with twice as much Sugar in a glass Mortar very fine. Also *Mercurius dulcis* may very fitly be given; And also, which is *Helmont's* experiment, water whether simple or specifick, boiled with Mercury, as if it were influenced by some Mercurial Star, though by the boiling the Mercury loose nothing, it is very effectual against Worms. But we must take notice, that *Glauberus*, p. 2. *fumi Philof.* p. 79. condemns shaking of Quicksilver with water or beer; and especially, because it is said, that the water is irradiated not corporally, but onely virtually, intimating that the subtil particles of the Mercury are by the shaking confounded with the Sulphur; and that this may be demonstrated by the settling. He adds also, that he never saw a good operation, whether from Infusion, or from *Mercurius dulcis*. But this virtue cannot be denied it, though it must be acknowledged, that Mercury is better at killing than expelling of Worms. So also *Cinnabarines* kill Worms, wherefore, though not so well, some go so high, as to affirm, that *Cinnabar* of Antimony, if there be any antepileptick virtue in it, it is onely in a Sympathick Epilepie, arising from Worms.

Idem.

IV. Or throwing them off by disturbing them. Wherefore it is certain, that all Purgatives, properly so called, are Anthelminticks, especially those they call Cholagogues. These, because they act in a twofold manner, not onely as they are bitter, sharp and resinous, all which things are enemies to the Worms; but also as Evacuaters, and as they irritate their exit, they are the best and the noblest Medicines of all to drive Worms out of the Body, especially Aloes, *Coloquintida*, or Trochisks of *Albandal*, *Rheubarb*, *Spec. Diaturbith. cum rheo*, which *Heer*, *observat.* 26. writes very well, that they are most excellent Medicines. Wherefore if there be any instances of great Worms being voided, all, or most of them at least, were performed by Purgings.

Idem.

V. There are yet two other Anthelminticks (which we cannot safely, nor ought to trust) to be added to these ordinary ones, which are yet sufficiently commended by grave Authours. 1. Sweet things, which though as a surfeiting Food they may kill Worms accidentally by repletion, yet these things do not hinder the breeding of them anew.

So some give raisins to Children troubled with Worms, and *Sennertus* says, a Decoction of *Sebesten* is a most experienced Medicine, if it be given to Children every day before meat. So they hold that Honey and other sweet things doe no harm, but good in Worms, because they easily turn to Choler, and so are rather enemies to Worms. But it is evident that sweet things do not turn to Bile equally in all; so that they doe no good in Worms, unless by cheating them, and insinuating them, so as they may suck in Gall and Poison instead of Honey.

Idem.

VI. Whatever divers affirm, that Earth-worms dried and given do by a certain property expell the microcosmick Worms, which might be deduced, from the mucilaginousness, that is in them, and from transpiration being hindred by consequence, or from their volatile Salt; yet, to say nothing, that sufficient experiments are yet wanting, it is uncertain, whether Worms that were voided out of the Body, when they are prepared and taken again, do expell those of their own kind; nay, the quite contrary may be produced, seeing it is certain, that Seeds of Worms are by this means propagated, and Worms are rather bred, according to the experience of many Authours; notwithstanding that upon taking such a Powder several are voided: Wherefore by Mountebanks it is usually vaunted for the best Remedy.

Idem.

VII. When the virtue included is of a middle order, or mixt with others: So the *Italians* have an easie and no contemptible Medicine for the Worms; it is Ly mixt with Oil-olive; and they give it with good success.

Idem.

VIII. They must be mixt with sweet things, so they are strongly drawn downwards by a Milk Clyster, so Medicines may conveniently be given with warm Milk, that with this Vehicle they may take the Poison: So Wormseed is taken with Bread and Honey, that they may be allured in that manner: So for the same end *Spiritus Vitrioli Philosophicus* is mixt with Sugar.

Idem.

IX. They must be given upon an empty Stomach, and another thing must not presently be given after them: for when they have any other Food, that which is ingratifull and contrary to them is neglected by them. And this holds good especially in round Worms, and it is not improper in broad ones.

Idem.

X. Mercurial Medicines want a Quickner, but cannot so safely be given to Children. Therefore *Glauberus*, l. c. says, That *Mercurius Dulcis* given to Children for Worms, does usually (unless they be all the stronger) cause a Weakness of the Limbs; For at that Age all things are fluxible and lax; especially the Bones and Nerves; but Mercury is an enemy to these, and so easily hurts.

Idem.

XI. Medicines must sometimes be changed, lest the Worms should be used to them, especially in a more grievous case, where there are abundance of Worms, and those Worms come not away.

Idem.

XII. External things must be applied to the Navel, and not to the Stomach, unless they come near it. Not onely because the Navel is more perspirable, but because it is the Centre of the *Abdomen*; and therefore when Worms are in the Guts, the virtue of Medicines may more easily be communicated to them, but these external things must onely be used for a help.

Idem.

XIII. Anthelminticks are not universal Medicines. *Langius* and *Hauptmannus* their hypothesis is sufficiently known, concerning verminous putrefaction, its being the Cause in a manner of all Diseases, Pains and Ails, and usually of Death itself; concerning which there is extant a Piece called *Hauptmanni Pathologia animata*. But as it cannot be denied, that Worms are among Causes of Diseases, so to extend them to be a Cause of all Diseases is absurd.

Idem.

XIV. E.

XIV. Evacuation is usually made by three sorts of Medicines, either by some sweet and lenient things, by things which act by their whole substance, or by strong Purgatives. Sweet Lenitives do not carry off dead Worms: Sweet things get Worms out, because they are allured and got out with the sweet food, which loosens the Belly. Things that act by their whole substance carry off the live and dead without distinction: And the strongest Purges are bitter, so that at one and the same time they can both kill and carry off: Therefore things that kill Worms are in vain given before Purgatives.

Saxonia.

XV. They are mistaken, who to kill the Worms use any slight Medicines, which have but a small virtue to kill them: for Worms, by their expulsive faculty expell bitter things that are but gentle. We may observe this, when Children are troubled with Worms and with a bilious *Diarrhea* at the same time: for Bile, which is naturally bitter, does not kill them. Wherefore unless we have recourse to strong Medicines, as to Aloes not washed, or to a scruple of Mercury made into Pills, with a little Aloes and Turpentine, we do nothing.

Sanctorius.

XVI. To evacuate the matter of which Worms are bred, that is, Phlegm, *Species Hiera* are reckoned good, if it reside only in the first ducts: But if in the whole, Agarick, not Rheubarb, (which many use) for though by its bitterness it be good to kill Worms; yet it does harm, as it purges Bile, and not Phlegm, and when the Phlegm is left, Sleepiness, Epilepsies, Apoplexies and Death follow. Agarick therefore is good, because it purges Phlegm, and by its bitterness kills Worms.

Capivaccius.

XVII. Women commonly give Wormseed in Comfits, or the bare Seed mixt with Honey. It is an excellent Remedy: for Worms, being greedy of sweet things, devour the Honey, and with it the Seed, which kills them. But, because it is very hot, it may be tempered, if it be infused for two hours in Vinegar, and then mixt with Honey, boiled up to the form of an Electuary, which *Amarus* commends as the best Medicine for the Worms.

Rivierius.

XVIII. When Worms are voided in acute Diseases, as in burning Fevers, and other Diseases of old Men and Children, we ought not presently to turn all our intention on them, as the good women, and Physicians that humour such women, do; which is a reason, why Patients die, when the Disease is neglected. Wherefore the Physician must carefully consider, whether the Fever depends on the Worms, or whether Worms be voided for some other reason, which are always contained in the Belly. And if you find the Fever comes from some other cause, perhaps it is a quartan, tertian or quotidian, and if no symptom be very urgent, they must be neglected, or only such Medicines given as are proper for the principal Disease and for the Worms.

Aletius.

XIX. Though in round Worms it be good to mix Purgatives with things that kill them; yet in broad Worms it is better not to mix Purgatives at first with them, because the Purgatives do not suffer things that kill the Worms to stay long in the Belly; but quickly purge them off. But if Medicines be first given to kill them, they roll themselves round like a Ball, and are so voided, and the Party recovers, as the Authour, *lib. 4. de Morbis*, writes.

Bennertus.

XX. The Medical Intentions are to kill the Worms, to expell them, to hinder a new growth of them, and to prevent symptoms. But, first of all, it is convenient to rid the Stomach and Guts of excrements and of food for the Worms by some gentle Purge: for we may not give a Vomit, lest the Worms should be drawn from the Guts into the Stomach, where they might cause more mischief. I know, indeed, it is the common opinion, that we must use bitter things, but I am quite of another opinion, preferring sweet things far before them, to withdraw the Worms from gnawing the Stomach, and to dispose them for voiding by stool. Where-

fore I presently give four ounces of *Manna* in Broth altered with Cinnamon, drinking three hours after it a dilute *Massa* made with Barley water, and that the Worms may be drawn downwards, and the Guts washed, in the evening I order a Clyster of Milk, Butter and Sugar. Then we must proceed to killing things, as Oil of bitter Almonds, of Peach Kernels, Wine of Infusion of *Scordium*, Spirit of Salt, Oil of Sulphur, Spirit of Vitriol, and the Poison of Worms, the distilled water of Garlick and Onions. I take care of the symptoms; and especially their gnawing; for sometimes by gnawing the mouth of the stomach, they cause Death; in this case we must act with gentler things, and abstain from bitter, sharp and other such troublesome things, instead of which a Pint of Milk, or more, with Sugar may be given; for, being enticed, they leave off gnawing, and turn to the Milk, as being sweet and amicable to them.

Fortis.

XXI. The acid Spirit of Vitriol, Sulphur, and the like, are commonly used to kill Worms, which I do acknowledge have the faculty to incide Phlegm, and kill the Worms, if a few drops be mixt with the ordinary drink, and the taking of them be continued for some time. But they are not good for all alike, because they augment the Acid in the Body and the Appetite, which is oftentimes too great in Children. Wherefore, unless they be very thirsty also, I had rather use volatile Salts, and bitterish Plants.

Sylvius de le Boë.

(See BOOK IX. Tit. of Childrens Diseases.)

Medicines especially made use of by eminent Physicians.

1. The most effectual Remedy for Children and others is, to put a piece of salt Flesh, the Fat being scraped off into the anus in form of a Suppository, and to let it be in as long as it can be endured, then to give a Clyster of Brine or a Decoction of Centaury, and we must often repeat this Remedy.

Ætius.

2. Spirit of Turpentine is a good Medicine for the Worms. ¶ Nothing is better for killing of Worms than Wine and Spirit of Wine.

Bartholiquus.

3. The seed and distilled water of Purslane is an excellent Medicine to kill Worms.

Baricellus.

4. St. John's-wort is a Specifick for Worms in the Stomach applied in manner of a Cataplasm, and given in Broth.

Quercetanus.

5. Coral-wort is a most excellent Remedy against all Worms. The Dose 1 drachm. ¶ The seed also of *Santonicum*, Tanfie, *Primerose-root*, *Scordium* and Goats Rue are good. ¶ Fern is commended especially for killing of broad Worms, from which a water is distilled, or half a drachm of the powder is given to Infants, 1 drachm to those that are a little elder, and to those that are of ripe years 3 drachms in water of Goats Rue, which kills the Worm without any trouble. Above all compound Medicines, *Diaturbith cum Rhabarbaro* is commended in Trochiscs. Among temperate things, *Sebesten* is the most tried Medicine, a Decoction of which may be given to Children every day.

Semertus.

5. I have often observed this to be very effectual in killing and expelling of Worms: Take of *Coloquintida* 1 drachm, Oil extracted out of *Coloquintida* seeds half an ounce, Treacle half an ounce, Myrrhe, Aloes, Dittany, Gentian, Tormenill, Wormwood, each 1 ounce. Make them into powder, and with a Bull's Gall and Rose-vinegar; make an Unguent to be laid all over the Belly and Navel.

Vid. vidius.

Luxatio,

Luxatio, or, Putting out of joint.

The Contents.

Reposition must not be attempted before the Inflammation be laid. I.

Nor if a Ligament be broke. II.

Strengthening Applications must not cool and dry. III.

The Cure of a luxated joint, when it falls out after restitution. IV.

If an Inflammation supervene, when Reposition must be made? V.

The Reduction of the Spine luxated inwards. VI.

The Reposition of the luxated Thigh, must not always be attempted. VII.

The Restitution of the Shoulder slipped into the Armpit. VIII.

The Luxation of the Os Coccygis restored. IX.

Contusions of the Nerves (which we call Strains) must not be treated like Luxations. X.

Medicines.

I. IT is not without reason, that *Celsus*, l. 8. c. 11. advises, that whatever in Dislocations is displaced, must be replaced before Inflammation. But if a Chirurgion was not called at the beginning, so that the part is swelled and inflamed, a thin Diet must be prescribed, and the Body must be purged of bad Humours: A Vein also, if it be necessary must be opened, and Repellents must be applied to the part affected, till the Severity of the Inflammation is a little abated, then the Operation must be tried; but care must be taken, that all things be done gently; they that doe otherwise, oftentimes occasion great symptoms, and sometimes, death it self. A Girl, leaping often to the ground, had wrenched her feet a little, and when a Pain and Inflammation arose, an Empirick was called, who so extended and wrenched her feet to and again, that the pain and inflammation increasing, Abscesses followed, and round the Joints of the feet in divers places sinuous Ulcers, out of which a serous Humour ran. The Pain in her Joints was so great and pungent, that she could scarce stir her feet, and was not able to walk.

Hildanus.

II. Before the Chirurgion undertake the Reposition of any luxated part, it is necessary that he first try well, whether a Ligament be broken: For, if he understand this, because the part cannot move, it is more adviseable to hold his hand, than rashly to undertake the Cure, to the Ignominy of the Art.

Walrus.

III. Swathes, that, besides Astringents, they may also keep off an Inflammation, must be wet in a Mixture of austere Wine and Oil of Roses, because, when they are dry, they do not stick well. Others besmear them moderately with *Ceratum Hippocratis humidum*, which *Galen*, l. 6. de Comp. Med. per Gen. c. 4. describes. And here Medicines must be avoided which are made of astringent Powders and whites of Eggs, because they either cool and dry the joint too much, so that the bending of it is hindered, or they stop the passing out of the influxed humours. The *Ceratum* is made of one part Wax and two parts Oil; as for example, white Wax one ounce, Oil of Roses two ounces.

Scultetus.

IV. A Joint slips out again for three Reasons:

1. When it is not well replaced, and the Ligaments are not well dried. 2. When there is any Tumour after an Inflammation. 3. When some Humour runs to the Joint, which makes lax the Ligaments. The first Cause requires great Driers. The second, Emollients and Discutients. The third requires the worst, after provision for the whole, Burning; than which nothing is better; for it will waste, 1. the moisture by the Crust, which makes a hollow Ulcer, and being covered with a Cicatrice contracts the relaxed part: for by Burning we heat, dry and digest the Humours. But note, 1. We must burn the place, on which the Bone falls; as, if the Shoulder slip below the *Ala*, under the Armpit. If

the head of the Thigh be luxated forwards, it must be burnt before in several places. 2. Nervous parts, Ligaments, Veins, Arteries and Glands, to which Fire is an Enemy, must not be burnt. 3. We must not burn with Irons, which make a little Elchar.

4. The Joint must be kept quiet for several days. *Idem.*

V. The time of extension is laid down by *Hippocrates*, de Artic. § 64. to be immediately after luxation, while the part is still warm. But if because of want of a Chirurgion it cannot be done presently, let it be done the second or third day, unless we be forced to desist by reason of an Inflammation, which prevents it: for it is observed, that if Extension be attempted, restitution does not succeed well; but many inconveniences follow it. Wherefore *Fallopins*, de Luxatione, c. 3. says, I advise you ever to have a regard to the time, not exceeding the third day at most: and if the third day be past, we must tarry till the Inflammation is over, and till there be no danger from it. And the seventh day is *Hippocrates* his day, 4. de Artic. 65. to which the Patient must be kept with a low Diet. Therefore if Extension cannot be made the first three days, we must tarry till the seventh. The time in which you may restore it is the first, second and third, or at least the seventh, eighth and ninth days; but the tenth, eleventh and twelfth days, and after are not safe; because then a *Callus* is bred. *Idem.*

VI. The general opinion is; that the Spine luxated inwards cannot be restored: Yet an ingenious and expert Chirurgion will not leave his Patient without Remedy. In old People *Hildanus* tries the Reduction, first, indeed, by Extension, and Concussion of the Spine sometimes to the right and sometimes to the left, and by lifting up the Belly on high by Instruments described by *Oribasius*, lib. de Machinam. c. 35. and by *Parvus*. Then by Incision of the Back to the luxated *Vertebra*, and by elevation of the *Vertebra*, which after Incision must be taken hold on with proper Instruments by the Appendix.

VII. If at any time the Thigh-bone be out of its place, it must needs be quite out: for because the Head of it is round, it cannot stay on the Lips of the *Sinus* or Acetabulum, so as to make a *caput squarum*, or a Distortion, which is commonly called Semiluxation or Straining: But it must of necessity either return into the *Sinus*, or fall besides; and any other body of a globous figure, set upon the edge of any Vessel, cannot be firm, but of necessity must fall either inward or outward. And when the Thigh is so perfectly out of Joint, though it be not put in again; yet the Patients do in process of time so far recover, that they can walk without help of a stick. *B. Jordanus*, a Chirurgion of Padua, experienced this in a certain Man, whose luxated Thigh could not be restored, because he had broke his Leg, which ought to have the greater care taken of it.

VIII. *Hildanus*, cent. 5. obs. 86. shews the way, how the Shoulder luxated under the Armpit may be restored, which the modern Chirurgions highly commend. There he shews the various uses of his *Remora*, and Girdle, and tractorie Machine which he invented. But upon my own experience I find, that if Luxations of the Shoulder downwards cannot be put up with the Hands, they may more easily be restored by *Hippocrates* his *Spatha*, than by *Hildanus* his *Remora*.

Scultetus.

IX. A Nobleman, falling on his Back, hit the end of the *Os Coccygis* so hard against a sharp Stone, that he put the Bone out of joint. Upon it he grew immovable. The next morning seventeen hours after his fall I find the Patient very feverish, not able to move a Leg or a Foot, and not far from Convulsions: He complained especially of an intolerable Pain about his anus. I had some suspicion he had broke some Bones, but I found all whole, onely about the *podex* all was fuggillated: And putting my Finger into the anus, I was ascertained, by the turning

ning in of the end of the *Os coccygis* that the *Coccyx* was out of joint. I presently gave him half a drachm of fixt Salt of Vipers in Chervil-water: afterwards I laid the Patient on his face, with his body and buttocks elevated, and his feet hanging down. Afterwards (according to *Paulus*, l. 6. c. 98.) I put the fore-finger of my left-hand anointed with Fat that had never been salted into the *podex*, and I bended it by little and little, then I set my thumb on it outwardly, and thus by drawing and squeezing, I made the Bones to crack, and reduced them to their natural situation, upon which his Pain and all things were well. Left the Bone should fall out again, I order the *podex* to be often fomented with a warm decoction of Oak-leaves, Acorn-cups, Red-roses and Pomegranate-flowers. The place affected was fenced with *Ceratum Vigonis*.

This Bone was so forced back in a Gentlewoman after a hard travel of her first Child, that her excruciations came away involuntarily from her always. Ten years after, I was consulted, I advise her to let the Midwife try whether she could force the Bone back again with her finger. She tried, but without any effect, for she could not hear the Bone crack. But afterwards the business succeeded well, by anointing the place often with Oil of Worms and white Lilies, and so being mollified; afterwards the place was fenced with *Empl. contr. ruptur.*

Misc. Cur. an. 72. obs. 35. *Wirtzii*. ¶ *Adr. Spigelius* restored a Gentlewo-

man's *Os coccygis*, that was luxated in travel, one-ly by a Swathe.

X. *Fab. Hildanus*, in *Cent. fol. 167.* warns unwary Chirurgeons, that in Contusions of the Nerves (which we call Strains) where no manifest Luxation appears, they do not wrest the Limb this way and that, nor try to replace what is not dislocated: for great Inflammations, Pains, Ulcers, *Caries* of the Bones and Death often attend such foolish operations.

Rhodus, obs. 80. cent. 3.

Hæferus.

Medicines especially made use of by eminent Physicians.

1. This Unguent is admirably commended by the Vulgar for Luxations, and other external Discales, where the Skin is whole and not hurt; Take of green Sea Wormwood a Peck, of Comfrey as much, gathered fourteen days before *St. John's-tide*. Let them be shred and boiled for 2 hours in 10 pounds of *May butter*. When it is strained, put to it of Goat-suet two pounds, Badger's-grease 1 pound, Wax half a pound, Turpentine 2 pounds and an half. Melt them on the Fire; when they are taken off, add of Oil of Juniper 4 ounces. Mix them.

T. Bartholinus.

2. A Pultes made of the Bulb of Daffadil helps them, who in going have put their Leg or Ankle out of joint, or when any part is out of its natural fire.

Pet. Laurent. bergius.

A GUIDE TO The Practical Physician.

BOOK XI.

Of Diseases beginning with the Letter M.

Macies, or Leanness.

(See Atrophía, BOOK I.)

The Contents.

Whether Salt things cause Leanness? I.

Whether fat things do make fat? II.

How Diureticks doe good? III.

Drinking between Meals is good for lean people. IV.

How the use of Poppy, Henbane, &c. is good for them? V.

Medicines.

I. IT is a Question, How the Limbs can be wasted and emaciated by a Salt Bloud: for *Plutarch*, in *Quest. nat.* I. writes, that Plants are not at all nourished with Salt things; because such food is earthy, and consequently cannot be fit to nourish. *Theophrastus*, 6. de causis, Plant. 14. inquiring the reason, Why all tastes, but a salt one, are found in Plants? says, It is because what is of a salt taste, is not fit to nourish. For an instance, he says, Fishes which live in the Sea, are not nourished with Salt-water, nor salt Juices, but either with sweet or acid things, or with other things, that are found in the Sea: wherefore, in this regard, it is manifest, I might very well say, that a salt bloud did extenuate and emaciate, because it is unfit to restore the parts, that are consumed every day. The same *Plutarch* is of the contrary opinion in the same Book, qu. 3. vel 4. where he writes, that Shepherds use salt to fatten their Cattel; Wherefore, if Cattel are fatted with salt, it cannot be said, that bodies must necessarily be consumed by a salt bloud: Yea, he adds, that *Apollonius* the Physician, Scholar

to *Herophilus*, used to restore and fatten emaciated Bodies with salt things. We must say, that salt and salt things, may, in some sense, conduce to make fat and nourish; and, in another sense, to consume and waste, principally and of it self, to wit, for the reasons assigned by *Plutarch* and *Theophrastus*, since salt things are dry, and therefore contrary to aliment, for which reason they make bodies dry, and are not converted into the lost substance. But by accident they may conduce to fatten and nourish, to wit, by causing an Appetite, and which especially happens, by carrying the nutriment into the parts. If salt things indeed be mixt with other Aliment, they are as certain vehicles to carry the aliment to the parts, and as wedges to fix it there. ¶ *Pliny*, lib. 10. c. 73. writes, that Salt is given to Cattel, to make them drink, and so to make them fat.

II. Another Question arises concerning the course of Diet: for, *Hippocrates*, lib. de salub. Dieta, shewing the way, how to make fat bodies lean, says, They must be fed with fat-meats; and the reason he brings, is, because fat things quickly satisfy, though they do not fill: He subjoyns in the same place, If we have a mind to make gross, we must take the quite contrary course. *Rhazes*, *Avicenna*, and almost all the *Gracians* are of another judgment, who advise the eating of fat victuals to make folk fat. For a determination, we must say, That the use of fat things may either be moderate or immoderate; and fat Meat may either be a little or very fat: The immoderate use of fat things, or of things that are very fat, are far from fattening, because they doe precisely, what *Hippocrates* says: But meats that are not very fat, and the moderate use of them, conduces much to making people fat; and of such things must this opinion of the *Arabians* and *Gracians* be understood. Mercurialis, lib. 1. de morbis puerorum.

III. And all Diuretick Medicines conduce to carry the Meat to the part: for they both open the passages,

Idem.

passages, and are as it were Vehicles to carry the juices and aliment to the part.

Idem.

IV. So also drinking between Meals is good: And they that in general condemn drinking between Meals, for emaciated Bodies, are much deceived: for, Galen himself, 7. Meth. commended drinking between Meals as good for consumptive Bodies; and it is almost always observed, that they who use to drink between Meals grow fat.

Idem.

V. And those things conduce most to fix the Meat to the parts, which do moisten with a certain tenacious and viscid humidity, i. e. hot in cold bodies, and cold in hot and dry bodies. And this is the reason why Rhazes and Avicenna commend Popy, Henbane, and several other things, which are very cold, for moistning of bodies. Upon this account Lucretius says, That Goats grow fat with Hemlock, to wit, because these Animals are hot and dry, and therefore their heat and driness are tempered with cold things, so that they digest their nutriment. For we must not think that Goats or Starlings grow fat onely with Hemlock, Nature thereby onely makes way to grow fat. ¶ Mercurialis, from the common opinion, concludes, that Popy, Henbane, &c. are cold; whereas, according to the modern opinion, they are hot. Now they doe good, either by procuring sleep, with which it is certain that bodies grow fat; or because they thicken the juices, that are thin, and apt to disperse, and so make them stick better to the part.

(For the Medicines, see Atrophia, BOOK I.)

Mammarum Affectus, or, Diseases of Womens Breasts.

The Contents.

Things to hinder the growth of them must be applied with caution. I.

In their Inflammation too violent Coolers and Astringents must be avoided. II.

They must be avoided in an Erysipelas. III.

Over-hot things must not be applied to an Oedema. IV.

We must be careful how we use Topicks in a Scirrhus. V.

(Concerning a Cancer of the Breasts, see BOOK III.)

A Swelling from Milk must be cured with Discutients and Repellents. VI.

A firmous one must not be touched. VII.

An Impossthume must quickly be opened. VIII.

Ulcers in Women, that give suck, and ly in, are difficultly cured. IX.

Abundance of Milk is abated by applying Attenuants. X.

By setting Cupping-glasses to the Back. XI.

When the Breasts are loaden with Milk, they must be drawn. XII.

When we rub the Breasts, we must not doe it hard, for fear of an Inflammation. XIII.

We must take care that the Impossthumes may be as small as may be, when we cannot hinder the breeding of them. XIV.

We must labour to draw them to the Superficies. XV.

Medicines.

I. **W**E must be cautious, how we apply Hemlock, Henbane, and such Narcoticks; and they must by no means be applied to such as intend to give suck: for they debilitate the innate heat, and extinguish the galactopoietick faculty in the Breasts. Astringents are the most proper to apply to Maids; but for Women, whose Breasts are drawn too big, by giving of suck, Driers and Discutients are most proper, whereby the excrementitious moisture remaining is consumed and discussed.

Sennertus.

II. When the Breasts are inflamed, we must use Repellents at first, yet not strong ones, by any means, lest the Heart be too much cooled, or the humour

should strike to it; but temperate ones, with which we must mix things that have a digestive and a discutient faculty. R. a ca. stro.

III. If an Erysipelas seize one, at the first coming of the Disease, such a cure must be insisted on, as is proper for an Erysipelas; and coolers, astringents, repellents, or fat things, must by no means be applied to the part affected, but dissolvents: giving Sudorificks immediately at the first, to the end, the more subtile part of the blood, which is inflamed, Sennertus. may be discussed.

IV. In an Oedema of the Breasts, dissolving and discutient Topicks, and also things to strengthen the Parts a little must be used; yet we must have a care that we do not apply over-hot and discutient things. Because hot Topicks may easily draw Blood to the Breasts, which are a fungous part, and this being mixt with Phlegm, affords matter for tedious and dangerous Tumours: And strong Resolvents discuss the more subtile parts, and leave the grosser; Idem: whence come Scirrhi.

V. Two things must be observed about a true Scirrhus of the Breasts. 1. That the thinner parts be not discussed by the excessive use of heating and attenuating things, and the thick ones left, whence comes a stony and incurable hardness. 2. That by the use of moistning and emollient things, the matter be not as it were fermented, especially if it be mixt; and so of a Scirrhus it becomes a Cancer. Therefore the emollient things which are here applied, must be hot in the second degree, and temperate as to the passive qualities, so that they must neither be dry nor moist, and in this differ from maturaters, because they are moist. And this caution is more necessary in a Scirrhus arising from melancholy, than in one arising from phlegm; for a Scirrhus which comes from melancholy, easily turns to a Cancer. Therefore the advice of the Ancients is the safest, that no drying or moistning medicine be used alone: but either moistning and emollient things must be used with digestives by turns, or Moistners must be mixt with Digestives. If it be a Bastard Scirrhus, and there be fear that it will turn to a Cancer, seeing there is some pain, that may cause an afflux of Humours, some things must be added to Emollients, Idem: which may hinder the flux of Humours.

VI. A Woman of her first Child had a red, hard swelling arose in her Breast from too much Milk. Mayerne took it away perfectly, in two days, by anointing the Breasts with warm Honey three or four times, strewing on every day some Powder of Cork: And with the like success he used in others Oil of Myrtles, and powder of Horse-tail, but with a different Intention: for these repell, and the former discuss. Velchius, obs. 32.

VII. It is not always safe to try to maturate Strumae in the Breasts, since it may easily so be, that Maturaters may corrupt the matter, and the Tumour may turn to a Cancer. Women also will rarely endure cutting, and besides, such Tumours last a great many years, without any great inconvenience; nor do they in this place appear to the Eye, as they do in the Throat. Sennertus.

VIII. Women put off opening of an Impossthume in the Breasts as long as they can; but it is to their prejudice, for, 1. The fibres are corroded. 2. The Membrane is too far extended. 3. The Bone is corroded; whence comes a perpetual Flux. Frid. Hofmannus.

IX. Ulcers in the Breasts are never happily nor easily cured, if the Woman ly-in or give suck, before the Milk is dried up, and the motion of the blood to the Breasts is stopt: For, since no Ulcer, unless it be without filth and dry, can be cured; as long as there is any afflux of humours thither, the cure will never succeed aright. ¶ We must know also, that one sore breast can hardly be healed, unless the Milk be dried up in the other that is well: for the blood comes out of the veins alike to them both. It may be dried up, if the Child

Sennertus.

do not suck; and if Linen-clothes wet in water, be laid to the Breasts.

R. à Castro.

X. Sometimes lying in Women are troubled with too much Milk, which the fat of Serpents, anointed on the Breasts, does dissipate, by a peculiar property. Namely, not onely repellents do hinder the afflux, but attenuants also do make it either quickly run through the Nipple, or go back to the Womb within seven days. To which end, Sir Theodore Mayerne, Physician to the Queen of England, applied *Diachylum Ireatum* with Powder of Sage and Oil of Roses, and with very good success. Some commend Parilly, or Pimpernell with the Blew flower, bruised and applied.

Vesalius, obs. 3.

XI. Hippocrates 2. Epid. Sect. 3. says, That the shoulders and breasts are puffed up after meat and drink: In which words he shews the first generation of Milk, which is bred of the sweetest juice, that the breasts and parts thereabout, especially the shoulders, draw to themselves out of the Stomach, and turn it into Milk. And this, above all other things, may be proved by the sensible testimony of the Nurses, who, as soon as ever they have either taken meat or drink, feel the matter of the Milk manifestly to run into their breasts; which farther testifies, that this humour comes down from the shoulders, by the *clavicles*, to the breast: and they say, they feel it more evidently, while the Child actually sucks. Whence it comes to pass, that nothing diminishes Nurses Milk more, than setting Cupping-glasses to the back, which thing is well known to Nurses, that they often refuse this sort of remedy, lest they should want Milk. ¶ It is the firm opinion of many, that blood does not afford matter to the Milk, but that the chylous, milky juice affords it, which is carried by peculiar Milk-vessels, to the Breasts, and to their *Tubuli*. And perhaps that remarkable chyloferous duct does contribute much to the carrying of that matter, for the breeding of Milk, arising from the *Pancreas* thorow the breast, along the *Aorta* and *Vertebra* to the very Neck, which inserts some branches into the subclavian and jugular vein.

Martianus, com. in cit. loc.

XII. Women, that give suck, have their breasts often grow hard and painfull, with an afflux of Milk; which may be cured in one days time, if the warty matter be often drawn out by sucking. This evacuation being neglected, or deferred, they grow harder and harder every day; yea, are inflamed; and so in this case Venæsection, Purging, Coolers, &c. are proper.

Barbette.

XIII. Sometimes breeding of Milk fails, through some fault in the blood, but especially through some fault in conformation, if the vessels, which tend to the Breasts, be too small, and it may be too solid. This fault, I think, must be cured slowly, and by degrees, in part at least; and indeed by frequent and gentle friction of the place, by which the Blood-vessels tend to the Breasts, adding emollient Unguents and Oils, by means whereof the Coats of the Arteries may be softened, and made lax, and by degrees made fit for enlargement; that being enlarged, they may carry more blood to the Breasts. But we must take great care, lest by violent or long rubbing, the glands of the Breasts should be broken or hurt, and so an occasion given for an Inflammation. We must not make haste therefore, but we must proceed slowly in the amendment and mutation of the parts, especially of the continent, from their natural state, because it is difficultly and slowly obtained.

Sylvius de le Boë.

XIV. We must take great care, that Imposthumes, especially in the Breasts, may not onely not be bred at all, but that such Inflammations as cannot be prevented, may come quickly to suppuration: And indeed, 1. that the manifold mischiefs subsequent or concomitant to Impo-

sthumes may be avoided. 2. That the Imposthume, being contained in a little room, the fewer parts may suffer damage. 3. That by the *Pus* continuing long in any one place, and growing gradually more and more corrupt, more parts be not hurt, and especially Vessels, because the hurting of them prejudices health far more than the corruption of any flesh. For we must take notice, that in every suppuration, besides the blood it self, or Milk, that must be turned into *Pus*, the neighbouring and circumjacent parts are often corrupted, but first the fleshy and soft, and the membranous more slowly, and therefore the vessels themselves, which being more firm and tenacious, use longer to resist corruption and corrosion. Hence, whenever after an Inflammation, and a subsequent suppuration, an Imposthume in the Breasts is opened, either by art, or of it self, and some of the lactiferous *Tubuli* are also hurt; whether this come by a great Suppuration, or by the Chirurgion's thrusting his Lancet too deep into it, the Milk comes out at ways where it should not, that is, by the Orifice of the opened Imposthume, and not by the *Tubuli* of the Nipples.

Idem.

XV. And as we must endeavour, that all these things may be done, so also we must doe what in us lies, to draw the Imposthume to the external parts, and to the surface of the Body: for Imposthumes that lie deep in, can neither be opened of themselves, nor by Art, unless with the hurt of several parts. When they open of themselves, this happens, because the *Pus* makes its way slowly to the surface of the body, which in the mean time corrupts several adjoining parts also, and now and then the vessels. When Imposthumes are opened by Art, it comes to pass, that while the Penknife must be forced deep in, the Chirurgion may easily cut some Lactiferous ducts, and so occasion the coming out of the Milk by improper ways. And this must therefore be especially avoided, because the cure of the Imposthume, or rather of the Ulcer remaining after the Imposthume is open, is far slower: for vessels and ducts continually pouring out Milk, are difficultly and slowly healed and closed with flesh, because hollow Ulcers remaining after an Imposthume, cleanse and fill slowly. And the effusion of Milk, by the said Ulcer, cannot be cured, till the said broken or eroded vessels, be healed with new flesh, or at least so fenced with it, that it may give a natural passage to the Milk, if any such thing can be.

Idem.

Medicines especially made use of by eminent Physicians.

1. The soft Leaves of Ash boiled in Water, and bruised, and applied hot, assuage the Pains of sore breasts; and the constant use of them does wonder-fully discuss. ¶ Drinking the juice of River Crabs for 5 days in Asses Milk, and eating the Crabs for 5 days: Such a Period seven times performed makes the *Cancers* very mild, so that afterwards they may be cured by the use of simple Epithemes.

Ætius.

2. This is an approved Unguent in an exulcerated *Cancer*; Take of Oil of Roles, of unripe Olives, each half a pound, Goat's and Calf's Suet, Ointment of Roles, *Ungu. Popul.* each 2 ounces and an half, Juice of Nightshade, Plantain, orrel, each one ounce and an half, Pomegranate-wine 2 ounces and an half. Boil them on a gentle fire to the consumption of the Juices. Strain them. Put to them of Cerus 2 drachms and an half, Litharge 5 drachms, burnt Lead, Antimony, each 10 drachms, Tutty 1 ounce and an half, white Wax what is sufficient. Make a soft Ointment.

Arcaus.

3. *Oleum Saturni* excels all other things, it takes off the malignity of the *Cancer*, assuages pain, and often cicatrizes exulcerate *Cancers*.

 The use of Laudanum is profitable. XII.
 What form of Diet is convenient? XIII.

I. Like as experience hath taught; that other Diseases, bred of some malignant matter, are sometimes cured by many Evacuations, as the French Pox; so I have often seen Empiricks cure several of Madnefs proceeding from a malignant matter, by very great and frequent Evacuations, such namely as had been left off by other Physicians; and I have oft experienced the same my self. Bleeding, seeing it may evacuate not onely the blood, but together with it the matter of the Disease lurking in the Veins, will be the chief and principal Remedy in Melancholy and Madnefs. Which though I know many have not taught, yea, that some have disallowed; yet I have known by long observation, that innumerable have been cured this way by those who have profest the Cure of these Diseases: who, by opening Veins twenty times, yea, sixty times, have so recovered those that were quite mad, or melancholick, that they have since then liv'd now a long time very well compos'd: And they used not to be solicitous in chusing a certain Vein, but they open'd this or that in the Arm or Foot, and sometime elsewhere, indifferently. Which kind of Remedy neither ought we to neglect, though we should use it with greater prudence.

II. We must come to the more generous Purgatives, especially to the more frequent use of black Hellebore, yea, even of white, yet not in substance, but in infusion made with Wine: yet so, that a drachm of the root of white Hellebore be onely infused for the first time in white Wine without boiling; the second time boil it, but onely gently; then boil it more strongly, and strain it hard; and so proceed by degrees to the strongest Medicines: for in this Cure we must persist a good while; and that the humours may be brought forth the more easily without danger of suffocation, they are to be soften'd and attenuated by bathing the whole body in sweet water not too hot, having Mallows, Marshmallows, Chamamel-flowers, Fenugreek-seed, &c. boil'd in it: and after taking the Hellebore he may drink upon it five or six ounces of Barley Ptsan.

III. The Evacuation of the whole body by Mercurial Salivation, though it be quite rejected by many, yet may it be used with benefit for the Cure of Madnefs. Great hope is placed herein, when other things have not succeeded.

IV. Nitre is commended not without reason; for seeing this Malady has its original from the impurity, heat and restlessness of the Spirits, Nitre does not onely clarify all thick Smoak and fumes Flame, but also fixes things that are volatile.

V. I remember Arteriotomy has cured some of their Madnefs, that were kept in our Hospital of the Incubables; among others a young man of Bologn, &c.

VI. In Madnefs and Phrensie actual Cauteries are commended by many both Ancients and Moderns; nor are they afraid of applying them to the coronal Suture; for they are persuaded, that the hot and accended Vapours are dissipated out of the Head by exhalation when the skin of the Crown of the head is burnt. A Mad-man, says *Gordonius*, whilst he kept the Wound of his Head open, was free from his Madnefs; which he fell again into as soon as the Wound was healed up. *Gariopontus* bids us cauterize both sides of the Occiput. *Dodonæus* saw a Mad-man cured by a Cautey applied to the Nape of his Neck. The fiery heat of the Spirits seems to dissuade us from it, as if they would be more kindled thereby; but *Epiph. Ferdinandus* appealing to experience, 'Tis wonderfull, says he, how the Brain is cooled, and foul and dark Vapours dissipated by it. ¶ That which I have found to profit greatly; are Issues: for if an Issue be made, and be kept open, either in the Nape of the Neck, or upon the Coronal Suture, 'tis certainly very profitable, because not onely black and hot Vapours are dissipated and brought forth by those holes, but it also cools, and consequently, that black and adust humour is emptied. But not onely does an Issue or two in the Head help; but if some be made in both Arms and both Legs also, they relieve wonderfully. And I know that a young Nobleman here at Padua being mad, after infinite other Remedies, was at last restored to his right mind by four Issues in his Arms and Legs.

VII. The last refuge in this Disease is to apply a Potential Cautey betwixt the Coronal and Sagittal Suture, which is let alone till it have so far eroded as that the Bone is laid bare: then let the Skull be opened with a Trepan, and let the place remain open for a month.

VIII. I have seen a Mountebank, who at the middle of the Coronal and Sagittal Suture scrap'd off the Skin with a Penknife till the Bone was laid bare, and by keeping the Ulcer long open cured some.

IX. A Youth being mad, after the use of the most powerfull Remedies, as Antimony, Arteriotomy and Trepanning, was at last guelt, whereupon his Madnefs ceased, but it degenerated into a Melancholick doating.

X. A Mad woman at Padua, speaking always of Venereal things, being kept in the Hospital and often laid with by the Servants, recovered.

XI. A Patient, thirty four years old, seven or eight years ago became mad, upon a disappointment in Love, where he had conceived an hope of a vast fortune. The first exorbitance was very violent, and lasted for ten months, without any lucid interval, but afterwards, recovering his right mind by degrees, he was married. But before he had been married a year, he relapsed, and has divers times for these six or seven last years returned to his right mind. But it is to be observed, 1. That that Indisposition never lasted less than eight or ten months without any relaxation, notwithstanding all that could be done. 2. That a Person of great fame undertook to cure him, and used Venæsection in the Feet, Arms, Head, even till eighteen times, and bathed him forty times; to say nothing of applications to the *Sinciput*, and Potions: But instead of amending, the Disease seemed to be made worse by these Remedies: His Phrensie was always periodical, and never remitted but by little and little: And the Remission happened rather when nothing was done to him, than when he was toiled with Medicines. Last of all, about four months ago, he relapsed into a delirium in a place about twelve miles distant from Paris; where he was shut up, yea tied with bands. But, notwithstanding all the care, he one time got loose and escaped, being quite naked, and ran directly to Paris on a dark night. D. Montmorius, being moved with Pity, resolved to

get him into one of the Hospitals, but withall thought of Transfusion, of which some experiments had been already made: But as to the Cure of so great a raving, we did not think our selves sufficiently instructed by experience to dare to promise it; and our conjectures went no farther than to think that perhaps the fresh *Bloud of a Calf* might aswage the heat and ebullition of his *Bloud* if it were mixed with it. Therefore on the nineteenth of December, D. *Emeresius* opened the *crural Artery of a Calf*, and made all the necessary Preparations; and having let ten ounces of *bloud* out of a vein in the right Arm of the Patient, we could transfuse into it no more than about five or six ounces of the *Calf's-bloud*, because his violent posture, and the crowd of Spectatours interrupted us. In the mean while the Patient, as he said, felt a great heat in his Arm and Armpits, and perceiving him going to swoon, we presently stopt the *bloud* that was a flowing in, and closed up the orifice. Yet after two hours he ate his Supper; and though he was dull and sleepy betwixt whiles, yet he past that night over with the usual exorbitances: Yet the next morning we found him less raving, whence we believed, that by repeating the Transfusion there would a greater alteration be made in him: Therefore we prepared our selves to repeat the Transfusion at six a Clock in the evening, in the presence of many skilfull Physicians, *Bourdelot, Lallier, Dodar, de Bourges* and *Vaillant*: But because the man seemed to be very lean, and it was not probable that his *bloud* offended in quantity, after having spent three or four days without sleep or refreshment, in the cold, running naked about the Streets, we onely took two or three ounces of *bloud* from him at this time; and after we had placed him in a convenient posture, we performed this second Transfusion in his left Arm more plentifully than we had done before: for, considering the *bloud* that remained in the *Calf* after the operation, the Patient must needs have received more than a pound of *bloud*. As this second Transfusion was larger, so were its effects quicker and more considerable. As soon as the *bloud* entred into his Veins, he felt the same heat all along his Arm and in his Armpits which he had done before: His Pulse was forthwith raised, and a while after we observed a great Sweat sprinkled all over his face. His Pulse at this moment was very much altered; and he complained of a great Pain and Illness at his Stomach, and that he should be presently choaked, unless we would let him go. The Pipe whereby the *bloud* was derived into his Veins, was presently drawn out, and while we were busied in doing up the wound, he vomited up what he had eat before, and besides, both piss and stur: By and by he was laid in his bed, and after he had for two hours sustained much violence, vomiting up divers liquours which had disturbed his Stomach, he fell into a profound Sleep about ten a clock, and slept all that night without intermission till eight a clock the next day, being Thursday. When he awaked he seem'd wonderfully compos'd and in his right mind, expressing the Pain and universal weariness that he felt in all his members. He piss'd a large glass full of such black Urine, that you would have said it had been mixt with Soot: He was sleepy all that day, spake little, and desired that he might be suffered to be quiet: He also slept well all the next night. Making water on Friday morning, he fill'd another glass with Urine that was altogether as black as that he made the morning before. He bled a pretty deal at the Nose, and therefore we thought it convenient to take from him two or three Porringers of *bloud*. In the mean time, his Wife, who had sought him from one City to another, came to Paris; and he, as soon as he saw her, rejoiced greatly, and related to her with great constancy of mind several chances that had befallen him as he wandered about the Streets, &c. He is now of a very

quiet spirit, minds his business very well, sleeps long without interruption, though, he says, he has sometimes confused and troublesome Dreams. This Story is taken out of an Epistle of *J. Denys*, Doctour of Physick and Professour of Philosophy and Mathematicks at Paris, concerning Transfusion of *bloud*, and insufory Chirurgery.

XII. Let *Laudanum* be given to the Mad to procure Sleep, temper the Brain, and hinder the ascent of smoaky Exhalations. But because such Patients do commonly refuse Medicines, and 'tis very hard to get them to swallow a solid Pill, the *Laudanum* may be dissolved in any convenient Liquour.

XIII. I think it is not inconvenient to use a pretty gross and plentiful Diet; for to those whose faculty is strong with defect of humours, *Galen*, (1. *Apb.* 17.) bids us allow Victuals plentifully and often. Nor is it inconvenient that somewhat remain crude and phlegmatick; yea, 'tis profitable on the account of moistning and cooling: For persons in this condition are seldom indeed recovered, for this reason, because generally they eat far less than is convenient: nay, 'tis sometimes necessary to use both fair and foul means to compell them to eat their Victuals.

An easie Remedy for Hypochondriacal Melancholy. XXVIII.
Melancholists are calmly and gently to be dealt withall. XXIX.
We must not insist upon Remedies too pertinaciously. XXX.
Whether boring of the Skull be profitable? XXXI.

I. THERE is no greater reason for Fear in any thing of Physick, than to take either more or less *Bloud* from the Melancholick than is fitting. For in these we should be afraid of this Remedy, because of their Fear and Sadness, where-with they are always necessarily affected through the dissipation, suffocation or diminution of the vital

tal spirits which the melancholick have so great need of: and moreover, in Bleeding, commonly that which is more thick is retained within, whilst the more subtle and profitable part of the blood is evacuated. Nor do we (as many advise) approve of permitting the blood to flow freely if it look thick when the Vein is opened; and to stop it, if it look thin: For it is better to weigh by an exact and more certain conjecture, whether blood is to be let or no: For oft when the effervescence of the blood has been let alone and no blood let, the Distemper has degenerated from Melancholy into Madness. Wherefore we must consider in this business whether the Liver being too hot and dry, breed too much of this humour; or, when a great deal of blood is bred, it burn it up through its own hot Intemperature, or that of the whole body, from an internal or external occasion; or, whether the blood of the Hemorrhoids, Terms, or Varices be supprest; Then truly blood is to be let presently, yet not in that quantity we would suffer it to flow in, if there were a redundancy of blood with the other humours: Something is to be allowed to the Disease of Melancholy, which for the aforesaid reasons does not admit of it. But when either the affections of the mind, or famine, care, want of sleep, love and such like induce a Melancholy, the nature of the thing advises us to abstain wholly from Bleeding; especially if we understand that long evacuations either of the blood or of the belly have preceded: the rather, if the body look lean, shrivell'd, withered, be wasted with cares, and be of a black colour: or if you find that there is a great deal of an adust, thick, cold and dry humour, but not much blood: upon the account of all which things, I think it was said by the Ancients, that Bleeding does the Melancholick little good.

II. In Bleeding we must give diligent heed that the thicker blood be not left within, and the thin and profitable drawn forth. *Galen* indeed advises us, that if the blood which flows out be not melancholick, it is presently to be stoppt; but others tell us it often happens, that though the blood be thin at first, yet that which is thick follows afterwards.

III. It is an error, not onely of the vulgar, but also of some Physicians, that the Hemorrhoids always benefit the Melancholick. There are many Hypochondriacal Melancholicks, and of other sorts, to whom the opening of the Hemorrhoid Veins is preferred amongst the chief Remedies, as if those Veins evacuated a thicker blood than other Veins, which I think to be very absurd: The Authority of the Ancients and Moderns, and mine own experience persuade me to this opinion. Amongst the most ancient *Hippocrates* (6. Epid. sect. 3.) thought that the opening of the Hemorrhoids (not by Leeches or otherwise, which few have consider'd, but) by Nature her self is very profitable for preventing and curing very many Diseases bred of thin blood, as the Pleurisie, Peripneumony, Phagedæna (or fretting Ulcer) Biles, Leprosie and other such like. Yet it is not to be denied, that the same profit those mad Melancholicks that labour under black Choler, according to *Hippocrates's* opinion, *Aphor. 11. sect. 6.* The Hemorrhoids supervening, says he, are profitable to those who are troubled with Melancholy and the Stone: He speaks not a word of provoking them, but onely approves of them, if Nature unlock them of her own accord. Now they flow not onely from a melancholick blood, but also from any other: for Nature oft makes use of this flux to purge the blood, if there be any thing faulty in it, or if its quantity exceed, as in the too great abundance of blood in women with child, or such whose Terms are stoppt, and in the maimed, whence blood flows plentifully by them. Hence *Actuarius*, m. m. cap. 20. observes, that besides from melancholick blood these Veins are opened in

those who intermit their usual exercises, that use too full a Diet; whose accustomed evacuations from other parts, as the Nose or Womb, are stoppt; or who have used to be let blood. Later Anatomists have observed that the Hemorrhoids are twofold, some spring from the *Vena cava*, and others from the *Vena portæ*; that those evacuate a more thin and pure blood, and these a thicker. But this they do not doe always, for a blood that is pretty pure is sometimes evacuated by these latter, and a thicker by the former. Wherefore unless Nature shew that she attempts that evacuation, these Veins are not to be rashly opened, and if a pure and sparkling blood come forth, they are to be stoppt presently, for the Melancholick are worse by their evacuation. When any opens them, he cannot promise himself for certain that a melancholick blood onely shall be emptied, and not that which is pure and sparkling. But if any have been accusom'd to them, and be upon the suppression of them become melancholick, mad, nephritical, or epileptical, it will not be unprofitable to open them again, that the humour which has its reflux towards the upper parts, may be more safely poured forth by the accustomed ways, whose passages are stoppt up. But if Nature do not affect this way, we ought not to make a custome of it; as *Galen* teaches, 4. Aph. 25. That we should not accustome our selves to that evacuation that is made by the Hemorrhoids; and *Hollerius* does rightly deny the opening of them, if they do not swell and have never flow'd before: But if Nature incline that way, in imitation of her, we may open them, otherwise by no means. For though Nature do sometimes profitably evacuate blood by the Hemorrhoids, yet we may not always imitate her; as in Fevers, she sometimes carries off the Disease by Bleeding at the Nose, or by Sweat, but who will dare to open the Veins of the Nostrils, or to provoke Sweat, before signs of concoction, or before Nature have shewn her inclination? The same we must think of the Hemorrhoids. Yet these things are not to be understood of particular Diseases, for in them particular Veins may be opened; thus we profitably procure Bleeding at the Nose in a Phrensie, or Head-ach, because these Veins communicate with the part affected: Thus in the Nephritical and Splenical the Veins of the *anus* may be opened, but never in other Diseases that are more universal, unless Nature follow this motion.

IV. As to Purgers, there is (says *Crato) in Hellebore a certain poisonous driness and moisture to be corrected, of which correction I might say many things, unless I remembered that of *Mesue*, That it is a degree of wisdom not to come to strong Medicines save when weak have not benefited. And although I know that almost all Practitioners do advise to give the strongest Medicines; yet I am persuaded by *Mesue*, that a weak Medicine often repeated does the same thing (and with less danger) as a strong does at once and together; and I have learnt this to be true by the experience of many years. I say nothing of how many and whom I have cured, that have been ill of this Disease, though I could do this truly; but I can truly affirm, that I never us'd *Lapis Lazuli*, or Scammoniates. I know that *Senna* is not onely safe, but moreover inoffensive to the Stomach and gratefull to the Heart: Let the Practitioner use it as I have done in melancholick Diseases. Thus far *Crato*. ¶ White Hellebore is celebrated by all Writers in Physick for melancholick and maniack Diseases: But 'tis better so to prepare it, that it may work by stool, than that it should work by vomit: The manner of its preparation is this: Boil it in Balm-water to the consumption of half; and in the strained decoction boil some Prunes, then with some *Cassia* newly drawn pass it through a Sieve, and with Cinnamon and Sugar make an Electuary: Or let its root be infused in the Pulp of Quinces, and then taking away the root give

give the Quince. Or infuse it in *Mesue's* decoction of *Epithymum*, which give with the compound Syrup of *Polypody*. But before the giving of it the humours are to be prepared for three days by Attenuaters and Incisers, and the body is to be moistened with Meats of good juice in plenty, by sleep, rest and anointing the Body all over, and the Belly is to be loosed by Clysters of Oil, or of Milk and Butter. See *Sect. 11. of Mania*.

V. Of Pills we must chuse those which evacuate gently and without trouble, and not those which evacuate strongly: Yet potions are to be preferred, as drying less than Pills: for Pills evacuate much and strongly, and dry the body beyond measure, by which drying the Patient is made worse.

Rondelet.
c. de Melan.

VI. Melancholy in this place signifies not an humour, but a Disease caused by the melancholick humour, because many think this humour alone to be the cause thereof, and direct all their Remedies to this alone: But many things shew that it is not always caused by this humour and by vapours therefrom. For we often see that those who labour under this symptome, have no signs of this humour abounding; yea, that persons of any temper may sometimes be thus affected, from the *intemperies* alone either of the Brain or Spirits. *Hippocrates*, when he reckons up the signs, mentions only Fear and Sadness. *Matthews*, *comm. in 9. Almanf.* by the authority of *Rhasis*, will have strong and long cogitations to bring on this Passion, without changing of the complexion really; and that men become sad when they cannot obtain the effect of things they think of. We often see how fruitlessly Physicians torture such Melancholicks with Purgings and divers other Remedies, who are cured presently after, only by the change of their imagination. One that believed he wanted an Head, was cured by only putting a leaden Cap on his Head, without any purging, alteration, &c. which could not have been, if that clammy and stubborn humour had been present. We meet with many such Stories, whence 'tis clear that such imagining persons are not always to be troubled with Medicines which bring hurt to the body, and no relief to the mind: for the cause lies not always in the humours, but in an *intemperies* alone, or also in the Spirits, which being either quieted, or sent off far from the Heart and Brain, the malady ceases, and joy succeeds sadness; for nothing can obey such motions but the Spirits: An *intemperies* cannot pass off, nor so stubborn an humour be evacuated and lose the destruciveness of its nature so suddenly, especially in a malady that is confirm'd by a long tract of time. Hence *Rhasis*, *1. contin.* says, *That sometimes there is a Melancholy when the humours are good, and he that has this disposition needs not any Medicine; and this is, when any thinks of some fact with great eagerness, and is cur'd by only changing his imagination, either by words or some other device.* *Avicen* also confesses that it may be caused by an *intemperies* without matter. But besides, there is another species of Melancholy, that depends not at all on an humour, viz. that which is caused by Love, to which men of all temperatures are subject, especially the sanguine, and such whose testicles have a hot *intemperies*; the Melancholick are not so often nor so strongly affected in such cases. That this is not caused by any humour, as it is an humour, appears from hence, that it spares no humour, and may be, what humour soever prevail; and besides, it invades those who are of a good constitution of humours, what such soever those be, only from the apprehension of a lovely object; and seldom invades those who labour under a putrefaction or corruption of humours; but such as are otherwise healthfull, and can be cured neither by Hellebore nor other Evacuations. If a Disease at length succeed such a long imagination, the Madness preceded the Disease, and this depends on that, and not that upon this.

Primros.
civ. viij.
l. 2. c. 25.

VII. Because Melancholicks are constant onely in inconstancy, they are apt to refuse Medicines, in which case I recommend the Flowers of Antimony, reputed by *Fonseca* a specifick Remedy of Melancholy, and oft experienced by my self also so to be, given to fifteen grains at the least: or half a glass of thin White-wine in which six grains of the glass of Antimony have been infused for a night, that at length we may come to the use of Hellebore.

VIII. Before the giving of Hellebore the body is to be sufficiently moistened, drinking every morning for a week a pint and an half of clarified Whey with the Juice of Borage; or distill'd Whey with an Emulsion of Melon-seeds: The Hellebore is to be given in the form of an Extract, beginning with half a drachm, with a little *Cassa*, and after an hour giving a good quantity of prepared Whey, especially when the Hellebore is biting.

Idem.

IX. Of what avail the Extract of *Coloquintida* is in Melancholy, is shewn by the example of a Maid that was ill of a dumpish Melancholy for almost a whole year, and afterwards, upon my giving of her Extract. *diacolocynth.* dissolved in a decoction of Prunes, returned to a sound mind beyond all hope and expectation. It expelled the morbid matter by stool in great plenty with rumblings, and the stools were all mucous and phlegmatick, and so slimy and viscid, that they would hang together like a Rope. After she was come a little to her self, she thought that all her body was full of a black and melancholick humour, and therefore she diligently viewed her excrements, amongst which I got some writing Ink to be poured. Another woman that was of a melancholick constitution, and barren, being afflicted with melancholick Passions, expecting now and then the Heads-men and Executioners, was cured by me at length with giving her the Extract of *Trochisc.* *Albandal*, and by a good wile. ¶ I obtained the same effect by an infusion onely of *Senna* with *Tartar*, in the water of *Balm*, *Borage*, &c. given for three days without the addition of any other Purger. The Noble young Gentleman, *Bernard*, of the Illustrious Family of *Wattenville*, labour'd under a great Melancholy, both essential and hypochondriacal; He had addicted himself to the Study of Physick, and had taken very many Remedies: Upon the use of a laxative Pilsan he voided such stinking, thick, tough, black stuff, that being fully persuaded that he had expelled pieces of his Guts, he got me to be call'd; yea, a Minister also that might take Care of his Soul. I bad him be of good cheer, and shewed the conquest of the Disease, demonstrating to him, that that filthy stuff was expelled out of the Mesaraick vessels, Spleen and neighbouring vessels, and that the *Viscera* and Guts were not violated at all. Being settled in his mind and merry, after four days (in the year 1658.) he returned into his own Countrey, and by Letter certified me of his firm health, returning me thanks.

Ch. Garman.
misc. cur.
ann. 1672.
obs. 202.

X. Purging, inasmuch as it withdraws the Fuel of the Disease from the first ways, and removes the Impediments of other Medicines, ought to be made use of at the beginning, and to be repeated betwixt whiles. But whereas some think that for the quicker rooting out the Disease, Hellebore and *Elaterium* are chiefly to be used, and alledge the authority of *Hippocrates*, we shall find, if we mind the success, that these are not so generally convenient, but that they do often hurt those that take them very much: For strong Purgers do in no wise take away the cause of the Disease, viz. the Dyscrasie of the blood, but rather increase it: And moreover they do farther weaken and cast down the animal Spirits that are already dejected. But Hellebore is therefore prescribed so often by *Hippocrates*, because in his time there were hardly any other Purgers known, at least they were not in frequent use. But now 'tis much better to drain the receptacles

tacles

tacles of the humours, by gentler and milder Medicines, and to cleanse only the bowels and first ways without great commotions of the blood and spirits.

Willis.

XI. As to *Confectio Hamech*, it is disapproved by some Physicians: *Solenander* says, (*sect. 5. conf. 22.*) that *Hamech* has made a wonderfull hodge-podge in his Confection, and has boild those things which are not to be boiled, and hath confounded together things very much unlike, and at length hath made an horrid Confection without any Art of Physicians, such as can be gratefull to none: I say nothing of the acrimonious Medicines, as *Scammony* and *Coloquintida*, that are put in it. *Rondeletius* is of the same opinion, who says, that it is only good against the naughty Ichors of the humours. *Fernelius* disapproves of it also. And in truth it seems to be no well composed Confection, especially for the great quantity of *Myrobalans* that is in it, which bind: For though the *Arabians* used them frequently; yet, they had them fresh, which we have not: and if any have a mind to use them, they are much fitter for naughty Ichors, Itch, and the like cutaneous Diseases, than for Melancholy.

Sennertus.

XII. Also because the melancholick humour uses to be moved towards evening, it seems convenient to give Purgers about four a clock in the afternoon, onely those that are gentle, and to continue them for some days: But Preparers may be given in the morning.

Idem.

XIII. *Cassa* has the preheminece in hypochondriack Melancholy from adust Choler: For *Cassa* does not (as most think) therefore loosen the Belly because it is slippery and soft, but because it is indued with a peculiar purgative virtue, whereby it brings forth both Choler, Melancholy and thick Phlegm, not onely out of the Intestines and first Veins, but also very plentifully out of the whole lower belly, especially when the belly has been first prepared by Baths: Wherefore let Atrabiliary Melancholists use it frequently, either alone, or mixt with Rhubarb; for 'tis very profitable for all Melancholists, because it moistens and cools the Bowels, and asswageth the fierceness of black Choler. If it do not purge effectually drink after it a little of the Decoction of the Leaves of *Senna*.

Enchirid.
Med. Pract.

XIV. Whence soever the Disease have drawn its first original, we must first note, That the whole body ought to be freed from the melancholick humour, and from all the filth of other humours. Secondly, That the chief Cure be always directed to the Hypochondres, seeing the first generation of the melancholick humour is in the Liver and Spleen, and the collection thereof uses to be in all the region of the Hypochondres: Therefore the Cure of the hypochondriack affection may suffice for the Cure of the other species of Melancholy.

Riverius,
l. 1. c. 14.

XV. Though a melancholick *Delirium* never happen but when the Brain is primarily affected; yet, seeing 'tis always joined with some affection of the mind, and the affections of the mind very much alter and affect the heart, it can hardly be that that should not be withall affected; therefore in the Cure we must also have respect to the Heart: especially because if the vital Spirit be impure and dark, this fault is communicated to the animal Spirits and Brain.

Sennertus.

XVI. There is nothing which is better for the concocting and preparing of the melancholick humour, than moist things: For its driness is the cause why it resisteth the Cure, and does not easily yield to Medicines. Wine, unless it affected the Head, and were a little of the hottest, were most convenient for concocting, maturing and preparing the melancholick humour; wherefore 'tis good to make use of it in all melancholick Diseases wherein the Head is not affected. ¶ Melancholists are rather to be moistned with Meats and Baths; or Potions and irrigations, than their bodies to be heated and

Rondeletius, cap. de
Melanch.

dried with laxative Medicines. *Galen* writes (*3. de loc. affect. c. ult.*) that he cured a melancholick person with the use of a Bath of sweet water and a moist Diet. If the Disease proceed from *intemperies*, a long moistning cures and conquers it: if from an humour, it prepares the matter for evacuation: for 'tis the driness alone which makes dry Diseases hard to cure: For such Patients are then cured when they wax fat, which is a certain sign of moistning. Wherefore we must endeavour to moisten all the body by Baths, especially if the Disease arise from the whole body: but if the head be onely in fault, then is the head onely to be moistned, &c.

Idem.

XVII. The Mineral Waters that are impregnated by Iron, use to contribute much to the Cure of the Melancholick, inasmuch namely as being drunk plentifully, they wash away the Salino-sulphureous tincture of the blood, and destroy its evil ferments. Moreover, they cleanse away the filth from the *Viscera*, open obstructions, and, which is of great benefit, by their attraction they both strengthen the weak and over loose *Viscera*, and also shut the mouths of the Vessels that gape into the Brain, so that there is no passage into it granted to any preternatural matter along with the nervous juice. And for this reason, namely, for strengthening the *viscera*, and shutting the passages into the Brain; the Vitriolick preparations of Iron use to doe good in Melancholy, and also in the *Vertigo*.

Willis.

XVIII. Those things being premised that ought to be, in a Melancholy from an adust humour with obstructions of the *Viscera*, we must come to the use of Asses Milk, yet with Sugar, that it may soften the more stubborn dried obstructions, and temper the heat of the Liver and Veins without injuring the Brain, because of its short stay in the stomach, as being of a very thin substance, not buttery, nor very cheefie. ¶ The most excellent and experienced *Wesper* uses not onely Asses Milk, but also Goat's and Cow's, with benefit.

Fortis, conf.
24. cent. 1.

XIX. Vomitories (as in most Cephalick Diseases that want a Fever) are wont to help in a peculiar sort in all kinds of Madness. The reason hereof consists partly in this, that the viscous stuff that loads the Stomach, and very much dulls the mind, being evacuated, the Spirits becoming thereby freer, do expand themselves more briskly and cheerfully: and besides, Vomiting, inasmuch as it compresses and empties the neighbouring receptacles of the humours, namely, the Gall-bladder, the duct of the *Pancreas* and the Glands of the Mesentery, hinders their Contents from being translated to the Head.

Willis.

XX. I esteem that Preparation of Steel the most profitable and safe, which is made with the Acid of Sulphur, and is commonly called *Crocus Martis aperitivus*; It is to be given to three grains with half a drachm of *Pil. de tribus* with Rhubarb, an hour after which let the Patient drink a pint of Barley-water or of clarified Goat's whey: Nor need we fear *flatus*, seeing they are hot and dry, and not cold and moist, as is commonly believed. Continue in the use hereof for twelve days.

Fortis, conf.
23. cent. 3.

XXI. We must not use Catharticks continually, nor too often, but 'tis sufficient to give them once in six or seven days; and at other times, if the Patient be costive, let him take Clysters. As to other Medicines which are not evacuating, though the Ancients laid but little, yet we lay the greatest stress of the Cure upon them. They (with whom many Moderns also consent) ordered nothing more to be done for the Cure of Melancholy, but to purge off the Melancholick humour: Wherefore, esteeming Purging to be of the greatest moment, they prescribe other Physick onely for the sake of this, calling all the rest Preparatory: with the intention, namely, that as soon as the humour was reduced to a fit consistence by altering Medicines, and the ways

Ccc

were

were open enough for its evacuation, it might at length be expelled by Purgers. Which kind of Hypothesis seems incongruous both to reason and medical experience, namely, because the Melancholick receive rather hurt than benefit from frequent Purgings, though made use of never so methodically. We therefore, placing the Cause of this Disease in the Disorders of the blood and spirits, and in the weakness or bad conformation of the *Viscera* and Brain, esteem Alteratives and Corroboratives for the Remedies of the first rank, and onely for the sake of these do sometimes intermix Catharticks. Purgings therefore being prescribed rightly and with due intervals for the removing of impediments, proceed to Alteratives and Corroboratives in divers forms: As for example: Take of the Conserve of the flowers of the Gilli-flower call'd *Tunica*, and of Borage, of each two ounces and an half; of the candied rinds of Myrobalans six drachms, of Coral and Pearl prepared of each a drachm and half, of Ivory and Crabs-eyes of each a drachm, of *Confectio de hyacinth*, two drachms, of the Syrup of Corals or red Popies, as much as suffices to make an Electuary. The Dose is two drachms morning and evening, drinking some Cordial Julep after it.

Willis.

XXII. Amongst Corroboratives, *Confectio Alkermes* is of great efficacy, as exhilarating, and resisting fear and sadness, if it be rightly prepared. And the *Lapis Lazuli*, which some think should be omitted in this confection, has not onely a virtue to purge, as *Avicen* witnesses, but also to separate melancholick vapours from the blood.

Sennertus.

XXIII. A Nun of thirty years old, having the courage and voice of a Man, thick and black Hair, and a ruddy colour in her Cheeks, having labour'd under great and oft returning Pains in her Head; fell afterwards into a continual Melancholy. The ordinary Remedies not prevailing, making an incision in the Temple artery, I drew half a pound of blood: And, which was wonderfull, all things were presently allayed, and she quite recovered: The estuating distemper of her Brain was cured by this Remedy, even as a Coal is quenched by throwing water on it.

Severinus,
Med. Eff.
p. 46.

XXIV. Issues are profitable to those who are of a melancholick habit, because, as *Hippocrates* affirms, they have very ichorous blood. ¶ Issues are commended, but in that Melancholy which is with matter; but let them be made in the lower parts, in the Thighs or Hips. ¶ In hypochondriacal Melancholy we use to make Issues in the Legs or Thighs, which I have known doe a great deal of good.

Claudin.
resp. 43.Saxonia,
l. 1. c. 16.Mercurialis,
lib. 1. c. 50.

XXV. Some commend an Issue made upon the concurrence of the sagittal and coronal Suture: I think some impure vapours may exhale through such an ulcerous hole; but am of opinion that many inconveniences happen thereby: for, besides that vapours are drawn from the lower parts to a noble part, an abscess is made above the Disease: whereas *Hippocrates* writes, that Abscesses, which are as it were the Outlets of Nature, onely help then, when they are below the Disease, and very far from the Belly, or very remote from the Disease.

Rohfinc. 1. 2.
conf. 6.

XXVI. In the first Preparation of the humours some Cream of Tartar may be added to decoctions and distilled waters; for by a certain sympathy it moves, ferments and draws acid humours to it self, whence Chymists call adust Melancholy, Tartar. The second Preparation is better performed by clarified Juices than by sugared Syrups; for these latter excite heat, as being sweet, and puff up the *Viscera*.

Fortis, con-
sult. 23. cent.
1.

XXVII. Whether must the Melancholick use *Veneris*? distinguish thus: If any become such by the retention of corrupt seed, whether he be hypochondriacal or not, and be not yet essentially weak, he will doubtless be relieved by using of it: for Evacuation cures Diseases proceeding from Repletion,

when such things are expelled as are fitting, that is, the proper matter and cause of every Disease. But as to others it is unprofitable and hurtfull, by cooling, drying and exhausting of the Spirits: If it doe good, that happens from the resolution of some *flatus*, and from being cheered by it, but then it must not be too frequent, nor the party very weak.

XXVIII. A Professour of *Padua* being almost wasted off his Legs by long courses of Physick every year without any benefit, at length taking up new resolutions, drove away the Disease by taking a meal of Succory pottage for the first course every meal.

Rhod. obs. 4.
cent. 1.

XXIX. We strictly admonish, not to disturb and provoke these Persons: For those are madder than the Patient, who, when they seem to be plac'd in authority, use it unseasonably; who fright him that is already frightened, and do stubbornly and frowardly endeavour to withdraw from stubbornness and frowardness which are the beginning of the Disease: for they are not to be cast down, but to be cheered up. ¶ Sometimes we must indulge them something, especially when we know that their fancy is bent upon this or that: for, as the imagination commands the humours and spirits; so it may be that by the means thereof the innate heat may be excited, and sometimes of its own accord vanquish the morbidick

Crato apud
Scholtz.
conf. 174.

cause.

J. Horst. De.
cad. probl.
10.

XXX. This is to be noted, from *Aetius*, that we must sometimes, for some while, abstain from all Physick, and that some rest is to be granted to Nature, which having been afflicted with continual Remedies, is recreated when she is let alone, and more strongly sets upon and conquers the Disease.

XXXI. A young Man, of thirty years of age, was ill of a very stubborn Melancholy: The Skull being carefully opened by *J. Cass. Placentinus*, though there was no suspicion of pus lying upon the membrane, he was recovered by the eventilation of his Brain. ¶ The *Terebration*, or Boring through of the Brain, is the last Remedy, the safest and most profitable of all: For if superficial Ulcers arising in the Head have cured the Melancholick, as *Hollerius*, and others testify; how much greater benefit may we believe that Ulcer will bring which penetrates the Skull? Yet that perforation shall suffice me which reaches to the marrow or middle, with the removing of the outer *Lamina* of the Skull, without hurting the *Dura mater*, lest the Brain be too much cooled: and this shall be done by making a Caute-ry near the coronal Suture with a red hot and sharp Iron, penetrating even to the marrow, (or to betwixt the *Lamina*) rather than by true *Terebration*: I say near the Suture, to avoid hurting the Membrane which passes out by the Sutures: If this be done, and be kept open with a pellet, it may benefit very much. See Examples in *Rohfinc. meth. spec. p. 413.*

The Weakness of the Memory and Mind.

The Contents.

The Memory is not always to be restored by heating Medicines. I.

The Abuse of *Confectio Anacardina* & *Aqua magnanimitatis*. II.

Where Issues are to be made? III.

Their Efficacy. IV.

Treacle and Mithridate ought to be rejected in Weakness of Mind. V.

I. I Can hardly consent to *Galen's* opinion, that Forgetfulness depends on a cold Intemperature, because I know several that have very cold Brains

Brains without impairing of their Memory, which yet ought to follow, if *Galen's* Arguments from the similitude of efficient Causes, and from the similitude of cold Animals, were of any strength. I have seen the contrary in some forgetful persons whose Cure I have undertaken, in whom there was no manifest sign of Cold: In some I discovered a notable Heat of the Brain, whom I helped by the application of cooling Remedies about the coronal Suture. I deny not but there is in many a notable dry Intemperature; but I doubt whether the Memory be either diminished or abolished by this Intemperature alone. Some cases observed by me increate the doubting: I have known some lose their Memory quite by a great blow on the Head: *Galen*, from *Thucydides*, relates, that some who recovered of a Pestilence, forgot all things that were by-past; And what cold Intemperature is to be accused here? I have seen a Woman that forgot all things, who by a spontaneous looseness, by which she evacuated cholerick, bloody, green, mucous and the like stuff, recover'd her lost Memory, without the application of any particular Medicine to the Brain it self.

II. The pernicious custom both of Physicians and others is to be condemned, who being indued with a weak Memory from their first constitution, endeavour by violent Medicines to recover that which they have not lost. For you may find young Students, not a few, who being desirous of a good Memory, beg both by Intreaty and Money, that *Confectio anacardina* may be given them: Whence not a few either unsettle their Judgment, or better not their Memory at all, or are tormented with great Pains in their Head. For who knows not, that if we would change the natural temper of the Brain, or any part, into a better, we must act leisurely, and by degrees, not with vehement and the most effectual Remedies, as those are which are made of *Anacardum*? which finding in the Heads and Bodies of young men nothing that is preternaturally thick, cold and moist, do waste and weaken the natural temper and substance, whence proceed a thousand kinds of harms, and the Memory perhaps becomes worse. Such things help those indeed whose Memories are hurt, if they were good before by their natural constitution. ¶ It is called *Confectio Sapientum*: Yet it is to be given warily, especially in those that are well, for strengthening their Memory: whence some give half a drachm or less of it in hot water, that its too much drying may be remitted: But those who have their principal members hot are by no means to use it: For even Experience has taught this, that some have indeed acquired to themselves an admirable Memory by this confecti- on, but have not been very lively, and have died in the very flower of their age, by having their body too much dried. ¶ In both confirming and restoring the Memory *Aqua magnanimitatis* is of wonderfull virtue (which see in *Schroder's Pharmac. lib. 2. cap. 38.* and *Hofman. in clavi, p. 50.*) 'Twill be more powerfull, if the *Species anacardina* be extracted with it; from three to six grains of whose essence being given once or twice a week in Wine or Lavender-water, is a singular Remedy. But note that this Water dries very much, and therefore its use in the cholerick and more dry ought to be rare and with caution; so that 'tis rather good for the phlegmatick and melancholick. ¶ See concerning its efficacy, and another preparation of it in *Miscell. curios. ann. 3. vir. 1672. p. 605.* from *Wedelius*, where there is most excellent Counsel for an impaired Memory.

III. Issues help in these cases; because when humours abound in the Brain, it helps if they be evacuated by little and little and turned aside from the Brain. But note, that as I commend an Issue in the *Armes*, so I condemn it in the *Occiput*, because that place is the Seat of the Memory, and 'tis pernicious to evacuate the whole body by the part affected.

IV. I am wont to make Issues in the Head with very good success when the Memory is lost, and Ratiocination impaired, especially in case of a cold and moist Intemperature; but the body must be first well purged. They must be made near or upon the Sutures, three or four, or more, as shall seem necessary.

V. Some commend Treacle and Mithridate, which I had rather omit, because of the *Opium* which makes all the Senses stupid or more languishing, though it have been a long time made; I say, 'tis better to let them alone, seeing there want not other things, and no pain or necessity requires them here, nor is there any malignity of humour.

Mensium fluor nimius, or, The too large Flux of the Terms.

The Contents.

Bleeding is very good. I.
We must often purge. II.
When Vomits have place. III.
Diureticks are unfit to make derivation. IV.
Astringents and Incrassates being used long doe harm. V.
Opates are profitable. VI.
Whether Astringents are to be applied. VII.
The Cure of this Flux joined with an hysterical Suffocation. VIII.
Sylvius's Causes and Cure. IX.

I. PHLEBOTOMY for Revulsion is to be celebrated in the *Arme*, ever and anon stopping the orifice a little while with your finger. A good quantity of blood is to be let, as much as the strength can bear. ¶ I have known many who have been cured by being let blood largely, when the flux could be stented by no other Remedies.

II. Some Lenitive Medicine is not inconvenient, which may bring Serosities plentifully out by stool: for, besides that it may make a Diversion, it will cleanse the first ways, and prepare them for the use of Astringents. Let it therefore be either Manna with Syrup of Roses solutive, or *Cassa* with the Powder of yellow Myrobalans and magistery of Mechoacan.

III. In an Hemorrhage of the Womb though *H. Petreus, disert. 47.* and *Lazarus Riverius, lib. 9. Pract. c. 3.* persuades us that Vomitories are very profitable, as being a greatly revelling Medicine; yet in the very Fit we quite reject them: But out of the Fit, if the condition and motion of the humour require it, we admit the use of the same with great caution, as *Galen* advises in *comm. Epid.*

IV. If the too great flux have its rise from a serous, thin and watry blood, that is to be evacuated; for that being evacuated, seeing the blood is made more fluid by it, this stays of its own accord; and this is done very well by Hydragogues, as Mechoacan and Rheubarb, and by Sudorificks. Some think, that in this case derivation may be made to the passages of Urine by Diureticks; But Diureticks do not derive the blood it self. For though they may derive thin humours, mixt with the blood, to the Urinary passages; yet there is fear left by fusing the blood, they make it more fluxile, and increate its violent motion to the Womb.

V. When the disease is inveterate, things that astringe, and incrassate much, are not to be used long, for there is danger lest they stuff up, close and constringe the passages, and so breed obstructions, and doe great harm to the principal bowels (which are wont to receive notable prejudice in this disease:) But 'tis much better to insist upon strengtheners of the Liver, which bind indeed, yet so moderately, that they can doe no harm thereby.

VI. Opiate Medicines are profitable: For like as when Nature is provoked by too strong Purgers,

the expells not onely the excrements of the proper humours, which are drawn by the Medicine, but withall, such as are profitable; so also does it fall out here; Nature indeed begins to expell that which is unprofitable, but through a furious irritation she exceeds in her work of expulsion, so that her natural work becomes symptomatical. In this case 'tis necessary that the depraved motion of Nature be stayed, which after other common Medicines may be done by using Narcoticks. But 'tis to be noted, that we must use Opiates warily, because Womens innate heat being but weak, they are therefore more vehemently affected by Stupefiers. But we doubt not, but in case of necessity, having considered the circumstances well, we may doe more to our desire by three or four grains of *Laudanum* Opiate rightly prepared, than if we fruitlessly repeat even to loathing, those astringent potions which consist of so many Ingredients: And in so great a space of time as is requisite for the taking of so many remedies, How greatly must the strength and spirits be spent? ¶ When the Terms flow excessively, and will be stayed by no other sort of Medicine, we rightly make use of corrected *Opium*; which my Wife experienced six years ago, who by this means was snatched even out of the Jaws of death, the fervour of her blood being reduced to a due temper by the use of *Laudanum*.

H. B. 10.
c. 10.

VII. We must have a care how we use those things that have a compressing virtue: for seeing these do compress the part to which they are applied, they will necessarily repel in the affected and flowing womb the humours that are staying there, and by consequence will increase the fluxion.

VIII. A Wench had her Terms flow so very plentifully, that she evacuated four or five pounds of blood in two hours time, whereby she was so greatly affected, that she lay speechless and dead as it were, yet having her eyes open, and signifying by her hand, that she was strangled: But she was cured of all by this potion: Take of the Waters of Orange-flower, Roses and Plantain of each an ounce, of *Sang. draconis* twelve grains, of *Sal. prunelle* one drachm: mix them, and make a potion. This was repeated after three hours, she having taken some Cruel in the mean time. Upon the first dose all the Symptoms remitted, and after the second they all ceased.

IX. The Terms continue to flow longer than usual, First, through the abounding of a laudable blood, and the straitness of the vessels. Secondly, through the too great fluidity and serosity of the same, and also the straitness of the vessels. Thirdly, through the passages of the womb being too open, and not contracting and straitning themselves again soon enough, and so through the womb's being weak. Fourthly, Through some great affection of the Mind, Anger, Fear. Fifthly, Through the heat of the Air, especially when joined with moisture. Sixthly, Through the too great motion and wearying of the body, as also want of sleep joined therewith. Seventhly, Through eating and drinking too Aromatick things, or abusing Medicines that too powerfully provoke the Terms.

1. When the blood abounds too much in the body, and the vessels are strait, if there insue no notable detriment to health, the Flux is not then to be esteemed preternatural, though it be somewhat troublesome to Women, but they must bear it patiently, for if they should endeavour a change, there is danger they will receive more harm than benefit thereby: For either the abounding blood is to be diminished by Venæsection, or the ways are to be made more open by Inciders and Emollients: But by opening a Vein the present flux is often stayed, if we bleed in the Arm; or is too much promoted, if in the Foot: And if, by Inciders, we endeavour to make the passages more open, there is danger lest the blood be made withall too thin and fluid,

and the Flux should become too great: If by Emollients we attempt the enlargement of the same ways, the strength of the Womb will be in danger of being prejudic'd, and more and greater inconveniences follow than that we would change. 'Tis therefore better patiently to endure that trouble, than besides the uncertainty of making the desired change, to incur perhaps the evident danger of the greatest diseases. 2. When the Vessels of the Womb are so narrow, as that the blood can flow but slowly by them, being it self moderate both in quantity and quality, and the long continuing flux of the Terms is not so much grievous and hurtfull, as troublesome; in such case neither ought it to be esteemed as preternatural: wherefore, as was said just now, Women are rather to be exhorted to a due patience, than by much toil, and an uncertain event to be cast into danger of some more grievous disease. For whether we endeavour a cure by Inciders and Openers, or by Emollients, the Woman will incur the forementioned danger: and therefore I advise every practitioner of Physick to abstain therefrom. 3. When the blood is too fluid and serous, and the vessels also too strait (for otherwise, if the ways were open enough, the blood would flow forth more abundantly, and therefore also in less time) the flux of the Terms continuing too long, shall be cured, by using Medicines, that both restore a due consistence to the blood, and also open the passages slowly and gently. Those things, by degrees, increase the consistence of the blood, which lessen the superfluous moisture in it, and which do more inactivate it. Hydragogues, Sudorifics and Diureticks do lessen its superfluous moisture: and the same is prevented by using more solid aliment diluted but with a little drink, and moderate exercise of body. Things a little sower being taken oft, and in a little quantity, do inactivate the blood better than any thing else. As to things that gently and leisurely open the passages of the Womb, Externals are more convenient than Internals; for these latter would be apt to increase the fluidity of the blood. Externals shall be both Inciders and Emollients, which shall be used in the form of a fomentation and bath. I said, that Inciders may be joined with Emollients, because most Inciders are also Aromaticks, and therefore strengtheners of the Womb, which Emollients do in some sort weaken. Therefore lest while we cure one disease we cause another, 'tis good to use Medicines that may prevent new mischiefs. I added, that the foresaid things may be conveniently used in the form of a fomentation or bath, and that Emollients may be joined with Inciders, because so they will go directly to the Womb, (the other parts being untouched, at least unhurt) and open its vessels leisurely and gently. 4. When the vessels of the womb are too open, and do not contract themselves again soon enough, and so are the cause of a too long continued menstrual flux, then are such things to be used as leisurely, and gently strengthen and astringe the womb and its vessels, especially Externals. 5. When the affections of the mind are a great cause, then is the mind to be reduced to tranquillity. If the blood be become too acrimonious and fluid through vehement anger, it will be temper'd especially by sower things, used oft a little at a time. Lastly, The womb being much weakened and loosened by some great affection of mind, it shall be strengthened by Astringents, both such as are somewhat sower, and also Aromatick, especially mixt together. 6. VVhen the great heat of the Air, joined with moisture, is the cause of a too long flux, then it is cured by changing the Air. 7. VVhen much, or over-great motion of the body have preceded, Rest is to be prescribed and observed: in which case kindly sleep is to be procured, both by Emulsions, and also Opiates, not taking too much at once, but often. Lastly, If the blood

blood be made too sharp and fluid by Aromatical Sauces, or Medicines, let it be gently corrected, temper'd and thickned, especially by sower and tart things, but such as are more mild, taking them now and then in a small quantity; for these will not only take away that too great fluidity of the blood, but also gently strengthen and constringe the womb that is too open and gaping. To these I would have Aromaticks joined, but those that are less Acrimonious, as Nutmeg and the like, that sower things may be better temper'd, and the blood not curdled too much, or the womb straitned above measure.

Mensum suppressio, or, Suppression of the Terms.

(See *Menses moventia*, BOOK XIX.)

The Contents.

- Whether Blood must always be let in the Foot? I.
Some lean Women may be bled. II.
Whether Bleeding be proper for every Suppression? III.
When Opening of the Hemorrhoids may be tried? IV.
Opening of the veins in the Neck of the Womb by Leeches. V.
Vomits are not good for every one. VI.
When they stop for the straitness of the Vessels, how they may be moved? VII.
Aperient Medicines hurtfull, when they are stop'd by compression. VIII.
They must not be provoked, where there is want of blood. IX.
Emmenagogues must follow Universals. X.
They must be given in a large Dose. XI.
When they are given in a Bath, they operate most successfully. XII.
Some generous Remedies in a pertinacious obstruction. XIII.
For whom Pessaries and Uterine Clysters are proper? XIV.
The excellency of Suffumigations. XV.
Issues are good. XVI.
We must not make haste in the Cure. XVII.
The cure of their stoppage, accompanied with Spitting of Blood. XVIII.
Sylvius his cure of it from Obstruction. XIX.
The lower parts must be kept hot. XIX.
The Physician must follow Nature's Guidance. XX.
A provident care must be taken of them, in whom they are stop'd, by reason of their Age. XXI.
The cure of a Suppression, by reason the blood is translated to the Hemorrhoids. XXII.
How Specificks must be made use of. XXIII.

I. IF the Suppression arise from too great a quantity of Blood, the quantity must be abated by bleeding liberally in the Arm: For, if the lower veins were first opened, the blood would be drawn more towards the Womb, where it would cause a greater obstruction and distension of the vessels, with danger of their breaking, or of an Inflammation of the Womb. ¶ A certain Woman, a foreigner, of a Sanguine Complexion, had divers Ails, arising chiefly from the suppression of her *Menses*: for which, when the Physicians there present had used divers remedies, and they appeared contumacious, the Advice of the Physicians of Mountpelier was desired. And in the relation, the ordinary Physicians took especial notice of this, which they wondered at, and craved a reason for it, namely, That when a vein was opened in her foot, her Terms stop'd: but when she was let blood in the Arm, they ran more freely. Which events seemed contrary to Reason, and to the common Tenets of Physicians, which hold, that the Terms are provoked by opening the Lower veins, but that they are stop'd by opening the upper. To this Query it was answered, That these Events were agreeable both to Reason and to Galen's Doctrine: For seeing this

Woman was Plethorick, and that the suppression of her Terms arose from excess of blood, to distending the vessels; that they could not well contract themselves, when the blood was drawn to those places, by opening of the lower veins, the obstruction was increased: But when retraction of the Blood was made by the upper veins from the vessels of the womb, and their plenitude and distension was abated, then they could with ease contract themselves for natural and ordinary expulsion, which is made by the Womb. And this reason is back'd by Galen's opinion, 10. Method. 2. That Obstruction is caused not only by the thickness of Humours, but by their abundance. Therefore the Physicians there present were advis'd, to abate the *Plethora* by bleeding plentifully in the Arm: and that afterwards they should draw the blood downwards, by opening the lower veins, especially about the time the Patient used to have her Terms.

II. It happens sometimes, that the stop'd Terms, being retained in the Veins, acquire a bad quality, by reason whereof the blood is rendred less fit to nourish the parts; whereupon a Leanness and Extenuation of the body follows, though the veins remain full of much, but bad blood: Then bleeding with a liberal hand uses to doe much good: Which is confirmed by a plain Instance in Galen, who, 3. 6. Epidem. by taking away no small quantity of Blood from a Woman, who had had a suppression of her Terms for eight months, and was extreme lean, quickly restored her to her proper habit.

III. By this method (See Section XIII.) which is easie and gentle, without all violence, I have brought down the Terms in several Maids, using no letting or evacuation of blood for that end; unless excess of blood, which is very rare, did concur; which indeed sometimes is afterwards observed in the suppression of the Terms, scarce ever when they are not yet come down, nor unless some great error be committed in Diet about the time when they are first ready to come down. For the sake of young Physicians I explain the matter. I think that blood scarce ever abounds in Girls, in whom the Terms do not come down of themselves, at the time of Pubescence, except they have committed some great error in their diet, though they be often suppressed in the elder, when they are plethorick: For young Girls are more carefully looked to by their Mothers or Governesses, and they have not so great a liberty of Diet allowed them, as to be able to commit any notable Error. But the case is otherwise in them that are grown, who, as being better exercised in humane affairs, have a greater liberty and opportunity of offending allowed them. I said, that a *Plethora* is very rarely observed in Girls about the time of Pubescence, because about that time their bodies grow most; and in that growth much of the blood is spent, so that abundance of it scarce ever concurs: But after the body is grown to a due stature, no wonder, in a healthy body, when the mind is chearfull, and their food is of a laudable juice, and they eat a sufficient quantity of it, if a *Plethora*, and abundance of blood be produced. And when there is a *Plethora* in those that are grown, and are beyond the first years of their Pubescence; no wonder also, if when they have a suppression of their Terms, Venæsection now and then have place, not so much to move them again, as to diminish the *Plethora*. But if, when there is no remarkable disease, or fault in the vessels of the Womb, the Terms nevertheless do not flow, because of a *Plethora* of the blood, and the motion of it hindered thereby, who does not see, if blood be then taken away; and the *Plethora* of it be also abated, that its motion is increased and renewed, whereupon its motion to the Womb, and through the Womb, is promoted? Nor is it any wonder, if in such a case Bleeding in the Arm do as much, or more good; than Bleeding in the Foot; and especially because the blood comes in greater plenty

Idem obs. 2.
cent. 1.

Idem.

Riverius.

plenty and violence out of the Arm, than out of the Foot, and therefore better able to renew and augment its motion: For how much more powerfully the blood is moved through the vessels of the whole body; so much more powerfully and easily it makes its way through the Womb, which is here required. This therefore is the reason, why at the time of Pubescence a *Plethora* scarce ever is observed, and why Bleeding is then scarce ever necessary to promote the Terms: But when the *Menstrua* have come at Pubescency, and a *Plethora* is made for the said causes, if they then be suppressed, blood may profitably be let. And though sometimes it may so be, that the Terms come too slow because of a *Plethora*, and therefore they are promoted only by letting of blood seasonably; yet because for the most part some fault in the vessels of the Womb does concur, arising from a bad diet, therefore Medicines are usually required to open the obstruction of these vessels, whether they alone be sufficient, or upon the urgency of a *Plethora* Bloodletting be joined with them. ¶ When the Terms or *Lochia* stop in the Womb, then they are commodiously evacuated by its neck, as well the Internal as External; and indeed partly by External remedies, partly by Internal. Among the Internal, Bleeding in the Foot may very well be reckoned, since often when the blood is prepared for its natural flux, especially when there is a *Plethora*, and therefore the blood runs too slow; the Terms and *Lochia* which are stopped by a *Plethora*, are often by means hereof moved and brought to their natural flux. But when either of them stops because of an obstruction in the vessels of the Womb, and in the orifices of the vessels, then, unless there be a *Plethora*, Bloodletting does more harm than good: because, by diminishing laudable blood, not exceeding in Quantity, it only weakens Women, and does not at all restore the flux of either. Then there is need of such medicines both Internal and External, as remove and amend the Harm, if any be done to the Womb by the External Cold of the Air, Water, Snow, a Floor, &c. And such things as incide, attenuate, and make fluid, congealed and obstructing Phlegm, and that may move and remove it, &c. See Section XIII.

Sylvius de
le Bcē.

IV. If the *Saphena* cannot be opened, because the Feet are swollen, or if the Patient be against it, and bleeding in the Ham, and against setting Cupping-glasses to the inside of the Thighs; let Leeches at least be set to the Sedal Veins, and let a moderate quantity of blood be taken thence. Nor is it any hindrance, that by this way derivation is made from the Womb, upon which account the operation appears suspicious, that is, lest the Terms should be hindered: for when the thick and feculent blood is evacuated thereby, the blood that remains, will easily be made more fluid, and will run to the usual places; especially if after this remedy the Womb be fomented, and dry Cupping-glasses be set to the Hips. But we must take notice, that this must not be done, when the Terms are present or at hand.

Sylvaticus.

V. For the motion of the humours lodged in the Womb, Galen, 13. Meth. 19. propounds the applying of Cupping-glasses to the Pubes and Groin: But a safer and more successful derivation may be had from a replete Womb, by setting of Leeches to the Veins of the Neck of the Womb: for a good quantity may be taken away well enough. Hieronymus Nigrifolius first began to put this operation in practice.

For. 18.

VI. In Women and Maids, that labour of an obstruction of the *Menstrua*, which arises not from any foulness in the Bowels, but only from the obstruction of the veins that come to the Womb, according to *Minsitibus* his advice, Vomits must be avoided.

Frid. Hofmannus.

VII. The Terms being near in some *Viragoes*, and restagnating, because of the narrowness of the Vessels, do create a great deal of trouble to the ferment, both of the first and second digestion, so that

thence there arises loss of colour in the face, and other symptoms representing the green-sickness in Maids, especially if over and above there be an Astral Influx, that hinders the Terms, the said Symptoms do not only grow worse; but the Cure also proves very difficult. In the mean time, at the beginning, violent Expellers, which only disturb the morbid matter, and do no good, must be avoided; but they must be moderately moving, and also they must help the fermentation of the first and second Concoction. Of which rank are, Extract of the lesser Centaury, Juniper, Mugwort, *Species Dialaur.* *Minsitibus*, Extract. *Splen. Bov.* *Elixir proprietatis Paracelsi*, *Uterinum Crollii*, if instead of Spirit of Wine, Spirit of Baum and Sage be used, adding toward the latter end a sufficient quantity of Salt of Mugwort: for these things moderately provoke the Terms, strengthen the concoction of the Bowels, resist putrefaction, and are good against Worms, if there be any.

Frid. Hofmannus.

VIII. Galen, 5. Aphor. 46. says, that if the Mouth of the Womb be compressed by a swelling, the Terms must not be provoked: The reason is, because the swelling would increase, and the Disease would be enraged, by giving things to provoke the Terms. Thus they are in error, who, when the Vessels of the Womb are compressed, either by a swelling, or too much Fatness, they do open the *Saphena*, and they do not see that the swellings increase. Therefore the Basilick vein must be opened.

Sanctorius.

IX. If the Terms flow not for want of blood, as after long Fevers, great Evacuations, and in any notable extenuation of the body, they must not be provoked, before the body be recruited with convenient restorative food, before a sufficient quantity of blood is bred, and before the Disease, the cause of extenuation, be conquered; which when done, the Terms usually come of themselves: But if it do not so fall out, to the end Nature may be recalled to her duty, blood may be taken from the lower Veins, according to the measure of the strength. But we must take notice, that every extenuation does not denote want of blood: but only that which succeeds consuming Causes.

Riverius.

X. We must never use Remedies to provoke the Terms, unless universal Evacuations were premised, lest the humours being moved in great plenty to the Womb, should increase the obstruction; or being much attenuated, should fall on other parts, and produce much mischief. So *Schenckius* reports, that a Physician of Venice gave a Woman, for the suppression of her Terms, a Decoction, before he had evacuated the Phlegm, which was the cause of her Obstruction, upon taking of which she fell into a Palsie.

Fortis.

XI. But they must be given in a great quantity; because much of their virtue is abated by the way from the Stomach to the Womb.

Riverius.

XII. If they be given at the going in or out of a Bath, they exert their virtue the more powerfully, because the Medicine gets into an open and warm body; and yet much more effectually, if they were given before bleeding in the foot.

Idem.

Some generous Remedies in a pertinacious Obstruction.

XIII. Seeing the suppression of the Terms is caused, for the most part, by the obstruction and stuffing of the Vessels that go to the Womb, and through the Womb, we shall pursue this sort most. And whereas we have shewn, that this said obstruction is produced either by a viscid and glutinous Phlegm, or by such a blood, it easily appears, that inciding and detersion are indicated, and required by the tenacity of the humour, for its cure, and the provoking of the *Menstrua*. And both Acids and Aromaticks, and things abounding with a lixivial Salt, as well fixt as volatile; and therefore fixt and volatile Salts themselves. But because Acids serve to produce

duce a glutinosity, especially when they incline to Austerity, therefore in curing of this Disease Aromaticks are deservedly preferred, which Experience also it self testifies to be better than Acids. Whether things be bitter or not, but of various taste, they must be called Aromaticks. And whoever is conversant in the Chymical mutations of things Natural, he will find both far more powerfull things, and more easie to be used, than these things that are commonly used; As Volatile Salts made of infinite things, of all Bones, Horns, Hoofs, Hair, Blood, Urine, Fleish, and all parts of Animals whatever, that is, all Volatile Salts are good, though I should prefer Oleous ones before the rest; because they doe their work more kindly and successfully. Whence also it is manifest, that fixt Salts are less to be valued, because since they are purer, they operate the more violently. And the said Volatile Salts may be conveniently used at any time, and especially (when all the blood is glutinous) at Dinner and Supper in a draught of Wine, Beer, Broth, or any other liquor the Patient shall chuse: But when the whole mass of blood is not glutinous and pituitous, though the said Volatile Salts may be used at mealtimes; yet they may be used to greater advantage at another time, and especially when the Phlegm, first dissolved by the motion of the body, heat of the Air, &c. and carried to the Womb, is by and by coagulated there again by the subsequent Cold; for then it is good to take Volatile Salts upon an empty Stomach, and also to dispose the body it self to a Sweat: for so the virtue of the Medicines will the easilier penetrate to the farther end of the vessels and passages. And above the rest I recommend Spirit of Sal Ammoniack to all, when a stoppage of the *Menstrua* happens suddenly and lately upon heating and cooling of the body; by benefit of which alone I have very well cured several in a short time, by giving 3, 4, 5 or six drops, as it is stronger, or weaker, in a spoonfull of Wine twice or thrice a day. And not onely a Volatile Salt it self, but all things also abounding with it, whether Sudorificks or Diuretick, are very proper. It will be usefull also, in a suppression that comes gradually, to add such things to the Deobstruents, that are used towards the latter end. For Example, make the following Apozeme; Take of Root of Parsly, Lovage, each half an ounce, shavings of *Guaiacum* three drachms, *Sassafras* half an ounce, Juniper Berries two ounces, Bay-berries half an ounce, *Scordium*, Pennyroyal each half an handful, tops of lesser Centaury half an handful, Millet-seed two ounces. Boil them in fair Water; to 25 ounces of the Colature add of Syrup of Mugwort, *Cardus Benedictus*, each one ounce and an half. Tincture of Cinnamon and Castor each half an ounce, Oil of Amber eight grains. Mix them. Let the Patient take a draught of this Apozeme warm early in the morning, and being well covered with clothes, let her lye to Sweat; but if within an hour after it do not come, let her promote it by taking broth, let her often repeat it, and about the usual time of her Terms, to the end the blood also may at last be forced to the Womb. But if the said Phlegm redound not onely in the blood, but in the Head and Guts, it will be good and beneficial now and then to abate and evacuate it by Phlegmagogues, among which, Agarrick, Turbith, Hermodactyls, *Coloquintida*, &c. are vulgarly commended. And among the Chymical ones, all Medicines made of Mercury are chief, both præcipitate and sublimate, especially *Mercurius dulcis*.

Among External Medicines Baths, Fomentations and Fumes are deservedly commended; from which either the arising Exhalations, Vapours, Fumes, or the Penetrating Liquour, do incide and attenuate the Phlegm or other glutinous humours, sticking in the Orifices and Vessels of the Womb, and causing Obstructions; and so make them fluxible and apt to give way to the blood; then, or

afterwards, desiring an *exit*, or to go out with it. Baths certainly, in which Women use then to sit above the Navel, do by their moisture insinuate themselves into the outer Neck of the Womb, and then into the inner, and do set loose and dissolve every glutinous humour whatever, that so frequently sticks in the cavity of the inner Neck, and that being within a-while removed thence, they penetrate inwards, and incide and dissolve, and so make fit for efflux the glutinous humour there also, that sticks to and in the Orifices of the Vessels of the Womb. But warm Baths are used, that so they with more speed, ease and efficacy produce their desired effect. As to the Liquour of the Bath, Water may conveniently be used, and at the time of Use a little strong White-wine, not Red, may be added, as also Spirit of Wine, and Volatile Salt, though this do not augment the Liquour so much, as it promotes and intends the virtue of the rest of the things that are decocted. As for the things that are to be boiled therein, I commend aromatick Plants, i. e. strong smelling ones, that have a sharp and gratefull taste, but especially those they call Hysseric. But since drying Baths are observed not always to promote, but often to hinder the Flux of the Terms, here also Roots of Lilies, Seeds of Line and Fennugreek, &c. will be proper to boil, not onely to incide and conveniently to attenuate by the Aromaticks, which are often too drying, and therefore incrustating, but also to mollifie. For so the glutinous humours being partly attenuated, partly mollified, are more easily made fluid; nay, they are brought to a Flux and Efflux, and so the highway for the stoppt blood is cleared again, and laid open.

But it is good for the Bath not to be over hot, lest too much Sweat be caused, whereby when the more serous parts of the blood are exhausted, the glutinous humours would be rendred more glutinous. Not must the continue long in the Bath, for the same reasons: for unless by means of it the Obstruction be removed quickly, that benefit will scarce be obtained by tarrying long therein.

Fomentations are made of the same things with Baths, and are applied to the *Pudenda*, and that most fitly with Sponges or woollen Cloths, but not with linen: for they, as well as Sponges, soak up more Liquour than linen, nor do they so easily let it run away; besides, they keep the heat of the Liquour longer in them, without which Fomentations doe more harm than good. Akin to these is the Vapour arising from a Decoction heated, and received into the *pudenda*, through an open Chair, and so penetrating inwards. Thus Exhalations doe good, which may commodiously be made of Salt of Tartar, or of any other fixt Salt, and Sal Ammoniack, which, because it is most penetrant, will doe very much good here, and is deservedly preferred before many other things.

XIV. Pessaries and Uterine Clysters ought onely to be prescribed for Women that are married, and that lye with Men: but for Maids, *Nuptialia*, Fomentations, Injections and Suffumigations.

XV. Suffumigations are approved of above all ways; for so the Medicine acts most effectually, and a Fume also of Spices brings down Womens Terms, *Aph. 28. 5.* For the virtue of Medicines is abated in their passage, when they are given in form of a Powder, Potion, Pills or *Bolus*, before they get to the Womb, which it is not, when they are administered in form of a Suffumigation. Besides, since things that provoke the Terms are hot, they often by the way hurt a hot Liver: for the Terms are often stoppt by the thickness of the blood, which is caused by a hot Liver. And this way is preferred before the rest, according to *Galen*, because you may meet with some Women, who will not endure Clysters or Pessaries, who will admit Fumes; and

and they penetrate more. The only hindrance is Weakness of the Head: for some Womens Heads are easily disturbed by Aromatics: But in admitting of a Suffumigation two things must be observed from *Galen*, 1. That Women be girded. 2. That the Fume ascend through a Pipe into the Neck of the Womb: for so the Fume does not easily get into the Head.

Capiuac-

XVI. In a diminution of the Terms, *Mercurialis Conf.* 8. highly commends two Issues below the Knees on the inside. And *Conf.* 108. he says, that an Issue below the Knees on the inside of each Leg is very effectual.

Sylvius de
le Boë.

XVII. I have hitherto observed, that we must make no more haste than good speed, and that more may be done by gentle Medicines than by strong. That therefore the Cure may be safe, we must abstain from all things that have any danger in them.

Fortis, cent.
2. conf. 163.

XVIII. *Avicenna* orders, when Women spit blood, because of a Stoppage of their Terms, that they must be provoked by Bleeding, Cupping, Frictions, and other such things; yet not by Medicines that move the Terms; but near the usual time we may add a spoonfull of distilled Savine Water, or five drops of its Oil to a Decoction of white Saunders, *Guaiacum*, Box, *Rhodium* root, &c. And outwardly, at this time, that is an effectual Remedy; Hempen Thread newly boiled, and still warm, applied twice a-day for an hour, to the region of the Womb: for we may not go higher.

Walau.

XIX. The lower parts must be kept warm, and the upper cold. Women offend often herein, when they cover the whole body with Bed-clothes, and hereupon all the parts draw upwards and downwards.

Idem.

XX. Medicines must be given at the usual time of their coming: For if a Physician should stimulate Nature in the full Moon, that was accustomed to her excretion in the new, he would then labour in vain, unless he used most violent Medicines, wherein there is more harm than benefit.

Mercatus.

XXI. A Flux of the Terms, which stops of it self, by reason of the Woman's Age, though they do not require to be brought again; yet it is necessary to disburthen Nature by some Evacuation: For though this Suppression do not cause the most grievous Diseases; yet, it frequently breeds tedious ones, and such as are difficult to cure. Therefore every year, till Nature be broken of her custom, she must be eased by gentle Evacuations.

Riversius.

XXII. If the Blood come by the Hemorrhoids, and be turned from the Womb, the Cure will be very difficult: for whether you use Attractants to the lower parts, they draw to the Seat; Or if you use Astringents, they also, because of their vicinity, repell whatever comes to the Womb. The only way of Cure therefore, to do any good is this, to apply local Medicines to the Womb, which may draw the moved humour more to the Womb.

XXIII. Specifick Medicines use most conveniently to be given a few days before their usual Flux, after Baths and Fomentations, wherewith the Vessels of the Womb are heated and opened; then after taking of these Medicines, it is good to put the Feet into a Decoction of some convenient Plants, and then to walk. Let the Woman sit up to the Navel in Fomentations, and let her hold the boiled Herbs, put in a Bag, to her Belly: After Fomenting, the parts near the Womb may be anointed with Oils and Unguents, as *Unguentum Martiatum*, Snake's fat, with distilled Oil of Savine, Lavender, Bayes and White-lilie. Outwardly let another Woman's Smock, newly bedaubed with her Menstrua, be put on, which is very well approved from experience; for, in a manner, by Sympathy it excites the Mumial Ferment of the blood within the Womb.

F. Hofmannus.

Mesenterii Affectus, or, Diseases of the Mesentery.

The Contents.

Handling of the Abdomen does not shew its Diseases. I.
In opening of Obstructions, we must have a care, lest Aperi-
ents be hurtfull to the Liver and Stomach. II.
We must not insist over much on Purging. III.
With what things Preparation must be performed? IV.
We must have a care of too much using of sweet things. V.
Sometimes a Vomit must be given. VI.
When Baths are proper? VII.
What such the Diet must be, if it come from the straitness of
the Vessels? VIII.
We must abstain from violent Openers. IX.
The Cure of its Pain. X.
When the Mesentery is inflamed, Purgatives and Diureticks
usually doe harm. XI.
In its Ulcers Mineral Waters must be avoided. XII.
The Virtues of Cypreis Turpentine. XIII.
Voiding of Pus often comes from some where else. XIV.
Obstructions must be prudently opened. XV.

I. IT is a common mistake amongst many, who neglect all Anatomical knowledge, to take a Tension reaching lengthways on each side of the Abdomen, for a Swelling of the Mesentery or Liver, when it is indeed a Swelling of the right Muscles. Truly it is an inexcusable error; for the Mesentery lies under the Guts, and no part of the Mesentery arises above the Guts, which can be felt by the Hands in the Abdomen; but these right Muscles are not onely above the Guts, but above the Omentum and Peritonæum, and above the transverse Muscles of the Abdomen. Wherefore no man can by feeling any part of the Abdomen judge any thing for certain, concerning the state of the Mesentery: for indeed these two parts of the body are too far distant in site and origination. This Tension lengthways may be found in a Thousand People, that are very well in health. And this error in notion passes into operation: for the Patients are ill treated with divers outward Applications.

II. Medicines, that open Obstructions, must procure a firmness and strength to the Liver and Stomach: For, as *Avicenna* lays excellently well, *lib.* 3. *Fen.* 14. *tr.* 1. c. 1. He that uses a Cure for Diseases of the Mesaraicks, without any regard at the same time had to the Liver as to the cause of them, is not unlike to him, that fences the Feet, when they are hurt by something being amiss in the *Spina dorsalis*, but omits the chief of the Cure, which resides in the Spine.

III. Purging must not be plentiful nor constant and continual, nor exceeding the bounds of Moderation. The condition of the Passages seems to persuade this, and Nature also, who is very observant of Moderation and Security, and the Nature of the Humour that causes the Obstruction.

Mercatus.

IV. Preparation with Syrups, when the extenuated Humours run to the stop parts, will undoubtedly cause stronger Obstructions. ¶ It is better in Winter time to doe it with Elestuaries than with Liguours. ¶ Viscid and tough Humours are, according to *Galen*, 15. *Meth.* 12. corrected with Attenuants and Extensives. But the bilious and adust, and which tend to Inflammation, are made fit for Evacuation by moderate Coolers and Detersives.

Idem.

Fernelius.

V. Left Bile should be increased, or occasion given to the Liver or Spleen to swell, we must, as much as may be, have a care of Sweet things.

Mercatus.

VI. When the Humours are prepared, a Vomit is proper: But Obstructions must not be opened by a Vomit presently, unless there be great store of bilious and sharp matter, lest the Inwards should be

Martini. be strained by the violence of the Vomit, or the Head should be filled.

VII. Bathing in Sweet waters, used with Moderation, is good to open the Pores of the Skin, and to amplify and open the passages of the Mesentery, and to remove the Filth that sticks there. But it must be used with this caution, that nothing be in the first ways, that may in a moment be drawn to the body; that there be no great impurity in the Bowels; and that the Concoction of the precedent Food be finished.

Idem. VIII. If the Disease have its original from a Straitness of the Veins, Attenuating Meat, according to *Aëtius* his Judgment, must be given three or four times a day, but in a small quantity.

IX. Diseases of the Mesentery require not violent Openers, because of their relation and vicinity to the Heart, Spleen and Stomach, and communication of Offices and Diseases, whereby they quickly affect one another.

Idem. X. For the Pain of the Mesentery, if it be violent, *Laudanum Opiatum* is good inwardly, dissolved and mixt with Purgatives, which stops the Pain by Purging.

Fr. Hofmannus. XI. Purgatives and Diureticks in the beginning of an Inflammation, can seldom or never be used safely: for there is fear, according to *Galen*, 14. *Metb.* 11. lest the Liver and Mesentery be sooner or worse inflamed.

XII. If an Abscess of the Mesentery be brought to Suppuration, *Reason* tells a man, that all Waters with a mineral virtue in them must be avoided: for though they do much good to the Bowels designed for Nutrition, by attenuating the thickness of the humours; yet, because by their penetrative and absterfive virtue, and by a peculiar faculty, contracted from Mines of Vitriol, Iron, Salt and others, they corrode all Ulcers in the inner parts; for these villanies, as *Pliny*, l. 25. c. 3. speaks, they ought to be repudiated.

XIII. Among Balsamicks, according to *Galen*, *Cypus Turpentine* is chief, a Medicine fit for many uses, and exceeding proper for Inflammations; especially where the peccant matter lies in the Loins, and about the Kidneys, and causes Pain; yet it cannot safely be given to such as are inclined to Epilepsies, or to other grievous Diseases of the Head.

Martini. XIV. Of all the Guts, onely the *Colon* is subject to Exulceration, which produces *pus*, which many think does run from an Ulcer in the Mesentery; and they unhappily use Purges and Clysters, after which the Disease grows worie.

Riolanus. XV. When the first ways are emptied; we must cautiously proceed to the opening of Obstructions both with Preparatives and Aperients, and with Purges themselves. For Aperients and Attenuants that are too strong do not onely prepare the Humours, but carry them to the Liver; and there is the same Inconvenience in strong Purgatives.

Fortis.

(seeing if it were a true Conception, we should destroy it) is a very hazardous thing, and should not be rashly undertaken, but when we make the least doubt of it, it should be omitted. And it is better then either to leave the business to Nature, and wait the event till we be certain of the thing, or at least to hinder the growth of it by taking away a little nourishment from it by Bleeding; or by giving of Purges to solicit Nature, that, as she expells other Uncleanesses, so perhaps she would vouchsafe to force away a Burthen, that is grievous and strange to her. Nor let us fear to give them, because if perhaps it were a true Conception, there might be an Abortion, seeing we have observed that it does not follow, in many Women with Child, who have often been so evacuated, or have had long *Diarrhoeas*; and Nature is not so easily moved to the Excretion of things that are natural, as of things that are preternatural and burthensome to her. But if we be certain of it by many concurrent signs, especially if, after the time of Birth is over, a swelling and hardness of Belly be found by the touch, then, that Nature may endeavour Excretion, we must excite her, by giving and applying, and injecting things, and we must open and dilate the passages, that it may get out of the Womb.

II. If it so happen, that a Mole cannot be parted, and when it is parted, if Nature be not able to expell it, the Chirurgion must set the Woman in the same posture, as we said she must be set in extraction of a Child from the Womb; Then opening the *Pudendum*, and putting in an extractory Instrument, which, from its likeness, is called a *Griffon's Claw*. And when it is got into the Womb, it being opened and dilated, take hold of the Mole. Nor can it otherwise be taken hold of, especially if it be a thick one, because of its roundness; for it has no handle to take hold by: And when it is onely sought for with the Hand, it slips away, because of its lubricity, and runs like a Ball all over the capacity of the Womb. But it may more easily be taken hold of by the *Griffon's Claw*, if the Woman's belly be squeezed this way and that, and then the Mole be run into some corner, whence it cannot easily slip: for so at length being taken hold on, it may easily be extracted. When the Mole is extracted, the same care must be taken as of a Lying-in-woman.

III. In Extraction of a Mole some use sharp Hooks, or a *Griffon's Claw* (as they call it) but in my opinion, not without extreme hazard: For if a Hook should miss, it might easily tear the Womb. For this reason I have invented a *Forceps*, whose extremities are made in form of a *Duck's Bill*, but deep enough to receive the Hooks: In the middle whereof there are three teeth, square and very sharp, so as that they stand in a right line one against the side of another. Therefore when the *Forceps* is shut, not a tooth appears; and besides, let the *Forceps* miss never so much, it can never hurt the Neck of the Womb.

IV. There is a manifold difference in Moles: and this may be reckoned among the rarer sort, which I had the hap to see this present year, 1631. in the month of *March*. A Noble Woman (I am an ocular Witness) about thirty two years old, who had first been happily brought to bed of a Child, thought her self with Child within three months; she was sickly all that time; having, by the Prescription of her Physician, taken a Purge, she fell into Pains of Travel, then abundance of various things came from her Womb, bloody, membranous, watry things, clotted and black blood; and, which is the most to be admired at, an infinite number of Eggs as big as Pease, sticking one to another, just as in the Row of a large Pike, or a Trout; but besides, there was an Ovi-form piece, on the outside like the *Parenchyma* of a fat Capon's Liver, the inside

D d d

side

Mola, or, A Mole.

The Contents.

Extraction must not be undertaken rashly, but Ezyulsion must rather be tried by Medicines. I.

Paræus his way of extracting it by a Griffon's Claw. II.

Hildanus his way by a toothed Forceps. III.

Cast out by Purging. IV.

Medicines.

I. Since usually we are not certain of a Mole, though there be great suspicion of it, yet to set upon the thing with strong Medicines and to endeavour to cast out the Conception by force

side full of black clotted blood: All these things were promiscuous, and filled a large Bason. It is very likely these Eggs were inclosed in the torn Membrane, which, being thrown into warm water, were not dissolved. Several such examples are found in *Schenckius*.

Medicines especially made use of by eminent Physicians.

1. There is not a better Secret than the Powder of a Secundine given in water of Mugwort, Mather, or Penny-royal. *Hartman* performed the Cure in several successfully with this.

2. Before Bathing let the Belly be chafed with Malmsey-wine; if there be a Child, it will be strengthened; but if not, the Woman will void abundance of bad humours by her Womb. It has been often tried.

Morbilli, or, The Measles.

The Contents.

A bad method of Cure sometimes makes them mortal. I.

The safe method of Cure. II.

The mitigation of the Cough, which is familiar to them. III.

The Cure of the Loosness that follows them. V.

A hot regiment, and taking of hot Medicines does harm. VI.

I. **THIS** Disease, after Shivering and Chills, begins the Tragedy with inequality of Heat and Cold, which follow one another by turns; at length, on the second day, it ends in a perfect Fever, attended with great Sickness, Thirst, a White Tongue (but not dry) a Cough, Heaviness of Head and Eyes, and a perpetual Drowsiness; for the most part an humour runs out at his Nose and Eyes, the Patient sneezes, as if he had taken Cold, his Eye-lids swell (that is, a little before they come out) he vomits, he has often a Loosness with green stools. The Symptoms usually grow worse, till the fourth day, at which time usually little red Spots, like Flea-bites, begin to break out about the Fore-head and rest of the Face: They go away usually on the eighth day, at which time the Vulgar (being deceived by the time the Small-pox use to continue) hold they strike in, though indeed they have finished their course designed them by Nature; and the Symptoms that supervene, when they go away, they think they come therefore, because the Measles struck in too soon: for then one may observe, the Fever and Difficulty of Breathing is increased, and the Cough is more troublesome. Children especially, that are kept over hot, or they who have taken Medicines to bring the Measles out, are subject to this mischief, which shews it self, when the Measles are going away, upon which they are thrown into a *Peripneumony*, which kills more than either the Small-pox themselves, or any Symptom whatever, which belongs to that Disease; though the Measles, if they be skilfully treated, have no danger at all in them. A Loosness also follows such, not without extreme hazard to the Patient. Sometimes also, after a very hot regiment, the Spots are livid, and then black; but this only happens in grown persons; who may be given up for dead, as soon as that Blackness appears, except they be presently relieved with Phlebotomy, and the refreshment of a more temperate regiment.

Bydenham.

II. As the Measles do in their Nature agree with the Small Pox, so also in their method of cure, hot Medicines, and a hot regiment are very full of dan-

ger, how frequently soever they be made use of by ignorant Nurses, to this end, that they may keep the Measles from the heart. I have had the best success in this method above any, in which the Patient was kept in his Bed three or four days after their coming out, to the end the blood might gently, according to the Nature of the Disease, discharge by the pores of the skin the inflamed particles, easily separable, by which it was hurt, adding neither more clothes, nor more fire, than what he used, when he was well. I kept him from all flesh, I allowed him Oatmeal and Barley Grewel, and sometimes a roasted Apple. His drink was small Beer, or Milk boiled with thrice as much Water. I would ease the Cough, which is almost constant to this Disease, with a draught now and then of some pectoral Decoction. He that takes this course, seldom dies, nor is he afflicted with any new Ails, besides the necessary and inevitable symptoms of the Disease. *Idem.*

III. The Cough is the most tiresome of all, in which notwithstanding there is no danger, till the Disease is gone, and when it still continues for a week or two, it may easily be removed by a good Air, a Pectoral Decoction, Syrup of Violets, Maiden-hair, with Oil of Sweet Almonds, and other things good for the Breast; yea, it decreases by degrees of it self, and at length goes away. *Idem.*

IV. But if the Patient, after taking of Cordials, or too hot a Regiment, or while the Measles are still high, or after they are gone (which is most usual) be brought into hazard of his life by a violent Fever, shortness of breath, and other accidents, such as use to afflict *Peripneumonicks*, I always breathe a Vein, with very good success, even in the Arms of tender Infants, taking away such a quantity of Blood, as the Age and Strength require. Sometimes also, when the disease is urgent, I have not been afraid to bleed again. Truly, through GOD's blessing, I have saved several Childrens lives by letting of blood, when they have been just ready to be killed by this Symptom. And this befalls Children after the Measles are gone; it is so destructive to them, that it may well be reckoned one of Death's prime Instruments, which kills more than the very small Pox, and I have not yet met with that Man, who could help it by any other certain method. *Idem.*

V. Moreover, a Loosness, which often follows the Small Pox, is, in like manner, cured by bleeding, for seeing it owes its rise to exhalations of the inflamed blood, getting into the Guts (which is usual also in a Pleuritic, *Peripneumony*, and other Diseases, created by an Inflammation) whereby they are stimulated to excretion, only letting of blood will give relief, whereby both revulsion is made of these sharp humours, and the Blood also is reduced to a due temper. *Idem.*

VI. What I have said of the cure of these Symptoms, which come when the Measles are going away, may sometimes agree with them, when they are at the height; if, to wit, they owe them to an artificial, if I may so say, and acetic heat. This year, 1670. I visited a servant Maid, who lay ill of the Measles, with a Fever, shortness of breath, and Purple Spots all over her body, and other very dangerous Symptoms; and because I attributed all of them to over-hot keeping and Medicines, abundance of which she had taken, I ordered her to be let blood in the Arm, and I prescribed her a pectoral and cooling Ptilan, to be taken often; by means whereof, and of a more temperate regiment, both the Spots, and all the other Symptoms vanished by degrees. *Idem.*

(For the Medicines, See *Variole*, BOOK XVIII.)

A

A GUIDE TO The Practical Physician.

BOOK XII.

Of Diseases beginning with the Letter N.

Narium Affectus, or, Diseases of the Nostrils.

The Contents.

A Polypus scarce gives way to Medicines. I.

The Cure by Pricking. II.

Not only a livid one, but a white one endangers a Carcinoma. III.

We must take care of the Inwards, rather than of the Brain. IV.

The Cure of one by Medicines. V.

The Restitution of the Nose, when cut off. VI, VII.

A safe Remedy for the Hæmorrhoids, Polypus, and any Excrecence in the Nostrils. VIII.

Ulcers are best cured by Fumigations. IX.

The Cure of a Red Nose. X.

I. **C**ELSUS says, that a Polypus sometimes withers away, which perhaps is true in a little one, in one beginning and in a soft Polypus: Otherwise, Experience shews, that such Medicines do no good, both because they cannot stick long on, by reason of their moisture, and because if they have a burning faculty, they inflame and put to pain the inside of the Nostrils; and therefore it is evident, it can only be happily cured by Excision. ¶ Applying of Medicines does more harm than good: therefore a Polypus must be taken away by Chyrurgery, by means of an Instrument in *Scultetus*, tab. 12. fig. 1, & 2. To which this may be superadded, namely, that two or three square and sharp teeth must be made in the concave upper part of it, that it may hold the faster. When the Poly-

pus is taken out, let them be seared with a red hot Iron let through a Pipe into the Nostrils. J. Van H. in Microtechn.

II. There are some, who, as the report goes, tying three long Needles together, and take holding of the Heads, do lance so long with the Points, till all that is faulty be taken away and waste by pricking, then they presently wash it with Oil, and doe the same the following days, till the Man is cured.

¶ Which gentle Operation, what hinders, but that it may be used to our Polypi? For I can upon my own experience affirm, that I cured such a Swelling newly risen in a Nun, onely by several times pricking it with a Lancet, and making it bleed a little. Hierocles.

III. After frequent Catarrhs the Wife of N. had a large Polypus, white in colour, in substance Phlegmatick, conspicuous not onely in the Nostrils, but in the Throat, with a double Caruncle, the one white and soft, the other livid and hard, differing very little from the nature of a Carcinoma: and that part being taken hold of with a Forceps, which threatned a Carcinoma in the Throat, and being pulled violently the whole Polypus, having eight feet, came out with it, and all of them were covered with a Membrane, within which was contained concrete Phlegm, in most of them soft and pellucid, like the pulpy part of a white Prune, but in others hard and opaque, like a singed Horn: A good Argument certainly, that we may be afraid not onely of livid and melancholick Polypi, but of white and pituitous ones; especially if from hot blood, or from inclosed heat they degenerate into the nature of a Carcinoma, as here. Therefore they are under a Mistake, who think that a Phlegmatick Polypus has no danger in it; for it is not ever true. Severinus.

IV. Have a care you do not think the noxious and redundant Humour, whence this Evil arises; does always come from the Brain through the holes of the Os Cribiforme: for that matter comes thither

not of the Vessels which are within the Nose. Wherefore we must direct our Cure to the Parts, that make Blood, rather than to the Brain. I examined carefully in every part the Head of a dead Man opened, who in his life time had often had a *Polypus*. I found the Brain well, and those nervous Filaments, which run to the holes of the said Bone, and the holes I found entire; on the contrary, the parts in the *Abdomen*, the Liver and Spleen were out of order.

Schneiderus.

V. If you will try to cure it with Medicines, you must fly to Powder of calcined Vitriol, or to Root of white Hermodactyl, mixt with Honey of Roses, or Savine-water; by which Medicines the Coat of the *Polypus* is rather corrugated than opened: Nor does this Powder penetrate through the hole near the end of the Nose, which is stoppt by this Excrecence: Whence notwithstanding except you get out the Caruncles sticking there, they will continually increase, and the Pulp which remains in the dried Coat, will continually swell with an afflux of new humours: Unless perhaps its Coat be so round and soft, that the Pulp, as well as the succingent Coat, is consumed. And when some have found such success from it in some place, they have therefore thought, but rashly enough, that the foresaid Powder will doe the same every where, and will infallibly cure any *Polypus*.

Tulpius.

VI. One had his Nose cut off, where the Bone ends in a Cartilage. A Country fellow held the piece next the Teeth down with his Fingers. He applied Millefoil bruised with black Wine, and bound it up after a rude fashion, upon which the Blood stoppt quickly, and the Wound cicatrized finely in a short time.

Hollerius.

VII. In the year 1590. when the Duke of Savoy made Warr upon Geneva, a chaste Maid fell into the hands of some Souldiers; and when they had attempted to force her in vain, they were so vext that they cut off her Nose. Two years after she came to Lausanne, to Mr. Job. Griffonius, a most successful Chirurgion, who undertook to restore her Nose; and restored it, to the admiration of all Men. The first Inventour of the Operation and Cure was Gaspar Taliacotius, Professour at Bologna.

Hildanus.

VIII. The Hæmorrhoids, which are soft and without Pain, though all Writers commend the Cutting of them with an Instrument, or the Burning of them with an actual Caustery; yet I have found a much easier and safer way, whereby I have seen not onely the Hæmorrhoids in the Nostrils cured, but the *Polypus* also, and any superfluous Carnosity growing in the Nostrils, or in any other place, without trouble to the Patient. This is the way; Take a Ruptory (the Caustick Stone) then get an Instrument made of Lead, about the length of ones finger, of such a thickness as that it may be put into the Nostril, which at that end that is put into the Nostril, must be made hollow, like a Box, so that the Carnosity may be received into the hollow place, with a Ruptory in it, and the sides of the Cavity may defend the Nostril from being hurt by the Ruptory. Let the Patient hold this Instrument to his Nostril steady with his hand for an hour. When it is taken out, apply Butter, till there be an Eschar, and the burnt flesh be removed. Then apply the Ruptory again, till all the superfluous flesh be consumed, always applying Butter after the Ruptory. But if an Ulcer should happen to remain, let it be cured with things proper for an Ulcer in the Nostrils. I experienced it in X. who had a Carnosity in his Nostril, which not onely filled the Nostril, but hung out half an Inch. This Carnosity was perfectly removed without any deformity.

Bayrus.

IX. Ulcers of the Nostrils may best be cured with Fumigations; wherefore it is best to make Candles of red Wax: For the Smoak of such a Candle does good by drying, especially if it be kept in a narrow and close room: And we find, that the

Smoak is received when we sit up late at our Studies, for afterwards our Spittle and what comes out at our Nose, is made black with Smoak. In this manner I have cured an Ulcer, which neither the Italian nor French Physicians could cure.

Rondeletius.

X. A Woman had always a red Nose, especially in Winter; after she had taken a gentle purge, she found benefit by this Unguent, which Giffertus Horstius used at Rome; Take of live Sulphur 3 drachms, white Ginger 2 drachms, let them boil gently with white Rhenish Wine and Rose-water till the liquor be consumed, then with fresh Hogs Lard make an Unguent. She anointed after Supper, and in the morning washed with water of Roses, Beans, and a Decoction of Bran warm. It is good for Pustules in the Face, as well as for a red Nose.

Forestus.

Natta, or, A Wen.

(See Tumores, BOOK XVIII.)

The Contents.

A great one in the Thigh happily extirpated. I.
In the Head. II.

I. *Johannes Ferber*, about 24 years old, had a Wen arose on the inside of his right Thigh, which in two years grew so vastly, that it was as big as any three Mens Heads, and hindered his going. A certain Chirurgion corroded this Excrecence with a caustick Medicine, to let the Matter out, and then he intended to close the Ulcer with Escharotics afterwards. But when he found there was no fluxible matter, away runs the Empirick, and leaves his Patient to look to himself. This Patient an. 1634. came to *Ulm*, and there implored the help of *J. G. Baulerus* a Chirurgion, who, when he could not heal the foul Ulcer with any Medicines, by my Advice and *G. Riedlinus*, he took hold of the exulcerated and painfull Wen with a *Forfex*, he cut it off with a cuttillary Caustery, and when the Eschar was removed, he brought it to a fine Cicatrice with *Ceratun divinum*. When we had looked upon the Substance of the Wen that was cut off, which was perfect flesh, and had Veins and Arteries, we enquired of the Patient, whether he was naturally so lean? He told us, that before this Wen grew so vastly, he was well in flesh. Hereby we were convinced, that the Excrecence had drawn by the Veins and Arteries almost all the nutriment, wherewith the whole body should have been nourished. When he was well, I advised him to use a moderate Diet, and once a month to set six Cupping-glasses with Scarification to his back, till the Habit of his Body by little and little were accustomed to assimilate the blood to it self, which Nature before had transmitted to nourish the Tumour. The young Man followed this Advice for half a year, and afterwards he lived well in health.

Sculetus.

II. A Wen, a sort of Tumour with a Coat, often arises in the Head. All of them have an Artery, by which they receive nutriment and augment. They are inclosed within with a peculiar Coat; The Contents are not of one sort, in some I have found a fat, inflammable substance, in many onely a chalky one or mixt with some Serum. Here is a Family subject to this sort of Tumours. If the *Basis* be narrow, they fall off by tying them with a Horse's hair, straitened by degrees, as I have done several times. But if the *Basis* be large and not capable of constriction, I make a long Wound in the Top of it; I squeeze out the Contents, and then apply onely a little Butter of Antimony in Cotton, or mixt with a digestive Liniment to the *Basis*, by which, as by a Stalk, it receives its nourishment: for unless the Stalk be cut off, or eroded, it quickly grows again. I have known such Tumours cut off by rash and unskillfull Chirurges.

Chirurgeons at one slash, and a large Hæmorrhagy follow it, which could scarce be stoppt, till the Patient was much weakned. Butter of Antimony causes no Pain, no Itching, unless the Lips of the capillary Skin be imprudently touched: For the inner Pellicle is void of Sense.

Wepferus.

ter in which red hot Crystal has been quenched (which Strassius, in Theatr. Sympathet. pag. 138. commends) with good success.

Germannus, misc. cur. ann. 72. obs. 44.

Nephriticus Dolor, or, The Stone-colick.
(See Calculus Renum, BOOK III.)

The Contents.

Taking of Laudanum does good. I.
The Efficacy of Mercurius dulcis. II.
When Cassia fistula is good. III.
A spurious, scorbutick Nephritis, how it may be cured. IV.

I. IN the Stone-colick, and Colick from Bile, let Laudanum be mixt in Clysters, and also taken by the Mouth, yet not too often, lest, especially in the latter end of a fit, the morbid matter be concentrated, the humours be incrassated, and rendered immovable, and so the Patient at length yield to the triumphant Intestine Enemy; drowzy Nature being unable to apply the virtue of Medicines to her self, especially of Purgatives; and this happened in the Count de Haut.

Mayerne, MS. de Laudano.

II. Nothing is better in this Disease, than to give Mercurius dulcis once or twice in a just Dose: for it seldom uses to trouble them, who every month take Mercurial Pills; because by this means the Passages are enlarged, and then the Stones are voided.

Hartman.

III. One very necessary thing cannot be passed over, to wit, that Cassia Fistula, which is generally used and indifferently by all men, is not so safe, except the Stomach and first ways be first cleared by Fasting, Vomiting or Purging, since it is a high Diuretick.

Zecchi.

IV. I have often observed that Scorbutick Symptome, which resembles the Stone (of which Dravifius, de Scorbuto, p. 346.) not onely familiar to Scorbuticks but to Hypochondriacks, that is, the Spleen uses to evacuate excrementitious Gravel, or the Tartar of the Hypochondria by the Kidneys: This Tartar usually shews it self in form of a reddish sand, in the sediment of the Urine, at first divided into so subtle Atoms, that it cannot be seen: But it is manifest that its Atoms consist of very sharp Angles, because they stick to the Glass, and cannot be got off without force. Sometimes, when abundance of them come together, the Urine looks bloody: This Gravel settling in the Spleen and parts adjacent, causes Heat: But when it gets into the Kidneys, Ureters, or Bladder, it vellicates these nervous parts with its pointed Atoms, thereby torments them, and causes worse and severer Pains than the Stone it self. These things are accompanied with an intolerable and continual Strangury, partly by the Atoms vellicating the neck of the Bladder, and partly by Urine inclining to Acidity. Hot Diureticks, I find, doe little good, but rather exasperate. Spirit of common Salt, is an effectual Remedy, as also Spirit of Earth-worms. Also Nephritic Essence, drawn off Lignum Nephriticum, with Spirit of common Salt and of Strawberries. For a Vehicle I use Parsly and Nettle-wa-

Nervorum Affectus, or, Diseases of the Nerves.

The Contents.

Wine is hurtfull inwardly and outwardly. I.
Modern Medicines for a Puncture, better than the Old. II.
Oil of Turpentine must be poured in in time. III.

I. I have experienced in my self, that, Wine even outwardly applied, is hurtfull in Diseases of the Nerves. When I came home from Basil, I felt a Coldness all over my Hand; I had a mind to try what Wine would doe outwardly applied in Diseases of Nervous parts. I therefore chafed my hand twice a day for three days with Spirit of Wine; and what did it? The Pain increased, so that for several days I could not stir my little Finger without pain. A Nobleman of Savoy, who had lost the use of his Legs by the Palsie, when he had made a Bath of Herbs, which were very proper, but boiled in Wine, and had used it several days, was taken with a Lethargy, which killed him in three days.

Hildanus.

II. Galen used Euphorbium, the quantity whereof, he himself being Judge, none is able to find, by reason of the various age of the Euphorbium, and the various natures of Mens bodies. But the Moderns have found far safer Medicines, as well chymical, as exotick; yea, and things common among us, that doe their work without Pain, which the strong Medicines of the Ancients were apt to cause, and such as, whether the Nerve be bare or covered, may safely be applied, (whereas to a bare Nerve all the old things could not be applied with safety) As Balsam of Peru, distilled Oil of Turpentine, Tar, Wax, Oil or Balsam of St. John's-wort; in which there are all the qualities that Galen requires, with a Balsamick virtue, which the old want; and the old have also a corroding quality; and the new do not onely waste Excrements, but very much strengthen the innate Heat of the wounded part.

Sennertus.

III. Sometimes Oil of Turpentine will doe no good, when it is applied too late; and then we may hope in vain for a Cure, as it fared about 18 years ago with Theodor. Vander Noen, a Physician and Chirurgeon of Amsterdam; Who having about noon let a pair of Scissers fall out of his Hands, as he was catching them up in haste, he hit the last joint of his right Thumb against the point of them; and because he felt but little pain, he neglected it for several hours; but about ten at night, he felt some small Convulsions in the part that was hurt, and all over his body. He was of a cholerick Complexion, which made him, when he had taken Physick, to vomit it up again, nevertheless, his Convulsions and Pains continued; therefore he called me in the morning and signified to me that he must die; Because he never saw one cured, into whose Wounds that piercing Oil had not been poured at first, which he had neglected, because the Pain was not great. And it happened as he foretold.

*Taken down by drinking Vinegar. I.
What kind of Purging is good? II.
Wasted by a Medical Powder. III.
Their Diet. IV.
One made lean, onely by chewing leaves of Tobacco. V.*

*Strada, de
Bello Belgi-
co.*

I. **C** *Hierapinus Vitellius*, Camp-Master-General, a middle-aged Man, grew so fat, that he was forced to sustain his Belly by a Swathe, which came about his Neck: And observing that he was every day more unfit for the Wars than other, he voluntarily abstained from Wine, and continued to drink Vinegar as long as he lived; upon which his Belly fell, and his Skin hung loose, with which he could wrap himself as with a Doublet. It was observed, that he lost 87 pounds in weight.

II. Left any great mischief should follow, we must try to substract by Medicine; what a spare diet will not; because it has been observed, that a looseness either natural, or procured by Art, does not a little good. But this must be done by degrees and slowly, since it is not safe to disturb so much matter violently, lest it should come all at once. Therefore the best way of Purging is by Pills, of Rheubarb, Aloes, each 2 drachms, Agarick 1 drachm, Cinnamon, yellow Sanders, each half a drachm. Make them up with Syrup of Cichory. They must be taken in this manner; First, 1 Scruple must be given an hour and an half before Meal; then two or three days afterwards, take half a drachm or two scruples before Meal. Thus Purging must be often repeated

at short Intervals, till you think all the cacochymie is removed.

*Fernelius,
Conf. 17.*

III. A certain Goldsmith, who was extreme fat, so that he was ready to be choaked, took the following Powder in his Meat, and so he was cured; Take of Tartar two ounces, Cinnamon three ounces, Ginger one ounce, Sugar four ounces. Make a Powder.

Forestus.

IV. *Horskins* found the things following, to take down fat Men; especially Onions, Garlick, Cresses, Leeks, Seed of Rue, and especially Vinegar of Squills: Let them purge well: Let them Sweat, and purge by Urine: Let them use violent exercise before they eat: Let them endure hunger, want of Sleep and Thirst: Let them Sweat in a Stove, and continue in the Sun. ¶ Let them abstain from Drink between Dinner and Supper: for to drink between Meals makes Men fat.

Idem.

Ferdinandus.

V. I knew a Nobleman so fat, that he could scarce sit on Horse-back, but he was asleep; and he could scarce stir a foot. But now he is able to walk, and his body is come to it self, onely by chewing of Tobacco Leaves, as he affirmed to me. For it is good for Phlegmatick and cold Bodies.

Borellus.

VI. Let *Lingua Avis*, or Ash-Keyes be taken constantly, about one drachm in Wine. According to *Pliny* it cures Hydropical persons, and makes fat people lean.

Ferdinandus.

Obstructiones, or Obstructions.

(See *Aperients*, BOOK XIX.)

Oculorum

Oculorum Affectus, or, Diseases of the Eyes.

The Contents.

- Bloudletting not hurtfull. I.
Great and frequent Evacuations are hurtfull. II.
Wine is the Vehicle of drying Medicines to the Head. III.
Eye-bright is not good for every Disease of the Eyes. IV.
Upon what the Efficacy of a Seton depends? V.

Oculorum Dolor, Inflammatio, Ophthalmia, or, Pain of the Eyes, Inflammation, Bloudshotteffs.

- When the Eyes are ill of a fluxion, where a Caustick must be applied? VI.
In a pertinacious Ophthalmia we must proceed to a Seton in the Occiput. VII.
Where Issues must be made? VIII.
A contumacious Ophthalmia cured by applying an actual Caustery to the swollen Veins of the Eyes. IX.
Boring the Tip of the Ear is good. X.
Whether Purging be always proper? XI.
Topical Medicines must be used circumspectly. XII.

Gutta Serena, Visus Imminutio, or, a Blindness without any visible cause, Diminution of Sight.

- When a Gutta Serena is curable? XIII.
Cured by applying Blisters to the Thighs. XIV.
By fasting. XV.
By a Wound in the Forehead. XVI.
How using Spectacles helps the sight? XVII.

Suffusio, Cataracta, or, a Suffusion, a Cataract.

- The Body must often be purged. XVIII.
One beginning cured by a Topick. XIX.
The efficacy of Pigeon's Bloud. XX.
Cautions about couching a Cataract. XXI.
The way of using purging Pills. XXII.

Macula, Cicatrices, Phlyctæna, &c. or Spots, Scars, Blisters, &c.

- Spots must be distinguished from Scars, because there is no cure for Scars. XXIII.
The Chirurgical Cure of an Albugo. XXIV.

Oculi Procidencia, or, Starting out of the Eye.

- The Starting of the Eye cured by setting a Capping-glass to the hind part of the Head. XXV.
The restitution of the Humours of the Eye lost by a Wound. XXVI.

1. I Have found in my self, that letting of bloud is not hurtfull to the sight: for when I had found my sight troubled for seven years, and I had not let bloud for six months, I opened a vein, and let ten ounces of impure bloud, and as much after dinner, after which I found my sight come to me perfectly. But because the last bloud was feculent: the next day I bled again in the other Arm. And ever after, when I perceived my sight fail me, I presently used that remedy, and I cannot find a more present one.

Botallus.

II. Though most Practitioners do strongly torment the body with many Evacuations, in a Suffusion especially, which they think is a falling down of Water into the eyes; Yet we who have demonstrated that the cause is in the eyes, and that no defluxion can be carried into the Capacity of the eye, do certainly know, that Evacuations doe no good, but only as they keep the body clean. Platerus.

III. Wine is the Vehicle of Drying Medicines to the Head, and is commended by Hippocrates, 6. Aphorism 31. for contumacious fluxions to the eyes, as a thing that is able to attenuate and dissolve the rebellious reliicks of the humours. For which end, Wine, but small, must be prepared for the Table, with Ingredients, in a little Vessel. So that to every Pottle of Wine, there may be two ounces of red Sanders rasped, and one of Rosemary Wood. And in this manner some exiccation of the gross matter, contained in the Head, and strengthening must be attempted. Fortis.

IV. Almost all Botanists in dimness of the Eyes do extoll Wine, wherein some Eye-bright has been steeped, to the Skies. But it is, as its sharp Taste argues, manifestly hot, and because it stops fluxions of the eyes, it is also very probable that it is dry. Therefore we must act circumspectly, and not use Eyebright Wine promiscuously. For we are taught, Sect. 6. Aphorism. 3. That either drinking of Wine, or the Bath, or Bleeding, or Purging, cures Pains of the Eyes. But it is not said, that onely drinking of Wine cures pains of the eyes. So we must reckon, that Eyebright-Wine can dissolve some Mists of the eyes, but not all. Therefore after Camerarius, Hofmannus does learnedly maintain, That Eyebright does not cure any dimness, but onely that which comes of Cold, and not every such dimness, but that which positively comes of Phlegm. For the Taste, which has some bitterness in it, shews it to be a hot and dry Plant. And they make the matter worse, who gather the dry, small and short herb, and either take the juice, or infuse it in strong Wine; Therefore I very much suspect the daily use of the Conserve. Wherefore since Eyebright-Wine is often taken amiss, that is, neglecting Indications, let no Man admire why Lobelius observes, that how much soever some Men commend it, it must not be relied on: for he says, that by drinking it but three months, his Companion had almost lost both his eyes, and was oppressed with fluxions, whereas he had before but a slight Cataphora, and wept a little. S. Paul.

V. A Seton is an excellent thing in diseases of the eyes; First, because the Spinal Marrow enters the first Vertebra, and the Nerves of the eyes come from the Marrow. Secondly, all Membranes are terminated at the Vertebra, but the parts of the eye are Membranous. Nic. Benzonus.

Oculorum Dolor, Inflammatio, Ophthalmia, or Pain of the eyes, Inflammation, Bloudshotteffs.

VI. The external Jugular sends out two branches below the Clavicle, one of which ascends to the lateral parts of the Head, one portion passing behind the Ears, which is dispersed to the forehead and Occiput, above the Temples, in many branches. And Fernelius thought that a serous humour was gathered in those places, because of the Veins, which falling on the parts underneath, creates fluxions in the habit of the body. And the same party thinks, that a Caustick applied to the hollow place, behind the Ear, does more good to them that are ill of a fluxion, than one applied to the forehead, because of a Branch of the Jugular, that runs to the eye. Riolanus.

VII. Whether sometimes also in an Ophthalmia, may we not proceed to a Seton in the hind part of the Head? The affirmative seems probable, because in so doing, the afflux of humours is diverted from the part affected, and so the peccant matter, which feeds the disease long, is subtracted from the place affected. For, since in other cases an Issue draws

draws out the Ichorous Matter, which chiefly offends in the Body, from the more noble Internal parts outwardly to the Skin; and since it is able to correct the preternatural motion thereof to any part, it seems therefore, as if with very good reason it might be used here, that is, when the affluent matter is pertinacious, and after universal Correction of the Plethory, or Cacochymie, it does still stand in need of some strong Revulsion. Setons use to be made in the *Occiput*, says *Gavassetus de nat. Cauter. c. 18.* for revulsion of the Matter, that flows to the eyes, when the *Occipitium* is perforated between the first and second, or, which he approves better of, between the second and third *Vertebra*. But all do not agree in what place it may be properly made, while some think it must be made in the Coronal Suture; others on the contrary rather think it should be made in the *Occipitium*, where the Neck begins, and do demonstrate it by probable reason, since the region of the Neck is directly opposite to the place affected, and the peccant humours do more incline to that place, as being declivous; and an *Ophthalmia* does not so easily return from thence, as from the Coronal Suture: But seeing the place about the beginning of the Neck, between the second and third, or the third and fourth *Vertebra* of the Neck, is not very fit to bear an actual Caution of one hole, therefore Experience rather commends a Seton; when, to wit, the thick skin of the said place is taken up with a Forceps, and a thread is run through it.

Horsius.

VIII. *Avicenna*, *Mesues* and *Albucasis* say, That Issues in the crown of the Head, and the Neck, are very effectual. Let two Issues, says *Rogerus*, be made in the forehead, at the corners of the eyes, or one Issue is made in the Neck, or two between the Neck and the Nose, under the thin part of the Ear. One Man, says *Riverius* in his Observations, was a long time ill of an Inflammation in the *Tunica adnata*, and both Eye-lids; the Disease was not continual but recurrent: Remedies were used in vain. At last I ordered him two Issues between his two Shoulders, and a Cupping-glass to be applied over them both, that is, when the fluxion was upon him; and when he had done this, his eyes were well.

IX. An Oculist in *Paris* got himself great Riches, by applying actual Cauterics to the veins of weak and red eyes. This often succeeded very happily with him, and is taken for a new Remedy, which nevertheless is found in *Hippocrates*, *lib. de Visu*.

Borellus.

X. I will not begrudge my Readers a singular remedy for an *Ophthalmia*, which was communicated to me by a friend; let the lobe of the Ear, on the side affected, be bored through, and put into the hole a long Tent, made of the bark of Spurge Laurel Root, turned and rowled up. The Tent must be let alone there, till the Ear and parts adjoining swell: then the Tent must be moved a little, that the water which is gathered, may run out; When this is drawn out, the Swelling of the Ear will fall, and the *Ophthalmia* will be laid.

T. Bartholinus.

XI. *Hippocrates Aphorism. 17. 6.* commends Purging: And *Galen*, in comment. And this is one Example of those things, which are evacuated spontaneously and beneficially, which the Physician must imitate. Reason and Experience agree with it, because Inflammations and Pains of the eyes are caused by very sharp and salt humours, which must be carried off from the eyes by Purging; and it has usually good success. On the contrary, one would think Purging should be rejected, because Blood, not Cacochymie offends, the redness and inflammation are witnesses. Therefore *Hippocrates*, 2. *Epid. Sect. 2. tract. 18.* says; Bloodletting cures a Quinsie and Bleer-eyedness. Besides, Purges disturb and put the Humours in Motion; and drive them into the weak parts, which are inflamed, or in pain. For a Solution, we must know, that an *Ophthalmia*, or a pain in the eyes comes either from a Defluxion, or a Gathering. When Humours come from the Head, or the Parts underneath, and from

the whole Body, both the Head and the whole Body must be Purged. Therefore *Hippocrates*, *lib. de Visu*, says; Purging of the Head and the lower Belly is good for an annual and epidemical Bleer-eyedness. For such an one indicates, that there is matter continually sent from a Cacochymie, either in the whole, or in the Head, whence arise the ends of Purging; But when there is only a Plethora, Blood must be let, according to *Hippocrates* his advice in the same place. For some such pains letting of blood is good, if the body abound with Blood. But where the Disease comes from a Gathering, Purges do plainly harm, and not good: for the eyes are weakened by them, and through weakness their proper aliment degenerates into a bad juice. And we may very well say, that such Diseases of the eyes, as are effects only of an Intemperature and plenitude of the Head, are irritated by Purges, and the greater share of the fluent Humour runs to the eyes: For the Brain sometimes uses the eyes as its proper Emunctories, to purge it self, which, if they be disaffected, do readily receive the Excrement. But when the mischief arises from the Bowels below, and from the impurity of the Belly, it is safe to give a Purge. Moreover, you may not be much out, if you say, *Hippocrates*, in his *Aphorisms*, spoke of gentle Medicines, and a spontaneous looseness; But in other places, of strong Elaterick Medicines, which with their acrimony and heat hurt the eyes.

XII. Indications for applying of Local Medicines are taken chiefly from the place affected: For the laxity of the part, the sensibility, aptitude to suffer, sympathy and vicinity, especially of the pupil and humours of the eyes, all these things will not permit us to apply any thing that is violently repercussive or resolvable. For things that are too bitter and astringent, though they be highly repercussive; yet they irritate and exasperate these parts of the eye, and cause greater pain: And such things as are over-hot and sharp do resolve indeed powerfully, but they increase the Inflammation, and exterminate the part from the proper temperature of the eyes. Therefore things moderate in each faculty must be applied, both in repelling and dissolving. Repellents must be such, as by their excessive Coldness and Astringency may not condense the Coats of the eyes, and shut the pores; nor such as may exasperate the eyes by their dryness, nor such as may increase pain upon either score. Therefore let Lenients be mixt with cold and astringent things, as Milk, Saffron, *Sarcocolla*. The same things must not be over-tough, lest they grow hard and clammy, and stick too close to the eyes: And therefore though the White of an Egg beaten up with Rose-water, or the like, be a most proper remedy to repel; yet we must see that we mix nothing with it, to make it hard and stick to the eyes. Let Medicines also, which are put in the eyes, be carefully cleansed from their filth, and very finely powdered and sifted, that no asperity may be in them, nor biting. Therefore, if their biting depend upon heat, let them be often infused in water of Roses, Endive, Barly, or Womans Milk: If upon coldness, let them be infused in a decoction of Raisins, Fe-Sennertus, nugreek or Melilot, with sweet Wine.

Montanus.

Gutta Serena, *Visus Imminutio*, or a Blindness without any visible cause, Diminution of Sight.

XIII. If this Disease come of Humours gathered in the fore-part of the Brain, which compresses the Nerve, it may the more easily be cured; So *Hildanus*, *cent. 5. obs. 19.* reports, how a certain Man lost his Sight by a Vomit, who was cured by taking another. For the Humours were driven to the Optick Nerves by the first, and were removed by the second. The easiness of the Cure shewed, the matter was not fixt in the substance of the Nerve, but only lay on the outside of it.

XIV. A

XIV. A malignant Vapour from the Womb cast a Woman with Child into such bitter Contractions of the Nerves, that she was delivered, and knew it not; Besides, she lost her Sight, though there was no fault to be seen in the outer Coat of the eye, which could never be cured without effectual remedies, of all which Velicatories applied to the inside of her Thighs, did her most good; by means whereof, the blood, that tended upwards, was drawn down so effectually, that she escaped Blindness.

Tulpius.

XV. A young Woman fell into a *Gutta Serena*; She resolved to fast her self to death, and would take nothing but what her Husband forced her to take. She persisted in this condition for a year, and was made very lean, her innate heat, for want of food, feeding upon her natural moisture, and on that moisture also, which caused the *Gutta Serena*. So the Patient recovered her Sight, and recovered by a restorative Diet.

Formis.

XVI. We read, how some Blind Men have recovered their sight, and that suddenly by a Wound transverse the Forehead; some by a loofness coming suddenly. The cause was nothing but a compression of the Optick Nerves by the Vessels near them, that is, by the Veins and Arteries being swelled with Blood, which were emptied by the Wound. Wherefore sometimes, and with very good success, in the Blindness, which they call *Gutta Serena*, I open the middle vein in the Forehead, and let it bleed, as long as it will.

Spigelius.

XVII. I am of *Platerus* his opinion, who thinks, that hurts of the Sight, which are commonly ascribed to some fault in the Spirits, may rather be ascribed to the ill Site of the Crystalline Humour, or some faults in the other humours; which often happen in young Men, in whom there is no fault or want of Spirits to be seen, and such faults may be amended by help of Spectacles, which could not be, if this proceeded from any fault in the Spirits: for how can Spectacles ever amend any fault in the Spirits? For since the *Cornea Tunica*, as also all the Humours, are made for admission and refraction of visible Spirits, if they offend in Sight, or any other way, this refraction cannot be duly made, which may be amended by Spectacles: So also we may observe, that they who are otherwise well, do see very little things at a distance by help of Spectacles; which comes to pass, because of the peculiar refractions of the visible Species, but by no means because of the Spirits, which Spectacles can neither make clearer, nor more plentiful.

Sennertius.

Suffusio, *Cataracta*, or a Suffusion, a Cataract.

XVIII. They that are troubled with this Disease, are always in a manner costive: Therefore they must be kept loose with Suppositories, Pills, or laxative Diet. *Galen* affirms, he has cured several by prescribing *Hiera picra*, onely by way of Epistle. But Pills must be made without Saffron or Myrrhe, or but with a very small quantity of them.

Rondeletius.

XIX. There are many descriptions of Collyries for the discussion of Cataracts in the beginning. I have experienced the Gall of a Pike-fish, mixt with a little Sugar (after Purging and a Blister behind the left Ear) dropt into the left Eye of my Nephew. In a week it dissolved the Suffusion that was beginning. *Adrianus Spigelius* used this Gall with great success.

Scultetus.

XX. Many commend Pigeon's Blood dropt warm into the eye: for the part is much strengthened with the innate heat of the Animal, and the excrementitious humour is dissolved. But because this heat is soon spent in the Blood; it would be much more proper to take a young Pigeon, before it be feathered, and to split it in the Back, and apply it to the eyes.

Idem.

XXI. One may know it is safely couched, when

in turning of the eye the couched pellicle does not appear; and that the Cataract couched may not return, we must have a great care we do not tear it into several parts: for several pieces, though couched, will rise again and hinder the Sight. ¶ Observe, that all the *Tunica Cornea* is covered with a very thin Membrane, which must be forced into Wrinkles, before the *Cornea* is pierced (beginning at the outer corner, when you would couch the concrete humour, which is in the Watry Humour) lest the Watry Humour should run out; after taking out of the Needle. *M. Valentin*, a great Oculist, observed this.

Heurnius.

XXII. A Suffusion has its rise from viscid Phlegm, commonly called Melancholy, attenuated and mixt with the blood, and carried together with it by the Arteries to the eyes, sticking especially in the Watry Humour, and darkning it, till it increasing more and more, and congealing whereabouts the *Uvea* makes the Pupill, it hinders the passage of the visible Species in whole or in part. This said viscid Phlegm will be removed by Phlegmagogues, both common and Chymical, especially *Mercury* any way well prepared. For Example, these following Pills may be prescribed, which serve divers Indications; Take of Gum *Galbanum* prepared, with Vinegar of Squills one drachm, choice Mastick half a drachm, the best Castor, red Myrrhe each one scruple, white *Carabe* fifteen grains, Saffron half a Scruple, *Aloe Rosata* half a drachm, Trochisks of *Alhandal* one scruple, distilled Oil of Fenil six drops. Mix them. Make fifteen Pills and gild them. Let the Patient take 3, 4, or 5 of these every other day, an hour or two after a light Supper, so that he may have a stool the next day.

Sylvius dele Boë.

Macula, *Cicatrices*, *Phlyctena*, &c. or Spots, Scars, Blisters, &c.

XXIII. We must observe what *Gordonius* admonishes us of, that Scars happen in the *Cornea* after the Cure of Ulcers, and they are all white; wherefore they seem and are taken to be Spots. And when Physicians are called, they labour to cure them, as if they were Spots; but they labour in vain: for Scars can never be abolished. Others, on the contrary, no sooner see a Spot, but they take it for a Scar. Both are deceived, and we must let a Scar alone, except onely for beauty: But you may have hopes of clearing a Spot or *Albugo* by Medicines.

Plempius.

XXIV. An *Albugo* is a Scar which is left in the black of the Eye after a Pustule or Ulcer; which when it is deeper than a superficial cloud, Physicians commonly try to cure it in vain with Medicines, because they are either too weak, or too strong; so that they gather the humours, and settle them there when gathered: Therefore if the Chirurgion have a gentle and light hand, and the Scar come not of a Wound, it is best to scrape it off with a very sharp Penknife.

Severinus.

Oculi Procidencia, or, Starting out of the Eye.

XXV. *A. de Aldrighetis* could find no better Remedy for the Starting of the Eye, than setting of a large Cupping-glass, without Scarification, to the hind part of the Head. One by a blow had his Eye struck out of its Orbit, which a Physician of *Constantinople* got into its place again this way, as by a Divine Hand.

Rhodius.

XXVI. It happened, as two Sisters were playing together after Dinner, the younger lifting up the elder Sister's hand hastily, as she was sewing, that she struck the Needle into the midst of the Sight of her Eye. When I was called, I observed, that the watry humour, and part of the vitreous, was run out. About four of the clock in the afternoon I applied to the swollen Eye the Juice of Elm-

E e e

bladders,

bladders; I ordered about midnight that the linen Cloth, that was to be applied, if it should be dry, should be wet in more of the Juice; in the morning, I call GOD to witness, I found her well, but the Sight of her Eye was lost: And now, though it be twenty years since, you cannot tell which Eye is blind by looking on them.

Heers.

Oris Affectus, or, Diseases of the Mouth.

(See Aphthæ, BOOK I. and Infantum Affectus, BOOK IX.)

THE falling down of the Palate is omitted by Physicians, a Disease no less dangerous than rare. It comes from a distillation of an humour, which so depresses the Muscles at the end of the Palate, that they are ready to stop the passage of the Wind both by the Mouth and Nose. This straitness kills a Man presently, unless you immediately lance it, and by letting out the humour make way for Breathing. I saw once a Swelling arise in the Palate so quickly, that one had not time to think of a Gargarism, nor of any other Remedies, except onely of cutting with a Penknife, which being done dextrously and quickly at that time, I saw not onely much Water run out, but when the Swelling of the Palate was gone, the Man who was just dying, came to himself.

Tulpius.

Ossium Affectus, or, Diseases of the Bones.

The Contents.

With what Exsquamation must be performed? I.
The Cure of a Caries following the Pox is difficult. II.
The Excellency of Euphorbium, to correct a Caries. III.
Bared Bones do not always contract a Caries. IV.
The Causes and Cure of a Spina Ventosa. V.
The Cure of an ulcerous Hyperfarcosis. VI.
The Cure of a Cancer of the Bone. VII.

I. BONES must exsquamate and be taken out, when they are corrupt, or after Burning. Powders are made of Sarcoticks, as Myrrhe, All-heal, Frankincense, adding some things which are reckoned to have the property to draw Bones, as Root of Reeds, which draws out Thorns and Splinters; Some also add Pine-bark, but without either judgment or reason; for this Powder is usefull and effectual sometimes indeed, as in Bones, which consist of a rare substance, or of two Tables, such as the *Os Cranii*, the *Os Coxendicis*, and the *Os Sacrum*: for they have Veins within, wherefore they draw Flesh out of these Bones. But in thicker and solid Bones they are not so commendable, because Flesh cannot be bred in the inside of them. Therefore drier Medicines must be sought, which have an eviscerating faculty, as Powder made of Agarick, Tartar and Bone Ashes: for such a Powder, because of the Agarick, draws out the Humour that lies within and corrupts the Bones, because of the Heat it has, and the faculty to draw Phlegm. Besides, Lees of Wine burnt, do by their Heat and great Driness sever the sick parts from the sound, especially in corruption of the Bones by the Pox.

II. A Caries of the Bones, an usual Symptom of the Pox, is difficult to cure: The difficulty arises hence, because the Venereal Poison intimately in-

sinuates it self into the Bones, whither Medicines that are proper to correct it cannot reach; and the Disease cannot easily be conquered with Fire or an actual Cautey. It is well known that an Acid (and we reckon the Venereal Poison consists in a sharp Acidity, and that it is most penetrating) does most closely insinuate it self into the Bones, and corrupt them even to Death; for Bones do truly live, and therefore such as are corrupted with a Caries, must be reckoned for dead. Therefore for the Cure of a Caries it is necessary, that all the part affected, as being dead, be separated from the sound and living, with which the Caries can neither close nor long subsist, but it will infect the same, and by little and little bring it to the like corruption. But it is hard, either by Fire or by a red hot Iron, or by convenient Medicines, to separate the carious part of the Bone from the sound, when the Venereal Poison had made holes in the Bone; and the farther it eats, the stronger it grows; as it is plain in a Venereal Caries, which is the reason that it stops not at a Bone, which corrupts, but daily grows sharper, whereupon at length, when it is arrived at the height, the Venereal Caries grows incurable. And all the difficulty lies here, that usually proper Remedies cannot be conveniently used and applied: for the parts near the Bone, as the Membranes, Tendons, Nerves, &c. are often hurt by an actual Cautey. And this Malady increases, because actual Cauteyries, which doe little good at once applying, must be often applied, if they will doe any great matters, other Remedies are either too weak, or cannot penetrate sufficiently to all the places, where the said Poison has insinuated it self, which consists in a sharp Acidity, and is very penetrating. For whatever things yet have been found to take off the Acrimony of an Acid any way, are either lixivial Salts, both fixt and volatile, or volatile Spirits, or Oil, or Watry things, or some things compounded of them. But fixt lixivial Salts, which are the chief opposites and adversaries of an Acid, if they be pure and alone, will stay at the superficies, and will doe nothing of moment; and if they be diluted with water, they will lose some of their virtue. If they be joined with a volatile Spirit, they will penetrate indeed the better, but they will operate more weakly. If they be made into a Soap with Oil, they are weakened, and cannot easily penetrate deep in, and if Water be added, to make them more penetrable, they are made more dull. No wonder therefore if a Venereal Caries of the Bones be seldom cured.

Sylvius de le Boë.

III. In curing of Ulcers a Chirurgion meets with nothing that creates him more trouble, and puzzles him more than when an Ulcer is accompanied with a Caries of the Bones, especially if it be deep, because of the Moisture in the Bone. And for the drying up of this Moisture, and for making the Bone to scale, Physicians and Chirurgions both ancient and modern could think of nothing better than an actual Cautey; I allow Euphorbium the next place, since it not onely dries up the Humours in the Bone, because it is sharp and hot in the fourth degree, but it seems to be proper here by an occult quality.

Hildanus.

IV. I have observed some Physicians and Chirurgions, and those no ordinary ones, who were of opinion, that Flesh can never grow upon Bones, that are made bare in green Wounds, unless the surface of the Bones scaled by the benefit of Nature and Medicines. Wherefore whenever they meet with a Wound where the Bone was laid bare, they scraped it with *Scalpra* till the blood come for several days; then they applied sharp Medicines, as Oil of Sulphur, Vitriol, *Aqua fortis*, and the like, and therefore of a simple Ulcer, they often made a malignant one, as we may see in rotten Teeth. And though the Air be stark naught for bared

Bones;

Idem.

Bones; yet it does not follow, that they are always altered and corrupted by it, especially if the Chirurgeon be carefull, and use no sharp thing. ¶ Hippocrates, Aph. 6. 46. says, that in all annual Ulcers, the Bone must of necessity corrupt: for because such are malignant, therefore the Flesh and the very Bone must of necessity corrupt. This is often observed in the Pox, Small-pox, and other putrid Abscesses: for when the Bones are made bare by such causes, for the most part they are corrupted before the Flesh and the Skin are ulcerated (as I have often observed) nor will the Wound close up till the Caries of the Bone is removed. And that it may very well be, if the Lips of the Ulcer be kept open with prepared Sponge, and if Powder of *Euphorbium* be firewed on every day. I have several times cured a Caries of the Bone, when it has not scaled. For *Euphorbium* rectifies the Bone by degrees, and all that is carious runs out with the Pus. I found this in a Girl, who after the Small-pox had a huge Abscess in her left Arm; when it was opened, the Bone was found to be carious: In one part of the Ulcer, where the Caries was deep the Bone scaled by the benefit of Nature and *Euphorbium*, and Nature insensibly corrected the rest, so that she perfectly recovered.

Idem.

V. I am resolved to treat of the Cure of a *Spina ventrosa*, because no Authour has made it his business to explain it. The matter of this Disease is Phlegm. The place affected always the Joints, never the places between the Joints primarily; which if they ever be affected, it is by Sympathy. This is the way of its generation. If Phlegm, designed for the Nutrition of the Bones, putrefie or grow sharp, first it corrupts the Bones, without any pain, and then the *Periosteum* after the Bones. A sign of it is a cutting, sharp and pricking Pain; so that the Patient says he is as it were prickt with a Thorn: whence the Disease is called *Spina*. And while the Patient is vexed with this Pain, and the *Periosteum* is eroding, there is no Swelling, as then. But when the Bone is first corrupted, and after that the *Periosteum*, the Pituinous Matter, having a free passage into the fleshy parts, causes a Swelling in the Joint, at first soft and lax, and without Pain, of the same colour with the Skin, which being laid open, grows harder, because more humours flow thither; the thinner part of which exhales, and the thick remains, out of which there comes a serous matter, and the Bone appears to be corrupt by a Probe. I have observed both Men and Women are subject to this Disease till they are twenty five years old, not elder, unless it took them before and was not then cured. The Pathognomick Signs are, Pains at first like the pricking of a Thorn, the Joints being affected, Youth, a soft, lax tumour, which gaping, pours out a Serosity, and if any Pus come out, it is bred of the carious parts. The Disease is hard to cure, both because of the constant Conflux of Matter, and the Corruption of the Bone, which, the worse it is, the more difficult the Cure. One beginning is easilier cured than an old one, but it will never be cured, till the Fluxion is removed, and till all the corrupt Bone is taken away, either by Fire or the Knife. As to the Cure, as soon as ever the Patient feels a pricking Pain, like a Thorn, in the Joints of his Hands or Feet, in his Armes or Knees, though this be rare, or in his Ankles, presently, though no Swelling appear, it must be cut, from which we must not take away our Probe, till we find the unevenness of the Bone, which is a sign that the *Periosteum* is corrupt. Then the first Indication is, to remove the Caries of the Bone, namely, to scrape it off, without which neither Ulcers nor Wounds can be healed. When the Caries is removed, Flesh must be bred, and then it must be cicatrized after the usual way. But if by reason of the depth of the place, abraforay Instruments cannot be got in, we

must burn with actual Fire. When therefore the hole is dilated, by Section, prepared Sponge, Gentian-root; or Pith of Elder, an Iron Pipe must be put into it: then the corrupted Bone must be burnt with a hot Iron, till the skilfull Artist thinks it will separate quickly, then you must prosecute the rest of the Cure as before. But because it sometime happens that the whole space between two Joints is corrupt in a Finger or Toe, especially in Children, in this case neither Fire nor the Knife will doe: but in their stead we must use a small Trepan, and bore it in the middle, from which with Scissers made neatly for the purpose, the sides must be cut off, and the whole *Internodium* must by little and little be taken away with a *Vossella*; and the empty place in time is filled with Flesh, which in Children grows hard and serves instead of a Bone: though when the whole *Internodium* is taken away, the Finger is shortened, because the Muscles are drawn to their Head, and the Softness of the Flesh gives way. Now if a Physician be called, when Solution of Unity is made by the pituinous Matter, grown sharp by putrefaction, the whole Cure must be directed to the removing of the corrupt Bone, by the Contrivances and Cure before proposed; in which sometimes two, three or more small Bones are taken out. But in scraping, burning or taking out a Bone, we must take heed not to hurt the Tendons, for fear of Convulsions. This is the topical Cure of this Disease, whereto must be premised the Care of the whole body by Medicines that purge Phlegm; yea, by giving a Decoction of *China*, *Sassa*, *Guaiacum*, and the like, to dry. Marchetti.

VI. Bones are subject to several Diseases, especially to a Caries, which, because it is bred divers ways, These ways deserve notice. Preternatural Humours, upon whatever cause, whether special or general, they penetrate the bone, sometimes they cause an Ulcerous *Hypersarcoma*, with moistness of the Bone; sometimes they produce a Cancer of the Bone, or a *Spina Ventrosa*, which are Diseases, that must necessarily be distinguished. And because no Physician has designedly described them, I have a mind to communicate, what Reason and Experience have taught me; The cause of an Ulcerous *Hypersarcoma*, with a moistness of the Bone is Preternatural Phlegm, which taking away the temper and hardness of the Bones, the Flesh cannot be sustained by this soft foundation, whereupon it loses its natural consistence: its constant nutriment from the blood turns to a soft and spongy *Sarcoma*; this by degrees increases, and at length Ulcerates, whereby the Tendons, Ligaments and Nerves are corrupted, and the whole Limb is endangered. In this case you can doe no good with Medicines, till you come to the ground of all, the Bone; for when the Bone is cured, presently the Ulcer will be cured, and the Flesh will come to its self. Here is occasion therefore for deep Incision to come at the Bone: But if the excrescence be too big, extirpate it: If you find it grow again, apply a flat actual Cautery, having ever regard to the Bone. Barbetter.

VII. The cause of a Cancer in a Bone is a sharp Humour, corrupting first the Bone, and then the *Periosteum*. Here is an Ulcer both of the flesh and skin, which cannot be cured, till you have first cured the Bone. The hole of the Ulcer is very small, the lips are pale, the flesh is soft and a little swelled; but it does not grow again of it self, as we said in an Ulcerous *Hypersarcoma*, and here we must cut to the very Bone lengthways, and then apply things to correct the corruption, as *Euphorbium*, Spirit of Vitriol mixt with Spirit of Wine, &c. The Powder of Turpentine boiled, till it is hard, is excellent in this case, mixt with *Ungu. Fel. Wurtz.* or *Aegyptiacum*. An actual Cautery is also sometimes necessary. The cure is hastned also, when, instead of a tent of Lint, Pith of Elder is used, because this imbibes the sharp and thin Humours, and so

an

an opportunity is afforded to Nature for doing her work more commodiously. And since these Diseases do usually depend most upon an intemperature of the mass of Blood, so that when one *Cancer* is almost cured, another arises in another place, Medicines are very necessary to help the whole Body, which the following things will doe; Take of Root of Comfrey, Osmund Royal, China, *Sassa*, each one ounce, Bark of *Guajacum* shaven two ounces, best Rheubarb six drachms, clean *Senna* 10

drachms, light Agarick 6 drachms, Cloves one drachm, Cinnamon two drachms. Make an Infusion twenty four hours in a sufficient quantity of Barly-water warm. Boil them on a gentle fire; to four pounds of it strained out; add of *Syr. de Symp. Fernelii* four drachms. Mix them. Make an Apozeme. The Dose, three, four or five ounces. It will Purge gently, promote the Cure, and prevent a Relapse.

GUIDE

TO THE

Practical Physician.

BOOK XIV.

Of Diseases beginning with the Letter P.

Palpebrarum Vitia, or Diseases of the Eye-lids.

The Contents.

When the Eye-lids are wounded, the parts adjoining must not be anointed with the Oyl of Roses. I.

With what cautions Tubercles growing thereon, must be cured? II.

A Hare-Eye must be treated with caution. III.

In the falling down, Contraction, &c. how Section must be made? IV.

The Cure of Warts. V.

The Cure of a Ptilosis by pricking. VI.

The Cure of an Entropium by Scarification and Section. VII.

I. **W**hen these parts are wounded, Chirurgeons do use, and they do well, to anoint the part all over with Oyl of Roses, that they may prevent Inflammation. Nevertheless, when the Eye-lids are wounded, the parts thereabout must either not at all, or exceeding cautiously be anointed with Oyl of Roses, as *Aquapendent* well advises, lest the Oyl fall into the Eye and inflame it:

for Oyls are great enemies to the Eyes; but rather a Linnen Cloth wet in an austere black Wine, and strained out, should be applied.

II. Writers recite good and proper Remedies in the *Hordeolum*, *Grando*, Stone and Wart of the Eyes; but *Galen's* Rule (which few take notice of) *Com. 2. in lib. 6. Hippocr. de morb. popul.* must be observed concerning them, to wit, that these Tubercles be first exasperated with the Shell of a Cuttle-Fish, or a Pumice-Stone, or with our Nails, and then we must lay on some Detractory Medicines: And the reason why we do so is, that the Ulcerated Tubercles may receive the virtue of the Medicines deep into them; a thing, which, if you be wise, you will observe not only in hard Tubercles of the Eye-lids, but also of any other part.

III. *Parvus*, lib. 16. c. 6. shewing the cure of a Hare-Eye, bids us have a special care, lest in administration of the Section the Cartilaginous edge of the Eye-lid be hurt. For, when that is cut in sunder, he says, we may endeavour in vain to elevate the Eye-lid. But what has this Cartilaginous edge to do with the elevation of the Eye-lid? Cut it boldly, and cut it through again; if you do not divide the right Muscle of the *Palpebra* transverse, you will not hurt the elevation of the *Palpebra*. His Predecessor *Guido* expressed himself more to the purpose, and with better skill, *Avoid as much* *idem ibid.* as you can the Ciliary Rimb, for if it be hurt, it is very

Plempias
Ophthal.
mogr. l. 5.
c. 1.

very hard to cure. This is very true, because of its Cartilaginous Nature.

IV. Authors practise Section of the Eye-lids in the falling of them down and laxity, in their contracture, as in a Hare-Eye, in Tubercles, Warts, *Mori*, *Grandines*, &c. In which Diseases they always, and without any distinction, order Section to be made according to the duct of the Wrinkles of the *Palpebra*. But a distinction must of necessity be made: For if the foresaid Tubercles rise upon the Skin or the External Circular Muscle, we must in Section follow the duct of the Wrinkles in the *Palpebra*, for that is the process of the Fibres in the Circular Muscle. You must use the same Surgery in a Hare-Eye, whose Cause has been a Cicatrice: Where we must take special care, that in cutting we do not force the Instrument deep, so as to hurt the right Muscle lying underneath, which being hurt, the elevation of the Eye-lid perishes. On the contrary, if the Tubercles possess the inner *Superficies* of the Eye-lids, because the long, right, descending Muscle has its seat there from the Eye-brows downwards, the Section must be administered conformable thereto, having again especial care that we force not the Knife too deep, and cut through the Circular Muscle, the transverse Section whereof causes an abolition of the shutting of the Eye. As for the under Eye-lid, it consists of one only Muscle, namely, that same Circular one which is found in the upper: Therefore a Lunar Section has only place in it, so as the Horns are turned not to the Jaw, but to the Eye; for there is the progress of the Fibres of the Muscle. But from the transverse Wounds of the Eye-lids, all that profess Surgery do unanimously predict the fall of them, and the abolition of their Elevation: And all Wounds are called Transverse by these Men, which pass from one corner towards the other. Therefore they assert, that if a Wound descend from the Eye-brow downwards, and cut the *Palpebra*, abolition of the elevation of the *Palpebra* does inevitably follow. But Anatomy tells me otherwise; Because therefore the Circular Muscle, which encompasses both Eye-lids, exercises the shutting the Eye as its proper action, an abolition of the shutting of the Eye follows the Transverse Section of its Fibres, therefore a Wound inflicted from the Eye-brows downwards hinders the shutting, not the opening of the Eyes: for by such a Wound the Fibres of the Recludent or Elevating Muscle lying within are not cut asunder. Besides, a straight Wound, (say they) that is, proceeding from one corner of the Eye towards the other, has no danger in it, and portends no inconvenience, because the duct of the Wound follows the rectitude of the Fibres in the Palpebral Muscle: They say true, indeed, if the Wound only hurt the Superior Circular Muscle; but if it reach deep, so as to cut through the Inferior, or Internal Right Muscle, then it will do no small harm, that is, it will cause a falling down of the Eye-lid, because the Fibres of the Elevator Muscle are cut across.

Idem.

V. Physicians, that are flatterers and soothers of Diseases, do not so much as touch, much less cut off Warts of the Eye-lids. But *J. C. Arantius l. de tum. c. 20.* clips them with Scissors, and wets them with Plantain Water, ringed with Alum, that they may not grow again, and that they may the sooner Cicatrize. I can aver this upon my Experience, that I took off such a Wart as this, which hung down from the middle of the Eye-lid, and hindered the sight of the Eye, by running a Needle and a Thread through it, and taking both ends of the Thread, and drawing it up a little, I cut it out by the Roots with a sharp Pen-Knife, and anointed it with a little Oyl of Sulphur. The Man had had it Twenty years, and still the Physicians had dissuaded him from meddling with it, though it put him to continual trouble.

Serapin.
Med. Eff. p.
123.

VI. *Prilosis* is a callous, red thickness of the Eye-lids, often accompanied with the falling off of the Hair; a contumacious and tedious Ail, the Cure whereof I once experienced by pricking of the little Veins in the outside of the Eye-lid, which rise as it were into *Varices*; and many others came to me, whom I always cured the same way. Among the rest, a Religious Man, who for six months could find no benefit by any Medicines, was thus quickly cured, that is, by frequent pricking with a Needle. *Idem, p. 791*

VII. I have often cured an *Ectropium* by Scarification. And an *Ectropium*, according to Celsus, is a fault in the upper Eye-lid, which turns up a little, and comes not down far enough to shut; or in the lower Eye-lid, which is not drawn high enough, but turns back and hangs down, and cannot joyn with the upper. And both are caused by some inward Disease, and by a Scar, and this not without defect in the Eye-lid, which if it be too defective, says Celsus, no Cure can restore it. So He indeed, but I found that an Eye-lid inverted after the Cure of a Carbuncle; so that all the lower Sinus of the Eye lay much open, was amended by cutting the Circle of the Deglabrated Eye-lid; And this happened to a Capuchine, who by such cutting recovered the beauty of his Eye almost entirely, who had been despaired of by the Surgeons.

The trembling of the Heart differs in the Causes from the Palpitation. XVI.

I. Although oftentimes Wind be found in this Malady, yet because there may be Wind in a Spurious Palpitation, which proceeds from the heat of Blood, or inundation of the Pericardium, it is not safe at the first coming of it, to apply hot things. Wherefore, if the mischief arise from the heat of Blood first of all, according to Galen's Opinion, Blood must be let. In them, who labour of an Inundation of the Pericardium, never, unless very sparingly and seldom; only that what oppresses the Spirits of the Heart may be moderately subtracted, and that the Fever (which perhaps for want of convenient Ventilation increases) may not gain ground, and I think this is what

what must chiefly be done in a Spurious one. *Mercatus* thinks Blood-letting hurtful, because its Inducant, namely abundance of Blood, does not at that present offend: For who will affirm, that Flatulent Matter, which is the immediate cause of this Affection, can be taken away by Blood-letting? Yet *Galen*, 5. *loc. aff. c. 2.* intimates the contrary, when he affirms, that all who are ill of a Palpitation of the Heart, are cured by bleeding and attenuating Food and Physick. Which Tenet is not without reason; for when abundance of Blood is in fault, it indicates plentiful detraction, lest the Spirits be suffocated. But if there be no great Plenitude, yet Bleeding is convenient, because the Disease in respect of the part affected is great: for a principal part is affected, where we must take care by Revulsion, that abundance of Humours do not run more to the Heart, which is otherwise debilitated.

II. The Palpitation of the Heart, as is very apparent to me, is usually caused by a Melancholick Humour, (that is, by consent with the *Hypochondria* in Splenetick Persons.) wherefore I always did my Patients a great deal of good by setting Leeches to the Hemorrhoid Veins.

III. When in time of the Fit the strength is not able to bear Bleeding, we must use Leeches and Cupping-Glasses. As for the place, *Rhases*, 7. *cons.* applies Cupping-Glasses to the Back. *Avicenna* disapproves them, because they raise Palpitation, by drawing the Blood to the Breast. This contradiction is thus taken away; Cupping-Glasses in Plenitude of the whole, applied to the Back with much flame and deep Scarification, especially if they be large, use to raise this Tremulous affection of the Heart: Therefore in this case they must be set to the lower parts. But when the Body is evacuated by Medicines and Bleeding, small Cupping-Glasses, gentle Scarification, with a little Flame, applied to the Back, do good; for they draw the Vapour, Wind, and Blood from the Center to the Circumference.

IV. For Revulsion of the Matter in a tedious and frequent one, Issues and Blisters, either in the Arms, if the Matter fall from the Head; or in the Legs, if it be essential, or transmitted from the lower parts to the Heart, are good. Concerning Vesicatories *Mercurialis* cautions us, not to use *Cantbarides*, because they have a faculty malignant and adverse to the Heart, but rather Crow's Foot, *Flammula Jovis*, &c.

V. Where the Matter is sanguine, almost all agree in this, that Extenuating Syrups should be given: Being swayed by *Galen's* Testimony, 5. *de loc. aff. 2.* who treats a Palpitation with Blood-letting and Extenuating Medicines. And they take their Matter for Extenuaters from *Lib. de Palpit. c. 5.* where he reckons up all hot Medicines, endued with an Attenuant virtue, Penny-royal, Calamint, &c. This Operation is to me suspected, yea, dangerous; seeing Wind may be bred of a hot cause, where Cacoehymie or Plenitude is. The place is in *Galen*, 4. *acut. 9.* For if hot Attenuants be given in abundance of Blood, Wind and Vapours will be raised, and they will increase the Palpitation. Therefore Attenuants may be chosen, but they must be cooling, as *Pisane*, *Oxymel*, *Syrupus acetosus simplex*, *acetosatus Citri*, &c. And I believe *Galen*, 5. *de loc. aff.* must be understood of Attenuating Meats and Diet, not of Attenuating Medicines, but of true Extenuaters. And such are they, which diminish Blood, either of themselves, or by accident. Of themselves *Vena-Section* and all Evacuation of Blood; All Purging by Vomit or Stool, Sweat, or Urine, diminish Blood: By accident, a spare Diet, Labour, Friction, Bathing. The place is in *Galen* 2. *aphor. 28.* where under the name of Attenuating Medicines all these things are understood; And truly in abundance of Blood it is good to extenuate, that is, to let Blood and diminish it.

VI. *L. Septalius*, lib. 6. *animad. 117.* forbids Diureticks in the Palpitation of the Heart, if thick Blood offend, because they exhaust the Serum of the Blood, and make it thicker. But when it arises from a watry and ferous Humour, there is nothing that can more easily conquer the violence of this Disease.

VII. Although we must presently relieve the Heart, as a principal part, by such things as have a singular virtue to encrease its strength, and to discuss the malignity of the Vapours, such as are most sweet scented and Aromatick things, which by their Balsamick virtue defend the innate heat of the Heart, and by their heat discuss and waite the Vaporous Matter. Yet if the Womb be the cause of the Palpitation, we must abstain from them, the Diseased Constitution of the Womb forbidding it. For such things presently cause Fits, and then the Palpitation is greater. For when the Brain is refreshed with sweet scents, by the sympathy which is between it and the Womb, if this be morbid, the latent Vapours are raised, which fly to the principal parts, especially to the Heart. Therefore we should rather fly to those things, which have the faculty of discussing that vapid Substance, such as some fetid and strong smelling things, which by their inimicous quality excite the expulsive faculty to cast out what is noxious. Besides, they have a virtue to attenuate and violently to dissipate, as appears in *Castor*, *Galbanum*, *Asa fatida*, and the like. *Sennertus*.

VIII. If the Palpitation come from Wind, Electuaries and other Compositions must have no Symplicia de Pomis in them: for Apples keep their windiness to the third concoction, as *Avicenna* writes. *Rondeletius*

IX. A certain Valetudinary Prince, when he had been a long time most grievously troubled with Palpitations of the Heart, could find relief by no Medicines. A young Physician coming in, tells, how he found in some Writings of the former Age, that a certain kind of Worm sometime breeds in the Heart, which by taking a Clove of Garlick Evening and Morning may be killed; which Remedy was neglected, and accounted despicable. But at length, when the Disease had killed the Prince, his Body was opened, a white Worm, with a very sharp horny snout, was found sticking to the Heart; which the Physicians took, and put alive into a Circle drawn on the Table with juice of Garlick; it crept about and about; and was wonderfully tormented, but would not touch the Circle. At length being overcome with the sent of the Garlick, it died within the Circle.

X. A Noble Matron of *Newemburgh* 35 years old, had been troubled with the Hypochondriack Disease for ten years: She was taken with so violent a Palpitation, that one would have thought her Heart would have broke her Ribs and leaped out of her Breast. When I was called, I presently ordered an Emollient Glyster to be given her, because she never went to Stool, but upon meer necessity. This was succeeded by a Carminative one. Afterwards an Epitheme was applied of Treacle, *Consolidio hyacinthina*, and *Alkermes* without Amber or Musk. Then the following Potion was given her; Take of Water of Balm, *Carduus Benedictus*, each 1 Ounce, Orange-flower Water half an Ounce, Cinnamon Water 2 Drachms, *Syrupus corticis Citri*, made according to *Zwelfer's* Correction, and of *Betony* Flowers each half an Ounce, Oyl of Citron rind 2 Drops, prepared Pearl 5 Grains, Saffron 1 Grain. In two hours time it left her, and never returned again.

XI. This must be reckoned in the Palpitation, which comes from heat and abundance of Blood; we must neither use hot things, lest the effervescence be increased, nor cold ones, lest, when the efflux of Vapours is stopt, the Palpitation grow more violent. For it is sufficient to use temperate, strengthening, and odoriferous things.

XII. Issues are very good in the Palpitation of the Heart, as I have happily experienced. Which, since they may be made in divers parts of the Body; if the matter falling from the Head cause the Palpitation, as *Hippocrates* says, it is best to make Issues in the upper parts; and in this case I use to

Mercurialis. advise an Issue in the right Arm. But if it be essentially in the Heart, or come by consent with the lower parts, it is much better to make an Issue a little above or below the Knee.

XIII. In this sort of Disease we must insist long on Medicines; for after six months, or a whole year, the Disease uses to return; as I have known several. Wherefore we must always be doubtful of it, and not be overjoyed, because it ceases for a month or two.

XIV. *Joh. Prævotius* in a years time cured Baron A. of a Palpitation of the Heart, and of all the Arteries, in manner of an Aneurism, from retortid Bile, with drinking of Whey, and bathing in fresh Water. *Fernelius* mentions this Pulsation, *Patb. lib. 5. cap. 12.*

Rhodius,
Cent. 2.
Obl. 40.

XV. Since the Causes are various, the Cure must also variously be insisted on: For what some hold, that these Remedies, which are vulgarly called Cordials, do refresh the Heart, and are thought to help it, as it is laboring, this is repugnant to Reason and to ordinary Experience. Since therefore we have declared, how the Palpitation of the Heart proceeds from some fault in the Blood, or in the Arteries that are joyned to the Heart, and have shewn the divers ways of affecting both of these, an apt method of Cure must be accommodated to every sort of that Disease. 1. Therefore, if the Disease proceed from some fault in the Blood, the primary Therapeutick intention must be, to exalt the Blood, that is too watry, and unfit for Accension and Fermentation, to a better *crasis*, and to exalt and increase its active Principles, that are depressed or diminished: For which purpose, Spirituous Medicines, also Saline of all sorts, Sulphureous, and especially Chalybeates, are proper. Here also we may prescribe such things as are used in a *Leucopneumonia*, *Pica*, and a cold Scurvy. 2. The Palpitation of the Heart, which is more frequent and much more violent, comes from the Cardiac Arteries; and then their fault is either an Obstruction, or a Spasmodick Affection. The first Disease is usually continual, and often incurable, especially if it comes from Consumptive Lungs, or from a Tubercle at the Roots of the Arteries, or some bony Excrescence, whereby they are half stopp'd up or compress'd; Which causes, if at any time they be there, and can perfectly be known, it would be in vain to endeavour to remove them: But rather this only must be done; we must give the Patient some ease by an Hypnotick, to prolong a miserable Life a little further. Nor is it also improbable, that the Arteries are in a great measure filled by Polypous Concretions, that are used to breed there, and sometimes within the Ventricks of the Heart, and therefore the free and total exilition of the Blood is hinder'd. As the Diagnostick of this is very difficult, so I think the Cure of it is no less rare. When there is suspicion of it, Saline Medicines especially seem to be of use, and such of them must be given, as are endued with a Volatil or Acid Salt. And the same things must not be given together, but these for some space of time, and (when they will do no good) others may be tried. 1. Spirit of Sal Ammoniac compound with *Millepedes*, or distilled with other Antasthmaticks 3 Ounces. The Dose from 15 Drops to 20 thrice a day in some Julep or appropriate Water. 2. Spirit of Sea-Salt, or Vitriol, impregnated, distilled, and often cohobated with Spirit of Wine, and Pneumonick Herbs, 3 Drachms. The Dose from 15 Drops to 20 in the same manner. 3. The Palpitation of the Heart is often a Convulsive Affection,

and is usually produced by the like cause and way of efficiency, whereby other Hypochondriack and Asthmatick Diseases are usually produced. The Cure whereof must in like manner be attempted by Antispasmodick Remedies, &c.

Saxonia mentions this last sort, *Prælect. Pract. parte 2. cap. 1.* It must be observed, says he, that it is caused by some fault in the Nerves alone, nothing appearing amiss in the Brain, Breast, or Muscles: Which I observed in my Brother, whom I perfectly restored by the use of Treacle only, applied to the beginning of the Spinal Marrow.

XVI. The Trembling of the Heart (which they commonly call the Passion of the Heart) is a Disease distinct, yea, quite another, from the Palpitation of it. For in the Trembling the Carnous or Motive Fibres seem to be affected by themselves, and the Morbifick cause does not in this, as in the other Disease, consist in the Blood, or in the Arteries of the Heart. The trembling of the Heart may be described to be a Spasmodick Convulsion, or rather a Trepidation of it, wherein the Motive Fibres do very quickly make only semicontracted, and very speedy *Systoles* and *Diastoles*, but abrupt, and as it were half strokes, so that the Blood can be brought into the Ventricks of the Heart, and carried out only by small portions. The formal reason seems to consist in this, that the Animal Spirits belonging to some certain Muscles, do start restless out of the Tendons continually into the Flesh, and return, and so in a perpetual vicissitude they repeat their Excursions and Recursions; in the mean time when they are only exalted with small Forces, so that they do not fill up the Carnous Fibres, and they stay in these Fibres only a short time; and although they make sometimes, frequent efforts, yet they are weak; insomuch that the Members and Limbs are not moved out of their places by the Muscles, so perpetually agitated; and the Heart, during its trembling, how quickly soever shaken, yet it is scarce able to drive the Blood about; as is plainly manifest from the little, and as it were, tremulous pulse, and a decay of all strength. As to the Conjunct and Procarterick Causes, whereby namely the Muscular Spirits are made so instable, or acquire this Desultory Faculty, it seems, that some Heterogeneous and Elastick Matter, having pass'd the Brain and Nervous Ducts, then is carried into the Muscles, and the Tendinous ends of them, where mixing now and then with the Spirits it irritates them, so that they can be quiet no where, but run hither and thither continually, and in the mean time they either omit, or do not strenuously perform their proper Offices. The cause of the trembling of the Heart is commonly laid upon the Spleen; for it is vulgarly supposed, that foul Vapours are, by this parts being obstructed, or otherwise amiss, sent to the Heart, which seizing of it, make it so shake and tremble, yea, as if it were in a cold fit. This Opinion has gained some credit, because Hypochondriacks or Spleneticks are found to be very subject to the Cardiac Passion. But the reason why they that are reckoned Splenetick and Hysterick, are so commonly troubled with the Passion of the Heart, is the great affinity, and intimate communication between the Splenetick and Cardiac Nerves, so that not only the affection of one Part does draw another easily into consent; but if at any time Spasmodick Matter falls upon the Branches of the Nerves belonging to the Spleen or Bowels in the lower Belly, it seldom misses, but the same in like manner seizes those that belong to the Heart. As for the method of Cure to be followed in the Cure of the Passion of the Heart, because it is a Disease merely Spasmodick, therefore not Cardick, but rather Cephalick and Nervous Medicines are indicated, which yet according to the Temperament and Complexion of the Patient must be hot or moderate, and sometimes of some

sometimes of the other nature. That I may comprehend the business in short, three sorts of Medicines use to do the most good in this Disease, Testaceous, Chalybeates, and things endued with a volatil salt. Therefore first of all provision being made by evacuating the whole, Medicines may be prescribed, which shall seem to be most useful.

Idem.

Medicines especially made use of by eminent Physicians.

1. Let a Man take this Potion inwardly, which I have seen do good to a miracle; Take of Water of Borage 5 ounces, Syrup of Borage 1 ounce, Julep of Roses, Cinnamon Water, each half an ounce, dissolved Pearl 2 drachms, dissolved Gold 1 drachm. Mix them.

Crato.

2. Spirit of Balm alone cures the Palpitation of the Heart, when the Body is purged. Take of Regulus of Antimony 2 ounces, the best Gold 2 drachms: Melt them in a Crucible, then reduce them to Powder, add of red Coral, Pearl each 2 drachms. Mix them through a Sieve. Add the like weight of the best Nitre. Burn them in a hot Fire for three hours. Powder them very fine. Wash it in sweet Water. Put it into a Glass retort with the best Spirit of Wine, and distil the Spirit, colorating it three or four times upon the Powder. So it is prepared for an excellent Bezoardick Powder, which in virtue excels the Bezoar-Stone. The Dose half a drachm with Water of Carduus Benedictus, Meadow-sweet, or Balm. It is given to drive out, in Palpitation of the Heart, Malignant Fevers, and the Small Pox.

Faber.

3. For the Palpitation of the Heart I ordered the following Bag to be applied to the Heart; Take of dry Balm 4 handfuls, the Cordial Flowers 1 pugil, shred them grossly. Make a Bag. When it was applied to the Heart, the Palpitation ceased to a miracle. There is an admirable virtue in Balm both taken inwardly, and applied outwardly. I took green Balm and Borage, bruised them a little, laid them upon a hot Tile, sprinkled them with a little Rose Water and Vinegar, and applied them to the Heart; and the Palpitation of it ceased, to the admiration of all Men.

Forestus.

4. The Juice extracted out of Weather's Hearts strengthens the Heart wonderfully; Take the Heart of a Weather or a Kid, dry it, stick a few Cloves in it, put it in an Earthen Vessel, set it in an Oven, in which the Heart dissolves into juice. Give it the Sick to drink.

Grembs.

5. The following Water is a great Secret; Take of Hearts of Hogs, of Harts each N. 2. Cut them in pieces. Add of Cloves, Galangale, Seed of Basil, each 2 drachms. Flowers of Bugloss, Rosemary, Borage, each 2 Handfuls. Let the Spices and Seeds be cut and bruised after a gross manner. Put to them as much Malmsey Wine as is sufficient. Digest them for 24 hours. Distil them. The Dose, half an ounce with Sugar.

Herlicius.

6. A piece of fine White Bread, sopt in Wine of Crete, and eaten, is admirable for strengthening the Heart, and stopping its Palpitation.

Joel.

7. In a Palpitation from a cold Cause true Rhapontick is of incredible Efficacy, if 2 drachms of it be taken in Wine; or if Wine wherein the same Rhapontick, All-heal, *Aristolochia rotunda*, or Fennugreek has been infused, be drunk.

Whether Oxymel may be admitted among Preparatives? V.

Whether Sudorifics may be given? VI.

Or Treacle, or Mithridate? VII.

Why sometimes Sudorifics do hurt? VIII.

How Sweat must be raised, when External Pains accompany a Palsy? IX.

Diureticks to be preferred before Hydroticks. X.

Clysters must not consist of over emollient things. XI.

The use of Bathes sometimes hurtful. XII.

How they do good in that which follows a Colick? XIII.

Insensible Evacuants must be violent. XIV.

Cure by Salivation is not good for every one. XV.

One cured by Salivation. XVI.

Whether we may raise a Fever? XVII.

When it comes from External Humidity, it must quickly be cured. XVIII.

There is no harm in making Decoctions, Infusions, &c. with Wine. XIX.

Whether Confectio Anacardina be safe? XX.

Sinapisms and Blisters, when proper? XXI.

Ortication good. XXII.

Topical Medicines must be applied to the Original of the Nerves. XXIII.

They must not exceed in heat. XXIV.

A Palsy from an External Cause cured by an easy Remedy. XXV.

Only Medicines are not proper for all. XXVI.

The Cure must be varied according to the variety of Causes. XXVII.

It may be caused by Bile, and Blood. XXVIII.

That which comes from a Melancholick Juice, must be cured with Chalybeates. XXIX.

Ceasing after voiding of Worms. XXX.

That which follows the Colick, requires not the Cure of the Origination of the Nerves. XXXI.

How by Pications we may help the Atrophy of the Limbs, which follows. XXXII.

The continued use of Infusions is excellent. XXXIII.

Medicines.

I. Some mention Venæsection, which yet, unless there be a Plethora, seems not proper, because here is not the same danger of extinguishing the Vital Flame, as in an Apoplexy. But yet, if the Blood appear not to circulate conveniently, and that from above, small Pulse and short Breath, I think Venæsection altogether necessary, for the same Reasons, which we propounded in the Apoplexy, [See Tit. Apoplexy Book I.] And I recommend these two Signs, taken from the Pulse and Respiration, to be carefully observed by all Men, because they are the principal Signs of the Blood's Restagnation about the Ventricles of the Heart, and of danger of Suffocation. ¶ Although Medical Writers do usually respect Pituitous Matter, yet since it is manifest, that it sometimes arises from Plenitude of Blood, this may be let boldly. I speak this, because some fear to do it: reckoning that a Palsy always comes from Phlegm. I know a Woman, who, when she had been let six ounces of Blood, could not be cured; but when some pounds had been let, she was cured; though some Physicians were afraid of so great a quantity: And I know two Men, who by bleeding in great quantities, and at several times, were cured: Therefore in a Sanguineous Palsy Blood may be let boldly, not once only but oftner, not in one place but several. But if in the Palsy there be not a Legitimate Sanguine, but a Spurious Plenitude; Blood must be taken away, yet sparingly, as *Avicenna*, *Paulus*, *Alexander*, and *Celsus* are of Opinion: For the last, *l. 3. c. 27.* writes, That Bleeding and Purging are good for Paralyticks. In this case it must be let sparingly, only to about six ounces.

Sylvius de la Boe.

P p p

Yet

Yet this must be observed, That it the Palsy seize all the Parts of the Body but the Head, the Haemorrhoid Veins must be bled: If one part be free, Blood must be let in that.

Saxonia.

II. Vomits sometimes do abundance of good in curing the Palsy, namely, because they substract Matter from the Conjoint Cause; and they do not always drive further the Matter impacted into the Nerves, but make Revulsion of it, shake it, and often break it into pieces, so that when the continuity of the Mass is broken, the Animal Spirits themselves do easily dissipate the Particles of the Morbifick Matter, when they are parted asunder.

Willis.

III. There is a Controversie between *Rhases* and *Avicenna*, whether we may Purge in the beginning. *Avicenna* before giving of Purgatives, propounds Preparatives and gentle Medicines. *Rhases* at the very first uses *Pilula Cochia*, and consequently strong Purgers. I thus compose that Controversie; When the Palsy is new, through some great fault in the Head, as after an Epilepsie or Apoplexy, I am of *Rhases* his Opinion, presently to give a Purge. The Reason is plain; for there is danger of the return of the Epilepsie or Apoplexy, which we must immediately prevent by giving a Purge. But if the Palsy be old, in a determinate part, without hurt of the Brain, *Avicenna's* Judgment must be followed, first a Lenitive must be given, and then Preparatives.

Saxonia.

IV. In the Palsy our Ancestors observed this, that in the beginning it must be treated with gentle Medicines, and not with very violent ones, whether taken inwardly, or applied outwardly. Certainly I have sometimes observed, That a Palsy of one side has followed that which was only in a part; and sometimes an Apoplexy has followed this, the abundance of Noxious Matter being agitated in the Head more than it should be, when any one has endeavoured to carry it off by a sharp Medicine. And there is a great Error oftentimes committed, in that, when the Head and Body are not well purged, such Medicines are given, as by their heat and motion easily get into the Head, and there they put the Humour into Fusion and Fluxion, which Nature by rest and a good Course of Diet, would have at length overcome and concocted. Experienced Physicians know this.

Solenander.

V. I do not disapprove of *Oxymel* with other Preparatives, although Vinegar be an enemy to the Nerves, as they are dry parts; but when they are imbued with, and full of Pituitous Juice, Vinegar is not hurtful, and especially diluted with Honey, and mixt with Syrups.

Saxonia.

VI. *Sepralius*, l. 6. *Anim.* 74. rejects Sudorificks, and prefers things that provoke Urine, and he thinks Physicians generally commit a great Error, that, omitting promoters of Urine, they use Hydroticks, because thick Matter is also carried off by Urine: And when the thinner part is evacuated by Sweat, the thicker is rendered more hard, obstructive, and difficult, as to Motion and Evacuation. But grant all this to be true in Diseases, whose cause lies in the Bowels and *Hypochondria*, or in the Veins, yet the reason does not hold in the Palsy: For seeing the cause of the Disease sticks about the Nerves, I see not how it can easily get from thence to the ways of Urine: But Evacuation by the ambit of the Body is easie. Nor need we fear, that by the use of Sudorificks the Matter will grow too hot, because it is cold, and so requires heating, inasmuch that some think, a Fever should be raised, which may heat and melt it; Nor that it will grow thick, seeing Hydroticks have an Attenuative virtue.

Sennertus.

VII. Opiates are much commended by Practitioners, which, because of the *Opium*, are very much suspected by me in the stupidity and imbecillity of the Nerves. And they give Treacle, Mithridate, *Aurea Alexandrina*, &c.

Platerus.

VIII. There is not one among the vulgar, but may easily observe, that Diaphoreticks do much good, and sometimes much harm. Wherefore it is of much moment, to explicate the Reasons of so different an Effect. Therefore plentiful Sweating is sometimes good for Paralyticks, upon a twofold account especially, namely, because it plentifully exterminates the Impurities of the Blood and Nervous Juice, that are apt to exhale; And, that the Morbifick Matter may flow no more to the Brain and parts affected, and that what is flown already may in part be thrown off. And secondly, because the *effluvia* of heat, flying from the assuaging Blood, do very much open the Nervous Ducts, stop before, and open a passage for the Spirits, while in Evaporation they pass that way. Wherefore this Administration is proper for them especially, and in a manner for them only, whose Blood, not being very full of fixt Salt and Sulphur, is diluted with a limpid and insipid serum. For on the contrary, Paralyticks, in whose Blood and Humours there are abundance of wild, exotic Particles of enormous Salts and Sulphurs, that are fixt, and unfit for exhalation, do find a great deal of harm from violent Sweating. Of which Affection we assign these two Causes, namely, That the Morbifick Particles through agitation being too much exalted, become more outrageous. 2. That when abundance of them is driven into the Head and Nervous Kind, they often increase old Obstructions, and not seldom produce new ones.

Willis.

IX. If Pains about the Arms and Shoulders do accompany it, we order Sweating in Bed, to be raised with heated Bricks, or Bottles full of hot Water, that the Matter sticking among the Muscles may be digested and resolved; yet above all these things, Sweat must rather be raised by the ambient heat, than by the internal use of a Medicine or Decoction that melts or thins the Humours, which is proper only when in the Stove Sweat does run plentifully, all the Matter being put into fusion: Whereas otherwise, if the antecedent Humours be dissolved in the Veins by a Decoction, and when they are dissolved, be not discharged, but tarry in the Body, they will increase Pain. Which, as Reason it self teaches us, so I have found true by Experience, so that I can never do enough, to extirpate this abuse. Therefore, when the Matter is but little, and therefore the Pain but small, when we intend not to move or put into fusion the antecedent Humours residing in the whole Body, we only give a Decoction of Groundpine, so much commended by *Matthiolus* upon *Dioscorides* in these cases. Whereto if you add a little *China*, it may not be amiss; abstaining nevertheless from Mistletoe of the Oak, and such melting things, as also from Sanders, which hinder Sweat.

Fortis.

X. The Head also should be dried with a Sudorifick Decoction, but that is very much suspected by me: for I am afraid, lest the Humours of the whole Body and of the Head being melted, fly into the Head violently, and cause an Apoplexy. Wherefore I should more willingly use some Decoction, not very colliquating, but cherishing the innate heat, and dissipating the Matter impacted into the Nerves, as well as drying the Head, the Matter being rather derived to the Center by Urine, than to the Circumference by Sweat. The Decoction may be made of Mastiche Wood, Rosemary, Mistletoe of the Oak, and a little Sassafras in Pigeon Broth, giving first Turpentine with Salt of *lva Arbritica* and *Sat Theriacalis*.

Idem.

XI. Loosning and alterative Clysters are very convenient, having a care of over emollient ones, whereby the Spine being more relaxed would be further hurt, so that not without reason the Vulgar think Clysters in the Colick occasion the Palsy: Which nevertheless rightly prepared, both do good,

Platenus.

good, and if the Cause lye about the lower part of the Back, may serve for Topical Remedies.

XII. But indeed as generous Medicines, if they turn not to Alexitericks, often prove Poysons. So going into the Bathes, has made these Paralyticks much worse, whom it did not cure; so that when more parts, and those that were affected before grew more Paralytick, the Lame leave their Crutches there for no other reason, but because they cannot use them, when they are made more impotent. The reason hereof is, because Bathing, by disturbing the Blood and all the Humours, does more exalt all the Morbifick and Heterogeneous Particles, and forces them, being enraged, out of the Bowels into the Mass of Blood; whence, because they do not easily evaporate, entering the Brain and Nervous Kind, they increase the Palsy, and often cause a Convulsion. For this reason Bathing sometimes first actuates the Stone in the Kidney, and the Gout, and brings a Spitting of Blood, *Asthma* or Consumption upon many, when there was no disposition to it. Wherefore the Bathes should not be tried without the advice of a Physician, and if when they are tried, they do not agree, they must be quickly left.

XIII. Bituminous, Sulphureous Bathes cure a Palsy succedaneous to the Colick. And they do good not only by drying the Humours, and strengthening the Parts; but I rather think, that the adust, salt, nitrous, and tartareous impurities of the Humours and Vapours in Man, which spoil the virtue of the Nerves, are quite dissolved by the virtue of the Bathes, and being dissolved, are by a peculiar and Mineral Analogy, which the qualities of the Bathes have with the divers Humours and Juices in Man, drawn to the ambit of the Body, and so our Bodies are delivered from the Enemy that besets the Nervous Kind, not without corroboration. The Efflorescence of the Skin in such as use the Bathes often, sometimes coming with a troublesome Itch, shews the truth of this. Which Efflorescence indeed you can scarce explain otherwise than by the solution of the Salts latent in the Body. Neither yet will I deny, that the great heat of the Bathes does now and then contribute something for Revulsion of the Matter outward: for I remember one that was dangerously ill of a fit of an *Asthma*, having put his Feet into Strong Beer, very hot, upon a translation of the Humour of *Asthmatick* became *Arthritic* on a sudden.

XIV. According to *Avicenna*, Medicines that evacuate insensibly ought to be strong and far. Strong, that is, violently hot and very thin of substance, and the reason is, because the Nerves and Spinal Marrow lie deep. They must be far, that by their means the strong Medicines may stick the longer, and that their virtue may not waste, and that they may prevent the breeding of a *Scirrhus*. Besides the greatest Dose of Medicines is approved; for the Morbifick Matter is cold, thick, viscid, impacted, and therefore of so great activity, that it will not yield to Medicines, unless they act violently, that is, unless they be given in the highest Dose, so that sometimes even by reason of the height of the Dose a Fever may be raised; for according to *Avicenna*, Paralyticks are holpen by a Fever. Wherefore *Rhazes* gave one 2 drachms of *Confectio Anacardina*, which is hot in the third degree. In our days we only give a few grains.

XV. That some Paralyticks are cured by Salivation with *Mercury* is proved both by my own and other Mens Experience. Yet this sort of Remedy, I think, must be used only in an habitual Palsy, that has its Procaratick Cause in the Blood and Brain, moveable enough, and the Conjunct Cause in the Nervous Appendix, not very fixt. But when this Disease is caused by some External and great hurt, or follows a *Carus*, Apoplexy, or Convulsions,

Salivation is almost always tried in vain, and sometimes not without great hurt. Whoever therefore have a weak or an over lax Brain, are subject to a *Vertigo*, Stupidity, and Convulsive Motions, let them not lightly use Mercurial Medicines: Yet sometimes Salivation in an habitual Palsy, and one that is not very fixt, doth much good, as by taking away the impurities of the Blood, it cuts off all Matter from the Disease. Also as some Mercurial Particles, when, having passed the Brain, they come into the Nervous Ducts, do divide the Morbifick Matter impacted in them, and severing the parts thereof one from another, they variously disperse them, some one way some another. Whereas it is the fault of other Medicines oftentimes, that they can only make an effort upon the Mass that stops the ways of the Spirits, and therefore if they do not separate it into parts, they drive it faster into the obstructed places.

XVI. In the Palsy I have used inunction with Quick-Silver, whereby I cured a confirmed Paralytick, one *Julius* a Shoemaker, who is yet alive. After an Apoplexy and an old Pox, he fell into a Palsy of his Right Side. I used the Ointment of *Mercury* in this manner; Take of Quick-Silver 5 ounces, Hogs Lard 1 pound, Hens Grease, Ducks Grease each 2 ounces, *Sagapenum*, *Opopanax*, Castor, *Assa fetida* each 1 drachm, Mustard, Pepper, Pellitory of Spain, *Euphorbium* each 1 ounce and an half, *Iva Aritrifica* half an ounce, Oyl of Turpentine 3 ounces. Mix them. Make a Liniment. I anointed the hurt part especially with this Medicine, and others also, and Salivation succeeding, the Patient grew well.

XVII. Whether is it proper to raise a Fever in the Palsy? I answer in short, In Cacoehymick Bodies, we may not use such hot Medicines, as to raise a Fever on purpose. The reason is, because such Medicines corrupt bad Humours, and will breed a Putrid Fever, which will be worse than the Palsy. But if the Body have been already exactly purged, hot Medicines, if they do cause a Fever, raise an *Ephmera*; This is not dangerous, and yet it both heats the Nerves, and digests the Matter.

XVIII. If the Palsy have its original from External Humidity, and either a Nerve or Muscle be disaffected, it is not so difficult to cure, so it be not neglected, but cured in time, before it have contracted an ill habit: for then it is difficult, and sometimes cannot at all be removed or conquered, that is, when the laxity has proceeded so far, that it cannot perfectly be restored. And it is no new thing for the Membranes now and then to be so moistened and softened, that they cannot afterwards be reduced to their pristine firmness, and natural tension, but then they are either too much or not stiff enough, either of which is a fault. I do not see any reason, why this may not happen in the Body, yea, that it must happen, this Disease being often incurable, does argue.

XIX. Infusions made in Wine especially do good: for though Wine, especially if it be strong, be not at all convenient, yet joining the virtues of other things to it self, and carrying them, as a Vehicle, to the Nervous Kind, it will make an useful Medicine, taken in its place.

XX. I cannot much approve of *Confectio Anacardina*, as it is now prepared by the Apothecaries, because of the Myrobalanes, which being much astringent, cannot be mixt with very hot things; for they cause the Medicines to tarry long in the Body, and do harm. This is the reason, why this Confection causes a Fever. It is better therefore instead of Myrobalanes, to put in some Medicine of subtil parts, as Cinnamon and the like.

XXI. I do a little suspect Sinapisms, Blisters, and Cauteries, because they digest more violently than is convenient for a Disease of six years standing.

ing, in which time the Morbifick Matter must necessarily be impacted: Unless there come a new Fluxion; for in this case they will do much good for Evacuation of the Matter.

Epiph. Fer-
dinandus,
Hist. 46.

XXII. We must proceed to a singular and excellent Remedy, The Body must be exasperated and its Sensifick Faculty, if I may so say, awakened, especially when the Body is well purged, and other things done; And it is to apply Stinging Nettles, or to whip all the Body with Nettles; which is not our invention, but is laid down by *Celsus*, l. 3. c. 27. And I attest I have used this sort of Remedy in several, and always with great felicity: for I was scarce ever deceived when the Body was well purged.

Scholtzius,
conf. 50.

XXIII. Although *Galen* and other Physicians write, That Remedies must not be applied to the hurt Parts, but where the Nerves arise; yet I think this must be understood thus, That Remedies should be applied especially where the Origination of the Nerves is. But the same Men do not deny, but that it does some good to apply Medicines to the hurt Limbs. And especially when peccant Humours have dispersed themselves far and near, and are got into the hollow of the Nerves, and must be dissolved. And Physicians, after Evacuations use to apply Remedies to the Relaxed parts: for in the Apoplexy, which is called an universal Palsy, the whole Body is usually anointed with Odoriferous Oyl.

Saxonia.

XXIV. This must be observed, That we do not apply a Medicine to the Paralytick part, as some do *Droppers*, who by this means think they can recall the heat and sense of the Part, if they burn the Part with hot Medicines, which do no good, but may cause a Gangreen in the Part. Medicines must be applied to the Original of the Disease, not to the part affected it self.

Solenander.

XXV. A certain Young Man tarrying a long time for his Sweet-heart in a Wine-Cellar, was taken with a Moistness and Palsy in his Limbs: And when the Physicians were puzzled about applying Remedies to him, one carried the Young Man to an Oven, and making a Bed for him, he heated some Nut-Tree-Leaves in the Oven, when they were hot he wrapt them in Linnen Clothes, and laid the Young Man in them, and covered him well up, and presently Sweat burst out in abundance. While he Sweat, he was refreshed with a little Chicken Broth, and he was well.

Sylvius.

XXVI. Oyls, Liniments, Unguents, Plaisters serve to correct and consume the Pituitous Humour, and indeed in them only whose Skin can bear fat things. For it happens to several, that upon the application or illinition of any fat things, presently Pustles arise, and an *Erysipelas* takes the whole Body, and sometimes Mortification and Gangreen of the part does follow, which will be proper for the Physician and Patient to observe. When therefore the Patient can bear fat things, they must be used in a various form, and especially the Oyl, because they penetrate more easily and deep. But where fat things are hurtful, Roots, Herbs, Seeds, &c. proper for the Palsy, may be infused in rectified Spirit of Wine, and the Parts affected may be anointed with it.

XXVII. As there are manifold forms and divers causes of the Palsy, so the Cure of it must not always be insisted on in the same manner, but by a various method, appropriate to each sort. There are usually these three kinds, or three methods of Cure, as the Palsy is caused suddenly. Either, first, From a blow or fall, &c. Secondly, It follows some other Disease, that is, an Apoplexy, *Cajus*, &c. Or, Thirdly, As a Disease primary and *per se*, and depending upon a *Procatarxis*, or some previous *Apparatus*, it is caused by degrees. When it comes the first way, the only intention of Cure is, that the hurt part may recover its pristine

strength; and first, Let the Blood and other Humours flowing to it, as to the affected and weakest part, should increase the Disease, Blood must presently be let, a moderate Sweat must be given, to the end, that all superfluities, being got out of the part affected, may exhale in abundance, and that the Spirits gently agitated may begin again their old rounds, within the pores and passages of the part being unlocked by the hot *effluvia*. To this end *Pulvis ad casum Augusti*, *Decoctum traumaticum*, or a Decoction of Madder Root, or Butter-burr, or Flowers of St. John's Wort may be given frequently. Moreover, in the mean time the place affected must be diligently enquired. Secondly, When a Palsy comes upon a Fever, Apoplexy, Colick, and other Diseases, it is a great one, and comes suddenly. First of all we must use our skill in Physick to remove its Conjunct Cause, which usually has its seat in the *Medulla oblongata*, or *Spinalis*. Thirdly, An habitual Palsy depends on the *Procatarxis*, either in *fieri* or disposition, or in *falso* or habit, each of them requires a peculiar method of Cure. The intentions of Cure in the former will be. 1. That when the works of making Chyle and Blood are rightly performed, Matter both laudable and plentiful enough for the breeding of Animal Spirits may be supplied to the Head. 2. That the Brain, being still firm, the Heterogeneous Particles being excluded, may admit proper ones, and rightly exalt them into Animal Spirits. But if a Palsy arise after a previous disposition in the whole, or in one side, or in certain parts, a large and complicated method is always requisite, and often not sufficient, for the Cure of it: for not only the Disease, or its Conjunct Cause, or the Procatarick, must be opposed severally; but all of them must be opposed at once. Cephalick and Antiforbuitick Medicines use to do most good against the Procatarick Cause of the Disease. But all such are not proper for all Men; but, as we have observed in the Scurvy, according to the various Constitutions of Patients, so the Medicines must be of a different kind and virtue. For Medicines that are hot and endued with very active Particles are not proper for Bilious Paralyticks, in whose sharp and hot Blood there are much Salt and Sulphur, and but little Serum, yea, they often do harm; which yet are very good for Phlegmatick Persons, whose Blood is cold, contains much Serum, and few active Elements. Wherefore according to the twofold state of Patients, it will be proper to proceed in two methods; one whereof must be for cold Paralyticks, another for hot.

Willis.

XXVIII. *Paulus*, l. 3. c. 43. writes, That in his time there was a Colick, which ended either in a Convulsion or a Palsy; and that it could no way be cured but by a certain rash Physician, who cured it with cold Herbs, drinking of cold Water, and incrassating Mears; whence one may gather, that the Humour was hot and bilious. I also a few years since saw an illustrious Bishop, who after a Colick fell into a Palsy in his Arms, and used hot Medicines a long time to no purpose; at length, when for a long time he had used cold Herbs, (not to cure himself, but on account of Religion) and cold Water, &c. he was cured of his Palsy. ¶ Seeing it comes sometimes from bilious and hot Humours in abscesses after acute Diseases; and sometimes from abundance of Blood falling upon the Veins at the Spine, it must not be cured by hot Medicines. For in the first case emollient and temperate things must be used, such as Fat and Marrow: but in the second case only Blood-letting is usually the Remedy: for a Palsy from Blood is not a true Palsy; but is cured by accident, in as much as the Veins being full do compress the Nerves.

Saxonia.

Fonsca.

XXIX.

XXIX. I have seen several Melancholick Persons cured by the use of Chalybeate Medicines, who being deprived of the motion of their Limbs, have been reckoned Paralytick. Among these was a Noble Maid, who belonged to the Queen of *Burbonia*, who being deprived of the use of her Limbs by the violence of the Melancholick Juice, and committed to my Care, by GOD's Blessing, left me chearful and in her perfect Health, all that had her in hand before admiring the success, in whose Judgment she had a Palsy, and they went a quite contrary way to work to that which I went, by means whereof I cured her. ¶ So in the year 1663. one of *Newemburg*, by name *Convers*, took my Advice, when I lived at *Geneva*, for a numbness in all his Limbs. The Physician, which he had made use of, contended with the Pituitous Humour, being intent on strengthening and drying the Brain, which was too dry already. Because there were remarkable signs of an Hypochondriack Affection in him, I bid him be of good cheer, and lay aside all vain fear of a Palsy. So laying aside his prescribed Medicines, a Decoction of *Guajacum* and such things, whereby a great driness was brought upon him, and instead thereof giving Chalybeate Waters, and opening things, in a short time he perfectly recovered.

XXX. It is known, that Convulsions arise from Malignant Vapours coming from Worms; but I do not remember, that I ever read of a Palsy arising from thence. A Noble Maid was twice taken with a Palsy of her left Side, being as it were turgid with Blood, but easily dispersed, a Vein was opened on the contrary Side, Revellents and other things were used: but the latter time, after she had taken some Pills, she voided a great number of Worms, and after that has lived well till this day.

XXXI. Being taught by Experience, we judge, when the Colick Pain ends in a Palsy, that the Matter gets out of the Guts into the Limbs, and habit of the Muscles, by means of the Veins: Wherefore the Nerves and Tendons, which are inserted into the Muscles, both because of their fulness do not admit the Animal Spirit; and especially because of their softness, are distended, and cannot contract the Limbs, whereinto they are inserted. This Palsy therefore differs from that, which accompanies an Apoplexy or Paraplegia, in its Original and Causes: For in that, which comes after the Colick, all the mischief arises from the Intestines, and by violence is carried to the out parts, and seizes the Muscles, Tendons, and the out parts; oftentimes the Principle of the Nerves being unhurt, which in the other is affected together with the Head and Spinal Marrow. Hence it is obvious that they are much mistaken, who endeavour to cure this sort of Palsy, improperly so called, in the same manner as they do the true Palsy properly so called: Because in this later the cause of the Disease must be fought for about the beginning of the Nerves; which yet in the other way keep its natural Constitution. Therefore such a Palsy cannot be cured by curing the Brain, or the Spinal Marrow, but rather we must take care, that the Antecedent Cause, which is still in Fluxion, may be stopt: and that which is next the part, and in the original of that imbecillity, may be corrected and consumed, as much as may be.

XXXII. We must help Extenuation of the Limbs, beginning with gentle things, and fomenting the Arms and other parts, with parts of Animals newly killed, while they are hot: If that do not succeed, we must go to bathing in Sulphureous Baths: But if that do not succeed, we must proceed to Pication, but with great caution, taking great care that an Inflammation do not follow; for if the Swelling or redness go off quickly, it is well; but if they continue long, it is a sign of the fluxion of the Humour to the part, especially if the Veins

swell, which as soon as it appears, we must desist immediately: For this Remedy requires great care and skill in the Physician; yet according to *Galen*, this is the only Remedy above all others.

XXXIII. I have found, that the continued use of Nervous Infusions is excellent in the Palsy: And they do the work, because they act slowly and successively, and by searching deep they slowly open and put in motion, that which has been slow in gathering.

Medicines especially made use of by eminent Physicians.

1. If it come from the Head, this is an excellent Elixir; Take the small Roots of Bees; Bruise them, till they become stringy; then put these Strings into the Juice of the said Herb, into which a little Pepper, Masterwort, Castor, and *Elastrum* has been put, take one or two of these Strings, and put it up the Nostril, like a Tent; This brings away abundance of Excrements.

2. All things being premised that should, *St. Ambrose* his Syrup is very good to cause Sweat, with which I have cured several. It is made thus; Take of Millet excorticated what is sufficient, boil it in Water, till it swell and burst: To 7 or 8 ounces of this Water add 3 or 4 ounces of Greek Wine. Let the Patient drink this Potion in Bed in the Morning, and let him Sweat; and let him repeat this ten or more days, if need require. ¶ Baths wherein proper Herbs, especially Foxes, have been boiled, are very good. In a Palsy after the Colick, for the intemperature of the Bowels, except there be an Inflammation, I have used with great success the distilled Oyl of *Galbanum*, *Barberries* and Gum *Elemi* applied to the Navil. Fried Oats applied in a Bag is good in the same.

3. Universals premised, Let the Paralytick Limbs be anointed with Oyl of Cats, which is made thus; Take a fat Cat, flay her, and take out the Entrails, and cut off her Head; steep her for a night in *Aqua vita*: In the morning stuff her with Leaves of Bayes, Sage, Rue, Lavender, Rosemary. Lard her, and stick Cloves into her: Roast her with a gentle Fire, keep the Drippings. I have anointed the Paralytick Limbs with it, and then carefully wrapt them in Foxes or Cats Skins. ¶ Castor must not be omitted either inwardly or outwardly: for it has a wonderful property in all Palsies.

4. *Hyperus* highly commends Sage Wine, if a draught of it be taken Morning, Noon, and between Noon and Supper, for ordinary Drink. ¶ Spirit of *Sassafras* excels other things. ¶ Oyl of Aniseeds anointed on a Paralytick Tongue, restores Speech. ¶ Paralytick Limbs must be long rubbed with essence of green Tobacco Leaves a good while, made only by infusion in Malinsey Wine, a Sweat being first given.

5. Distilled Oyl of Juniper most happily cures a Palsy from great Wounds of the Head, if the Neck, and *Spina Dorsi*, and the Paralytick part be anointed with it.

6. The fat of a Fox either roasted or boiled, first stuffed with Betony, Sage, Marigold, *Iva Arthritica*, Primrose, and Rosemary, either alone, or mixt with Unguents, is of great moment.

[See Medicines for an Apoplexy, most of which are good for a Palsy, Book I.]

Paronychia, or a Whitlow.

The Contents.

*A Compendious and safe method of Cure. I.
We must take care of the Malignity. II.
Medicines.*

I. **H**OW painful, and long in curing, a Whitlow is, no Man is ignorant; yet if the part affected be cut in the beginning, the pain ceases, and the Patients are quickly cured. I was called to a Matron, who for three days and nights could not sleep because of a Whitlow, which violently pained her; having cut away the Skin, I found a Speck under it in the tip of her Finger thus big, O, in which scarce one drop of Ichor was contained when the Speck was cut, and a Cotton applied, dipt in *Aquaviva* wherein Treacle was dissolved; and a Linnen Cloth doubled and dipt in Water and Vinegar was applied to her Hand and Wrist, the pain immediately ceased, so that the next day her Finger was well. I have used this Cure in several others; and always under the Skin, near the Nail, I found something of Ichor. But this Incision must be made at the beginning, otherwise by the violence of the pain the Humours quickly run thither, which cause inflammation and swelling, which an erosion of the Flesh and Bones does follow: for the Skin there is very thick, hindring the transpiration of the Malignant Matter. Therefore before incision I order them to hold their Finger in Cow's Milk, wherein Flowers of Chamæmil, Melilot, Seeds of Fænugreek, Line and Quinces have been boiled. And there is no danger in Incision, nor Pain, nor offending the Nerves or Tendons, because it is superficial. But the other way, commonly used by Practitioners, namely, Incision, which is made from the *superficies* to the center, and towards the Bone, is very dangerous, for it hurts the Nerves and Tendons, whence comes pain, &c. It is sufficient for me to cut the *superficies* of the Skin by little and little, and then to scrape off the Skin, till the Speck appear.

Hildanus,
cent. 1.
obs. 97.

II. Physicians that are beginning to practise must observe, that in the Cure regard must always be had to Malignity. I have observed, that a Whitlow very rarely or never has its rise from an Internal Cause, unless some ill conditioned Diseases, as Malignant and Spotted Fevers, long Tertians, not ending, as they should do, in a *crisis*, or the Small Pox or Measles have gone before, especially when some error is committed either by the Patient or those about him in such Diseases. Of which this may serve for an Instance. In the year 1658. a Son of mine, Fourteen years old, was seized with a Fever, like a Tertian Ague, which when after the third fit it ended in a *crisis* by plentiful Sweat, he begged of his Nurse, that she would give over wiping the Sweat, who was afterward free from his Ague fit, and went about his business; but scarce fourteen days were over, when all on a sudden he complained of a swimming and pain in his Head, then he was neither able to sit nor stand, so that his prevailing symptoms cast him from his Stool to the Ground: He could not lift up an Arm, nor rear his Languid Body; and all his Senses being entire, a Cynick Spasm came upon him, and he was drawn variously now and then, yet his Limbs were flaccid, as if he had been Paralytick, he was speechless also at times, and made signs: And being asked what he ailed? He answered, He ailed nothing, only he was tired and feeble. I prescribe him Clysters, purge him gently, bleed him in the Arm, because he was Plethorick, and under the Tongue. I give him Sudorificks and Alexipharmacks, because of the Fever, gentle indeed

as to the touch, but malignant in effect, which not hastning so much as creeping to a *crisis*, behold, the Thumb and Ring-Finger of his Right Hand had Whitlows both at once; that of the Thumb vanished of it self, but that of the Ring-Finger required a Surgeon's help, and my Son recovered his Health. The cause of which Symptoms was the stopping of the Sweat which Nature endeavoured to cast off, whereby the Humours being afterwards corrupted, frothing up in the Fingers ends, (by the intervention of the Veins and Arteries, by benefit whereof the Circulation of the Blood is performed in these parts) gave occasion to the Whitlows, which, if I may so say, were preposterous *crises*, which, when Surgeons do not handle as they should, expecting perfect maturation, they render their Patients mucous, or lame of their Fingers ends, because the Bones do sphacelate.

Simon Pauli

Medicines especially made use of by eminent Physicians.

1. I have tried this certain Experiment several times; Take live Earth Worms, bind the Whitlow in the beginning, then check and heal it, so that it lasts not above a day. Baricellus;
2. The Blood of a Mole smeared over the Finger, and the Skin tied over it, cured a Whitlow in one night. Van Helmont.
3. The Crum of White Bread boiled in Milk, with the White of an Egg, and a little Turpentine stops the pain, especially if some Mucilage of *Psyllium* be added. ¶ Goose Dung is much valued by Surgeons as it is warm made by the Goose, and applied, which is requisite in this Disease. Platerus.
4. Worms found in the Teazle are good, if they be taken and bound on alive. Platerus;
5. Root of White Nettle, applied with Wine, I have often tried to be very good. Sennertus; Ströckerus;

Quick-Silver may safely be put in Cataplasms. VI.
They strike in after Blood-letting. VII.
Whether they must be opened with a Knife, or with a Cautey? VIII.*

I. **W**HILE we attend Suppuration, if perchance it should happen, that by the efflux of Humours either to day in the evening, or to morrow morning, the swelling should grow to such a bigness, that the Swallowing, and perhaps also the Breath might be stoppt, then without doubt we might proceed to take away Blood by opening a Vein, as *Galen*, 3 per loca, teaches us. Moreover, when the Parotides are caused by Blood, *Trallianus*, l. 3. c. 6. advises the opening of a Vein immediately, to prevent Suffocation.

Fortis, cent.
91. cent. 1.

II. Although *Oribasius* and *Aetius* advise, That not Repellents, but rather Attrahents should be used; yet if the Humour come with violence, the same *Aetius* advises, that nothing be done with Curiosity; yea, *Trallianus* observes, that if it be caused by Blood, Attrahents may very easily cause Suffocation, which was taken from *Galen*, 10 *Simpl.*

Nos

Idem. Not Repellents, says he, but rather Attrahents, or at least Laxatives, or the whole affair must be committed to Nature acting aright.

Idem. III. Although Celsus, 6. de re med. 6. advise the opening of a Parotis presently; yet this ought never to be done in the beginning, nor unless there be some suppuration of the Matter: Nor yet must we expect Pus in the Superficies, as some unexperienced Persons think, for before it rises, it sinks and diffuses it self into various and difficult Sinus's. Besides, if it be long before the Abscess be opened, the Antecedent Matter sticks in the head, when the Conjunct will not make way for it, for that without hinders that within.

Idem. IV. When the Abscess is opened, we must abstain altogether from evacuating and diverting Medicines, and must use only Clysters. As also we must insist on Attenuants, to wit, store of Zulepium Acetosum, with respect to the febrile heat.

Idem. V. In Parotides, that come after other great Diseases, I use burning in the very tumor, presently, without expecting any suppuration. For we can no way better prevent the falling back of the swelling, than if the Matter be purged out by the Ulcer, which is inflicted.

Vallesius. VI. One would scarce believe, did not Experience testify it, what virtue there is in Quick-Silver (which some reckon cold and moist) to dissolve and discuss swellings of the Ears, or any other Swellings. Therefore it may safely be mixt in Cataplasms; for it will not repel the Humour, that is the cause of the Parotis inwards, but will discuss it by insensible Transpiration.

Ench. Med. Pract. VII. A young Man, otherwise of a good Constitution, being ill of the Parotides behind his Jaws, was taken ill with a Fever: Upon which he grew worse, because perhaps they began to ripen; and the Physicians taking little notice of it, he was let Blood in the Arm, after which the Swellings immediately went in, difficulty of breathing followed, his Fever increased much; on the sixth day Exanthemata came out, with great weakness, and within a little while after the Patient died.

Rumlerus, obs. 56. VIII. The Abscess may be opened with a Knife, if the Patient be young, his innate Heat brisk, and if the Tumor be rather Phlegmonous or mixt with Bile, than Oedematous or mixt with Phlegm. Nor is the Knife always so safe, that is, when a Man is old, the Native heat weak, and the Febrile strong, and the Humour, the cause of the Swelling, inclining to cold; for then a Wound may cause a Gangrene, for which reason we use a Caustery in stead of a Knife.

Medicines especially made use of by eminent Physicians.

Fontanus. 1. Take of old Hogs Lard not salted 3 ounces, Butter 1 ounce, Wax 2 ounces, burnt Oyster Shells powdered 2 ounces. Make a Plaister. It is most effectual to discuss the Parotides.

Hertod. 2. This is an admirable Unguent to assuage and dissolve; Take of Oyl of Henbane expressed 1 drachm, Oyl of Chamæmil distilled half a drachm, of Saffron distilled 5 grains. Mix them.

Medicines.

I. Hippocrates, 1. de Morbis Mulierum, prescribes a Remedy for hard Labour almost omitted by all; it is Bleeding in the Foot. But if, saith he, a Pregnant Woman be kept a long time, and cannot bring forth, but is in Pains of Travail for several days: If she be young, and in her full strength, and abound with Blood, a Vein must be opened in the Foot, and Blood taken away, respect being had to the strength. Although this be never put in practice by Practitioners, but is rather dreaded, because strength is absolutely necessary in Travail, which is much weakened by Blood-letting; Yet if difficulty of bringing forth arise from a Plethora, which Hippocrates seems to intimate, when he says, if the Woman be young, and in her full strength, and abound with Blood, no doubt but it may do much good, seeing the Veins, when they are full of Blood use to make all the inner passages much narrower, therefore in the Nephritick Pain the like Bleeding often does wonders, and facilitates the exclusion of Stones contained both in the Kidneys and Ureters. ¶ In those that have hard Labour, I have let Blood, with great benefit. ¶ It were better in the sixth or seventh Month to extenuate and lessen the Fetus by a spare Diet and Bleeding, especially if the Woman be with Child of a Girl: for Girls when they are born, are always fatter than Boys.

Idem. II. Many things are commonly disputed about a Cesarean Birth. Baubinus his Opinion to me seems probable, who in his Preface to Fr. Roussetus his Book, proves by Reasons, That by no Art the Child can be cut alive out of the dead Mother: And though an Example be brought, (such as Crasus, l. 5. f. 371. mentions out of J. C. Arantius) he thinks the Mother was wronged, before she was dead, or it happened by chance; that is, the Surgeon by chance hit on that very last point of time, when the Soul was just going out of the Body. Sennertus seems not to be of this Opinion, and he says the Child has a Soul, which makes its Body to survive the dead Mother: And though he seems there to have given an Epitome of Roussetus, yet he contradicts not Baubinus his Reasons, nor according to his custom examines them. Horstius also in Fab. Hildanius, says the Child in the Womb lives not by its own Life, but its Life depends upon the Mother, which the Anatomy of an Infant does demonstrate, and he gives a further demonstration. Laurentius, fol. 324. Anat. demonstrates the same, where he had proved before, That a Child in the Womb neither breaths, nor breeds Vital Spirit, nor do the Heart and Arteries beat of themselves, and therefore all parts belonging to these things, as also all that belong to the first and second Concoction, are idle in the Child and useless; but all these things are communicated by the Mother. ¶ We must know, there are three cases, in which we may think of this Chirurgery. 1. When the Child is dead and the Mother alive. 2. When the

Riverius.

Rondeletius.

Idem.

Hæserus, Herc. Med. l. 7. c. 4.

the Mother is dead and the Child alive. 2. When they are both alive. In the first case it is not necessary to expose a Woman, who cannot easily be delivered, to manifest danger. Because, if it cannot be got out by Surgery, Nature has found other ways, by the *Anus*, *Navil*, *Groin*, as Histories do testify. The second case frequently happens, That the *Embryo* is condemned to darkness, before it see the light, and the hope of a living Soul dies with the Big-bellied Woman, as the Emperor, *l. 10. Digest. tit. 8.* speaks. By whose fault? Whether the Magistrates, as without whose consent that Operation cannot be performed? Or the Surgeons, who are afraid of *Vesalius* his fortune, who, when he was cutting open the Breast of one, whom he thought had been dead, found the Heart then beating? For it is necessary, that the Section be made almost in the very point, when the Mother expires, or while the Infant does still stir and leap. Nor does it any good to keep the Mothers Mouth open with a Key; for it is a vulgar error, to think that the Child lives by the Respiration of the Mother. The third case is when a live Child is cut out of the Mother alive: This is truly a *Cæsarean Birth*, but how dangerous this Operation is, any one may easily see. And though it must be acknowledged, there may happen a necessity of making such a Section, yet so many, and such Circumstances must be observed, that in the interim, in this hazardous case, no Man dares put his Hand to this Operation, for fear of the disgrace. For it is a thing worth the observation, that after *Rouffetus*, there was never found an Eye-witness, they were all Ear-witnesses, only except *Doringius*, who in an Epistle to *Hildanus* affirms, that in his presence the Womb, which was split into the Groin, was cut open, and a lively Infant was taken out, but that three days after cutting the Mother died: Which thing the Excellent *Rolfincius*, *p. 182. Dissert. Anat.* writes, happened to himself, who therefore dissuades this Operation in a living Woman. But I should earnestly persuade the cutting out of the Child, if it could be known by signs, that the Infant had broke its Cell, and got into the Cavity of the *Abdomen*, as Histories do prove.

Van Horne.

Rolfincius,
Diff. Anat.
l. 1. c. 13.

Rouffetus may boast, as he pleases, of a *Cæsarean Birth*, and may proclaim it secure from danger. I once attempted it, but was so terrified with the unhappy event, (for the Woman died within four days, taken with Epileptick Convulsions, when the Wound that was made, did promise well) that, while I live, I shall never advise this Operation, for fear that they who are decreed to die, should be reported to have died by the Physicians hand. But when I went about the work with Hooks and Pliers, neatly made, I never went away without accomplishing my desire, to the admiration of the By-standers.

Frid. Hofmannus.

III. In difficulty of Travel *Angelus Sala* gives *Mercurius Vita* (a very strong Vomit) to Big-bellied Women; and I have imitated him in the like cases, always with good success.

Barbette.

IV. Among Causes of a hard Labour, this is omitted by all Writers, that I have read, to wit, When the Childs Head, just as the Mother is ready to be delivered, pitches forward above the *Os Pubis*. This is a thing truly not undeserving the notice; for how much stronger the throws of Travel are, and the more the labours, so much less able will she be to bring out the Child, unless the Childs Head be put upwards towards the Mothers Back, and then be directed downwards besides the Bone by the Midwives hand.

V. *Riverius* his Judgment was, That a *Cæsarean Section* must never be practised, while the Mother is alive; because while she is alive, her delivery is never despaired of. He proves it by the instance of a Woman at *Mompeliev*, who had hard Labour,

and, when she was dead, the Child was found dead, but yet delivered; whence it is evident, that the Child may be born at the very last throws, when the Mother dies away, because of her pains, which she has undergone. Wherefore no wonder, if *Hildanus* procured sleep and strength to a Woman in Travel, who was just ready to beat her last, by giving her 1 drachm of *Confectio Alkermes* in 2 ounces of Syrup of Red Poppy, and Water-Lily, and Borage Water; and most happily relieved her. He said also, That a great Wound in the Skin cannot be cured without Sewing, nor in the Womb, which is moister than the Skin, and it has no proper Substrate Matter to breed a *Callus*.

VI. In a Woman that died after her delivery, the Womb was found torn by the coming out of the Child. The Midwives said, that her Womb had a very narrow mouth; a most violent Potion was given her by a certain Matron, to force away the Child, by which her pains and throws were so increased, and the Child forced so violently, that making its way by main force, but finding the passage too strait, it tore the Womb. From whence it is clear, that this kind of Remedy must not be used, but with great caution, and not till we have first considered whether the Womb be fit for it, and whether the Child lie right, before the Potion be given.

Hildanus,
cent. 1. 64.

VII. Sometimes the Mother goes with Twins, one of which is dead (and that always comes out the first) the other alive presently follows. Here I shall relate to you something of this nature, which perhaps may seem wonderful to you, that so you may know how to behave your self in delivering of Twins: For once it so happened, that in my presence, the Mother earnestly contended with the Midwife that the Child was alive, which she said, she felt to stir: on the contrary the Midwife urged that the Child was dead, from many outward signs. But at length it happened, when that Child was delivered, which was reckoned dead in the Womb, and the Secundine was taken away with it, that presently another live Child came out with its Secundine, although before, we could perceive nothing like it by outward signs. Therefore they were both in the right; for the Mother, when she affirmed she felt the Child stir, did not think she had had two in her Belly: And the Midwife, when she contended, that the Child was dead, did little think that another, must have followed. See, I pray, how variously things happen: And let it be a Maxim to you, not to use (as some are of the mind) an Instrument in delivering a Child, for nothing is more certain than the Hands, nothing more secure and gentle. But, to return to my former Story; When the dead Child was delivered entire alone, we searched, if by any signs we could find out, what had caused the death of the Child; whether it was the Mothers fault, or it came by some External violence. We took the Afterbirth entire, but corrupted, extended it with our Hands, and held it to the light. We thought we saw something livid and confused in the right side of the *Chorion*, such as comes after receiving a blow, so that the Veins in that part were altogether corrupt and broken. Then we concluded that the Child was killed by a blow about the Mothers Womb.

Car. Stephani,
nus, l. 3. c. 2.
Anat.

VIII. Although I never used Quick-Silver, yet I have often seen a scruple or half a drachm of it given by the Midwives of *Goritia* without any inconvenience. It is given alive, not killed: For that which is killed, sticks to the Stomach and Guts, and causes cruel Symptoms; yet it must be washed first in strong Vinegar, mixt with Salt, then it must be strained through a piece of Leather. For so they that use it, do cleanse it.

Matthiolus.

IX. When delivery is hindered through the Mothers fault, because the *Offa Pubis* and *Coccygii* are not so movable, by reason of Age; it is good to soften them by degrees with an emollient fomentation, which may very well be done two or three weeks before her time: For so the Cartilages that knit the said Bones, are by degrees softened, and the Bones themselves part more easily: For they scarce part asunder, but give a little, to make the passage for the Child more easie. Therefore the steam of Emollient Herbs boiled, received in a Perforated Chair, will be good. Such Fomentations do not only afford Women the foresaid benefit, that is, to cause the Child to come out with more ease and less trouble; but after the use of them Women are not so apt to be lame, when they are up again. Because then the said Bones do give way with less violence, and therefore the softened Cartilages do more easily return to their former state: Which when they are left hard, and parted by violence, and in a manner severed from the Bones, they do seldom return to their Pristine state, but they leave the knitting of the Bones more lax, and Women more or less subject to halt.

X. In hard Labour it is a case that deserves observation. Oftentimes the Child is born in a manner dead, but before the Navil is tied, by pressing the Blood in, as if it had received nourishment, it is restored to life again, which otherwise had died. D. G. Horstius told me, he was at Rome, when the Child was in the Midwife's Hand, and the After-burthen remained in the Mothers Womb, and she fell into a grievous Swooning; so that one while she seemed to expire, anon the Child was just dying, when immediately the Midwife called out, Wine, Wine; Greek Wine was brought, she warmed a little of it, and opening the Womans Mouth with a Strick she poured a Glass of it into her Mouth; so the Woman came to her self again immediately, and was as if she had risen from the dead, and at the same moment the Child began to stir finely, so that both survived, and all was well. Therefore in all Swooning we must not use Vinegar or Lavender Water, as is done commonly, but the best Aromatick Wine. Which also Doctor Sittardus judged should be done, unless the Swooning be with Vomiting; for then it is not amiss not only to give Wine, but to hold a Tasse of Bread and Vinegar to the Nose.

XI. We must not only use things that have a virtue to facilitate Birth from an Elementary quality, but such as have it from their whole Substance, such as the Eagle-Stone, which when I had ordered to be tied to the Thigh of a Woman in Travel, after it had been there a while, a huge monstrous Membrane came away with much ado: but as soon as it was come away, I ordered the Stone to be taken off; for if it should have tarried long on, it would have drawn out the Womb by its potent virtue; which I found in the Wife of N. to whom, being in hard Labour, when the Women had tied a great Eagle-Stone to her Thigh, and after she was delivered, did not take it off her Thigh, through carelessness and forgetfulness; within a few hours her Womb came out, and killed the poor Woman.

XII. One Cause of hard Labour, omitted by most, yet often taken notice of by *Aranus*, consists in the bad formation of the *Offa Pubis*, which are not aptly disposed, that is, broader than they should be, and flat on the outside, so that within they are rather gibbous than hollow, and come near to the *Os Sacrum* and *Coccyx*, and are so strait, that the Child has no way to get out. Then the business must be committed to Nature, seeing there is nothing that the Physician can do.

XIII. Things that promote the Birth do operate, as they either comfort Nature, wherefore a draught of Malmsey Wine is good, and Volatil

Cordials, and all Spices: Or they stimulate, and make the motion quicker, and they are watry, and not altogether void of volatility, such as Pennyroyal Water; Or emollient, as Water of White Lillies; Or Diuretick, as an Emulsion of Gromil Seed and Violet Seed with some appropriate Water: Hither belong Oily things, as Oyl of Amber, Amber also it self; and Saline things, chief among which is *Venice Borax*: Or they allweage and comfort the Nervous Kind, the painful irritation whereof renders the Labour much more difficult: Hither belong Cinnabarines.

XIV. But things to facilitate Birth must not be given, unless the Child be near, and Nature want help. To which is requisite not only, 1. That the space of nine months, or 280 days be fully completed; but also, 2. That there be true pains of Travel; and 3. Which is chief of all, That the Child be near the Birth, for unless the Aperture expand it self, it is in vain to irritate and sollicit Nature, when she does not act, since thereby she as hitherto acting well, is disturbed, so that endeavouring to eject the Child unseasonably, that is, by giving this Provocative, she puts it in a bad posture, and causes a Preternatural difficult Travel: As otherwise the Midwives themselves also, do in this very much offend, while they encourage the Woman too soon, provoke, force, and set them on a Stool.

XV. The Midwife cannot foresee, much less correct, all the vicious postures. Indeed it is easily ordered in a Book, Change, amend the situation of the Child; but in so narrow a place it is scarce possible to do it quickly and successfully: For how can she amend what she does not see? You will say, Can she not feel? I answer, in so narrow a room she may be mistaken in her Judgment. How often do Midwives, judging only by feeling, mistake the Shoulder or the Elbow for the Head? Then how can the Midwife help *Agrippa's* (or Children coming with their Feet foremost?) What if the Child come double at the Hips? How can she help this ill posture?

Medicines especially made use of by eminent Physicians.

1. Amber given to Women with Child hastens the Birth wonderfully. A certain Physician gave 1 scruple of *Borax* dissolved in a Decoction of Motherwort or Savine, to Women in hard Labour, and he did wonders: for quickly the Child came out alive or dead.

2. Let the Patient tie the Root of Gourd to her Kidneys, and she will presently be delivered: After she is delivered, let it be taken off immediately, that the *Matrix* fall not out.

3. If a Woman before her Travel drink Oyl Olive, it will prove easie, and she will not be troubled with after-pains. They say, Water of Adders-Tongue does the same.

4. To cause Pain, (for the more easie delivery) Take of warm Water 2 ounces, Honey what is sufficient. Mix them. Give this Dose at any time, when there is occasion.

5. This was communicated to me for an Infalible Secret; Take Nettle-Roots; boil them in Wine; and in a draught of that Wine put of powdered Cinnamon 2 drachms, Saffron 1 scruple. Let her drink it.

6. This is an excellent Secret, and never fails in hard Travel: Take of the Seed of Lavender half a drachm, Plantain, Endive, of each two scruples, Pepper one scruple. Make a Powder. Take it in the Water of Endive and Woodbine, of each four drachms.

7. This has been found to be excellent by long Experience: Take of the Bark of *Cassia Fistula*,

8. *Of Night Heracium*, 16 drops were given to a Woman in Labour, and a dead Child with the After-burthen came away within an hour, the Mother who had hard Labour being safe.

Sennertus.

9. This Powder has been tried by Experience: Take of White Dittany, Amber, of each one drachm and an half. Make a Powder. Give half of it in White Wine for one Dose.

Pectoris & Pulmonum vitia in genere, or, Diseases of the Breast and Lungs in general.

(See Thoracicks, Book XIX.)

The Contents.

- Blood is not to be let to swooning. I.
- It is profitable to open the Hemorrhoids. II.
- Whether Purgers be hurtful. III.
- Whether Manna be friendly. IV.
- Vomiting is not always hurtful. V.
- Antimony is both the Medicine and Poison of the Lungs. VI.
- Purging Clysters hinder Expectoration. VII.
- Things that incite too much, do sometimes hinder it. VIII.
- Eclegmas or Lambitives sometimes rather hinder than promote it. IX.
- They are not good if a Fever be present. X.
- When they are to be prescribed. XI.
- The too much use of them hurts the Stomach and Liver. XII.
- Sweet things hinder Expectoration in Choleric Di-
stempers. XIII.
- Astringents are profitably added to Expectorators. XIV.
- The excellency of the Decoction of Turnips. XV.
- The efficacy of Suffumigations. XVI.
- Whether the Smoak of Tobacco be profitable. XVII.
- When Diureticks are proper. XVIII.
- Those things which pass into the Lungs by the Wind-
Pipe, act more effectually than such as are swallow'd. XIX.
- Whether sweet or harsh Wine be best. XX.
- Anointings of the Breast are oft hurtful. XXI.
- The correction of the Flowers of Sulphur. XXII.
- When Sulphureous Waters may be drunk for strength-
ning the Lungs. XXIII.
- Whether the Origin of Fluxions be always from the
Head. XXIV.
- When Lambitives are hurtful. XXV.
- They are unfit to astringe. XXVI.
- Simple Flowers of Brimstone are better than the
Compound. XXVII.
- Acids are to be temper'd with sweet things. XXVIII.
- How the Serum when it is too Acrimonious, is to be
temper'd. XXIX.
- The Serum must be thickened that it may be expecto-
rated. XXX.
- The Correction of an Humour offending in Acidity. XXXI.

I. **T**Hough Galen says, (1. Aph. 23.) That in great Inflammations, and especially burning Fevers, Blood is to be let to swooning away; yet it is very dangerous to bleed to that degree in Diseases of the Spiritual Parts: Wherefore, though we ought to bleed plentifully, and even almost to fainting away, yet we must not proceed so far as till the Patient swoon, which the

skillful Physician will understand by feeling the Pulse.

II. Evacuation out of the Hemorrhoidal Veins has great consent with the Breast.

III. I do not approve of Evacuations in Pectoral Diseases from a Catarrh; and those Physicians who are but indifferently learned, and vers'd in the practice of Physick know the Reasons: For what good do Evacuations do as to the Concoction, or Evacuation of the Matter out of the Breast? What do they do towards derivation, seeing they move and roll it the more? What do they do as to the strengthening of the Head and Stomach? What towards the Correcting of the Temperature of the Liver? I know something may be said against me: but I have found by Experience that in Pectoral Diseases it is most profitable to abstain from Purging Medicines. Thus *Crato* in *Scholtzius* conf. 4. yet he uses them in difficulty of breathing from a Catarrh. *Foris*, conf. 7. cent. 2. writes thus: Let strong Purgation follow Lenients and Preparatives: for it is not to be queried whether Purgers draw from the Breast or no; for besides that they may draw forth Humours by the *Vena sine* part; whilst the whole Body is purged part after part, the Breast it self is also purged; for there is one and the same Conflux, one Conspiracy, all things consenting. Indeed though they be not proper in respect of the Matter that is pass'd out of the Vessels, yet they bring forth the antecedent Matter at least, whether it flow from the Brain, (seeing 'tis manifest that the stronger Purgatives draw from thence) or through the Pulmonary Artery into the Lungs, which has convey'd thither the Cacoehymic mixt with the Mass of Blood.

IV. Their Opinion ought to be rejected, who understanding that Manna is friendly to the Breast, give it to those who have their Breast loaden with Crudities, not seeing that Crude Humours are made more thick and unapt for Concoction when the Serum is discharged: I have often observed such to be thrown into a very bad state by the giving of Manna. Nature desires that thick Humours should be made fluid; but those who give Manna, or Scammony, separate the Ichors, or watry part, and make the remainders of the Humours thicker. *Johann Baptist Montanus* considering this, gives Manna with the Cream of Tartar for the bringing forth of the thicker Humours. I lately saw the efficacy of Manna given after that manner in an Asthmatical Woman, whose Lungs being turgent with Serum, she was cured the same day, a great quantity of Serous Humours being carried off.

V. Vomiting is not good, if there be a solution of Continuity in the Lungs: but if they be full of thick and Viscid Humours only, 'tis an excellent Remedy. Hence 'tis false, That Vomiting is hurtful in every Disease of the Breast. It often happens that a slimy tough Matter lies a Finger breadth thick upon the upper side of the Midriff, which kills the Patient unless it be taken away by Vomir. So died a certain Landgrave of *Hessen*, in whose dead Body, being opened, there was found such a Matter. When an Empyema follows a Disease of the Lungs, it shall be cured by *Paracentesis* or Tapping, or by purging off the Pus by Stool and Vomir: Which I remember was done a few years ago by an Empirick by a particular Decoction, by the help whereof a Patient that was esteem'd to be incurable by several Physicians, being affected in his Breast, and wasting away by degrees, was cured very well in a few weeks, and still continues well. Let none censure that rashly, which he knows not the reason of. It is clear by Experience, that from a violent straining to Vomir, the expulsion of what is contained in the Wind-Pipe is promoted; except in Spitting of Blood, wherein Vomiting is always dangerous.

Idem, c. 23.
p. 29.

VI. One taking the Flowers of Antimony of a Mountebank fell into an Apoplexy, during which he fell into a great Salivation, so that he quickly emptied by his Nose and Mouth a great deal of frothy Phlegm. His dead Body being opened, the Region of his Breast, his Stomach, and Head were found full of such like Matter. Whence gather, That as *Antimonium Diaphoreticum* being well prepared, is an excellent Medicine for the Lungs; so being not as yet deprived of its Arsenical Sulphur and Mercury by Calcinations and Solutions, is a very great Poison.

VII. We must abstain from *Astringent Clysters* when there is a brisk Expectoration; for Expectoration is hindered by the virtue thereof, the Matter being drawn downwards: and in such case there follow anxiety, inquietude, and divers other Symptoms.

VIII. According to *Hippocrates*, l. 3. de vit. acut. v. 68. Medicines that incise and attenuate much, such as *Oxymel* that is very sharp, are to be abstained from in Diseases of the Breast, when the Patients through weakness cannot Cough up: for the Matter by such Medicines is not only made more tough, and so the harder to cough up; but being deterged from the sides of the Vessels, it slides into their Cavities, and so causes a greater suffocation (the passages for the Air being stoppt) than when it cleave to the sides of the Wind-Pipe.

IX. Amongst the conveniences of *Pisum*, *Hippocrates* (in acut. l. 29.) reckons these, That it is fluid, and sticks not to the Parts, nor carries in the passage that goes directly to the Breast: from whence we may gather, that he takes away the use of all Lohochs, because they cleave to the Parts, and cause Anhelations in the Inflammation of the Lungs, Pleurisy, and Asthma. For the Ancients used Lohochs only for sore Mouths, where it was necessary the Medicine should tarry some while.

X. The same are not good when a Fever, and a Cough or other like Distemper of the Breast come together. Thus in Catarrhal Fevers, in the Small Pox and Measles, and especially the Pleurisy and Peripneumony, Lohochs have no place. Nor are those to be listened to, who in a Pleurisy, especially in the beginning thereof, commend *Spec. diatrachacanth. frig.* and such like, which are quite opposite to the indication and motion of Nature. So that *Heurnius's* Advice (in Meth. ad prax. p. 313.) is rather to be followed; nor does *Helmont* write amiss in this case, That Syrups and Lohochs have not benefited one of a thousand, and therefore we ought to persist no longer in this Miry Track.

XI. Some Physicians do ill in prescribing *Lambitives* at the first Visit, (such Physicians are like Women) for the Matter that is in the whole Body forbids them. For a Lohoch is given upon the account of a Cough; now by a Cough the Lungs, Breast, and Pleura are agitated: and therefore if the Body be full of Humours, they rather hurt, by the attraction of new Matter, than profit. Wherefore they ought not to be prescribed till after Bleeding and Loosening the Belly.

XII. There is need of some Moderation and Circumspection in the use of *Lambitives*, lest such sweet things, while they stay in the Stomach, turn to Choler; or being carried to the Liver, cause Obstructions there. We see that by the too frequent use of *Lambitives*, those who labour under Pectoral Diseases do sometimes fall into a Dropsy: for there is but a small part of such Medicines that slides into the Lungs, the greatest part going to the Stomach and Liver.

XIII. That Admonition of *Hippocrates*, lib. de vit. acut. is very worthy of notice: Sweet Wine in such as it makes thirsty, helps Expectoration less than other Wine. Therefore though sweet Wine do not itself facilitate Spitting, yet in such as are Choleric, or labour under a Choleric Cacochy-

mie of the Breast, as a Choleric Pleurisy, Peripneumony or Destillation, namely in such as it makes thirsty, it brings forth less Spittle than the Vinous, because it heats the Liver, increases Choler, dries the Lungs, and makes the Disease drier. Which same thing is to be observed indeed in all other sweet Potions and *Lambitives*; nor must we without distinction press *Lambitives* upon all who we desire should Cough up easily; for in some (namely such whose Breast is very hot, and their Liver Choleric) the Phlegm will come easier up by abstaining from all such things, and allowing only Water or a Decoction of Barley. As for my self, I give to such only warm Water to concoct the Phlegm, and find a very good effect of it.

XIV. That such things as astringe moderately, are necessary, and not hurtful, in Diseases of the Breast, especially being mixed with other things, appears from the composition of the Syrup of *Lykorrhize*, wherein *Mesue* puts Rose-Water. Now such things are profitable, in as much as by condensing and strengthening the substance of the parts of the Breast, they hinder the unprofitable Humours, that are sent from other parts, to be so readily received; and such as they have received, whether they would or no, by contracting themselves, they expel the more strongly. Thus *Avicenna*, in imitation of *Hippocrates*, 3. de morb. prescribes a Wine of Sweet Pomegranates for the Peripneumonick and Pleuritic; upon which account he is blamed by some for prescribing an Astringent where there is occasion to dilate: for according to *Galen*, 8. x. r. even sweet Pomegranates bind in some measure: though some think it to be prescribed upon the account of the Looseness that sometimes happens in these Diseases. It may be added, That moderate Astringent helps the Penetration of the rest.

XV. How profitable a Decoction of Turnips is in Pectoral Diseases, loosening the Matter collected in the Breast, I have found by Experience, and therefore I earnestly recommend it. Take Turnips and pare the Rind off them, slice them, and pouring Water on them boil them a little; throw away the first Decoction, and boil them again in fresh Water: Press out the Juice, to which add a little fresh Butter and Sugar Candy.

XVI. Nothing is more difficult in Diseases of the Breast, than to bring the Medicines to the place affected, for through the length of the way they hardly do any good: for the greatest part of them (if not all) slides down the Gullet into the Stomach, and before they reach the Lungs, their virtue is either lessened, or altogether destroyed. It seems more advisable therefore, that Pectoral Medicines, whether Lozenges, *Linctus*, or others, be held a good while in the Mouth, that they may slide down leisurely by the sides of the Larynx: yet this is but a slow kind of Remedy. That Medicines may be received plentifully and speedily into the Lungs, we must make an artificial use of Respiration: A Decoction of Vulnerary, Pectoral Herbs and others, according to the scope of the Physician, is to be prepared, the Vapour whereof let the Patient continually receive, together with the Air, in Inspiration: for thus the Steam being carried to the Lungs in its entire virtue, and by a short way, shall cure the Diseases thereof. Let all the Air be thus infected to the benefit of the Patient; and you need not with *Galen* sail to Egypt, your Chamber may become an Egypt for you. I think the Diseases of the Breast, Head, and Lungs can be helped no way better than by Vapour. For as we relieve the thick Guts by Clysters, the Stomach by Vomits, the Kidneys by Diuretics, because these Remedies reach to those parts; so it seems are the parts serving for Respiration to be helped by Vapours; for nothing else is carried entire into those parts. As for my self,

I often use Vapours for the Diseases of the Breast and Head, setting Kettles full of sitting Decoctions by the Patients Bed side, or using Suffumigations upon Coals: for Concocting and Inciding Vapours may be prepared as the matter shall require. Wherefore it will often be convenient, whilst Fomentations are applied outwardly for allaying of Pain and discussing of Humours and Wind, to receive inwardly the Vapours from Sponges dipt in the Decoction, for concocting or drying. Yet this will not be always convenient; for if difficulty of breathing happen thereupon, we must desist.

Vallef. de
vict. acut.
p. 49. de
evaporat. &
suffumig.

XVII. Without doubt *Tabaco* given in Potion does as much harm to the Stomach and Guts, as it does good to a moist and cold Brain. But 'tis some Question, Whether the Smoak of *Tabaco* offend the Lungs, because it is an hot Plant, yea acrimonious and twitching, either naturally, or by art; namely from the Pouders of *Euphorbium*, *Bastard Pellitory*, *Pepper*, or other acrimonious Spices, which are sprinkled betwixt its Leaves by Cheating Fellows, as they are made up into Rolls: by the Vapour of all which 'tis likely the Lungs are no less offended, than the Brain is, when a Man is made to sneeze by the Pouders of *Horse-Rhadiſh*, or *Pepper*. For as its immoderate heat does exhaust the Radical moisture; so its cloudy Smoak obscures the illustrious spirit of our Life, yea, it suffocates the innate heat so evidently, that like *Tabid* or *Consumptive* People they are waſted with a continual Cough or shortness of Breath.

Nicol. Tulp.
obf. l. 1.
c. 6.

XVIII. I believe that a Catarrh does not only come to the Breast by the Lungs, but also from the whole Circuit of the Veins: witness *Galen*, 2. de fac. nat. who says that all Superfluities flow upon a weak part. Wherefore *Diureticks* are good in such case, because the Matter descends from the Veins, and there is a great consent betwixt the Veins and the Breast. Therefore *Diureticks* are profitable for the Lungs and Diseases of the Breast.

Montan.
conf. 145.
See the title
of Respiration
hurt,
Book 15.

XIX. Those things which bring Matter or *Phlegm* out of the Breast, are prepared divers ways, and are used sometimes in the form of a *Decoction*, sometimes of a *Mixture*, sometimes of a *Loboch*, and sometimes of *Lozenges*. And 'tis good to hold them for a while in the Mouth, that passing leisurely to the Fauces or Throat, a good deal of them may go down by the Weazand, and so may be mixed in a greater quantity with the *Phlegm* that is to be incided. But that which we swallow, may also by a longer way return with the Blood to the Lungs.

Sylv. dele
Boe. m. m. c.
18. sect. 25.

XX. *Hippocrates* uses sometimes sweet, sometimes harsh Wine in Diseases of the Breast. Sweet Wine is not so well allowed of before Expectoration begin, because it does not raise a Cough, whereby the Purulent Matter is discharged: Therefore harsh Wine is then proper, because by irritating a Cough, it causeth Expectoration: but he abstains from it when the Patient Coughs up freely, for then sweet Wine is more convenient to make the passages glib, and to expand the Wings of the Lungs.

Sinibald. l. 4.
Antiph. 14.

XXI. I do not well approve of *Pectoral Ointments*; for though they help towards expectorating of the Matter which is at present lodged in the Breast, yet they make the parts more loose and subject to Fluxions.

Crato, conf.
8.

XXII. I use the Flowers of *Brimstone* in inveterate Diseases of the Lungs with no bad success: but *D. Job. Crato* hath frightened me from the use of them, who disallowing of them endeavours to shew, That something of a more subtil Arsenical Poison is still contained in them. But seeing in strong Distempers strong Remedies also are to be used, and I should hope that by often washing of them with the Water of *Scabious*, *Speedwell*, or the like, that Poisonous quality may be taken away, or at least so corrected as not to hurt, I would not

in that case be against the use of these Flowers. Now half a scruple or a scruple of them may be given in one of the forementioned Waters, adding *Spec. Diarr. Simpl.* in the same quantity; or take half a drachm of each of these, and with two ounces and an half of Sugar dissolved in proper Waters make *Rosula*, whereof let one or two melt in your Mouth often.

Joac. Camer.
rar. in citta
medic. Hor-
nungi Epist.
118.

XXIII. The Head being dried, and the Lungs themselves in some sort, the drying and strengthening of them may be perfected by *Sulphureous Waters*, drinking them for twelve days with a loosening Vehicle. For there can be no Remedy more excellent in art; yet it is not proper till the Head be first dried, seeing it ascends thither, fills and tuses it, and so increases distillations; yet when the Head is dried, it dries it yet more without any inconvenience attending.

Joh. Ray-
mund. For-
tis, conf. 13.
cent. 2.

XXIV. The Substance of the Lungs is soft and spongy, therefore is it subject to defluxions above other Bowels; whether those come from the Brain, or from the *Viscera* by the mediation of the Heart. For when the Head does destil Rheum upon the Lungs, and the Liver supplies an impure Blood to the Heart, which the Heart pours out again into the Lungs, their Substance is thereby infected, but that taint flows not from the Heart, but from the Distemper'd and ill Condition'd *Viscera*, which send impure Blood to the Heart, whose fault the Heart cannot correct but by many Circulations. Now the Lungs cannot receive Humours from the Head without a Cough; for if this be wanting, they suffer only from the Blood of the Heart: for the Lungs alone are supplied with Blood from the Heart, receiving Vessels therefrom, and not from the *Cava*.

Riolan. en-
chir. Ang-
tomit. l. 3.
c. 6.

XXV. Medicines that raise a greater fermentation are not to be added to *Ecloges* or *Lambitives*. Thus 'tis well known that the Flowers of Sulphur, and the Milk of Sulphur (so called) are excellent Pectorals, and yet 'tis advisable to give them rather in any other mixture than that of *Lambitives* or *Electuaries*: The same may be said of Salts, which 'tis better to omit also, because they are not so friendly to the Breast. For 'tis certain by Experience, that the mixing of Sulphurate Remedies with sweet, does in a special manner cause a fermentation: whence a resolution and *impetus* being made, such *Lambitives* (which also of themselves are apt to ferment, alter the manner of other sweet things mixt with what is Heterogeneous) incline to the out-parts of the Vessel, so that the Vessel seems always full, though every day something be drained thence. ¶ *Lambitives* are naught for the Stomach; for sweet things, as *Macrobium* says rightly, are enemies to Concoction; for by the continued use of them especially, they loosen the sides of the Stomach, dull its heat, and impair its ferment; so that *Montanus* himself (*Conf. 32.*) rightly admonishes us not to give them but on an empty Stomach, lest Concoction be hindered: Hence they destroy the appetite: So that where there is a weakness of the Stomach, especially a flagginess, they are more sparingly, or not at all to be used, but always when we use them we must have regard to the tone of the Stomach.

Wedel. de
medicin.
compol.
140.

XXVI. *Lambitives* do not bind safely, for they ferment the Humours, and by their proper sweetness do rather smooth, lubricate, and mollifie, than bind: so that we must not wholly trust to these in salt, acrimonious, and thin Catarrhs, nor in Spitting of Blood it self: whence it may be noted as a Rule, That *Lambitives* are indeed proper only for the Lungs, but yet not they alone for the Lungs alone, and that by altering.

Idem, p.
143.

XXVII. The simple Flowers of Sulphur are better than the Compound. As (*entia* or) several distinct Medicines use almost in every case to be

Fr. Sylv. m.
m. l. 2. c. 18.

be multiplied by Chymists without necessity; so is the same observed in the Flowers of Sulphur: for some prepare them with Aloes, Benzoe, Saffron, Myrrh, the Colcothar of Vitriol, Nitre, that they may look white, with common Salt, &c. and then give them among their *Arcana*; but generally with light and small success: For what does Colcothar communicate, but a Corrosive Acrimonious Quality? What afford Aloes, Saffron, or Myrrh, but an Empyreuma? For these have no quality to fly away or be sublimed, and they are burnt up the more by a double Fire as it were: And so great a change being made, the virtues which we expected cannot but fail also: so that 'tis better to join other proper things to the Flowers themselves of Sulphur.

XXVIII. As often as *Acids* are used to cut Phlegm, so often they are not to be given alone, but mixt with sweet and Sugared things in a small quantity, lest, if they should be given more singly, they should by their Acrimony too much irritate the Lungs to cough, and so should do more hurt than good.

XXIX. When the *Serum* is too *Acrimonious*, some things are to be used which may temper it, because through its Acrimony it does not only by its twitching cause frequent Coughing and wearies the Lungs; but also frets the Coat of the Wind-Pipe, and by degrees creates an Ulcer in the Lungs. Its most frequent Acrimony is a *Salt Muriatick*, more rarely such as is very acid: its sourness uses to cause singular disturbance. The *Salt Muriatick* Acrimony of the *Serum* is temper'd and blunted in part by the *Incrassates* to be presently mentioned, which by their Emplastick virtue do lenifie that Acrimony; and this they do more effectually if Opiats be joined with them, as the Pills commonly known, called *Pil. de Cynoglossa*, and *de Syrace*, do testifie, which are very well fitted for this purpose, and might be yet more fit if by adding Sugar they were made up into Tablets or Troches, and held in the Mouth: for so a far greater part of them passes to the Lungs, than when they are made up into Pills and swallow'd; though even so they are likewise observ'd to be very effectual, though every Caviller is not presently satisfied in the way by which the virtue of the Medicine is transmitted to the Lungs. We therefore recommend the said Pills *de Cynoglossa* and *de Syrace* for Salt Muriatick (or briny) Humours that are flown into the Wind-Pipe, and ought to be expectorated thence, in as much as they both temper their salt Acrimony, and lessen their too great fluidity, and so procure to them a Consistence convenient for Expectoration, and for Expulsion by Coughing; whatsoever several bawl to the contrary.

XXX. The *Serum*, be it of what taste it will, ought all of it in general to be *incrassated*, that it may the more easily be Expectorated; for otherwise it escapes the violence of the expired Air, and can be expelled but slowly, and by much Coughing. The *Serum* is incrassated by Gum Tragacanth, Gum Arabick, the Roots of Marsh-mallows, Comphrey, &c. of which, with Sugar, Troches may be made, which being held a good while in the Mouth, and by little and little dissolved by the Spittle, do leisurely tend to the Wind-Pipe, and thicken therein the over-fluid *Serum*, making it fit to be the easilier expelled by the help of the Air in Expiration.

XXXI. As to Medicines correcting an Humour offending by a more pure acidity, and helping Expectoration, they are the same which correct the Salt Muriatick *Serum*, and moreover such as *concentrate* and *infringe* Acids, such as Crabs Eyes, Pearls, Corals, Chalk, all sorts of sealed Earth, &c. But because the Wind-Pipe uses to be fretted sooner and forer by an acid *Serum*, 'tis necessary

not only to use the Remedies that more effectually correct it, but they must moreover be so prepared and administered, that a good part of them may be carried into the said Wind-Pipe. Wherefore the most convenient form will be *Troches* and *Lozenges*, that they may the longer be kept in the Mouth, and carried more plentifully to the Weazand, and may partly therein and partly in the Mouth imbibe and concentrate the acid *Serum*. A *sover Serum* shall be corrected by Medicines that amend it, such as are among the vulgarly known, *Castor*, *Asa fetida*, *Carabe*; among Chymical Remedies, all sorts of *Salts* that are truly *Volatil*, the most effectual whereof I have found to be the Spirit of Sal Armoniack, the Oyl of Amber, Mace, &c. Let the ingrateful things, as *Castor*, *Asa fetida*, be given in the form of Pills.

Idem.

Pectoris dolor, or Pain of the Breast.

The Contents.

An but Pain of the Breast cured by a Seton in the Part. I.

A wandering Pain ceasing by the use of a Decoction of China. II.

A Pain of the Sternum proceeding from a Bilious Humour included in a peculiar Membrane. III.

I. **T**HE most Noble Lord G. & B. being a Man of a very Cholerick Temperament, was long vexed with a most troublesome Pain in the left side of his Breast, which no Topicks or other Remedies could assuage. Himself proposed the passing of a Seton in the part, which with much ado his Physicians consented to. Calling L. S. a skilful Surgeon of Geneva, himself with his Fingers took hold of the Skin of the part affected, and raised it up strongly from the subjacent Muscles: then the Surgeon thrusts a Needle through it, being threaded with a Seton as thick as ones little Finger, and from the upper to the lower Hole there was six or seven Fingers Breadth space. A while after a virulent yellow *Serum* flow'd out in great plenty, which being exhausted the Pain remitted. After six weeks this Noble Person pull'd out the Seton without any return of the Pain.

II. Mr. N. being fifty years old, of a sanguin Complexion, returning out of Italy from the Wars, complains of cruel Pains, afflicting him every Night about his first Sleep: they begin in the left Side, reaching at the same time to the fore and hinder part of the Breast, to the left Side and Shoulder-Blades, with that violence as to awake him; nor can he continue to lie in any posture, but is forc'd to rise: The Pain continues till the morning, and then ceases, and is quiet all the day. He had been troubled therewith for two months, and had used no Remedy. Another Physician thinks that these Pains proceed from a thin Catarrh falling upon those parts in the night, in which season the Phlegmatick Humour is moved: I am of Opinion that they proceed from Wind, which is raised only at those hours by the heat being made more intense from Concentration during sleep: The Matter out of which it is raised, is a puddle of bad and crude Humours collected in the Stomach, Mesentery, and about the Liver, bred from a bad Diet in the Camp; whereby the Concoction of the Stomach is weakened, and thence are *status* sent all about, being raised from the bad Humours: When Concoction is finished, the *status* are no longer transmitted, and therefore towards morning the Pains cease. For Cure I prescribed first an universal

Evacuation by Apozems and Bleeding; afterwards a Decoction of China for fifteen days: by the use of which things the Distemper lessened by degrees, and at length was wholly removed without other Remedies.

III. I have known one or two troubled with a Pain in the upper part of the Breast-Bone, not very cruel, but of long continuance, which intermitted indeed daily a good part of the day, yet so as that there was always some troublesome sense remaining. It caused no difficulty of Breath, nor was it accompanied with a Cough; yet it was somewhat increased by strong Inspiration and deep Sighs, as also by a sudden lying along upon the Back and much bending of the Head backwards, and likewise by yawning and stretching. It always continued fixt in one place; yet it sometimes extended it self to the neighbouring parts of the Breast, and towards the Axill-pits. I thought this Pain proceeded from an Humour fixt between a peculiar Membrane, (for that which is common to the whole Breast, called *Pleura*, recedes a good space from the Breast Bone, while it forms the *Mediastinum*) and the very Body of the Breast-Bone, on that side next the Cavity of the Breast, in no great quantity, but such as was very Acrimonious or Malignant, yet Bilious, the Parties being in the vigour of Age, and of hot Bodies, and very subject to Diseases from Choler. The Cure confirmed this Conjecture, being performed chiefly by repeating Purgers of Choler: I also used fomentations of Anodynes and Relaxers, and laid on a Plaister of Olibanum, Virgin Wax, and Burgundy Pitch, which is of notable efficacy to draw forth gently any sort of Acrimonious Humours that lie deep, and to dissipate them by degrees.

Scultet. obf. 43.

I. Such as being wounded in the Breast, have Pus contained in the Cavity; while it is a purging out by the Wound, there is no better Remedy than not to purge the Body: for if a Purge should be given, all the Humours would run towards the Guts, and the Body would be wasted, whose wasting bad Symptoms will follow.

II. I have often seen Wounds of the Breast penetrating into its Cavity, yet without any hurt of the Internal Parts; which Wounds are indeed of two sorts, one which hurt the Intercostal Vessels, out of which the Blood flowing plentifully, issues into the Cavity of the Breast; the other, wherein the Vessels being not hurt, pour no Blood into the Cavity. The first sort of Wound is to be kept open; which method of Cure all Writers of Physick propound: But if there be no signs of Extravasated Blood in the Cavity, namely, if the usual Symptoms be wanting, amongst which are a Fever,

much Coughing, a weight upon the Midriff, and other such like, then putting a very short Tent into the Orifice of the Wound, wetting it with the White of an Egg, and laying a Linnen Cloth over it dipt in the same, with Bole-Armene and *Sanguis Draconis*, I gently compress the wounded part with a Swathing-Band: and the next day, throwing the Tent quite away, I lay on a Cere-Cloth of Cerufs; by which things I make my Patients sound in seven or eight days. By the same method I also cure Wounds of the Breast that only penetrate the Muscles thereof, though an Hands breadth long. ¶ Penetrating Wounds made in the upper part of the Breast, so that the Matter that is collected within cannot so conveniently be discharged forth, degenerate into an Empyema, according to the general Opinion: On which account I have made Incision in some betwixt the fifth and sixth Rib, and thereby have evacuated the Matter and cured several. See Instances in *Scultetus*, obf. 43. & 59. ¶ I have observed, that as oft as the Matter is quickly discharged, namely, in a days time at furthest, the Patients presently recover, the Matter flowing no longer out by the Wound, and which is strange, the Fever moreover ceasing, which is continual while the Matter stays in the Cavity of the Breast: Yea, this is thought to be a Pathognomonick Sign, That when the Patients are free from a Fever, there is no Matter in the Breast; and does indicate, that the Wound is to be presently closed up: Whereas on the contrary, when the Matter issues out by little and little, all such die; because by its delay the Internal Parts are Ulcerated, Pus is increased, and the Ulcers and Fever grow daily worse and worse: Which therefore must be marked by those that are employed in these Cures; namely, that if the Pus be not evacuated in a short space of time, they see to drain it forth as quickly as they can by Medicines; for which purpose I give either Barley-Water or Water and Honey, which deterge it by little and little, and make it fit for Evacuation, not without the help of Nature expelling it: which Remedy the more strong need not, who in a few days discharge all the Purulent Matter, and are cured, unless this Evacuation be prolonged, and then they dye. See *Parvus*, lib. 9. c. 31. *Nic. Massa* tom. 2. Epist. 11.

Marchet. obf. 41.

III. *Felix Writts* a Surgeon utterly rejects Tents in Wounds of the Breast, and determines, That Pus is self, Blood, or other Matter collected in the Breast may be fully evacuated by Sweat, Urine, Stool, or other ways: But though I deny not that Patients are in great danger, when unskilful Surgeons tie not the Tents with a Thread to hinder them from slipping into the Cavity of the Breast; yet I see no reason why the use of them is utterly to be rejected; seeing otherwise Nature, which expects assistance from Art, cannot discharge the Superfluities.

Scult. obf. 43.

IV. *Cosmus Sloranus*, a very good Surgeon, wholly abstained from Injections that are made by a Syringe: which he bids us observe in all Wounds and Ulcers either in the Breast or lower Belly: for some part of the Injection might easily glide into the vacuity of the Breast or Belly, and grievous Symptoms, with great danger to the Patient might be raised thereby. Yet *Scultetus* used them with very good success, as appears from his 51, and 56 Observations.

Horst. ap. Hildan. cent. 3. obf. 36.

V. One being wounded in his Breast, when I had poured into the Wound a very deterring Injection of Wormwood, Centaury, and *Alues*, there rose up such a bitterness into his Mouth, with a Nausea, that he could no longer endure it. Then I called to mind what once I had observed in one who had a *Fistula* upon his Breast. Therefore when I considered that such bitter things are apt to be received into the Lungs, and to rise from thence up into

Fabr. Hild. cent. 1. obf. 63.

into the Wind-Pipe, Throat, and Mouth, I declared that I would never more administer such bitter things to my Patients; for there proceeds far greater trouble than fruit and benefit therefrom.

VI. One was wounded in his Back, the Sword penetrating as far as to the left Pap; and though a great deal of Blood issued out of the Wound, yet on the third day he breathed difficultly, and had a very great pain near his Midriff. Therefore his Breast was opened betwixt the third and fourth Rib, that the Matter contain'd in his Breast might be evacuated: When the Perforation was made, there flow'd out of the Wound but three or four drops of Blood. Which I would have to be therefore noted, because some say that a great flux of Blood is caused through cutting the Intercoastal Vessels. Yet I will not deny, that sometimes, especially in the Choleric, there follows such a flux of Blood into the Cavity, when a Vein or Artery is cut, which yet may be easily avoided by such a Knife as *Celsus* and *Paulus* call a *Spalba*. Suppose an Intercoastal Vein or Artery be hurt, what matters it? for little or no Blood can be retained because of the Perforation that is made there: and if it should be retained, the next day it will flow out again when the Wound is dress'd.

VII. When no Blood issues forth in Wounds of the Breast, that it may not flow into the Cavity, put into the Mouth under the Tongue one grain of Mosch, and the Blood will presently issue forth of the Wound, which is reputed a Secret, says *Sennertus*, lib. 2. *pract.* From whence collect, that Mosch is to be avoided in any Hemorrhage where we would stanch the Blood.

VIII. Seeing the dignity of the Heart is very great, as being a principal part, 'tis manifest that Wounds in the Breast are more dangerous than others; whence a doubt arises, whether the same be to be treated like others, and like them be to be closed up as soon as may be. Some are pleas'd with the affirmative because of the nobleness of the part, in regard whereof we must have singular care, that the fountain of heat be not hurt by being expos'd to External Injuries; and therefore they endeavour to close up such Wounds with all the Art that may be. But seeing Wounds of the Breast pour out daily such a deal of Matter, as we hardly observe to issue from the Wounds of any other part, because Nature, both for preservation of the Part, and because of the Pain, sends daily very much Blood thither, which being tainted with malignity and filth, or not altered through the weakness of the Part, is quickly corrupted; I say on this account I am of opinion that such Wounds ought to be kept long open, that there may lie open an exit for the corrupted Blood and Matter: for the Blood being retained preternaturally, or any corrupt Humour, will become the cause of greater mischief. Whence *Parvus* (lib. 2. cap. 31.) adds for a decision of this Case, that the former Opinion is true when no Preternatural Humour is contained any longer in the Breast; but the later, when the Cavity of the Breast is filled with Matter and Clots of Blood.

IX. The opening of a *Vomica* or Imposthume is not to be deferred, lest there arise a Fistulous Ulcer, or rottenness in the Bones, which I have oft seen happen to many.

I. A Woman for five years together was taken two or three times a day with a very cruel Pain in the Soal of her left Foot: it rose from a thick *Flatus*, mixt with tough Phlegm, a weakness of the part accompanying, with heat, redness, hardness: Many Remedies being used in vain, at last an actual Cautery is affixed to the Pained Part: after the falling off of the Eschar there flow'd for fifteen days a virulent Matter in great plenty, and the Patient was freed of her Pain.

II. Seeing Excrements are collected about the Extremities of our Bodies, the Hands and Feet, as the most remote from the Heart, more naturally or plentifully than in any other parts of the Limbs, so that our Hands grow dirty, and our Feet are almost crusted over with virulent and stinking *Sordes*, we must be very careful not to hinder the usual defecation there. Wherefore such as pull not off their Boots or Shoes when they go to sleep, do great injury to their Feet: And those consult ill for their health, who to hinder the stinking of their Feet, put in their Shoes Myrtle Leaves, Filings of Iron, &c. For as the Arteries endeavour to discharge themselves of their Excrements in these parts; so when the Defecation (as I may call it) is hinder'd any way, the Veins are made to absorb the same together with the Arterial Blood, which is carried back to the Heart by means of the Circulation, and wants still to be defecated.

- How a Node of the Yard is to be cured. XIII.
- The Cure of a Phimosis and Paraphimosis when caused by a wholsom Coitus. XIV.
- The Cure thereof when gotten by a Clap. XV.
- Coolers and Repellers are not to be used in the beginning. XVI.
- The Cure of a Paraphimosis in Infants. XVII.

I. IF any Portion be to be cut off from a Gangren'd Yard, we ought presently to put into the Urethra some Pipe, or a Wax Candle for Pissing; otherwise all that which remains of the substance of the Yard, retires within the Body, so that thereby the Urine cannot pass forth. The Erection of the Yard perishes by the Incision, for the Spirits can no longer be retained in the Nervous Bodies.

II. When the Yard is cut off, an actual Cautery for stanching the Blood is very dangerous, both because it obstructs the Urinary Passage, and also is apt to cause an Inflammation in the Bladder and Circum-

Circumjacent parts. I order my Servants to take care of stanching the Blood, by holding continually (one after another) Stupes to the part wet in Water and Vinegar, and besprinkled with an astringent Powder.

Hildan. cent.
3. obf. 88.

III. To root out *Caruncles* in the *Vrethra* many do too boldly put up Wax Candles besmeared with Corroding Medicines; by the over great biting whereof, I have not only seen loss of substance in the *Vrethra*, but also a Gangrene, which infected not only the *Perinaum*, but also the inside of each Thigh, and consumed these parts with a foul Mortification to the destruction of the Patient. A Noble Person being troubled with a Caruncle from a virulent *Gonorrhœa*, when the Surgeon had injected with a Syringe a sharp Liquor into the Urinary passage, there presently arose a great Pain: whereupon followed an Inflammation and a Fever, his Urine was quite suppress'd, and he died in a few days.

Hildan. cent.
4. obf. 54.

IV. The original of a *Caruncle* in the *Yard* is sometimes to be attributed to a *Gonorrhœa*, in the inflammatory stiffness whereof, the Chord, as the Vulgar call it, being broken in Copulation, or to speak more artificially, the Membrane of the *Vrethra* being torn, which is contracted and made shorter by force of the Inflammation and Tumour, after a large Hemorrhage (such as is usual upon those strainings and violent tearings) there remains an Ulcer, out of which by degrees there arises a *Fungus*, namely, a Preternatural Tumour and Disease in the Urinary Passage, that cannot be safely and certainly rooted out any other way than by such Medicines as consume it by immediate contact. Those Spongy *Thymus's* use to run with a Purulent Matter, which has generally been taken for a *Gonorrhœa* by such as have less accurately consider'd the source of this Malady. Hence there appear Threads of Pus floating in the Urine, part of which Matter I think also to flow from the Prostates, which have been afflicted a long time by an *Intemperies*, not wanting Malignity, destructive of the Natural Heat, and injurious to all the Functions. I cured a Nobleman that had been afflicted fifteen years with such a Caruncle: Considering diligently all the difficulties, but especially his delicate Nature, the most exquisite sense whereof reputed even the easiest Chirurgical Remedies for the cruellest Torments, I put mine hand to the work, and having premised Universals, I consumed the whole Caruncle with little pain by an often repeated application of a Catheretick by a Wax-Candle: it was pretty hard, and three Fingers breadth long, possessing almost half the length of the *Vrethra*. The nearness of the neck of the Bladder gave me no small trouble, when I came to the end; but especially that small Tubercle, which by a gaping mouth gives passage to the Seed into the *Vrethra*, whose bulk being increased by an afflux of Humours, would have impos'd upon an unskilful Artist, and persuaded the further use of eating Medicines. But take this as a Secret from me in the Cure of a Caruncle, That 'tis better cured by delay than haste. As often as the lips of the Ulcer swell being irritated by Medicines, they fall again by the application of Lenients, and (which is strange) the most pertinacious obstacles vanish of themselves in a few days.

Theodor.
de Mayerne,
tract. de
Arthrit. p.
145.

V. Because it happens sometimes in a suppression of Urine, that there are found a great many Caruncles that hinder its passage and the application of Medicines, if neither Baths, nor Anointings, nor Candles do good, some endeavour to make a Penetration by the sharp end of a Rush, putting a Corroding Medicin upon the top of it, and so by degrees penetrating the Caruncles. Which manner of Operation is not well approved of, because there is danger the Rush may break.

Fonseca,
conf. 36.
tom. 1.

VI. Within the *Vrethra* behind the Prostates there is a Caruncle placed at the Orifice of both Ejaculatory Vessels, which like a Valve shuts both Orifices, lest the Urine being poured out into the *Vrethra* flow back again into the Seminary Vessels, or lest the Seed should flow forth involuntarily: Ignorant Surgeons hitting upon this with a Catheter, which it will not suffer to pass further, esteem it a Caruncle, which being eroded by Causticks breeds a perpetual *Gonorrhœa*.

Riolan, in
Anthropogr.

VII. There often arises a Caruncle from an Ulcer of the Urinary passage, and it is sometimes so increased as to suppress the Urine: This must be extirpated by Manual Operation and fit Medicines, which have an eroding vertue. But lest other parts also in the Urinary passage be eroded, or the Urine as it runs forth should wash off the Medicin that is applied to the Caruncle, *Aquapendent* hath invented an Instrument by the help whereof nothing but the Caruncle is eaten, and provision is made that the Medicin that is applied to the Caruncle cannot be washed off by the Urine that is often made. Let a Cannula be made of a Linnen Rag besmeared with White Wax, (a Fingers breadth long, and so broad as to equal a Silver Catheter) and let a long Thread be well fasten'd to it. Let this Cannula be first smear'd over with *Prevotius's* Eroding Medicin, (viz. Take of Honey burnt to ashes, Tutty prepared, fresh Butter washed in Plantane Water, Turpentine also washed, yellow Wax, of each half an ounce, of burnt Alum half a drachm, mix them, make a Liniment) and then be fitted to a Probe standing out of a Silver Pipe, and together with the Silver Pipe and Probe let it be put up the Urinary passage till it come at the Caruncle, and when it is just in the seat of the Caruncle, let the Silver Pipe with the Probe be drawn back again, but let the Cannula (made of a Linnen Rag Waxed over) be left in the passage, that the Urine may be expelled through it, and that it may also hinder the Medicin that is applied to the Caruncle from being washed off by the Urine.

Scul. Ar.
mam. tab.
40.

VIII. I use Precipitate safely in *Caries* about the *Glans*, sometimes alone without mixing any thing with it, having reduced it into Powder, when the *Caries* is pertinacious: Sometimes I mix it with Butter, or the Ointment of Roses: and sometimes I make it up in this form, wherein it cures all Internal *Caries*. Take of the Oyl of Sweet Almonds, of Oyl of Olive, of Unguentum Resinum, of each six drachms, of the Powder of Precipitate one drachm, a little Wax, and make an Ointment, and spread it on the finest Linnen. Ungu. Resinum is made of Oyl, the Rosin of the Pine, Turpentine and Wax. Precipitate being used thus, there is no danger it should repel the Malignant Vapour inwards, as *Petronius* thought, because of the Quick-Silver, because, as he says, it drives the Taint or Infection to the upper parts. Yea, if Precipitate should be used alone, there would be no danger hereof; for though it be made of Quick-Silver, yet from the *Agua fortis* whereby it is made, it has an attractive vertue: yea, I also approve of the use of Quick-Silver, where Precipitate, because of the Malignity of the Ulcers, is not sufficient, because it appears by Experience that either of them do very well cure these Ulcers. Nor is there any danger the Poison should be driven inwards, for we find it not to happen: nor can Quick-Silver in so small a quantity drive the Matter to the upper parts. Dalsified Precipitate, called *Turbith Minerale*, is also very good.

Fonseca,
conf. 34.
tom. 1.

IX. A Crystalline Bladder upon the *Glans* of the Yard is one of the Symptoms of the Pox, which unless it be well cured, uses to cause death. Now it by no means endures the Knife, only the Spirit of Tabaco is to be commended in this case; with which if it be but wet over five times at most, it dies and utterly wastes away. But let this be done when

Hartman.
prax. chym.
c. 233. sect.
34.

when the Patient is lying, unless you would have him fall Convulsed.

X. In curing Ulcers of the *Glans* and *Prepuce*, many mistake much while they wash the Ulcers with *Aqua fortis*, as they call it, also with the Water of Plantane, with Virioli, Alum, Verdegrise, *Ungu. Egyptiacum*, &c. and apply other acrimonious things: for by this means they add mischief to mischief, feeling the Pain which they raise by those Acrimonious Medicines, draws many Humours from the Body to the part affected; whence proceeds an Inflammation, and other Symptoms succeed daily. Wherefore such Ulcers are to be treated gently.

Fabr. Hild.
cent. 5. obs.
57.

XI. Of the Cure of a *Phimosis* (or too great straitness of the *Prepuce*) *Pareus* writes very well: There is no danger in the cutting of it, if the *Prepuce* cleave not to the *Glans*, for then the Cure is attempted in vain. But if the *Prepuce* be only too strait, and free from the *Glans*, then marking the place how far the Incision ought to be made, the *Prepuce* is extended, and the work is done by one incision lengthways of it; yet with this Caution, that the greater *Vena Pudenda* be not hurt, which being visible enough, the Surgeon cannot but see. The Incision being made, the head of the Yard struts out, being freed from all impediments. But care must be taken that the Dissected parts of the *Prepuce* grow not together again, but that they be skinned over apart.

Amman.
medic. Crit.
p. 141.

XII. The Coherence of the *Prepuce* with the *Glans* happens two ways. 1. Through an Ulcer of those two parts: For in the curing of the Ulcers thereof, they are apt to grow together, especially in Children, so that the *Prepuce* cannot afterwards be drawn back from off the *Glans*. In such Ulcers I use to put betwixt them a thin plate of Lead bended; sometimes I sprinkle thereon plentifully some drying Powder, as of burnt Lead, Litharge, &c. 2. From the first Conformation of them. Now when it is necessary to cut this band in sunder, we must see that neither the *Prepuce*, nor much less the *Glans* be touched, especially if the band be in the lowest or undermost part of the *Glans*, for in that place the Urinary Duct may be easily cut into, and thereby a hole be made through which the seed and Urine will issue. Wherefore if one cannot be avoided, rather cut somewhat off the *Prepuce* than off the *Glans*; for though the *Prepuce* should be perforated, yet the inconvenience would not be comparable to the perforation of the Urinary Passage.

Hild. cent.
3. obs. 54.

XIII. There sometimes happens an odd kind of Distemper to those who are too much addicted to Venery; some call it a *Node of the Yard*: though when that is fallen and become flaggy, there appear nothing amiss, yet he that handles the part thoroughly may perceive a certain small Tumour resembling a Bean or Glandule. I have known several that have been ignorant of the Cause, apply Emollients hereto, thinking to dissolve that hardish substance, as if it were filled with some Humour: But they have been so far from discussing of it, that the Patients have daily grown worse, their Yard bending like a Rams Horn to that side where the Tumour was, &c. Those things therefore are to be used which are prescribed for a Rupture of the Navel or other Ruptures, Astringent Fomentations, &c.

Jul. Cesar
Arantius, l.
de Tumor.
cap. 50.
Sennert.
pract. l. 4.
part. 2. f. 1.
c. 8.

XIV. If a *Phimosis* and *Paraphimosis* proceed from a vehement *Cottus*, the *Glans* remaining still tumefied, if it be fomented a good while with very cold Water, it will detumefie, and then the *Prepuce* may easily be drawn over the *Glans*. This is an admirable Secret.

Riolan. En-
chir. Anat.
l. 2. c. 31.

XV. I knew a Surgeon in Holland; that to such as were troubled with a virulent *Phimosis* and *Paraphimosis* gave presently at the beginning an infusion of *Subium Hyacinthinum*, which is not much to be found fault with in the strong and Phlegma-

tick, especially if *Crocus Metallorum* should be used in stead of *Stribum*; for it not only evacuates the offending Matter, but also revells from the part affected: but in the wasted and weak, Practitioners know it to be no safe Medicin. And we must diligently also consider whether the Whore had the Pox, for then we must abstain from the *Crocus Metallorum*, because with a certain violence it draws even from the remotest parts to the centre of the Body, as also from all Medicines that purge violently by Vomit, lest the offending Matter be drawn from the Genitals to the Liver, and an universal Disease be made of a particular one, which I have observed to happen in some. 'Tis better therefore, as I have always done with the greatest success, to purge the Body gently.

Fabr. Hild.
cent. 5. obs.
57.

XVI. Some (because they see an Inflammation present) do forthwith apply Coolers and Repellers to the part affected; but they do ill; for by that means they repel the virulent and malignant Matter contracted from impure Embraces, and rivet it as it were into the part, whence afterwards there arise virulent and malignant Ulcers. But in respect of the Pain, which is the principal symptom, I apply an Anodyne Cataplasim, of the Flower of Beans and Barley, the Seeds of Quinces and Fenugreek, Red Rose Leaves powder'd, Saffron and Milk, with the Yelks of Eggs; anointing the whole Yard, unless the vehemence of the Inflammation hinder, (for Oyl is bad for Inflammations, as *Galen* teacheth) with this Oyl: Take of Oyl of Sweet Almonds newly drawn, and of Roses, of each an ounce, of the Yelks of Eggs half an ounce: Mix them.

Idem ibid.

XVII. It happens sometimes that from the bad Diet of the Nurse an Acrimonious Humour falls upon the *Genitals of the Infant*, and there causes an itching, and upon rubbing of the part there happens a *Paraphimosis*, (that is, the *Prepuce* turns back to behind the *Glans*, and cannot be drawn over it again) the Humours flowing together betwixt the *Glans* and *Prepuce*; yea, there sometimes happens an Inflammation from the Acrimony of the Urine. Some foolish Barbers cruelly handle Infants thus diseased with deep Scarifications and applications of Acrimonious Medicines. Therefore I will here set down the Remedies whereby I have cured many. I first prescribe to the Nurse a thin and cooling Diet; then I purge her according to the nature of the predominant Humour. But if the Child be weaned, I give it at several times from one to three drachms of the compound Syrup of Roses Solutive. If the Nurse be Plethorick, after purging her I bleed her. From the beginning, if there be Pain and Inflammation, I apply this Cataplasim: Take of the Crumb of White Bread three ounces, the Powder of Roses and Balustins of each two drachms, of Saffron a scruple, of fresh Butter an ounce, of Cows Milk as much as suffices, with the Yelk of an Egg make a Cataplasim. If the Disease be stubborn I use the following; Take of Bean-Flower two ounces, the Powder of the tops of Wormwood, Chamomel Flowers, Elder Flowers, of each three drachms, of the Powder of Fenugreek Seed two drachms, of Cummin Seed three drachms, boil them in harsh Wine and make a Cataplasim. If there be Excoriation, in stead of the Wine I use a Decoction of the Flowers of Chamomel, Melilot, Elder, and Roses.

 How to remedy Vigilance or want of sleep in this Disease. XVIII.

I. **T**HERE is no small dispute concerning Phlebotomy, for 'tis written that Blood is to be let out by common Veins; whereas no Vein that uses to be opened has any communication with the Veins of the Lungs: nor are any branches distributed to the Lungs from the *Vena Cava*, as *Galen* has in several places disputed against *Erastfratus*. Besides, the motion of Nature shews this; for whereas in Diseases of the *Viscera* and burning Fevers, bleeding at the Nose is Critical, it is not so in a Peripneumony, because the Veins of the Nose that pour forth the Blood, have no communication with the Lungs. If it be true that the Blood does naturally pass from the right Ventricle of the Heart to the Lungs, and from thence is brought back into the left Ventricle, that it may be sent forth by the *Aorta*; and if the Circulation of the Blood be admitted, who sees not, that in Diseases of the Lungs the Blood flows thither in greater plenty, and oppresses the Lungs, unless it be first evacuated freely, and afterwards often a little at a time, to relieve them? This was *Hippocrates's* way, who when the Lungs are swollen draws Blood from all the parts of the Body, the Head, Nose, Tongue, Arms, and Feet, that the quantity thereof may be lessened, and it may be revelled from the Lungs. In Diseases of the Lungs he bids us Bleed as long almost as there is any Blood in the Body. The Circulation of the Blood being supposed, the Lungs are easily emptied by Venesection: if it be denied, I see not how the Blood can be revelled thence: for if it be to flow back again into the right Ventricle by the *Vena Arteriosa*, the *Sigmoides* Valves hinder; and the three-pointed Valves stop its regress into the *Cava* out of the right Ventricle. Therefore by the Circulation the Blood is exhausted thence by opening the Veins of the Arm and Foot; and the Opinion of *Fernelius* is withal destroyed, viz. That in Diseases of the Lungs Blood is rather to be drawn from the right Arm than the left, because the Blood cannot pass back into the *Cava* but by breaking through two stops and obstacles placed in the Heart.

II. And if Blood be to be let at several times and not all at once, for fear of swooning, yet it is to be let pretty freely for the first time: for unless there be a plentiful bleeding on the first days,

suppuration is to be feared. But when the Lungs abound with much Blood, we ought not to be afraid of opening a Vein three, four, five, or six times: Yet if it succeed a Quinsey or Pleurisy, we must take greater care how we Bleed.

III. Phlebotomy is requisite in almost every Peripneumony, yea, sometimes it ought to be repeated often: for the Vessels being emptied of Blood do not only withdraw the fomes of the Disease, but also resorb the Matter settled in the part affected. Now in a Peripneumony, as also in a Pleurisy, the Blood that is taken away, after it is cold, has a tough and discoloured thin skin on its surface. Further we may observe that sometimes all the Blood, and sometimes only a portion of it undergoes this change: for if the Blood be received into three or four Porringers, it will appear bad sometimes in all, but most commonly in the second and third, and pretty good in the first and last. Wherefore 'tis commonly advised to bleed always so long till that which is so depraved shall begin to run out, and, if the strength will endure it, to let the Blood continue to run till it appear good again. Indeed as frequent Experience, so likewise Reason does well enough approve of this practice: in as much as in this Disease the whole Blood does not presently acquire that lentor or sliminess; the portions that are first depraved are mostly gathered together about the place of obstruction, and stick all about in the lesser Vessels. Wherefore the Blood that first comes out will often be faultless; but then the Vessels being emptied will receive the other Morbifick Blood that stagnated before, and restore it to the Circulation: And seeing its portions that are placed near, march all in a body as it were, when they arrive at the Orifice of the Vein they will issue out together, and when they are issued forth, that which comes after presently appears purer.

IV. Wherefore in this case let the Orifice be always large, and let the Blood not only issue forth in a full, but also in a continued Stream: for otherwise if in the middle of the bleeding, whilst the naughty Blood is running out, the Orifice be stopp'd with ones Finger, (as some use to do lest the Spirits should fail) when it is opened again, the Blood that comes out next will be pure enough, the bad Blood, if there shall be any behind, having slid by and will not return presently to the Orifice.

V. If it be feared lest the strength should be cast down by Venesection; one may apply Cupping-Glasses with Scarification to the Arms and Breast, which draw the Blood from the depth of the Breast to the Skin and External parts. Yet 'tis convenient they should be first applied to the Muscles of the Arms, that the Blood may in some measure be evacuated and averted from the Lungs; and afterwards to the Shoulder-Blades, and to the Breast if it be fleshy. For though it seem to be a near place, yet it is at some distance from the Lungs, and the Attraction is made from the inner parts to the outer. ¶ For Diversion *Aretaus* substituted empty Cupping-Glasses in stead of Venesection, ordering them to be applied to the Back and other parts of the Body; and for derivation, to the Breast and Sides. *Paulus* proposes Scarified ones, which yet are not to be applied but to the deplorable. ¶ If the Body be fleshy, so that the Cupping-Glass when it is set on will not afflict the Skin that invests the Bones, there apply one: for by that means the Humours will be drawn aside to any part of the Body, and the Spirits are called out to the outer parts, whereby the Lungs are oppressed. Nor do I approve of their Opinion, who when there wants sufficient strength for Venesection at the beginning, supply it with Scarified Cupping-Glasses applied to the Breast and Back, seeing *Galen* is altogether against it, 11. *Metb. c. 17.* and 13. *cap. 19.* For at that time it will be sufficient to fasten them first

Enchir.med; pract.

Willis.

Idem;

Sennertus;

Fortis, conf. 49. cent. 1.

to the Muscles of the Arms, that the flowing Humour may after some sort be evacuated and diverted; and afterwards let them be applied to the Breast, if, as was said before, the Body be fleshy.

Mercatus.

VI. *Purging* is sometimes convenient in a Peripneumony before the seventh day, though it be then thought pernicious. Mr. N. sixty years of age was ill of a Phlegmatick Peripneumony, which was known by a Cough, difficulty of breathing, a Fever, a pain under the left Shoulder, and a flushing in his Face. And whereas he seem'd to be full of much Phlegm, and had vomited up a pretty quantity thereof, and had had three or four Stools by a Clyster which had been injected, the next day after bleeding (which he did but once) a Purge was given him of an infusion of Rhubarb with Manna and Syrup of Roses, by which he was very well purged on the fourth day of his illness, and the next day after was freed from his Fever and the other Symptoms. ¶ The impetus of the Matter is to be revoked by pretty sharp Clysters, and the plenty of Crude Humours to be lessened thereby. But we must take heed of disturbing the Belly too much; for, as *Hippocrates* tells us, a Flux of the Belly is dangerous in a Peripneumony, unless that be it only which is expelled: wherefore *Avicenna* does not commend the purging of Humours in this Disease, for the Humour being moved is exagitated more furiously, and flows more plentifully into the part affected; besides that the Medicin draws nothing of that which is contained in the inflamed part. But if it be known that the Humour is unruly and raging, or that the Body abounds with too much filth, when Blood has been let sufficiently, it will not be amiss to purge it off with some gentle Medicin, or by one that is pretty strong, but in a smaller dose.

River. cent. 1. obs. 98.

Mercatus.

VII. If Matter abound in the Lungs with rattling, and cannot be brought forth by spitting, and there be danger of suffocation on that account, as I have sometimes seen, then necessity compels us to *Evacuation by Stool*: in which case I have more than once tried Manna with good success, giving it every other day, with a good deal of Whey three hours after, in Choleric Persons; and in the Phlegmatick, with Mead made with Barley-Water, and after two hours something to eat after either of them; repeating it three or four times; For Nature when in a strait she is solicited by a loosening Medicin, provides ways for her self to send the Matter by the Guts.

Fortis, conf. 40. cent. 2.

VIII. That the emptied Vessels may withdraw the *forces* of the Disease, or resorb the very Morbifick Matter it self, even *purging* is prescribed by many. In the Practice of the Ancients, after Phlebotomy, Preparers and Purgers use constantly to be prescribed against this Disease, as against most others; but of late the Chymists with greater boldness give *Vomits*, and cry them up above all other Remedies in Peripneumonies: Yea, neglecting or forbidding Phlebotomy, they place the chief stress of the Cure in Stibiate Emetics; than which rash advice of theirs I know not whether any thing can be thought upon more pernicious. In Rustick and strong Bodies these Medicins are sometimes given without detriment, yet generally with as little benefit: but in tender Constitutions, they ought to be esteemed hardly any better than Poison. But as to purging by Stool, though it may not be convenient presently at the beginning, but always almost does hurt then; yet when the Fluxion of the Morbifick Matter is ceased, and the effervescence of the Blood allayed, we may gently empty the Body by a Solutive Medicin.

Willis.

IX. In stead of Purgers let Clysters be in frequent, yea, generally in daily use: but let these be only Lenient and Emollient, such as may gently loosen the Belly without any great agitation of the Humours or Blood, of Milk, Whey, with Brown Sugar, Syrup of Violets, &c.

Idem.

X. Having in the beginning of the Disease premised a Lentive of Manna clarified, and the Syrup of Roses solutive, the Belly is not to be solicited afterwards, as *Hippocrates* admonishes 3. de Morb. n. 17. but the Evacuation of the Matter is to be endeavoured to be made by spitting: And as at the beginning *Diapenidium*, *Diacodium*, *Diagacanth. frig.* red Poppy Flowers, the Waters of Burnet and Ground-Ivy, &c. are good, in as much as they stay the flowing Blood and greatly cool it: so in the progress thereof Take of the *Fulap* of Sorrel two ounces, of the Syrup of Marshmallows one ounce, mix them, for a Lambitive; proceeding by degrees to Remedies that are more attenuating and expectorating. Thus *Aetius* gives *Mulsa* (or Mead) with Hyssop or dried Flower-de-Luce boiled in it; and if there be danger of Suffocation, he adds Nitre also to the Decoction of Hyssop, &c.

XI. *Incrassating Lambitives* must be very cautiously administered; for nothing happens worse to the Peripneumonick, than to be hindered from Spitting; and they are in greater danger from want of Expectoration than the Pleuritick are. Therefore if the Fluxion be very thin, I disallow not of a Lambitive that consists of the Syrups of *Lykorrhize*, *Violets*, and *Jujubs*, if you moreover mix therewith some of the Syrup of Vinegar or of Oxymel, that the thin Matter which is a flowing into the Lungs may be thickned; but that that which being already flown thereinto is become thick, may be attenuated.

Fortis, conf. 40. cent. 2.

XII. Concerning the use of *Attenuaters* I also give this Advice, which I observe all have omitted, that such Attenuating Medicins as have a notable heat are not to be used; whereas all Writers of Physick allow even of those Medicins which are good in an *Orthopnea*, as Flower-de-Luce, Hyssop, Horehound, &c. But I do not approve of them, first, because they increase the Inflammation; secondly, because they dispose the Lungs which are already debilitated by the Inflammation, to an Ulcer. Therefore for inciding I would not pass higher than *Mulsa*, Oxymel, or in hot Temperaments the Syrup of Vinegar, &c.

Saxoni. præl. pract. c. 28. l. 1.

XIII. For an Alterative, and to temper the febrile and inflammatory heat, the drinking of cold Water is proposed by *Hippocrates*, 1. Acut. 43. which yet we must use cautiously, and not but in an Erysipelaceous Inflammation, or only in the very beginning, lest otherwise the inflamed part and the Matter it self be more and more condensed. The Whey of Asses Milk is to be given in this case.

Idem ibid.

XIV. *Hippocrates* (2. de morb.) bids us give sweet suppers on the first days, that that which sticks in the Lungs may be washed out: And otherwise also sweet things are friendly to the Lungs. Others disallow thereof, because things that are hot and apt to turn to choler increase the Fever, and lead towards an inflammation of the Liver and Spleen: And seeing *Hippocrates*, where he treats of the cure of a Pleurisy, gives acid potions to make the Patient spit the more easily, the same seem to be agreeable also to a Peripneumony, seeing these Diseases are almost cured alike. But we must know that sweet things are not all of one sort, for some are hotter, others rather temperate; yea, some are watry: of which the two last sorts cannot lightly hurt. And such as are hotter, are not given by themselves alone, but are diluted with those things which hinder them from being easily turn'd into choler. And though sweet things seem to offend the Liver more than the Lungs, (seeing they come to the Liver entire and but little changed, whereas but a small portion of them comes to the Lungs) it is altogether safer to chuse sweet things that are not over hot, and to give them mixt with other things. And if the Humours that are con-

Fortis, conf. 40. cent. 2.

tained

tained in the Lung, be pretty thick, their inciding and attenuating vertue may be increased by mixing Acids with them: whence Oxymel mixt with Medicines convenient for the Diseases of the Breast, is a most fitting Medicine to promote the Expectoration of rough Humours.

Sennert. cap. de Peripneum.

XV. *Actius* prescribes little drink, because moisture is hurtful to the Lungs: But *Hippocrates* determines the contrary, who, *lib. 1. de morb.* says, that the Patients ought to drink off their Cups, that the Lungs may be wet thereby. Reason assents hereto; for in a Peripneumony, and especially when choler and a too hot Blood abound, the Lungs wax dry, which Distemper seems to indicate moistening, which is obtained by much Drink.

Salus notis in Altimar. c. 51. Merc. cap. prop.

XVI. *Hippocrates*, *l. 2. de Morb. f. 3.* makes mention of a Disease of the Lungs, not much differing from a Peripneumony, which he calls a *Lethargy*: The difference of which Diseases consists only in the Matter. For in a Peripneumony the Humour predominantly offending is Choler, or Cholerick Blood; but in this Disease it is Phlegm: whence as in a Peripneumony a *Delirium* happens through heat; so in a *Lethargy* does there follow a drowsiness through moisture, (see the Title of the *Lethargy*) and from the putrefaction there accompanies it a slight doating. But it is not difficult to reconcile the difference of this place, and *lib. 3.* in allowing of Wine, if we consider that 'tis seldom but *Hippocrates* allows Wine in Diseases of the Breast, if not in respect of Drink, yet however for Medicin, that Expectoration may be promoted, or that the vertue of Medicines may sooner be brought to the Heart: On which account indeed he bids us often drink Wine after suppers; which is done in this Disease; wherein, in as much as drinking of Wine is suspected because of the *Delirium*, he therefore forbids the drinking of it, *lib. 3.* yet he forbids not the drinking a little quantity of it after suppers, as it is a Medicine. With us the drinking of Wine in a Peripneumony (yea, in almost any hot Diseases of the Breast) is very hurtful, as daily Experience assures us, so that even the very scent of it offends the Patients; yea, it cannot be allowed even in the invasion of a fainting-fit, but it hastens the death of the Patient. Whether the Reason be the Condition of the Climate or of the Wine, or somewhat else, I leave to inquiry: Surely the Heart that is seated near to the Lungs, soon partakes of the heat that accreus from the drinking of Wine.

P. Martian. comm. in v. 242. loc. cit.

XVII. As to *Topicks*, either none or only weak *Repellents* and *Astringents* are to be applied in the beginning of the Inflammation, both because of the nearness of the Heart, lest the Humour be repelled into a principal part; and also because of necessary Respiration, lest the use of the Lungs be hindered by constringing the Breast. Wherefore the Oyls of Roses, Myrtles, and Violets will suffice, with the Waters of Roses and Violets, and the Juice of Plantane.

Chalmet, Enchir. p. 145.

XVIII. The greatest difficulty is, what we shall give against *Vigilia* or want of sleep, when it is very troublesome; in as much as Opiats, because they hurt Respiration, which is already prejudic'd in this Disease, are not safely taken, yea, sometimes they become pernicious: wherefore *Laudanum*, and the stronger Preparations of *Opium* ought to be utterly avoided in a Peripneumony. Yet in the mean time the milder Anodynes and Hypnoticks, as especially the Water and Syrup of red Poppy, are not only allowed, but esteemed Specifick Remedies in this Disease and the Pleurisy: yea, we may sometimes use *Diacodiales* if the Patients strength hold out, and the Pulse be strong and laudable enough.

They are to be bound. XXIII.
How Urine is to be provoked when suppressed. XXIV.

I. IN all *Venessection* that is made in a *Delirium*, we must observe this, not to make a large Orifice: for so it will close again; for which end it is to be accurately bound up, that it may not be loosened by the Patient. Also for the quicker closing up thereof, 'twill be profitable to apply a Plaster made of Aloes, the White of an Egg, and Hares Wooll.

River.

II. Among deriving Medicines the opening of the Forehead-Vein has place, out of which Blood is to be taken to five or six ounces, which has good success, when Blood enough has first been taken out of the Veins of the Arm. Let Leeches also be applied behind the Ears, which Remedy is profitable indeed, but less effectual than the former, because by the Leeches the most thin portion of the Blood is only drawn forth, whereas by the Forehead-Vein there is sometimes drawn out in a Phrensy a more impure and corrupt Blood than out of the Vein of the Arm. See an Example in *Hecurnius*, *apbor. 72. 4.*

Idem, l. 174 c. 1.

III. Though plentiful Bleeding be requisite, especially if Blood abound, the Inflammation but beginning, and the Phrensy proceed from no other Disease; yet must we not, as some *Arabians* advise, bleed till the Patient faint away, lest the Spirits fail which are weak of themselves from want of sleep and continual restlessness, and which cannot expect to be recruited by a little fuller Diet: so that 'tis safer to bleed a little at once several times.

Sennertus.

IV. We may administer a Clyster after Bleeding: for if one be called in the morning on the first day of the Disease, he may presently open a Vein without delay, though a Clyster be not first given, seeing there is danger lest the Matter be carried plentifully to the Head. For, as *Hippocrates* says, (*lib. de rat. viſſ.*) we may open a Vein without premising a Clyster, in case of urgent necessity. But if any truce be granted, let a Clyster be first given.

Rondelet. pract. l. 1. c. 15.

V. Let

V. Let great care be taken to procure sleep the next night after Blood-letting: for after the Blood is evacuated, if the Patients do not sleep, they grow more raging. Therefore give *Diacodium* with the Juice or Water of *Ptisan*; for often after sleep they come to themselves again.

Hetruius.
Riverius.

VI. See that *Stupefiers* be not used continually, lest the Phrensy turn to a Lethargy. Let Externals also be warily applied to those whose Spirits are low, lest the Matter be coagulated in the Head, and through weakness of the Faculties cannot afterwards be resolved and dissipated.

Hartman.
pract. Chy-
miatr. c. 8.
sect. 9.

VII. Some think we ought to abstain from Medicines that purge *electively*, because the Matter is Crude, and the Vicious Humour not as yet separated from the good; which if it be agitated, will rush the sooner and with the greater violence to the Head. Others on the contrary hope for more benefit from the evacuation of the Humours, than hurt by the agitation of them: For though they cannot deny but that the Humour is as yet generally Crude, yet they suppose it to have the condition of a Turgent Matter, and that as it wanders about, it tends towards the Head; and therefore is to be purged off, lest it rush into the Head, especially seeing all of it cannot be evacuated by Bleeding. But there is need of a distinction here, and we must consider whether the Inflammation arise from the Fever, or the Fever proceed from the Inflammation as the primary Disease. For if the primary Disease be a Fever, and the Inflammation be raised from the motion of the Cacoehymie agitated in the Veins, such Matter is deservedly referred to a Turgent; therefore according to *Hippocrates's* his Advice, 1. aph. 22. it is to be evacuated presently in the beginning: And though Nature drive it to a certain part, yet it is not so immovable, but that it may easily follow the leading of a Purge; and that it is Turgent, appears even from hence, that such Matter seems at first to be moved to one part, and by and by 'tis carried to another: whence of a Pleurisy is sometimes made a Quinsy, or a Peripneumony; or of either of these a Pleurisy. But if the Matter be received already into the Brain, and the beginning of the Disease be over, 'tis to no purpose to give Purgers. Also, as *Massarius* affirms, 'tis dangerous to deter purging to the declination, seeing the Disease kills either in the beginning, or in the augment, or in the state. But the case is quite altered when the Inflammation proceeds (without a Fever preceding) from the hurt of the Brain or its Membranes, or from an effervescence of the Blood in the Veins of the Head: For in such case *Hippocrates's* Advice is to be followed, (2. de fract. 1. 20. & 22.) who in such Inflammation purges indeed in the beginning, before the Fever come; but after it is come, purges no longer: For then the Matter is not Turgent, such as rushes to any part in the beginnings of Fevers; nor is the beginning of the Disease from the Veins of the whole Body, but it proceeds from a peculiar part.

VIII. *Hypnoticks* are oft necessary in this Disease, but the stronger sort are not convenient presently at the beginning, nor are they to be used often, because the sleep that is procured by Opiats does carry more Morbifick Matter into the Brain, and fixes it more closely therein.

Dan. Sennert.
pract. cap. 27. l. 1.
part. 1.

Willis.

IX. Because want of sleep is very urgent in this Disease, sleep is to be procured some way or other even in the beginning of the Disease. The proposed Repellents are good for that purpose, especially if before the application of Oxyrrhodines the Head be wet with the cold Oyl of Violets, whereby Convulsions are also prevented. Inwardly with Juleps or Emulsions may sometimes be given an ounce of the Syrup of Poppy, or two or three grains of *Laudanum* Opiate; which likewise being given in Clysters does powerfully enough

and more safely procure sleep. Yet in the use of Narcoticks the Physician ought to be wary: for they ought not to be given if the Spirits be very low, lest these and the heat be extinguished by them.

Lazar. River.

X. *Narcoticks* which consist of merely cold things, must be cautiously given, because they agree not so well with some, the Fibres of whose Stomach are very tender and sensible. I have oft observed such Hypnoticks to cause a great oppression in the Stomach, then presently an inflation of it; and a while after, distractions and disturbances of the Spirits in the Brain, yea, in the whole Body have followed, so that there ensued not only a frustration of sleep, but also the greatest inquietude.

Willis.

XI. When watchings are very troublesome, we may make a Decoction of Chamomel Flowers with some heads of Poppy in it, and foment the Head therewith warm: For such things as are applied cold, condense the Humour and Vapour; and those things which do very much stupify, as Mandrake, Hemlock, and Opium, lead to a contrary Disease, and cause an incurable passion: for I have seen some whom their Physicians had brought into a deep sleep by immoderate cooling, to dye Lethargick. Of the efficacy of an actual Caustery, see the Title of Mania, or Madness.

Christ. a.
Vega. l. 3.
c. 6. Art.
Med.

XII. Some prescribe the decoction of Coriander for Drink, which yet is suspected by me, seeing Coriander Seeds are of themselves apt to disturb the Mind, and to cause a Delirium. Nor matters the Authority of *Avicen*, who thinks that Coriander is cold; for we must rather believe *Galen*, *Dioscorides*, Experience, Reason, and Truth.

Salus. c. 6.
Annot. in
Altim.

XIII. A Phrensy sometimes turns to a Lethargy, because the Humours are too much cooled by the use of cold Medicines, and where there is a thickness of Matter. Thence also happen sometimes those obscure, gentle, and trembling Phrenasies which *Galen* calls Hectick.

Rubeus. c.
13. l. 3.
comment.
in Celsum.

XIV. In the use of Oxyrrhodines the Constitution of the Patient, with the season of the year, or the External Air, are to be considered: For in strong and robust Constitutions, where there is a vehement heat about the Head, and so an exquisite Phrensy, and especially in Summer, they are to be applied not only virtually but actually cold. But when the Body is more weak, or the Patient is either a Child or old Man, and there is no such heat about the Head, and it is Winter, they are rather to be applied warm, especially in those places where the virtue of the Medicines can the better penetrate, namely about the Sutures. And this also is to be noted, that some Topicks penetrate easily of themselves, as being made of Vinegar, Vervain, Dill, and the like; which being often applied cold, do nevertheless perfect their operation: Others are astringent, as Roses, Plantane, Bole-Armene, which act better when they are warmed. ¶ Let not the use of these be continued too long; but only about three days; and let the quantity of the Vinegar be also less, because of the urgent *Vigilia*.

Sennertus.

Greg. Horst.
probl. 4. de
cad. 2.

XV. If (as it sometime happens) the Inflammation seem to tend towards the Skin and the outer parts of the Head, lest the Matter being repelled inwards and towards the Brain should induce a greater mischief, we must abstain from Repellents, especially such as are more strong.

Idem.

XVI. There is some dispute whether the Head should be shaven or not: For some think that upon shaving the Head, more Humour flows thither: but seeing Alteratives and Repressers of the Humours, such as Oxyrrhodine (for *Galen*, 11. meth. attributes a repressing virtue to Vinegar) and other cold things which are commended, may be the better applied to the Head when shaven, and the Matter may also exhale the better, I think 'tis best

Crato in
ἀνελουμ
μρ.

U u u

to

to shave it. ¶ Let Topicks be applied to the shaven Head, (and be renewed as oft as they grow hot) both that the vertue of the Medicin may penetrate the better, and also that the Head being eased of the burthen of the Hair, the Fumes may be the more easily discolled: for the crop of Hair being cut down, cannot sprout forth in so short a time (which *Archigenes* is afraid of) that more Matter should be drawn to the Head on that account. But when the Hair is short or very thin of it self, these things may be well enough applied to the unshaven Head.

Sennertus.

XVII. At length in the state, or beginning of the declination of a Phrensy, *Resolventis* are to be applied, especially Animals or their Parts, young Pigeons, Whelps, a Sheeps Lungs, which are the most convenient because they softly embrace all the Head. But some do ill to apply them at the beginning, because by increasing the heat they do the more promote the Fluxion to the Brain and increase the *Delirium*.

River 1. 17.
c. 1. sect. 3.

XVIII. Among those things which hinder the motion of the Matter to the Head, you shall expect the greatest benefit from washings of the Legs; unless you fear the striking in of Spots in Malignant Fevers: in which case you shall make use of this Remedy in a warm Room, and in the Summer season, or when the Spots are a vanishing; though such washings do sometimes the more draw forth the Spots themselves. This is a very excellent Remedy, both because it draws the heat to the lower and outer parts, and also because by the heat and looseness of the parts it discolles that which it has drawn.

Mercatus.

XIX. In the mean time the greatest regard is to be had to the strength; for when that fails, all hopes of Cure are lost. Now it uses to be soon weakened by great watchings, perpetual agitations of the Mind and Body, thin Diet, and Phlebotomy which sometimes 'tis necessary to repeat often. Wherefore we must take diligent heed, lest whilst by purging, or often bleeding we endeavour to root out the Disease, we do not suddenly weaken the Vital Faculty: If this begin to fail, neglecting the Phrensy, and granting a fuller Diet, we must chiefly insist upon Cordials. ¶ It is always expedient to add to other Medicins some of the *Solution of Perls*, and in the declination some drops of *Aurum potable*, for when Nature is strengthened the often uses to drive forth the reliques of the Disease by sweat.

Willis.

Hartman.

XX. A lusty Wench being in a Fever and stark staring mad, was continually held bound in her Bed: she was bled plentifully and often, took a great many Clysters, had Juleps, Emulsions, and Hypnoticks prescribed her: All which doing no good, she remained without sleep and very much distracted for seven or eight days, continually calling out for cold Drink: Wherefore she had as much Water given her to drink as she would, but her thirst was never the more quenched. I advised (seeing it was Summer time) that the Women should take her out into a Boat at midnight, and putting off her Cloaths and loosing her Bands should duck her in a deep River, tying a Rope about her middle to pull her up again by, to keep her from drowning: But there was no need of such an hank upon her, for she swam of her own accord almost as well as any Person could do, that had learned to swim. After little more than a quarter of an hour she is taken well and sober out of the Water, and then being laid in Bed she slept, and sweat plentifully, and afterwards recover'd without any other Remedy. The reason why this Cure succeeded so soon and so happily, was, because the excesses of both the Vital and Animal Flame (that were both of them vastly increased) were taken away by the proper Remedy of a too intense heat, to wit by the moisture and coldness of the Water.

Willis, cap.
de Phrenit.

¶ A like Instance we had at Geneva in the Summer of the year 1680. A strong Man being taken with a burning Fever and *Delirium*, (whose House was near the River *Rhodanus*) escapes those that were to look to him, and throws himself headlong into the River. One was to go out of the City a good distance (because of the Walls) before one could take him out of the Current; but before they could get thither, he was got to the Bank on the other side, (being a good swimmer) where he was found safe and return'd to his right mind; and being brought home, he recover'd wholly presently after. But this Remedy did not succeed so well with a Wench, that being somewhat frantick, by some bodies advice was thrown into a Bathing Tub full of cold Water in the midst of a very cold Winter, for thereupon she died a few hours after.

XXI. Physicians do not agree concerning the drinking of Wine: Some think 'tis wholly to be abstain'd from, as from Poison, seeing it helps forward the motion of the Humours to the Head, and increases the *Delirium* joined therewith: Others allow of it if the Watchings be pertinacious, and the Spirits low, because it recruits the Spirits, temperates Watchings and allwageth Madnes. But the former opinion is more agreeable to truth: for when Wine is said to moderate Watchings and demulce the Mind, 'tis to be understood of Melancholick *Deliriums* and Watchings rather than of that which arises from an hot Humour and Inflammation, which are rather exasperated by the use of Wine: Wherefore in the beginning it is to be wholly abstain'd from; but afterwards, where the Disease admits it and the Spirits require it, small Wine at least may be allowed to such as have been used to Wine, especially to those who have been otherwise accustomed to drink Wine without Water.

Sennertus.

XXII. Physicians dispute whether the Patient be kept in the light or in the dark: We produce *Celsus's* Opinion concerning it, who (l. 3. c. 19.) writes thus: *The Ancients kept such Patients in the dark, because they thought that contributed to their rest: Asclepiades said that they ought to be kept in the light, because darkness was frightful to them: But neither of these is constant. 'Tis best therefore to try both, and to keep him in the light that is afraid of darkness, and to keep him in the dark, that is disturbed at the light. But where there is no such difference, when the Patient is strong, let him be kept in a light place, and when weak, in a dark. For there is some diversity of Natures in this case, the dark disturbing some more, and the light others: And some when they are in a somewhat lightsom place, imagine they see many things which they do not see, take one thing for another, and conceive various Images from Objects; wherefore such a Patient is to be kept in the dark: On the contrary, if he be afraid in the dark, let him be kept in the light.*

Idem.

XXIII. When the Frantick are raging mad, order them to be bound, and look you come not near them, because they have sometimes killed their Physicians: And at Venice I knew a Mad Man that kill'd two Priests. Add hereto, That by such Ligaments there is made a diversion of Matter from the Head; and the Frantick hardly ever rave when they have their Bands upon them, &c.

Saxon. pract.
c. 3.

XXIV. In a Phrensy there sometimes happens a suppression of Urine on the sixth day, a continual Fever being present; which suppression if the Physician endeavour to remedy, he mistakes: for this suppression does oft indicate a Crisis by sweat. Therefore it is not to be cured, but to be committed to Nature acting well, lest she being disturbed by unseasonable Discreticks the Patient be brought to his end, an Instance whereof is given by *H. ab Her, obs. 3.* But if the Diureticks be

Hippocr. 6.
Epidem. 1.

or

of such a nature as to be withal Diaphoretick, opening, inciding, and moving of Tartar, such as the Antepileptick Powder of Hartman, the admirable effects whereof I have many times experienced in an Epilepsy and other Diseases of the Head, and in Madness it self, especially if the said Diseases arise from the Juice of the Nerves being too dull, acid, and vapid as it were; in this case Medicins full of a volatil Alkali salt are the most available, such as the Spirit of Hartshorn, of Mans Blood rectified, of Soot. But if the Nervous Liquor be too acrimonious and salt, or the Effluvia steaming from the effluating Blood drive the Animal Spirits into distractions, such Remedies which consist of a Volatil acid are given with success, as the Volatil Spirit of Vitriol, the opening Striated Spirit of Penetus, the Philosophical Spirit of Vitriol.

Medicins.

I. **T**Hough the Matter that causes the Cough defile not from the Head upon the Lungs by the Wind-Pipe; yet drilling sometimes out of the sides of the Wind-Pipe, and falling down into the Cavities of the Lungs, it produces that Disease which is commonly known by the name of a Catarrh. For the Wind-Pipe besides a Nervous and Musculous Coat, has also a Vasculous and Glandulous one; into this last are deposited superfluous Humidities from the Blood, which bedew the whole Wind-Pipe. Now if at any time the mass of Blood be too much fused and precipitated into Serosities, (as upon catching cold, drinking acid things, &c.) hereupon presently a great deal of watry Matter sweats out of the Glands of the Wind-Pipe and the mouths of the Arteries into its Cavities, which soon causes Coughing and Spitting. Whilst these things are moderate, and only the superfluities of the Blood are expelled, they often turn rather to profit than benefit, because thus the mass of Blood and the Lungs themselves are cleansed. But if these Affections being prolonged, the Serous Humour being every where deposited in the Ducts of the Wind-Pipe, shall at length begin to be alter'd towards Putrefaction, then the motion and crasis of the Blood are perverted, and the Humour is plentifully deposited out of the mass of Blood, which first of all enters the little Bladders annexed to the small Branches of the Wind-Pipe, and at length fills and somewhat distends them; and by and by the sides of one, two, or more of them being burst, there is made an Ulcer. The Curative Intentions are chiefly these three; 1. To hinder the dissolution of the Blood, which is the root of all the mischief: 2. Presently and sufficiently to evacuate the corrupt Matter gathered in the Lungs by Expectoration: 3. To strengthen and dry the Lungs, that have their unity dissolved, or are too lax and moist, that they may not be still more and more corrupted, and receive more and more the Morbifick Matter. As to the first indication let these three things be procured: 1. That the Mass of Blood may contain and assimilate all the Nutritious Juice that is afforded to it, and may be so proportioned therewith as that it offend neither in quantity nor quality. Wherefore above all things let it be order'd, that People that Cough and are Phthisical, abstain very much from Drinks, and take Liquids or Spoon-meat but in small quantity, so that the Blood, being weak in its Crasis, may the more easily subdue the Minute Portions of the fresh Juice, and retain them within its Compages, whilst it is not satiated with too many of them. Moreover, let that fresh Juice consist of such Particles, as being mild and thin may be tamed by the Blood, and assimilated without Effervescence. Wherefore Asses or Goats Milk, the Cream of Barley, Water-gruel, &c. will be more agreeable and nourish better than Flesh, Eggs, Gellies, &c. 2. The second thing to be produced is, that the Acidities, that are either bred in the Blood, or poured into it from some other where, may be so destroyed, that the Blood retaining still its mixture or crasis, may not be so prone to fluxions or fusions: Wherefore it is necessary that both its own Acidities, and those of other Humours mixed with it, be destroyed: which Intention will be the best performed by Medicins prepared of Sulphur, which should be taken freely if there be no Fever. Vulnerary Decoctions are also good for the same purpose, and Decoctions of Pectoral Herbs,

Herbs, as also of the Woods taken for ordinary Drink: Likewise the Powder of Crabs Eyes, Hog-Lice, and of other things endued with an Alkali or Volatil salt. 3. And lastly, That all the Recrements produced in the Blood be derived from the Lungs to other Emunctories and places of Evacuation; which intention, respecting the first indication, suggests that very many ways of Evacuations are to be made use of, Phlebotomy, Purging by Urine, slight Purgation by Stool, Baths, Frictions of the Extreame Parts, *Drapaces* or Shaving off the Hair, Issues, Apophlegmatisms, &c. The second indication in a beginning *Phthisis*, viz. that the Tabick Matter deposited in the Lungs may be easily and thoroughly expelled daily, is performed by Expecterating Medicines, whose virtue is carried two ways to the Lungs, either as their active Particles are immediately let down by the Wind-Pipe, and procure Expectoration partly by lubricating the ways, and withal loosening the Matter that is fixt therein, and partly by irritating the Excretory Fibres into Spasms; whither belong Lamentatives and Suffumigations: or, as they exert their virtue in coming along with the Blood, (which are the more powerful) for seeing they consist of such Particles as cannot be tamed and assimilated by the Mass of Blood, these being poured into the Blood, and because they cannot be mixed therewith, being thrown out of it again presently, penetrate out of the Arteries of the Lungs into the Ducts of the Wind-Pipe, where lighting upon the Matter they divide, attenuate, and so exagitate it, that the Fibres being thereby irritated, and successively contracted in Coughing, the contents of the Wind-Pipe and its little Bladders are cast up into the Mouth. Things fit for this purpose, besides Sulphur and its Preparations, are artificial Balsamicks distilled with the Oyl of Turpentine, the Tinctures and Syrups of Gum. *Ammoniacum*, *Galbanum*, *Asa fetida*, Garlick, Onions, and such like that smell strong, of which Lohochs are also made: And these operate both ways; for partly by sliding into the Wind-Pipe, and partly by entering into the Lungs by the Circulation of the Blood, they set upon the Morbifick Matter both before and behind, and so drive it forth with the greater violence. As to the third Indication, that the injur'd Conformation of the Lungs, or their vitiated Constitution may be restored or amended, let those things be used which resist Putrefaction, cleanse, consolidate, dry, and strengthen; for which purpose the Remedies prepared of Sulphur, Balsamicks and Traumaticks are useful.

Willis.

II. *Galen* (1. *Epid. comm.* 17.) speaking of a *Phthisis*, says, that it proceeds not always from a Fluxion from the Head, but that Excrements flow into the Lungs sometimes from other Parts. Wherefore their ignorance is not to be endured, who think that the Recrements which are in the Lungs proceed only from the Head. For it may so happen that a *Phthisis* may be caused by an Humour transmitted from other parts of the Body, the Brain being sound. In which case whether *Silicidia* (or droppings) upon the Coronal Suture, or Sinapisms, Errhines and Masticatories do any good, let others judge.

Sanctor. l. de remed. invent. c. 14.

III. Those Remedies which respect the whole Body are very necessary; at this day they are not rightly administered, wherefore few are cured. I was lately at *Venice* and prescribed to a Patient an ounce of the Honey of Roses and another of *Oxymel*, that the Phlegm that was in his Stomach, and was the cause of much mischief, might be cleansed away. The Apothecary by mistake sent ten ounces, and the Patient took eight and an half of the Medicine: The same acting violently upon the Phlegm, was somewhat disturbing to him, but afterwards the Phlegm descended so into the Guts, and was so expelled, that all the symptoms were mitigated; wherefore Physicians must be bold sometimes.

Capivacc. Pr. l. 2. c. 7.

IV. Whether it is fit, and strictly necessary, upon any occasion to give a Purge to Consumptive People, or to let them Blood? We have seldom need of Bleeding in a *Tubercle* or Consumption, especially when there is an Ulcer already made, unless a new Fluxion supervene, or unless there be a fresh opening of some Vein, or where the defluxion is very fervent, and the Liver hot, or the Lungs burst on some occasion.

V. *Avicenna* in a *Phthisis* gives *Pil. Cochia* for the sake of the whole Body: Our common Practitioners give them not, but they do ill; for we ought to succour the Fluxion presently: for we may hope well when the Ulcer is not deep, but it becomes so when the Disease is prolonged; which comes to pass through the Matter flowing into the Lungs, wherefore that Matter is to be evacuated. Therefore after one loosening of the Belly, after two or three Syrups, *Pil. Cochia* are to be given presently according to *Avicenna*, that the whole may be purged and the Head evacuated, and so the Fluxion may be remedied. What I say of *Pil. Cochia*, the same is to be understood of other strong Looseners, for the fault of the offending Humour is vehement, and is of the nature of a *Causa sine qua non*; therefore a strong Purge shall be given; especially because the strength permiteth, which forbiddeth it in the progress of the Malady. For at the beginning, though it be an Heftick Fever, it is in the habitude, not in the habit; and whilst it is in the habitude, the strength in an Heftick Fever hath suffered no mischief as yet.

Idem.

VI. In those who have a Fluxion of acrimonious, biting, and corroding Humours, especially if there be also an ebullition and effervescence of the Humours, not altogether neglecting the indication of the Consumption, (for an exquisit or confirm'd *Tubercle* admits not of Evacuators even in those in whom the Fluxion still remains, but only of Diverters) 'tis certain that it will be very safe and necessary to purge, especially with those Medicines which may profit both the Breast and the Ulcer, and avert and lessen or bridle the Fluxion. Of this nature is *Rhubarb* believed to be, (sometimes the roasted) mixt with *Spikenard*, and diluted with the infusion of *Roses* and *Goats Milk*. Alike profitable is it to take in the morning a spoonful of *Corinth* with the Powder of *Rhubarb* and *Sugar*, so that for a pound of *Corinth* there be half an ounce of *Rhubarb*, and four ounces of *Sugar*. *Sugar* of *Roses* with a little *Rhubarb* is likewise good, or the same *Sugar* with *Bolus Armene* and the Juice of *Agarick*; or a Bolus of the Powder of *Roses* with the Juice of *Carthamus Seed*, or of *Agarick* or *Rhubarb* extracted with Milk Water. But if the Matter that flows be acrimonious, by licking often a little of the Pulp of *Cassia fistula*, or of the same made into a Conserve, you may gently loosen the Belly and avert the Fluxion thither, you may lenify the Breast and Wind-Pipe, and help Expectoration, especially if you dissolve it in Barley-Water, to which you may add the Powder of either *Lykyrrhize* or *Roses*, or if you will of *Rhubarb*: because the only way to cure a *Phthisis* is to recall the Matter to some other place; for when it is restrained by any of the foregoing things, it is more inconvenient and dangerous.

Mercatus.

VII. Nothing is plainer in the Doctrine of *Hippocrates*, than that those who labour under a *Tubercle* are not to be purged by Stool. For in *lib. 2. de morb. sect. 2. v. 320*, treating of the Cure of a *Tubercle* from a Disease of the Lungs, he does not only expressly forbid purging by Stool, saying, Give no Medicine that purges downwards; but prescribing white Hellebore, he orders it to be given so temper'd as not to move the Belly downwards. Seeing therefore *Hippocrates* for the Cure of a *Tubercle* uses only Vomits for Evacuation, and is so fearful of purging by Stool, it is not reasonable that

Aphor.

Aphor. 8. sect. 4. should determine the clean contrary: And therefore we must affirm that by the word *quidam* he does not understand Persons labouring under a *Tabes*, but such as by their Natural Constitution are disposed thereto; for in these, Vomits are suspected, for fear lest some Vessel should be broken in the Breast, which in this sort of Constitution is strait and weak. But Purgation by Stool is hurtful to the *Tabid*, because it uses to bring on a Looseness that is deadly to them. Wherefore Purgings by Vomit will be less inconvenient for these, by the vehemence whereof though the Lungs be agitated and strained; yet because they are accustomed to such Commotions by reason of their Cough, which does violently exagitate almost all *Tabid* Persons, therefore Vomiting is not very apt to do mischief, and it may be of great relief to the Patient, not only in that it brings forth the antecedent Matter, but also because it does not a little help the Excretion of the Conjunct Cause, which is made by Coughing. Nor need the breaking of a Vessel be feared in these through the violence of the Vomit, because the Veins being exceedingly emptied in these Persons from their Extenuation, are not so apt to break, as in those who are not as yet fallen into a *Tabes*.

VIII. *Galen, 5. simpl. cap. 12.* greatly condemns *Diureticks*, because, he says, they hinder the Expectoration of Matter, for the Matter is thickened by them, which can only be expelled by Coughing: The reason is, because the Matter that is in the Breast is by *Diureticks* deprived of the ichorous part, which serves to make the Matter thin.

IX. Before you enter upon the Cure of the Ulcer alone, 'tis necessary also to have regard to the Humours that have flowed into the Breast or Lungs. Wherefore we must consider whether the Fluxion, from whence the Malady begins, remain still, or be already suppressed, or ended: For if it continue still, whether from the Body, or from the Head, or from any other place, we spend the time to no purpose in the Cure, unless we first restrain the Fluxion, or find it to be derived to some other place. Wherefore it will be necessary either to avert it by Medicines, or to end it with gentle Evacuations, or to restrain it in the part that sends it: For we restrain it by reducing the Head to its Native Temperament, or by ending and dissipating the Humour there; as *Galen, 5. meth.* hath reported of the Plaster of *Ibapsia*, which we must use neither rashly, nor in all cases, but only when the Head is cold and Phlegmatick: for then it both excites the sluggish heat, and corrects the cold Intemperature, and therefore stops the Phlegmatick Fluxion, because it dissolves or concocts. But if the Fluxion be hot, or acrimonious, or biting, we must perform the Cure by warm Baths, or by cold and astringent Pouders, &c. But the Matter that is already generated, and which is daily bred by the intemperature of the Head, can be averted by no Remedy more safely than by making an Issue in one or both Arms; whereby, by faithful Experience I know, that not a few Phthisical Persons have been cured.

X. I am of opinion that your Waters called *Acidulae*, are not good for those whose Lungs are Ulcer'd, (though they may seem agreeable at first sight by their cooling virtue, whereby they are opposite to a Fever; by their drying, whereby they cure Catarrhs; by their abstersory, whereby they cleanse the Ulcer) 1. because of their acrimony which is hurtful to the Corroded Lungs; 2. by reason of the acidity joined, which is astringent, whence they hinder Expectoration; 3. by Evacuating they hurt the *Tabid* that are already exhausted; 4. by drying and cooling they consume the Native heat; 5. by their coldness they hurt the Stomach that is already weak, with which the Heart sympathizes. A Bath is not good, because, 1. by its

actual heat it increases the Hectick Fever that is joined with the *Tabes*; 2. the Members are further dried; 3. they exhaust the Body still more by a *Diaphoresis* and provoking of Sweat; 4. nor are they profitable on the account of the Ulcer, because their virtue reaches not to the Lungs; 5. nor do they extinguish the Fever, seeing they heat and dry; 6. nor do they cure the wasting, for they evacuate, dry, and heat; 7. nor do they cure the *desfluxion*, which is often raised thereby. ¶ Yet *Foris, conf. 34. cent. 2.* has recourse thereto as the only Remedy.

XI. Let Physicians note that in case of an Ulcer the Lungs are to be cleansed from the Blood that is extravasated, as *Galen* advises *5. meth.* Nor must we in these cases always proceed with astringent and closing Medicines; otherwise the Blood being retained will be the cause of greater mischief, and hence suppuration and death will inevitably succeed. Let them note the same thing, if upon the descent of Blood from the Head to the Lungs there succeed either a dry Cough, or such as is not sufficient to purge the Lungs from the Blood; because if the Lungs be not perfectly cleansed, the same mischiefs will follow.

XII. The Decoction of *Guaiacum* Wood has a notable virtue to cure the Ulcers of Phthisical Persons, and is commended by several very learned Physicians. The Decoction of the Root of *China* is also profitable. For though these Decoctions seem to dry the Body, yet the profit that accrues from healing up the Ulcer in the Lungs, is far greater. For seeing the leanness of the Body has its rise from an Ulcer of the Lungs, such Decoctions, by taking away the cause of the extenuation of the Body, by confining the vitious Humours and curing the Ulcer, make the Extenuated Bodies to be well nourish'd again and grow fat, as Experience has often taught. ¶ I know that there want not very great difficulties in the administering of them; for to give an hot and dry Medicine to a *Tabid* and Feverish Body is contrary to all Medical indication. Nevertheless, because if the Ulcer be not dried, neither the Fever nor the *Tabes* can end, hence it comes to pass that the more Learned Physicians have admitted of the use of Driers. I declare that about seventeen years ago I cured a Phthisical Person that had gotten the Pox, by a Decoction of *Guaiacum*, who is yet alive still. If any be afraid of it, let him take the Root of *China*, which I used with good success in a Phthisical Woman after a suppurated *Peripneumony*, who is still alive. See an Example in *Riverius, cent. 1. obs. 99.* I have learned by Experience that a Decoction of *Lignum sanctum* is good in this case, says *Silvat. cent. 2. conf. 36.*

XIII. Among those things which are very much commended, is the Sugar or Conserve of *Roses*, which yet some deny to the Phthisical, because the Ulcer of the Lungs needs cleansing and bringing forth of the Matter; which two things are the chief causes why most Ulcers of the Lungs are incurable: Now this Sugar is too weak to cleanse and absterge the Ulcer sufficiently: Besides that when it is new, it loosens the Belly, the Flux whereof is dangerous; and when old, by drying and astringing it compresses the ways and makes them straiter; whence the eduction of the Matter is hindered, and the *Sanies* driven inward: yea, seeing it is cold, it seems inconvenient, according to *Aphor. 5. 24.* But in truth it is to be allowed to the Phthisical; for that is profitable for them, (says the *Reconciler diff. 194.*) which cleanses, absterses, glutinates, corrects the *intemperies* that is introduced, and is withal in some sort nutritive; all which this Sugar or Conserve does; whence we conclude that it ought to be much esteemed, as not only the Testimony of Classical Authors, but daily Experience also witnesses. Yet that is to be noted which *Mesue*

Sebil de Acid. p. 443.

Sennertus.

Saxon, pract. p. 146.

Prosper Martian, comm. in aph. 8. sect. 4.

Sanctor, de rem. invent. cap. 5.

Mercatus.

admonishes, and after him the *Reconciler*, That Sugar of Roses is not to be granted before stronger absterging and mundifying Medicines have preceded, and the Ulcer be purged from its Pus; at which time there is need of a slight absterging, but a greatly glutinating virtue; which thing is very well performed by the Sugar of Roses that is betwixt new and old, used daily in such form as it can best be taken in. Hence it appears what is to be answer'd to the first and second Reasons that forbid it. And when *Hippocrates* says that cold things are hurtful to the Breast, he speaks of an excessive coldness, such as is in Ice and Snow. ¶ Some Conditions are to be observed in the use of Conserve of Roses: 1. That Abstergers and Mundifiers be premised; and therefore at the beginning let that which is new be given, which has more Juice in it, and therefore a greater absterging virtue: 2. That it be given in a large quantity, and that daily; yea, let it be taken with Bread, and Meat and Drink: 3. That if by its use Expectoration be hindered, and Respiration become difficult, Expectorators be given betwixt whiles. ¶ *Red Roses* use to be much commended for consolidating the cleansed Ulcer, as also the Conserve that is made of them, though hitherto I have seen no good and great effect thereof; because when it is taken in a great quantity, as the Commenders thereof would have it, the Stomach and Guts are filled with much Phlegm, whence the appetite is not only dejected, but chylification also hurt: Moreover there often arises a troublesome coldness in the upper region of the *Abdomen*, and so of the Stomach, from which the Patients cannot be freed again in some Months space, which I have observed to come to pass more than once. Therefore I would prefer a Decoction of red Roses made with a strong Expression, and that sweetned with a little Sugar.

XIV. Most have commended the breathing in an hot and dry air for drying up the Ulcers of the Lungs: For this reason the Ancients also advised Phthisical Persons to sail into *Egypt*: *Galen* bade them go to *Tabia*. Nor must we think that such Air only of Naturemaking is to be procured, but we read in *Galen* (4. loc. aff. 8.) that an Air for this purpose may be also prepared by Art and Odours. Whom *Veslingius* imitating undertook to cure a certain grown Person, ill of a long Phthisis, by Suffumigations chiefly, such indeed as were moist at the beginning, of the Herbs of Agrimony, Betony, Foal-foot, Lungwort, Speedwel, and the Roots of Burnet and Cinquefoil boil'd in Potrage; and afterwards by such as were dry, as Benzoin, Ladanum, Stirax and Mastich, received in at the gaping mouth: testifying at large, that he hath known Phthisical Persons that were very desperate, recovered chiefly by a Suffumigation of Ambergrise. *Silvaticus*, cent. 1. conf. 51. hath commended the same. *Bennetius*, (*Theatr. tabidor. exerc. 30.*) has drawn Instruments fit for Effumigation and Vaporation. *Lud. de Leonibus* cured a Phthisical Person, who was so lean one might tell all his Bones, by a Suffumigation of Amber. See more before concerning the Diseases of the Breast and Lungs in general.

XV. When leanness hinders the use of Medicines that would dry up the Ulcer, I give *Asses Milk*, but with the Oyl of *Guaiacum*: This way six years ago I cured a Phthisical German Nobleman. Or you may give a Broth made thus: Take of *Guaiacum* or *China*; if *Guaiacum*, three ounces; if *China*, one: Infuse them in three quarts of Water: Then take of Barley unhusked half an handful; *Amylum*, Gum Tragacanth, of each two drachms; of the Seeds of Sorrel and Plantane, of each one drachm; of the Seeds of Melon blanch'd half an ounce; of the Kernels of Pine-Apples and Pistach-Nuts, of each an ounce and an half; the

Flesh of Wood Snails two ounces: Put as much of them as can be put in the Belly of a little Puller; Let them boil all together till the perfect consumption of the Flesh, and straining the Liquor let it be given for thirty days. This I give with great success to Phthisical Persons; The Dose is six ounces.

XVI. Tabid People cough importunately, and evacuate much purulent Phlegm: Therefore some are afraid of Milk, because they have persuaded themselves that it breeds and turns to Phlegm. But Milk being entire and new, and milked from those Animals that are of a good habit, is of good Juice, and is made of Blood well concocted; so little reason is there why it should be reckoned amongst those things that are of bad and Phlegmatick Juice; and that because the Butter is mixt with it: whence *Avicen* prescribes Butter-milk, because the Butter is apt to be inflamed, yea, it will take fire; so far was he from thinking that it would be turn'd into Phlegm, that it rather turns to Choler. (Therefore *Trallianus* commends new Cheese, because it cools.) Nor is it then turned into that thick and purulent Phlegm which Consumptive People sometime cough up: For Milk consists of Butter, Whey, and Cheese: The Whey is of a Nitrous quality, it cleanseth, opens obstructions, carries Acrimonious and Aduft Humours through the Belly, which are the effect of heat: therefore *Galen* esteems sower Milk cold, because it has lost the acrimonious quality of the Serum: however supposing that it cooled very much, yet it could never be turned into thick Phlegm by reason of the thinness of its substance: The Butter it self, seeing it is inflammable, never turns to Phlegm: The Cheesy part, having the Whey and Butter mixt with it, is not viscous: so that by the mixture of these three together Milk becomes very temperate: it moistens, nourishes, attemperates, nor does it breed that Phlegm which some Phthisical Persons are so troubled with. Yet suppose it were Phlegmatick, seeing that Phlegm is lodged only in the Stomach, and stuffs not the Lungs which are affected, there will more benefit accrue by its use, than inconvenience from the generation of Phlegm, because of the great faculty it has to nourish and temper.

XVII. Milk has the chief place amongst the Remedies of Tabid People: yet in the giving of it divers Cautions are to be observed, lest it rather do hurt than good; for it is apt to corrupt upon the Stomach, either being turned into a nidour, or waxing sower and curdling in the Stomach. When it waxes sower, a little Honey or Sugar may be boiled in it; for thus is the coldness of the Stomach amended, which makes the Milk turn sower. If it be turned into a nidour, it is corrupted by heat; and then it is profitable to mix Water enough with it. But the vulgar approve not of this mixture of Water; yet the best Physicians have advis'd it, for it tempers the heat, does no harm to the Milk, especially if it be Cows Milk, that now adays is by far the most usual. *Hippocrates*, 7. *Epid.* gives Cows Milk with a sixth part of Water, both because this sort of Milk is naturally more thick, and also because it is apt to turn to a Nidour. And 5. *Epid.* 36. he relates a Story of *Pythocles*, who gave his Patients Milk mixt with a great deal of Water. Thus likewise *Galen* commends Asses Milk, because it is the thinnest, and has the least Coagulum or Cheesy part: In defect whereof 'twill be convenient to bring Cows Milk to its temperature and consistence, which is best done by mixing Water with it.

XVIII. I have sometimes observed in an Asthma and an inveterate Cough, when very absterging and inciding things have been used, that the Patients have fallen into a looseness with great relief. But if there be not a moderation in the use of these things, the Phthisical and Dropical are apt to be offended by

by them and the like; whence a mortal *Diarrhæa* afterwards supervening, they go to the common place, to the great reproach of Practitioners. Whence *Hofman* says, such things as do so powerfully open obstructions, do withal purge in a just dose.

XIX. Modern Physicians have thought that *Ros solis* or Sun-dew, especially the distilled Water of it, is singularly good for all Phthisical and Tabid Persons. For as the Herb seems most tenacious of moisture and dew, so that even the most fervent heat of the Sun cannot consume the moisture: so it has been believed that the natural and genital moisture is preserved and cherished by it in the Bodies of Men. But the use of it teaches otherwise, and Reason also dictates another thing. For seeing it is a very Acrimonious Herb, and its distilled Water is not wholly destitute of this very acrimony, it cannot be taken without offence and prejudice: for those who have made use of its distilled Water have died sooner, than they would have done if they had abstained from it and followed a right manner of living and diet.

XX. I have used *temperate Acids* with very good success, contrary to the opinion of perhaps all Writers. The reason is clear, because the *Lympha* (which is collected in both the Orbicular and Sinuous Bladders of the Lungs) is too thick: Sweet things not temper'd with Acids, I with many others have observed to have been always, at least for the most part, injurious to the Patients.

XXI. Note that Sulphureous Remedies are not always convenient in this case; wherefore *Sennerius* (*in Insitut.*) admonishes rightly: *Lac Sulphuris* is not to be given alone especially, nor in a great quantity: yet it may be mixed with Moisteners (especially a Decoction of China with Raisins and Lykorrhize.) And, which is to be observed, from the too much using of the *Balsam of Sulphur* Practitioners testify that many have fallen into a Phthisis. ¶ Whether is it safe to use the *Balsam of Sulphur*, and other oily Balsamicks prepared of Sulphur with distilled Oils, in a Phthisis or Exulceration of the Lungs (or other *Viscera*) that has arisen from salt Humours causing a spitting of Blood? *Schroder* with others affirms they may, nor perhaps want there Reasons for it: because first, such Balsamicks increase the Radical moisture or Balsam with the innate heat: secondly, they refresh the Vital Spirits: thirdly, they temper the acid salts in the *Lympha* and Mass of Blood, from whence putrefactions proceed, as appears by Mechanical Chymistry, whilst by such distilled Oils the acid corrosive vertue even of *Aqua fortis* may be corrected: fourthly, they are internal Vulneraries, resisting Putrefaction; in regard that even externally being dropt into the broth of Flesh, they hinder the same from putrefying or stinking. But if we will not even in this case make slight of that common Curative Rule, That Contraries are to be cured by Contraries, we shall certainly have no good success if we undertake to cure a Phthisis or Ulceration of the Lungs with such Balsam of Sulphur, or other Oleous Balsamicks, made of the Flowers of Sulphur with distilled Oils. For it is well known that in a Phthisis or Ulcer of the Lungs, or other Internal *Viscera*, there is always either a previous, or a present Inflammation, and that not without an inflaming and painful Acid: 'Tis also well known to all, that the distilled Oils and other things of which the said Balsamicks are made, are also hot, inflammable, and resinous; though few perceive that this is to be imputed to their acid Particles. Distilled Oils and other fat things do harm in Distempers of the Skull and Bones, (being anointed therewith) and in Erysipelatous Distempers they bring on a Gangrene by reason of their occult Acid: With what sound reason therefore can these things be given in a Phthisis

or Ulceration of the Lungs? Besides, seeing then the digestive ferments of the *Viscera* are likewise very weak, and these Oleous Balsamicks, because of their unctuous Acid that is immersed in the Volatil salts, do rather fight against those ferments, as appears from the belching after taking of them, they cannot be brought into act and converted into Volatil salts agreeable to Nature, whence remaining thus crude they are wholly offensive to Nature, and cause an irreparable mischief. Furthermore in such Diseases the whole Mass of Blood, together with the *Lympha*, is otherwise grown vapid as it were, so that the Volatil salt, Oleous and Balsamick Particles which are congruous to Nature being spent or resolved herein, the Spirit of Life being become weaker, loses of its light, yea, becomes very little: and when such Sulphureous Preternatural very hot Oils are made use of, what else will happen, but that as a greater flame extinguishes a less, so also these things which are hot in an high degree, do utterly extinguish the remainder of the vital flame, or in stead of the vital heat introduce an Hætick? As to the second reason why they may be used, viz. because they refresh the Vital Spirits; I say it matters little, though by their sulphur they seem to cheer them a little, unless they did also thereby consume the Morbifick Cause, and unlock the stop and obstructed ways, and strengthen the ferments of the *Viscera*. As to the third, 'tis confessed indeed that distilled Oils do allay the corrosive vertue of *Aqua fortis*, whilst a weaker Acid corrects a stronger; but what signifies this to their Internal use? And lastly, the reason why these Balsamick Oils being dropt into Flesh-broth, preserve it from stinking and corruption, is because they defend it from the injury of the Air, even as we see that the Oil of Sweet Almonds made by expression, or the Oil of Olives, keeps Wine in the Vessel from corrupting; But what is this to the present business? It proves nothing; for the operation of these Balsams in Mans Body differs far from that which they have in other things without the Body: In the former there is a fermental heat; in the later a putredinal, elementary.

XXII. Amongst *Abstergers* and *Mundifiers* of an Ulcer, I have hitherto found no Medicine, which being used either outwardly or inwardly, has so safely and quickly not only cleansed, but also closed up fresh Ulcers, as the Balsam of Sulphur, when the Patients could and would make use of it: Now I prefer that before the rest which is made with the Oil of Aniseeds, though it may be also made with the Oils of Amber, Juniper, Venice Turpentine, Nuts, and other things. ¶ The toughness of the Matter which hinders Respiration, is loosned by inciding Medicines, and so is easilier cough'd up. For this purpose I do in like manner commend the Balsam of Sulphur prepared with the Oil of Aniseeds, as being not only good for cleansing and closing up of the Ulcer, but also makes the Pus it self more thin and fluid, and so promotes and facilitates its excretion.

XXIII. In this case some commend not only the Flowers of Sulphur and the Balsam, but also the Milk, whereof yet I never observed any notable effect, though I have oft given it to my Patients, and have also seen it given by others.

XXIV. *Injections* made into the cavity of the Breast help very much, when the outer surface or substance of the Lungs is Ulcerated; if the Ulcer be caused by a Wound in the Breast that extends to the Lungs, seeing in that case there is an open way whereby this may be done. And by the use hereof (such things being in the mean time given also inwardly as are proper in other Exulcerations) I have seen a Man recovered and live many years after, who was stabl'd in his Breast as far as his Lungs, from whence there arose an Ulcer therein, and corrupted pieces of his Lungs came sometimes forth

forth of the Wound, and the Man was become quite Tabid: I know another also who evacuated a Bloody, sanious, and purulent Matter through a Wound in his Breast, that by the use hereof was relieved a good while ago and is still alive.

Plater. tom.
3. p. 436.

XXV. The Catarrh is first to be stop't: Therefore I perswade the whole Head to be shaven, and Vesicatories to be applied thereto, first of the more gentle, but at length I come to the stronger, even to *Cantharides*. I applied Vesicatories to the Head of a certain Noble Lady that labour'd under a Phthisis, improperly so called, (namely that arose from a Catarrh descending from the Head and putrefying in the Lungs, whereby the Body rises to waste, and the same symptoms follow as do upon an Exulceration of the Lungs) and Nature supplied that which we could not do, all her Head being covered with Blisters and Croits, and she was cured of this Catarrh, and is still alive. Afterwards I would come to the draining also of the Breast and Lungs, and would blister all the Breast; and at length would make Issues upon both Arms, and so the Matter would exhale every where, and the putrefaction by that means cease, and there will be a diversion of the Matter. Whence *Galen* in a true Phthisis orders Cauterics or Issues upon the Breast, to drain it.

Montan.
conf. 147.

XXVI. The diversion of a Catarrh is most conveniently performed by *Fontanels* or Issues, which I cannot sufficiently commend, seeing I my self have seen such cured by them as have been half Phthisical, who cough'd up both Blood and Matter: for the Acrimonious Humour that flows from the Head upon the Breast, is first evacuated by them. I knew a Man who had been Consumptive a long time, of a Melancholick Constitution of Body, and who had used divers other Remedies in vain, whom I not only cured in a fortnight of the defluxion from his Head upon the inferior parts by making an Issue in his left Arm, but his Body also somewhat recovered its vigour and lost Flesh. ¶ A Girl had a *Fistula* in the middle of her Hip, and for three years together had been in several hands to no purpose, but being cured at length, she fell into a plentiful spitting of Blood after three or four Months. Though she was hardly ten years old, I presently let her Blood in the Foot of that side which the *Fistula* had been on; and then Purging her, and making an Issue near the place where the *Fistula* had been, I readily deliver'd her from a very imminent *Tabes*. This spitting of Blood came from no other Cause than from that Acrimonious and Bilious Matter, which having no exit any longer by the *Fistula*, afterwards ascended to the Lungs by the Branches of the *Vena Cava*.

fabrit. l. 5.
c. 3.

XXVII. We may use *Fontanels* in a Fluxion from the Head: for whilst the Ulcer is fed by the destillation, a *Fontanel* is indicated, as a Revelling Remedy; nor is there any prohibent Indication, especially when the Ulcer is small, and the Malady new. *Trallianus* saith, That in an old Ulcer, and a long-continued Phthisis, the Patients are not to be afflicted, or rather tormented with *Fontanels* or Cauterics. If the Malady be very vehement, it is to be made in the Coronal Suture, that Revulsion may be made: and if the destillation be fed by the interior parts, as by the Liver, let Issues be made in the Thighs. They are not to be deferred, as many use to do; for after a while no such thing is to be done, in a plentiful Defluxion, not only to the said parts, but not below the *Occiput*. We must use them therefore betimes; for afterwards when there is an hot Distemper in the Lungs, and the Fluxion is diminished, the Issue may be dried up. ¶ When the Matter is precipitated from the Brain upon the Lungs, which causes an increase of the Ulcer, what is then to be done? I say, if the Ulcer should be such as that there might be any hopes to induce a *Callus* upon

Capivac.

it, a Caution applied to the Coronal Suture would notably contribute to health; for it causes no pain there, nor is it at all dangerous. We make use of a Caution here, to make the *Callus* the firmer, which otherwise could not be firm at all because of the destillations; and by the incursion of the Catarrh it would be apt to be fretted off, whence the Ulcer would become also greater. But when there is no hope of making a *Callus*, we ought not to use a Caution without a Prognostick; declaring that there is no hope of curing the Party, but that with the Blessing of God his Life may be a while prolonged by the Caution, for the Ulcer will become the cleaner. But take heed of applying Caution when Death is not far off, and the Body is wasted, for fear of a Gangrene.

Heurnius.

XXVIII. The Son of Mr. N. twenty years old, had labour'd under a Fluxion for two Months, talking upon his Lungs with a Cough, frequent Respiration and a slow Fever, so that he seem'd to be ready to fall into a Consumption. I prescribed Bleeding, Purging with Manna, Medical Broths, and other ordinary Remedies; but the chief was an Issue made in each *Arm-bole*, which most powerfully derives Fluxions falling upon the Breast, and Humours contained therein; and hereby he was recovered in a months time.

River. cent.
2. obs. 61.

XXIX. A Noble Matron had labour'd for some years under a destillation upon her Breast, and that so violent, that she was nothing benefited by Medicines: At length the Malady being so far increased, that she cough'd up not only Purulent Matter plentifully, but also Blood, and was running into an Hectick, I being advis'd withal, besides convenient Diet and Medicines, made moreover a *Seton* in the Nape of her Neck; by the benefit whereof she was restored in a short time to admiration, so that she had Children afterwards.

Hild. cent. 3.
obs. 38.

XXX. The Ancients greatly approved of the use of *Baths*. *Hippocrates*, 2. de Morb. says, That a Tabid Person must bathe in luke-warm Water all but his Head, which ought very rarely to be washed. But we must consider that it is not expedient for all Tabid Persons, seeing there is a manifold cause of a *Tabes*; for it will do hurt, when the Blood flows, has flown, or 'tis feared is about to flow: also when a Fluxion falls from the Head, and likewise when the Lungs are very full of Excrements: it will do good only in a *Tabes* or Extenuation of the whole, without any defluxion; or in that which is caused by an Ulcer in the Lungs, by correcting the driness of the whole, and applying a moisture like to that of Nature, and by tempering the Preternatural heat. Yet you are not bound to use this sort of Remedy either long, or frequently, or in all cases alike, but according to the Constitution and state of the Body: because those who are of a rare habit, are more slowly and seldom to be washed, nor are they to be kept long in the Bath: neither those for the same reason who are become very Tabid, for their puny strength will be dissolved thereby. But you shall bathe those oftener and longer who are Tabid from an Ulcer in their Lungs; and that by so much the more often and longer while, by how much the Disease is but yet a beginning. ¶ In a Fever that proceeds from an Ulcer of the Lungs, seeing it is not Hectick but Putrid, (though 'tis not to be denied that sometimes an Hectick is joined with it in process of time) Baths are in no wise to be made use of; for they do not only do no good, but also much hurt, as it has been observed in many. But that they are good in an Hectick, unless it have a Putrid Fever joined with it, none that is skill'd in Physick is ignorant of.

Mercat. cap.
de phthisi.

XXXI. All Antimonial Medicines, both Diaphoretick, Purgative, and Vomitive, free the Blood from Pus better perhaps than all other Medicines; which Antimonials I have more than once observed

Crato, conf.
86. apud
Scholtz.

observed to have brought out by Stool and Urine a good quantity of Pus in a Phthisis and great inveterate Ulcer of the Lungs, so that for many days afterwards there was no Pus expelled by coughing. That there was an Ulcer appeared by the dissection of the dead Body.

XXXII. *Galen*, the Master of Physicians, sent Phthisical Persons to *Tabia*, not that he might quit himself of their Cure, but for the drying up of the Ulcer and Fluxion, by breathing in a pure Air endued with a drying faculty, and season'd with the Balsamick vertue of the Plants growing there. Some years ago I sent thither a Nobleman of our Country (by name *Cotton*) who was sick of a confirm'd Phthisis, and spit Pus with Blood, being like a Skeleton clad in Parchment for leanness; who at his return, being thoroughly recover'd, Married, living in good health in his Family, and became the Father of several Children. I have seen a Nobleman (that the efficacy of the Air in Diseases of the Lungs may appear) who was twice cured of a *Fistula* that succeeded a deep Wound in the opposite side of his Breast. He went into *Spain*, where after five years the *Fistula* closed up: but returning hither home again, into a cold and moist Climate, the *Fistula* broke out again of its own accord; whereupon going into *Spain* again, he was cured by the like stay. Whence it is clear that the Air, which passes through all the Pipes of the Lungs, does exert its vertue more effectually than any other Remedy, by its natural or ascitic qualities.

XXXIII. Yet from such change of place all do not receive help alike; for many going into *France* or into Country Villages, do find there rather their Graves than Health: yea, *London* is not presently to be left by all Phthisical Persons; for I have known several subject to a Cough and Phthisis, that have been better in this smoaky Air than in the Country. So that for the curing of the same Disease, whilst some avoid this City as Hell, others betake themselves to it as a City of Refuge. The reasons hereof appear clear enough from the Doctrine of Respiration: Namely, we have shewn that the Blood passing through the Lungs, both as to its accension or vitality, and as to its motion depends very much upon the Nitrous Air that is received in Inspiration; whence it follows that the Tenour of this ought to be proportioned to the Crasis of that, that the Blood being moderately accended in the *Præcordia*, may burn clearly and briskly, both without smoak and foot, and also without too vehement a Flame; and thereupon may pass through the Pneumonic Vessels freely enough, without stop or depositing its Excrements. Wherefore an Air that is moist, foggy, and not ventilated with Winds, as it is wholesome for none, so is it most hurtful to such as are troubled with Coughs: On the contrary, a serene and mild Air, enjoying the Sun and Wind moderately, as it is wholesome for all, so is it friendly to all Phthisical Persons. As to other Conditions of Inspiration, some avoid or lose a Cough by living in mountainous and open places, where the impending Atmosphere, being destitute of all thick, smoaky, and feculent Vapours, abounds with Nitrous Particles: For such whose Blood being thick and feculent is full of an impure Sulphur, and has need of a very thin and nitrous Air to kindle it rightly, and to consume its feculencies by the accension; if their Lungs be not too tender, but firm and strong enough, they endure the stronger appulses of such like Particles: On the contrary, such as have Blood that is thin and subtil, easily dissoluble, and endued with a more pure, but very little sulphur, and have also Lungs that are tender, soft, and being of a more rare texture are very sensible; these not enduring a nitrous and rough Air, receive most benefit by that which is thick, and

chiefly by the Sulphureous: Wherefore 'tis best for these to breath in the fat and more dull Air of a smoaky City, namely, such as may afford a sulphur (which is wanting in some sort) as well as nitre to the hungry and too thin Blood, and may a little incrassate and fix its subtil and over dissoluble consistence; and may moreover dull the substance of the Lungs, or their over sensible and rare texture, and fence them against the encountering of the too sharp and impropotioned Air. Indeed it is clear by frequent Experience, that a thick Air, if it be withal sulphureous, is very benign to some (that I say not to all) Phthisical Persons. 'Tis commonly observ'd that those Countreys where their firing is Turf, which in burning sends forth a very sulphureous smell, are more rarely infested with Consumptions: yea, those places are very wholesome for those who are subject to a Phthisis, and sometimes recover them who have sals thereinto. Whereto add, that a suffumigation of Sulphur and Arsenick (which is very full of Sulphur) though it be the last, yet is a very effectual Remedy for the cure of almost deplorable Ulcers of the Lungs. Now the reason why a Sulphureous Air is so agreeable to some Phthisical Persons, is, first, Because by inspiring such an Air, as well the jejune and hungry Blood as the tender and easily offended Lungs are both helped and spared; secondly, Because the Sulphureous Particles that are inspired together with the Nitrous, do very greatly prevent or take away the acidities of whatsoever Humours (from which Acidities the Fluxions and Extravasations of the Humours do chiefly arise.) And truly for this reason 'tis that Sulphureous Medicines do give that notable relief to Coughing or Phthisical Persons: and therefore, as was said before, Sulphur is called the Balsam of the Lungs: for as Balsamicks being applied to an Ulcer or Wound, take away the acidity of the Ichor that issues out, and corrupts, or grievously irritates the Fibres; do likewise ease the Pain, and afterwards cure the solution of Continuity: so also the Sulphureous Particles conveyed into the Lungs either with the Air or with the Blood, in as much as they prevent or destroy the acidities of all the Humours, viz. the Crisior or Blood, *Lympha*, *Serum*, Nervous and Nutritious Juice, do very much contribute to the prevention or cure of a Phthisis.

XXXIV. Modern Physicians do recommend Snails to the Phthisical and Hæctick, induced no doubt by the Authority of *Galen*, who 3. de alim. facult. c. 3. affirms that the Flesh of Snails doth nourish very much. But seeing the same Person, and the matter it self teach, that they are of difficult concoction, and do not afford a good Juice, it is apparent hence that they are not good. For seeing the Phthisical labour under a lingering putrid Fever, and moreover the natural faculty in the Stomach and Liver, yea, in the whole Body is weak, it will not be able to conquer Meat of difficult concoction, whereby many Excrements will redound, both in the whole Body, and also in the Lungs themselves; or therefore because they are of evil Juice. Moreover the same thing will happen here as in Wounds, which pour forth a more plentiful *Sanies* if the Patient feed upon bad Victuals; and many superfluities will be heaped up from the Ulcer in the Lungs, and much Pus, from which there is the greatest danger. And if we should grant that the extreame part of the Snails, which *Aristotle* calls *pharynx*, is more easily concocted, it is to be understood only in comparison to the rest.

XXXV. I have seen many become suppurated and Tabid without any preceding Destillation, or any Inflammatory Affection, or any Defluxion foregoing. Hence from Reason and Experience I say, that besides the ordinary Causes, there are

Y y y two

Sylv. prax.
med. l. 1. c.
24. lect. 20.

Th. de
Mayerne,
tract. de
Arthrit. p.
64.

Willis,

two hidden ones of Suppurated and Tabid Lungs; one is the languor and weakness of the part, the other the badness of the nourishment: which two Causes concurring, the Lungs are easily suppurated and wax tabid; without a distillation, or an Ulcer, or any other particular Affection preceding. This weakness is contracted from the Parents, and conceives Corruption and Putrefaction, not through any Intemperature, but through the vitiated Substance which is made too flaggy by Nature; yet such do not grow Tabid before they come towards Maturity, because till that Age they are nourished with a mild and sweet Blood, because the innate heat, that is much in quantity and sweet in quality, abounds, whence an equal nutrition is performed. But when they are arrived at their Juventus or ripe Age, their innate heat beginning to become somewhat Acrimonious and less kindly, they breed a like Blood, which, the further their Age proceeds, becomes also the more Acrimonious and unsweet, as does also their innate heat: and at length their Blood acquires a saltish or acrimonious quality, whereof an undue aliment being made, the Lungs are disposed to corruption. Whence in these Persons a naughty Excrement accreting from this bad Nutrition, there begins a little short Cough with spitting of various Matter, which is a sign of the Corruption beginning in the Bowel. Now I have attempted and performed the Cure hereof by such things as might correct the Blood and make it mild, and might abate of its acrimony and saltiness; as Baths of sweet Water, drinking of Milk, Meats of like nature, temperate and moistening Anointings, the decoction of the Root of *China*, and other things of this quality: with which I have used also such things as might resist the Putrefaction, Corruption, and Flaggingness of the Bowel, and might chiefly respect the Lungs. But I have principally made use of this as a most singular and powerful Medicin, by the help whereof I have performed wonderful and almost incredible things, not only in the cure of a *Tabes*, whether imminent or beginning, but also in salt Distillations, especially the thin, in long continued Fluxions of the Blood caused by its ardour or heat, and in many other rebellious Diseases: The Medicin is a decoction of *Saunders*, made almost in the same manner as the decoction of *Guaiacum*, sometimes in simple distilled Waters, sometimes with the addition of a little Wine either white or red, with respect to the Disease, and sometimes other ways: the manner of taking it is the same with that of *Guaiacum*. I advised the Patients to leave their Country Soil, and change their Native Air for a purer, at least to alter it.

P. Sallus, comm. in text. 5. sect. 3. l. i. de morb. See Fernel. de part. morb. l. 5. c. 10.

P. Borellus, cent. 2. obs. 59.

XXXVI. Many Students become Tabid by over much Study as is supposed, but rather from the Candle smoke which they draw in with the Air in their close Studies, as has been very profitably observed by *Placaus* a Professor at *Saumur*.

XXXVII. A Woman after spitting of Blood fell into a *Phthisis* with an *Heetick*; she cough'd up purulent Matter tinged with Blood; was troubled with Colliquating Sweats and difficulty of breathing; yet was cured by this only Medicin. Take of the Roots of *Comfrey*, *Foalfoot*, and *Elecampane*, of each six ounces, boil them in as much Water as suffices, till they are soft: then pound them, and pass them through a Sieve: Take of *Raisins* and *Corinths*, of each half a pound, boil them in the Liquor wherein the Roots were boiled, and extract their Pulp in the same manner: Take of *Sage*, *Betony*, *Hyssop*, *Speedwell*, *Ground-Ivy*, and *Lungwort*, of each an hand-ful, boil them in the Liquor that remains from the Raisins and Corinths: Take of this Decoction strained, and of *Sugar-Candy*, of each one pound, boil them to a consistence, and then strain them; and add of the Pulp of the Roots, Raisins, and Corinths, of *Sweet Almonds*, blanch'd,

and fresh *Pine-Apples* well pounded, of each three ounces, of *Cinamon* two drachms, of *Saffron* a scruple: mix them and make an Electuary. By the same Medicin, very little changed, I cured my Son of three years old, who after he had escaped from the *Petechia*, had Imposthumes gather and break in his Lungs four times, so that he expectorated Pus in great plenty, and was wasted to Skin and Bone. Otherwise a *Phthisis* is a dangerous Disease, not only because the Medicins cannot come in their entire strength to the part affected, but also because of the substance it felt of the Lungs, which according to *Malpighius* is not fleshy, but consists of Membranous Bladders: Now a Membrane is a *Spermatick* part, which being consumed is not regenerated. I know a Maid of about twenty years of Age, that is strong and juicy, who in her seventh year was *Phthisical* and *Heetick*, and given over by her Physicians, to whom her Sagacious Mother gave daily for six weeks together half a pint of the decoction of *Foalfoot-Flowers* with a little Sugar, whereby she recovered.

XXXVIII. A certain Man was grown Tabid and wasted, and received no nourishment from the Food he took: he was nothing benefited by any of the Medicins he took, whether purging upward or downward: But being bled several times in each Arm, till almost all his Blood was taken from him, he was then at length relieved and cured of his Malady. *Hippocr. 5. Epid.* The Disease arose from a great dissipation of the Aliment all his Body over, and from an hot and dry Intemperies, which was either in the Flesh it self without an Humour, or was fed by a very hot Blood; in which Affection Purgers are so far from relieving, that they even increase the Disease, though a Melancholick Blood nourish'd the whole Body, and Melanagogues were given; because (as *Hippocrates* hath written in his Book of Purgers) when the Flesh is hot, it distracts or draws aside the very Medicin; how much more necessary was it that it should be distracted in this Person, in whom it was sucked immediately from the Stomach? Seeing therefore Purgers are hot and dry, they increased the Intemperies, and therefore all the Symptoms. Whence therefore could he rather expect help than from cooling of the Body, that upon extinguishing the heat the dissipation might cease, and this ceasing the sucking might cease? And for cooling the Body, no greater Remedy was invented by the Ancients than bleeding till the Patient swooned, or became almost without Blood.

XXXIX. A certain Lord being subject a long time to a salt Distillation, fear'd a Consumption: Namely the Hemorrhoids being stop'd, especially the External, there returns by the *Vena Cava* (and great Artery) a Bilious and Phlegmatick salt Blood, which in tract of time acquiring an acrimony, erodes the Vessels, whence comes a *Tabes*. But this Person was rid of all fear by having the Hemorrhoids flowing for two years, yea, the noxious Humour of his Body was thereby amended.

XL. For helping in some measure the lost Appetite, which is a common symptom with *Phthisical* People, I think there has not a more convenient Remedy been as yet discovered than *Elixir propriatiss* taken in Wine or other convenient Liquor to five or six drops about half an hour before Meal. For seeing this Elixir consists of Myrrhe, Saffron, and Aloes, with the Oil of Sulphur prepared per *campanam*, and the Spirit of Wine digested together; upon the account of the Myrrh, as also of the Saffron, it is good for the *Phthisick* and Cough; and the Aloes incides the Phlegmatick viscid Humour, and brings it forth gently and slowly, yea, and does attenuate the Pus it self: besides, all these are good for cleansing the Ulcer; so that it is a most convenient Medicin for a *Phthisis*, whose Acidity may be temper'd with a sweeter mixture

Gott. Christ. Winclerus, misc. Cur. an. 76. obs. 55.

Valles. com. in loc. See Lindanus in select. Exerc. 13. & 14. Beniven. c. 44. de abditis: Dodonæus annot. in id cap.

Rhod. cent. 2. obs. 9.

mixture wherein it may be taken. The same Medicine will likewise promote the fermentation of Aliments in the Stomach that is hindered by the toughness or clamminess of the Pus which is sent into all the Humours of the Body, and so likewise will lighten the weight that is troublesome to the Patients after Meal.

XLII. As to drink, Wine that is generous and also sweet is commended, such as Malmsey, and that which is not harsh; yet Claret is allowed in colder Climates; White is often found to be too acrimonious. And though that stronger Wine be never fully fermented, yet it is not therefore more hurtful, but more profitable. For by that part which is sufficiently fermented it recruits the Animal Spirits that are withal enfeebled, or not so well drawn out of the Aliments; and by that part which is not fermented it breeds laudable Blood, and supplies plentiful and profitable Matter for making Animal Spirit. In the mean while it is to be taken in a small quantity, and conveniently with Bisket, whether simple or sugared, by the help whereof it is longer stayed in the Stomach, affects the Brain less, and recruits all the faculties, as is clear from Experience.

Medicines especially made use of by eminent Physicians.

1. There is no better Remedy for a Phthisis than an healthful Womans Milk.
2. Take of the Blood of an Hog a year old and newly kill'd four pound, of the Leaves of Foalfoot and Scabious of each two handfuls, of the Conserve of Roses and Borage of each an ounce and half, of the Water of Foalfoot fifteen ounces: mix them and distil them. Sweeten it with *Manna Christi* as much as is sufficient, and take half an ounce of it every morning fasting. This is good in an Ulcer of the Lungs, and when the Body is wasted.
3. A decoction of Bugle in Mutton Broth is exceeding good.
4. Balm of Peru contributes much to the Cure of Ulcers in the Lungs, if a drop of it being made up into a Pill or two with Sugar be given daily.
5. These following Pills are of great efficacy: Take of the Mafs of *Pil. Ruffi* an ounce, of *Antimon. diaphoret.* and Gum Arabick, of each half a drachm; with Balsam of Peru make a Mafs of Pills, of which take a scruple every day for a Month.
6. Take of green Foalfoot eight handfuls, of Hyssop two handfuls, cut them, and put them up in an Earthen Pot with a little Water: Lute on the cover which must have a hole in the top, but so that the hole be also luted. Put the Pot in an Oven when the Bread is half baked, and take it out again when the Bread is baked enough, and opening the hole in the Cover put a Funnel in it, and so draw the Smoak by your Mouth into your Lungs, and breath it out again by your Nose. It wonderfully helps Expectoration.
7. Take of new Goats Milk four pound, of fresh Snails cleansed with Salt and good Water (and shaken a little that the Milk may the better penetrate them) to the number of twenty, of Rosemary, and if you please of Foalfoot and Wall-rue, of each so much as to make an handful in all: boil them gently to the consumption of a fourth part of the Milk: Strain it and keep it. Drink hereof every Morning and Evening about half a pint warm with an ounce of the Conserve of Roses, or with the same quantity of white Sugar-Candy.

The Cure of a Pain raised from a Vomica of the Lungs. LVIII.

I. It is an Opinion commonly received among Physicians, That that continued Fever which joins it self as a Companion to the Pleurisy, has its rise from a Phlegmon of the Membrane that lines the Ribs on the inside and is near the Heart, and so in respect of the Pleurisy comes under the notion of a Symptom. Nor does this Opinion altogether displease me. In the mean time I think on the other hand, that a Pleurisy comes under the notion of a Symptom in regard to that essential Fever with which the Patient was first taken, namely, before ever the Pleurisy superven'd; but when this comes on, the former Fever seems to lay down its genius, or rather to be changed into a Pleurisy, which now from the aforesaid Phlegmon acquires to it self a new Fever, and is attended by it: and this later Fever springing thus, walks hand in hand with the Pleurisy, and stands and falls with it. Indeed I think it would be very hard for any, upon diligent examination, to produce an Instance of a Pleuristical Person who was taken with a Pain in his Side (which is so full a sign of this Disease) before he was sensible of some attack of a Fever, at least a more light one: For that Pain sometimes indeed invades sooner, sometimes later; but (as far as I could hitherto observe) never but after a Fever; and hence (in compliance with mine own opinion) I number a Pleurisy amongst the accidents that follow a Fever. Now I suppose a Pleurisy arises from the precipitation of the Febrile Matter into the *Pleura* or Intercoastal Muscles, and that this happens indeed in the very beginning almost of a Fever, whilst the Matter is as yet crude and unsubdued by a fit ebullition, and so unprepared for a due separation by more convenient places: And this mischief is very oft introduc'd by the unseasonable use of hot Medicins, as the Countess of *Kents* Powder, &c. and with the intent generally, to provoke Sweat in the first invasion of the Fever. Because Nature being disturbed by this means, is compelled to expel the Humours as yet crude, by any way that lies open, and so the Febrile Matter is sometimes carried with violence into the Membranes of the Brain, whence comes a Phrensy; sometimes to the *Pleura*, whence a Pleurisy; especially where the Age and Temperament, and the Season of the year, betwixt Spring and Summer, do also concur.

Therefore for the removal of this Symptom I use this method. Forthwith I order (if the Case permit it) Blood to be let liberally out of the Arm on the same side with the pained side, and by and by some fitting Ointment to be applied to the Side; I also use Pectorals diversly accommodated according to the Circumstances of the Case: But Oil of Sweet Almonds newly drawn is the best

amongst these. For ordinary Drink I enjoin Beer that is small and not at all sharp, or a Pissan of Barley, Lykyrhize, and a few Aniseeds. Moreover on the following days, repeating Venesection, I order to Bleed freely, as the Case is: Truly I seldom give over Bleeding, till I have evacuated forty ounces, unless somewhat indicate to the contrary. And though one may (not without some shew of reason) be afraid that so great an emission of Blood should be dangerous; yet the Blood it self that is taken away, after it has stood a while, will make these fears vanish, seeing it is very corrupt, at least after the first time, and almost of the same colour with true *Pus*. Add hereto, that you will not find the Patient weakened proportionably to the great loss of Blood. But we must admonish, that there is need of *Cautions*, that Clysters be not injected through the whole course of the method, nor that any thing be added to the Pectoral Medicins which has a loosening vertue; for the more bound the Belly is, the more safely shall we repeat Phlebotomy: on the contrary, if you take but half that quantity of Blood I have mention'd, and use Clysters and Looseners withal, you shall bring the Patient in danger of his Life, whether it be because Nature cannot bear both Evacuations in so short a space, or upon some other account: and this holds not only in this Disease, but also perhaps in all others wherein the Cure turns upon this hinge (Venesection.) Indeed in treating this Symptom I have often attempted to establish some way of Cure, which might not proceed to so great a loss of Blood, namely, either by resolving the Humour, or evacuating it by promoting Expectoration: but I have not yet had the fortune to find any practice so available as the fore-mentioned.

II. Venesection is good in the beginning of a Pleurisy, because it keeps the Blood that is somewherehindred in its Circulation, from too great an Effervescence: but chiefly because seeing the Vessels are much emptied by this means, they receive again whatsoever Humours were thrown off, and so the Blood that begun to stagnate in the part affected, and make it fluxile. Likewise the Remedies that help most at the beginning of this Disease, are such as hinder the Coagulation of the Blood, or dissolve it whilst it is a Coagulating; such as those which do very much abound with a Volatil or Alkalizate Salt, namely the Spirit of Soot, Blood, Hartshorn; also the Spirit and Salt of Urine, the Powder of the Claws and Eyes of Crabs, of a Boars Tooth, or the Jaw-Bone of a Pike, are of notable use. Amongst the Vulgar 'tis customary to give an infusion of Horsedung; which Medicin indeed I have known often to help in almost deplorable Cases. In the mean time all Acids, because they coagulate the Blood more, and hinder Expectoration, do very much hurt in this Disease.

Seeing Bleeding is the most powerful Remedy, Willis, de it is never to be omitted even in Women with febr. c. 11. Child, or when they lie in, while their *Lochia* or Terms are a flowing: for Experience has taught that Women with Child even in their eighth Month, Childbed-Women, or Women that are not with Child whose Terms are flowing, yea, Infants and Children of seven years old are all very well relieved by opening the *Basilica* of the side affected. Each. Med. Pract. & River.

III. Though Blood-letting be chiefly profitable in the beginning, yet if it were omitted then, or were not large enough, a Vein may be opened even after the seventh, ninth, or eleventh day, by the Example of *Hippocrates*, who let *Anaxion* Blood on the eighth day, either because he was called no sooner, or because in a very Crude Pleurisy, which hardly begun to be concocted on the eleventh day, the Disease granted truce. But when a free and liberal Expectoration begins, then we must abstain, because it is thereby suppress, and

Sydenhami

Lazar.
River.

and the Patient brought into danger of his Life.

IV. *Hippocrates* (2. de rat. viſſ. in acut. t. 10.) hath deliver'd to Poſterity an excellent Rule, and ſuch as is very profitable in practice, to let Blood till it change its colour. Namely, if at the firſt or ſecond Bleeding the Blood appear Crude, Phlegmatick, or Watry, the Evacuation is to be continued every day, or twice a day, till the Blood that is drawn look red, or yellowiſh: But if it come forth red at the beginning, Venefection is to be repeated ſo often as till it appear livid or black; for 'tis ſignified that the later Blood flows out from the part affected, or the Veins that neighbour upon it, which indeed is alter'd by the heat of the inflamed part, and of crude is made red, or of red is made black or livid by aduſion. Now though the obſervation of this Precept do for the moſt part ſucceed well in practice; yet ſometimes that change of colour is not pertinaciously to be expected, but we muſt deſiſt from Bleeding ſooner, namely when either the Patient is weak or his Spirits low, or he is of a rare and very reſoluble habit, or the Season is very hot.

Idem.

V. Some think that Diſeaſes which draw their origin from a ſuppreſſion of the Terms or Hemorrhoids, are only to be cured by opening the Veins in the Leg: which I willingly grant ought to be done in Chronical Diſtempers, and ſuch as give truce: but in Acute Diſeaſes, ſuch as the Pleuriſy, a Vein is not always to be opened in the Ankle or Foot, but a diſtinction is to be uſed. For if ſuch Evacuations as uſe to happen at certain ſtated times, be ſuddenly and wholly ſuppreſſed, and there be manifeſtly perceived a motion of the Blood to the upper parts, and an afflux thereof to the Side, the Cure is by all means to be begun by opening the Ham Vein or the like: But if the ſuppreſſion be now of long continuance, whereby there is accumulated by little and little a *Plethora* or ſome *Cacochymie*, and an abundance of Humours in the upper parts, and alſo it be not near the ſeaſon of the Terms, then the Cure is to be begun by opening a Vein in the Arm; for the Acute Diſeaſe requireth it, nor permits it delay till the Terms or Hemorrhoids be again provoked; for it may be whiſt we are taking pains to procure the Terms or Hemorrhoids, the Patient may die through the violence of the Diſeaſe: but the ſuppreſſion of the Terms or Hemorrhoids endure delay, and regard may be had thereto afterwards, when the Patient is paſt the danger of the Acute Diſeaſe, and endeavours may be uſed to provoke the ſuppreſſed Blood.

Sennertus.

VI. Nor muſt we omit to admoniſh, ſeeing a Pleuriſy does oft follow or accompany a Fever and primary Diſeaſe, which often has a notable malignity joined with it, (as uſes to happen frequently in an Epidemical Pleuriſy), that diligent regard is then to be had to the Malignity; and it is to be conſidered whether it admit of Venefection. *Gefner, lib. 1. Epistol. p. 19.* makes mention of a certain Epidemical Malignant and Contagious Pleuriſy of which many died, and wherein Bleeding in the Arm did no good; but Bleeding in the Ankles, and Sweating in the beginning by a certain Antidote, gave more relief: And by all means in ſuch Malignant Pleuriſies the Malignity is firſt to be aſſailed, and other things to be done afterwards.

Sennertus.

¶ The ſame *Gefner, Epistol. 49.* ſays, In this Pleuriſy I found nothing better than half an ounce or more of Linſeed Oil, which preſently relieves the Breath, and very well evacuates the Belly. Hence it is that *Aſclepiades* in *Cælius Aurelianus* teſtifies that at *Athens* and *Rome* he ſaw the Pleuritick become worſe by Venefection; but in *Parus* and the *Helleſpont* that they were relieved by it. *Wierus* in his *Observations* (p. m. 53.) mentions a Peſtilent Pleuriſy which went about in the years 1564, and

1565. in ſome parts of the lower *Germany*, where in it was obſerved that Venefection was very hurtful: Thoſe things which are preſcribed in other Pleuriſies to help Expectoration, could do no good through the increaſe of the Febrile Putrefaction and Peſtilent Poiſon: And contrary to the obſervation of the common Rule, they were to be helped by the giving of Acids, as the Syrup of the Juice of Sorrel, Lemons, &c. as alſo by Pectoral Potions prepared with a mixture of bitter Medicines, &c.

I will ſpeak a few things of that, which is common in every ones mouth, that a Pleuriſy is ſometimes found ſo malignant, that for thoſe years it cannot admit Phlebotomy, at leaſt not ſo often repeated as this Diſeaſe commonly requires. Indeed I think that a true and eſſential Pleuriſy, which infeſts indifferently in all Conſtitutions of every year, does every year indifferently indicate Venefection to be repeated alike; yet it ſometimes happens that the Fever of that year that is properly Epidemick, is apt upon any ſudden change of the manifeſt qualities of the Air, to depoſite the Morbiſick Matter in the *Pleura* or Lungs, and the Fever notwithstanding remain altogether the ſame. In this caſe as Venefection may be granted to relieve this ſymptom, if it rage much; yet to ſpeak generally, we ought not to draw forth much more Blood upon the account of the ſymptom, than ought to have been drawn forth on the account of the Fever, on which that ſymptom depends. For if this be of that nature as to admit of repeated Bleeding, it may be repeated in the Pleuriſy, which is a ſymptom of it: But if the Fever admit not of repeated Venefection, the ſame will not help, yea, it will do harm in the Pleuriſy which will ſtand or fall with the Fever. And this indeed I was therefore bound not to conceal, becauſe I think that he wanders in a doubtful Path, and is led by an uncertain Thread, who in the Cure of Fevers has not preſently before his Eyes the Conſtitution of the year, as it inclines to the production of this or the other Diſeaſe epidemically, and to turn all other Diſeaſes that concur with it into its own like- neſs and form. I thus treated a Nobleman ſick of this Fever: He complained of a pain in his Side and of other ſymptoms of which the reſt did that were taken with the ſame Diſeaſe: I Bled him no more than once, I applied a Blistering Plaster to his Neck, I gave him Clyſters every day, ſometimes order'd him cooling Ptiſans and Emulſions, ſometimes Milk and Water, ſometimes ſmall Beer; I adviſ'd him to riſe out of his Bed and ſit up every day for ſome hours; by which method he was recovered in a few days, and after Purging was quite well. See the ſixth Book of a *Pleuritick Fever*.

Syden. obſ.
circa morb.
acut. p. 362.

VII. 'Tis a doubt whether the Blood flowing from the Womb, either in Childbed, or out of it, hinder Venefection when a Pleuriſy happens? Before the ſolution of the doubt, I ſuppoſe that Bleeding is uſed upon a twofold account in all Inflammations, firſt, to revel the violence of the flowing Blood; ſecondly, for derivation: that is, that by one and the ſame track we may both evacuate and revel. If a Woman therefore be taken with a Pleuriſy whiſt her Womb flows, we muſt conſider whether the original of the Fluxion be from the Womb it ſelf, or the Humours flow thither from ſome other place? Moreover we muſt have regard to the manner of the Fluxion; for it is either large and ſudden; or ſlow. A ſudden Evacuation made out of the Womb, answering in proportion to the Fluxion upon the Membrane that inveſts the Ribs, indicates that the buſineſs is to be committed to Nature, and nothing to be innovated: But we ought to help a ſlow Fluxion, that by two Evacuations, the one Natural, the other Artificial, we may obtain our deſires. For if we ſhall heſitate in a great and precipitant Diſ-

L z z

caſe,

ease, we run great dangers: In this case we shall let Blood in the Ham or Ankle; or we may scarify the Thighs or Legs if we know there is but little Blood remaining, and the Woman look white, have soft Flesh and slender Veins: But whether one or other kind of Remedy be to be used, the nature of the Matter will teach, especially the greatness of the Disease and the Constitution of the Patient, &c. But if the original of the Fluxion shall not be in the Womb, the Case will not be so easy: I use to clear it by distinguishing thus: The Womb at that time does either make plentiful and sudden Expurgations, or such as are lingering and slow: If the first, we shall not let Blood, but be content with the spontaneous Evacuation; for seeing the Womb has great Veins and Arteries which communicate with the whole Body, and a very great consent with the Breast, we may hope that there will be made a good Revulsion hereby, in what part soever the original of the Fluxion be. But the case is not the same when from custom, or from any other Preternatural Cause the Womb evacuates Blood very slowly: For seeing we need some speedy Remedy, that the violence of the Fluxion may be restrained, whereas this is very sluggish and slow, so that we ought by no means to commit the task to it, we ought therefore in such case to Bleed. What Vein therefore, you will say, shall we open? Truly I would open some one of the upper, 1. because the lower are too far distant from the original of the Fluxion; nor can they remove the Fluxion but in a long time, which will not do our business; 2. seeing we ought to attend that which is more urgent, and seeing the Pleurisy is more, yea, most urgent, therefore we must endeavour with might and main that the Phlegmon may not be increased, which may be done by opening a Vein in the Arm, which we judge to be convenient for Revulsion. And though there follow that inconvenience hereby as that the Terms come to be stop'd, (which they may chance to be) yet that inconvenience is but small, and may be amended at some more fitting time, even with ease. But if we desire a derivation, when there has preceded a Revulsion made either by Nature or Art, or also when the Disease has not required it, I declare this one thing, that whether the Womb have flown or no, or also whether it have been plentifully purged or not, the inner Vein of that Arm which is nearest to the part affected is always then to be opened, and Blood to be let till there appear change of colour: for nothing ought to hinder us from relieving the Pleurisy presently, which is a doubtful and dangerous Disease. For if we must have respect to that which is more urgent, there is no doubt but we ought to be far more concerned about the Pleurisy than about the Purgations of the Womb, especially seeing these may be provoked from the omission of Bleeding, can by no means be redrest.

Hor. Auger.
tom. 1. l. 11.
Epist. 3.

VIII. A lean and very Choleric Woman, falling into a Pleurisy, desired earnestly to be let Blood: but though a Vein was opened timely enough, yet the Blood was drawn so strongly towards the Breast through the very violent pain thereof, that hardly any would spurt out of the opened Vein: But she being bid to endeavour to drive the Blood from the Breast again towards the Arm by strong coughing, I observed it to spurt forth freely, and the Woman was shortly eased of her pain. Wherefore let any one in the same case fly to the same succour: let him presently raise a Cough, and by that means the Blood will be repelled to the Arm. This invention I have seen to succeed happily with several since that time.

Tulpius,
l. 2. c. 3.

IX. A true Pleurisy will not invade the Phlegmatick, and such as are troubled with Acid Belchings: yet there often happens a Pleurisy in these Countreys (Holland) from a watry and thin

Phlegm, but that is not true and exquisite: For in these cold and Phlegmatick Bodies there often arise grievous pains of the Sides from *Flatus*, which may be mitigated by fomentations: if you bleed, you will kill. I once saw a very beautiful Woman, who being subject to *Flatus*, and having supt liberally, fell into a bitter pain of her Side in the night; and died presently upon opening a Vein.

Heurn. com.
in aph. 33. 6.

X. It is observable that there sometimes arises a difficulty of breathing from an ill ordered Diet; in which case Physicians do ill to Bleed. ¶ Their confidence seems pernicious to me, who so long as the Patient complains of pain, give not over bleeding, without any regard to the suppuration, which has not only made some progress, but is often also perfected within the first seven days: by which importune Bleedings, repeated even ten times or oftner, they cruelly weaken their Patients by exhausting their Vital Spirits with the Blood, though their strength be altogether necessary for a perfect Expectoration of the Pus, which oft cannot be obtained but in several months space.

Idem.

XI. Let us take heed not to bleed those who are emaciated by a long *Taber*, when they fall into a pain of their Side. For I have seen many such Bodies dissected, and observed their Lungs to be preternaturally close grown to the Membrane that covers the Ribs: so that when a windy Vapour gets in betwixt this Connexion, it pulls off the continuity and so causes the Pain. ¶ This Pain is taken away and cured by heating things, as by a fomentation of the Flowers of Chamomel and Cummin, which hath benefited many: They must be put up in a Bag, which being dipt in White Wine is applied hot to the pained part. Those who are so rashly bold as to Bleed, take away so much of their Patients Life as they do of his Blood.

Dodon. obs.
cap. 22.

XII. Experience sometimes shews that the saying of *Hippocrates* (aph. 31. sect. 5.) is not always true, viz. If a Woman with Child be taken with an Acute Disease, it is extream dangerous: for sometimes both the Mother and Child escape danger. While I was a Printing these things, I was called (June 27. 1681.) to a Woman about Thirty years old, the Wife of one *Bardot* a Tanner, that was nine Months gone with Child: She was slain into a very grievous Pleurisy on her left Side by travelling in the Sun and drinking of Wine: She was Plethorick, and her Face was much flushed. Premising a lenient and cooling Clyster, I order ten ounces of Blood to be taken out of the Arm on the Side affected, which came forth purid with some relief: The next day, because she was vexed with an Acute Pain and spit Blood, I bled her again to seven ounces, which looked more corrupt than the former; and therefore, though her Husband was against it, I prescribe a third Phlebotomy on the day following; upon which the Pain not yet ceasing, and the redness of her Face with signs of a *Pleurora* continuing, I advise a fourth Bleeding, though both her Husband and the Women were against it: upon which fourth Venesection (the Blood looking still worse) the Pain quite ceased, and she coughed up easily. On the fifth day of July she had an easie labour of a Girl that was plump and of a good Constitution; and her *Lochia* flowing orderly, she not only lived, but was freed of both her Pleurisy and Fever, &c. The Disease was the more grievous, because besides that the faculty of breathing was intercepted by the greariness of the Phlegmon and the vehemence of the Fever, the *fetus* kicked and sprawled strongly against her Diaphragm.

XIII. 'Tis not necessary to let those Blood who have Fluxions often fall from their Heads, through abundance of Crudities, presently upon the invasion of the Disease, especially if they cough up easily, and what they cough up be white or bloody,

and

and the Pain light: for a Flatuous Substance uses so to distend the Veins of the *Pleura*, that the Pores being rarefied the Blood issues out with pain, and is expelled by coughing, imitating a Pleurisy: wherein if you let Blood, you will do as much hurt as if you did so in the weak and Catarrhus who are ill of a light Fever. ¶ In a Pleurisy that is caused by a defluxion from the Head, Venesection has no power to draw back the Rheum that is in motion, nor to withdraw that which is settled, and therefore it does much harm in increasing the Catarrh by the generation of cold, and in exciting the same by weakening the retentive faculty.

XIV. Seeing the first indication is, by all means to take away as soon as may be the Phlegmon or Obstruction of the Blood in the *Pleura*, for this purpose Bleeding has used to be prescribed as the chief Remedy by all Physicians in all Ages (except some Fanaticks and Pseudochymists :) The reason whereof is altogether the same as in a Peripneumony and many other Diseases, that are caused by the stay and collection of the Blood in some place: namely, that the Blood-Vessels being much emptied, may not only cut off the fomes of the Disease, but also reformed and carry to another place the Matter which is the Conjoint Cause. Wherefore bleed very freely in a Pleurisy if the Patient be strong and his Pulse big: And truly 'tis far better to bleed largely at first, and so every time afterwards, so often as 'tis necessary to repeat Venesection, than to bleed often a little at a time: In as much as very many portions of the slimy and viscous Blood are collected about the part affected, which unless they be called away from thence by emptying the Vessels very much by a plentiful Bleeding, and be suffer'd to flow out the greatest part of them, the desired effect will not succeed. So that when some Physicians prescribe Blood to be let in a Pleurisy even to fainting away, it seems not to be incongruous to Reason, though that practice is not to be rashly undertaken, because every Evacuation ought to be proportion'd to the tenour and tolerance of the strength, which Rule such Phlebotomy exceeds.

XV. In the year 1679. May 9. I was called to one *Vilars* a Baker, a Man of about forty, lean, melancholick, and who had used to be troubled with a pain in his Spleen. This Person had been ill of a Quartan Ague for seven Months, having got rid of it a Month before he was taken with a violent Pleurisy of his right Side, with a very Acute Fever. On the second day of the Disease he had gotten himself let Blood, which was very putrid, without any remission of his Pain. His Water was very high colour'd, thinning whilst it was hot, and depositing a red tartar when it was grown cold: Wherefore I order him to be bled again, and his Blood was putrid as it was before, without any easing of the Pain, his Spittle crude, which he could hardly bring up, and without any remission of the Fever. On the sixth day of the Disease he is bled again, a corrupt Blood still coming forth, and all things abiding in the same state: On the seventh day there came a plentiful Sweat, which continued to flow to the end of the eighth, whereupon the Fever grows more mild, the Urine is not so high colour'd, and Expectoration proceeds better. On the ninth day the Fever grows worse, wherefore I order Bleeding again (always out of the right Side) because his strength held up still, and his Pulse was full and strong; the Blood was still corrupt. On the tenth day the Fever is much milder, the Pain in his Side ceases, his Urine is concocted and with a laudable sediment. On the eleventh day his Fever was quite gone: On the twelfth I gave him a Purge, upon which he recovered. The first three days he was troubled with a Vomiting, which ceased after the second Bleeding, whence I thought there had been a Peripneu-

mony; for such whose Lungs are inflamed, do often Vomit.

XVI. A great Disease requires that a great deal of Blood should be evacuated: for here it matters not so much what sort of Blood you draw, as in what quantity. I had a Patient that had a very great pain in both his Sides; I took away above four pound of Blood at one time, and he recovered with the help of God, though he was given over by all as gone. *Avicen* affirms there are twenty five pounds of Blood in the Body, and that seventeen may be poured forth in one day without destruction. *Galen* seems to have taken six pounds of Blood at once. But that we may comprehend the limit of the quantity, we must observe the strength.

XVII. Those who have a pain in their Side from thick and viscid Humours are not to be let Blood: for sometimes thick and viscid Phlegmatick Humours issue into the Cavity of the Breast, and into the Lungs themselves, which by their multitude distending the investing Membrane cause pain, and intercepting the passages of Respiration induce a difficulty of breathing: so that to bleed these, especially plentifully, is to hasten their death.

XVIII. The Matter is to be drawn outwards when other Evacuations proceed not well. And therefore in this case I will take *Actius's* Counsel, to scarify the pained part, and after Scarification to apply a Cupping-Glass, and upon the removal thereof to lay on some Acrimonious Medicin, whether it be the *Sacrum Ceratum* or any like it, and the next day to set on a Cupping-Glass again: so that the Matter may be brought forth by little and little both by the help of the Cerecloth and the Cupping-Glass. The like may be done also in such a case by a Veficatory. If the Disease yield not to these, then there is no hope. ¶ *Paulus Saxonius* applies not a Cupping-Glass before the fourteenth day, if the Malady continue so long; but *Trallian* sometimes makes use hereof at the beginning, and that not without Scarification; especially in such as seem not to have much Blood in their Veins: He scarifies the place deep with a Lancer, and sets a Cupping-Glass thereupon, that that which lies deep may be drawn out. Upon doing of this, says he, 'tis wonderful to see that how great soever the pain have been, even though the most violent, it ceases presently, so that it neither needs fomentation nor other Remedy. ¶ The use of Cupping-Glasses, says * *Rubeus*, being opportunely applied, especially to the Back, may be very profitable in a Pleurisy, because many twigs that spring from the branches of the *Vena sine pari*, that tend to the Intercoastal spaces, belong to the External Muscles of the Back, and from thence are extended out of the *Thorax*. But lest Matter should be drawn from other where to those parts, 'twill be better to apply Cupping-Glasses to the Buttocks also at the same time. Of the use of Cupping-Glasses see more in *Joubertus* in the Chapter of the Pleurisy. ¶ A Boy of five years old was taken with a Pleurisy on his left Side with a very Acute Fever. After the ordinary Remedies used for five days, and four times Bleeding, two Cupping-Glasses were applied to the pained Side with deep Scarifications. From that which was next to the pained place there flow'd a great deal of Matter for a whole day, and both the Pain and Cough ceased. The Leaves of Beer were laid upon the Scarified places, and the Flux of the *Sanies* continued for two days, and in the end true Pus flow'd out of the Wounds, and so the Patient was quite cured. I believe the Scarifications reached to the place of the Pleurisy, and that the Morbifick Matter flow'd out by those places.

XIX. Whether has the Chirurgical Operation, called *Paracentesis* or Tapping, place in the Cure

of a Pleurisy? I answer, it has not place in the beginning, but after suppuration, yet not always: For it may so be, that part of the Matter may be evacuated by the hole that is made, and a greater part retained, and a Fistulous Ulcer be left which will prove mortal at length. ¶ A Widow of sixty in a Pleurisy collected a great deal of Pus in her Thorax; the load whereof that officious Nature might expel, she shewed as with a Finger a place betwixt the Ribs that evidently protuberated: which the Surgeon perforating, the Patient outlived this seemingly dangerous Operation, and cast out daily a stinking and fordid Pus through the Wound that was made. Which Incision of a suppurated Side I have indeed oft seen performed, sometimes truly with good success, but oftener with bad; either because it hinders the motion of the Lungs, or because it commonly continues so long that the strength either of the whole Body, or of the Breast alone cannot bear up under it; for the cold and indigested Air does so weaken the Viscera contained in the Breast, that those seldom escape death who have the Pus drawn out this way. ¶ I saw a successful Operation in the year 1660. in a Pleuritical Woman thirty five years old, who keeping no pipe in the hole, it closed up in a few days, having first discharged a great deal of Pus; the remainder whereof Nature expelled by Urine. The occasion of this Operation was a Tumour jetting outwards, and the weight of the Side affected, and an absence of Expectoration.

XX. Jac. Fomannus, Pract. l. 2. c. 4. mentions a Malignant Pleurisy, which a thin greenish Humour causes, (whether collected in the Side, or flowing down thither) as was discovered by the dead Bodies opened, wherein was found an Impothume full of a liquid greenish Liquor: for which the only and singular Remedy is Section, because there is no hopes of Maturation. But seeing he declares nor the manner of Section, I think it more advisable to do it with a red hot Knife, because that way is not Bloody, and 'tis more accommodate for Concoction, which is so greatly to be desired. Add hereto what an Anonymous French Author hath writ in a Book de Cucurb. In a Pleurisy, says he, the Side is sometimes pierced; for if the Patient can neither be cured by Fomentation, nor Bleeding, nor other Remedies, and the case be otherwise desperate, Incision is made in the Side after the seventh day according to Archigenes and Aetius, after the fourteenth according to Paulus; a Cupping-Glass is set upon it; the Wound is hindered from closing up by putting a Tent in it wet in Oil; the next day the Cupping-Glass is applied again: on the first day Blood, on the second Sanies will flow out with great relief. But this is hardly attempted in our times, because it is a kind of cruel Remedy; though it may seem more Human, than to leave the deplorable Patient to certain death.

XXI. If the Physician guess, from the colour of the Blood let forth, and from other signs, that there lurks a Cacochymie in the Body which feeds and increases the Disease, we must come to purging, especially if it be perceived to tend toward the first region of the Body, from rumblings of the Belly, Vomiting, loose Stools, anxiety about the Stomach: But it is to be done betimes. Hippocrates, 4. Acut. aph. 6. determines the fourth day simply for purging. But Galen writes rightly, that such things ought not to be enjoined the Patient simply according to the number of days, but that what Hippocrates hath determin'd ought to be follow'd, and therefore we must purge presently in the beginning, or afterwards when the Humours are brought to maturity: for which cause he writes that he sometimes gave a Purge on the first day, or the second or third, and sometimes on the fifth. Therefore the Humours that abound in the

common Ducts, and are apt to flow to the part affected, are to be purged in the beginning, at which time aversion is the most desired; but afterwards when the Disease comes to its vigour, and the Humours are concocted, 'tis better to be quiet. ¶ I deny not that a Revulsive Purgation is sometimes convenient in the beginning, (though seldom) but it must be attempted by mild Medicines, and (as Vallesius says in Epid. or Galen himself) the Fever must not be high: Let Blood be let sufficiently, and the Humours must degenerate from the nature of the Blood, and the faculty must be strong to bear the Medicin, and the Constitution of the Patient well known.

XXII. So much as Venesection profiteth in a true Pleurisy, so much doth purging hurt, though never so kindly and gentle; for by moving the Humours it increaseth the Fluxion; or if the Fluxion had already stayed, it renews it to the great damage of the Patient. Add hereto, that a looseness is bad in Diseases of the Breast; wherefore we must refrain from Catharticks the whole Course of the Cure: the Belly is only to be loosened every other day with an hard Clyster.

XXIII. Hippocrates, 2. Acut. v. 21. advises to open a Vein when the pain reaches up towards the Collar-Bone; but to loosen the Belly, if it descend under the Midriff: for it is no new thing for Pleuritical pains to be felt sometimes under the Midriff. For what hinders why when an Inflammation seizes upon the Pleura, part of the Morbifick Matter that is diffused below through the fleshy parts, should not by pain give signification of it self under the Midriff where the Side is soft, or in the region of the Hypochondres? Surely nothing. Hippocrates testifies this (1. de Morb. sect. 2. v. 220.) treating of a true Pleurisy: And sometimes, says he, it causes a pain in the parts below the Side. And he teaches the same, 1. de loc. v. 258. & 3. de morb. v. 230. And 'tis reasonable that that should happen, seeing the Morbifick Matter inclines by its natural gravity rather downwards than upwards. Attending to this inclination of the Humours (according to the vulgar saying, *We must lead by convenient ways, whither Nature tends*) when the Disease tends downwards he propounds purging by the lower parts; but Venesection rather, when 'tis more inclinable to the upper parts. He thought this distinction so necessary, that he esteemed him who proceeded otherwise not to benefit, but to hurt. For as Bleeding takes not away the pain that reaches below the short Ribs; so Purgation is unprofitable when the pain possesses the upper parts and extends it self to the Collar-Bone. For whilst the Humours which tend upwards, and which may easily be evacuated that way, are drawn downwards by Stool, Expectoration is hindered, than which nothing is more hurtful in a Pleurisy that extends upwards. For seeing the Matter contained in the Breast is not brought forth by the Purge; the Spittle (as Hippocrates says) being retained, and sticking in the Lungs, causes difficulty of breathing, and not long after the Patient dies of Suffocation. Now 'tis ealie to give a reason why we should Bleed when the pain extends upwards, and Purge if it descend below the Midriff; for as often as a Pleurisy depends upon a Plethora and is fed by it, a pain and weight seizes upon the upper parts, because there are Veins there which are joined with the Veins that are dispersed through the inflamed part: whence those being filled that are in the place of the inflammation, and cannot contain all the plenty of Blood, the upper that are continuous to these must needs be filled and extended; whereupon the bordering parts happen to be pained and grieved. But some will say, Why does not that happen in the inflammations of other parts, where we see only those parts to be pained wherein the inflammation is? I answer, It is peculiar to these parts,

Enchir. Med.
Practic.

parts, viz. the Sides, as being Membranous and not Fleſhy, not to be ſo capable of a plenty of Humours as the Fleſhy: whence when Humours flow thereinto, the Veins thereof are ſo filled, that their extension is communicated to the neighbouring parts, whence there happens a dilatation of the pain. Therefore becauſe a dilatation of the pain ſuppoſes a plenitude towards the upper parts, which can be taken away better by no Remedy than by Venefection; *Hippocrates* does therefore adviſe Bleeding in this caſe. But when a Pleuriſy depends upon a Cacochymie, the pain is not communicated to the aforeſaid upper parts, becauſe the Veins are not ſo filled that their diſtention ſhould reach to the upper parts; yea inclining to the lower, it infects the parts under the Midriff: for every Humour, except the Blood, uſes to tend rather downward than upward, becauſe it partakes leſs of Spirits, by whoſe virtue the Humours in the Body ſeem to have neither lightneſs nor gravity; for Blood alone wants the motion of gravity or levity, becauſe it is governed by the Spirits which it is plentifully endued with: but the other Humours do deſcend by a natural gravity rather than aſcend, unleſs ſome cauſe concur that may raiſe them to the upper parts, or may hurt by Vapours, as otherwhere we have ſaid does happen to the Bile, which being in the Stomach cauſes pain in the Side. Therefore becauſe a pain deſcending to the Hypochondres indicates the Pleuriſy to ariſe from a Cacochymie, whoſe Remedy is Purgation, therefore *Hippocrates* approves of this in ſtead of Venefection, not only in this caſe, but as often as it happens that a Pleuriſy ariſes from a Cacochymie. Whence 3. *de morb. v. 284.* he ſays, If the ſick Perſon be naturally Choleric, and being not purged be taken with a Diſeaſe, you ſhall purge Choler well: for theſe things concurring, a Cacochymie muſt needs prevail. Seeing therefore *Hippocrates* hath left us this practice approved by long Experience, and confirmed by evident Reaſon, I cannot ſufficiently admire at *Galen's* boldneſs, who perverting it, durſt write that it was always ſafer to Bleed: but much more at the Phyſicians of our time, with whom purging is ſo familiar, that they can omit it in no Diſeaſe or Patient, making uſe of it often even againſt the Rules of former Phyſicians, and yet they are ſo afraid of it in a Pleuriſy alone, that they dare not give even the ſlighteſt Purge to a Pleuritical Perſon. For in truth *Galen* did not diſallow of Purgation when a pain is below the Midriff, but he ſaid thoſe things to admoniſh us that we ought to uſe it with great caution, ſo as that if we meet with any difficulty in purging, we ſhould abſtain from it and flee to Venefection, as being ſafer, though it do not diſſolve the pain (as *Hippocrates* ſays) ſo well as fit purging would do. As oft therefore as no great impediment gainsays, we may ſafely purge: About which ſome things are to be conſider'd, and firſt, That it be adminiſtered placidly, which *Hippocrates* intimates, ſaying, *We muſt looſen the Belly.* Secondly, That it is not to be procured by every Medicin indifferently, but ſuch as is agreeable to the Diſeaſe, like that which he propoſes of wild Purſlain and black Hellebore corrected with ſome of the *Aromata*, which though it be eſteemed ſtrong now a days, yet I have found it gentle enough when given in a moderate Doſe. But whether Manna and the Syrup of Roſes ſolutive, which I ſee ſome uſe, be alike profitable, I dare not affirm. I know indeed that theſe differ quite from the Medicin of *Hippocrates*, for they draw out thin and ſerous Humours, and do not a little raiſe *Flatus*; but * wild Purſlain and Hellebore draw forth thick and aduſt Humours, and, as *Hippocrates* ſays, diſcuſs *Flatus*; beſides, theſe are bitter, thoſe very ſweet. But whether Manna may not be uſed in ſtead of thoſe Medicins which *Hip-*

*Peplum.

ocrates gives in Pleuritical Sorbitions, I will not contend, if the Patient be of a weak Conſtitution and cannot endure a ſtronger Medicin: Otherwiſe I ſhould truſt more to *Hippocrates's* Hellebore, and to Scammony, put into the Juice of Piſtan with the Powder of Aniſeeds. If any ſuſpect *Hippocrates's* Opinion, becauſe of that which he has ſaid, 4. *ſc. 8.* *Whoſoever attempt to diſſolve preſently at the beginning thoſe things which are inflamed, &c.* let him read *Valleſii's* Commentary, or my Expoſition.

Proſper Martiani, comm. in ſilum locum.

XXIV. The Wife of Mr. N. had an *Eryſipelas* in her Leg for ſeven or eight days, with a continual Fever, and was cured of both Diſtempers by the care of her Phyſician: Afterwards ſhe expoſtulated her ſelf too ſoon to the cold Air, whereupon ſhe fell into a pain in her Side with a Fever, Cough, and difficulty of breathing, and ſometimes there were ſtreaks of Blood in what ſhe cough'd up: She was Bled twice or thrice, and other things were adminiſtered. I was call'd on the fifth day of the Diſeaſe; I thought that a Purge was to be given the next day, which ſeem'd to be againſt the Rules of Art, by which it is declared that a Purge is not to be given before the ſeventh day: But the following Reaſons induc'd me: 1. Becauſe the Pleuriſy ſeem'd not to be legitimate, bred from a collected or contractive Inflammation, but rather from a certain ſpurious, thin, and ſerous Fluxion; or alſo from Acrimonious Vapours raiſed from a Cacochymie contained in the lower Belly, and twitching of the *Pleura*. I concluded thus, becauſe there appeared Blood only in one or two Spittings, and that but very little like a Thread, which could not come in ſo ſmall a quantity from the inflamed *Pleura*, but rather from ſome ſmall Vein opened by the violence of the Cough: or it might deſcend from the Head, ſeeing ſhe had ſuffer'd a ſlight Hemorrhage about the ſame time. 2. Becauſe the pain was not continual, but ended and returned by intervals, with a very remiſs Fever. 3. Becauſe through the whole time of the later invaſion ſhe wak'd continually, though the pain of her Side did intermit very much even on the night; where-by one might gather that thoſe great watchings depended rather upon the putrefaction of the Humours and an eſſential Fever, than on a true Pleuriſy. 4. Becauſe all the time ſhe had had the *Eryſipelas*, ſhe had refus'd the Purge which was preſcribed her, and ſo the whole hoard of the Cacochymie remained ſhut up within. Therefore ſhe took a Purge on the ſixth day of the later Diſeaſe, of Senna, Rhubarb, Manna, and the Syrup of Roſes, by which ſhe was gently purged with good ſucceſs: for the pain in her Side remitted preſently, nor was ſhe afflicted any longer with want of ſleep, but only a little feveriſhneſs appeared towards night: afterwards by the help of ſome ſlight Remedies ſhe was thoroughly recovered.

River. gent. 4. obſ. 18.

XXV. To take away a Phlegmon of the *Pleura*, beſides the taking away of Blood by a large Phlebotomy or by Scarification, the ſerous and other Rectemmeritious Humours ought likewiſe to be gently expelled both out of its Maſs, and alſo out of the Bowels by Stool, Urine, and Sweat. The ſtronger Purgers are rightly forbid, becauſe they exagitate the Blood and cauſe it to be fixed deeper in the parts affected. And though ſome famous Chymiſts, viz. *Ang. Sala*, *Mart. Rulandus*, *Hartman*, and ſeveral others do give ſtibiæ Vomits to all Pleuritical Perſons, and cry them up as the beſt Remedy; yet truly this ſeems to me neither ſafe nor conſonant to Reaſon: The only way, as I think, that they can come to help, which alſo is very uncertain and dangerous, is this, viz. that the Medicin operating violently, whiſt their Spirits are diſſolved and they faint away, all the vigour and turgence of the Blood quails, and thereupon the Nervous Fibres remit their painful

(* A a a)

Corru.

Corrugations or Contractions, and the Sanguiferous Vessels being very much emptied resorb the Morbifick Matter. In the mean time there is danger lest the Humours being violently moved should rush more impetuously to the part affected; at least lest the Spirits being too much dejected, and the work of Nature about the concoction or separation of the Morbifick Matter being disturbed, the strength should fail before the Crisis of the Disease.

XXVI. Many Practitioners are much afraid to attempt the Cure of any great Disease of the Pleura by Vomitories: yet Rulandus and Hartman often gave *Aqua benedicta* with benefit. Riverius, in obs. comm. 29. also commends this kind of Remedy: All Pleuritical Persons, says he, that vomit presently in the beginning of the Disease, escape, as I have observed in very many, the Pleura being eased of the load of Humours by the help of Vomiting.

XXVII. Gentle Diureticks that are not very hot, are very good, according to Galen, apb. 44. 6. loc. aff. 4. and Hippocr. 1. Epid. 2. For there are several ways of purging out the Matter in the Breast, according to Hippocrates and Galen. ¶ *Provolitus* observed that a Pleurisy of the left Side is for the most part deposited by Urine; wherefore in this case he gave the milder Diureticks with good success, amongst which *Diacuminum* was very familiar with him. ¶ If Spitting cannot succeed, the Matter is to be evacuated either by Sweat or by Urine, or by Externals, or a suppuration is to be endeavoured. For provoking Urine Turpentine is commended in this case, either alone or mixt with the Poudre of Lykorrhize. Give a drachm of it, and let it be wash'd in the Water of Maidenhair, to which add half a drachm of the Poudre of Lykorrhize. Yet these Diureticks ought not to be administered in every case, but only when you see the Spitting does not proceed, and that the Patient pisses plentifully: For Hippocrates said (4. acut. 28.) that those Pleuritical and Peripneumonical Persons are treated amiss who spit nothing up, unless they void much Urine. Therefore when you see the propensity of Nature, you may come safely to Diureticks, to Maidenhair, Parsley, Fennil, to the cold Seeds where the Fever is urgent. ¶ Hippocrates, 2. de morb. makes three differences of a Pleurisy, according to the diversity whereof the Cure is to be varied. Concerning the first kind he writes thus (lib. 1. v. 233.) But often, if it be turned to the inferior parts, it distributes a pain through the Veins to the Bladder, and the Patient makes a great deal of Bloody Urine. In this place he sets forth, in what Pleurisy the Morbifick Matter is not expelled by Spitting, as is usual, but by Urine, a sign whereof is, a pain extending itself by the Groins to the Bladder, and the Patients making a Bloody Urine, understanding that which is tinged with a deep red, which looks of a Bloody colour. Seeing therefore this sort of Pleurisy has its Crisis by Urine not by Spitting, he therefore advises the Cure to be performed by those things which provoke Urine, for which purpose he gives *Oxymel* diluted with a good deal of Water; namely *Oxymel* is Diuretick, and by the coldness of the Water whereby it is diluted, 'tis very fit to temper Choler.

XXVIII. In the Pleurisy and Peripneumony, Nature which is the Curer of Diseases, does sometimes purge out by Urine the Morbous purulent Matter contained in the Cavity of the Breast, as Galen witnesseth, 6. de loc. 4. Therefore her Motion is diligently to be observed, lest it be inverted by her Servant the Physician: So that if it happen that Nature endeavours an Excretion by Urine, we must make use of Diureticks, as *Heurnius* persuades us, cap. 3. de morb. pectoral.

XXIX. Hippocrates, 4. acut. gave to a Pleuritical Person in the beginning *Oxymel* with *Panax*

(or All-heal) boil'd in it and strained, as also to the Hepatick and such as were pained about the Midriff; viz. to such as had Phlegmons or other collections of Humours in the Liver or Midriff: namely to digest powerfully, and to move Sweat or Urine, or both. This way of curing Pleuritical Persons by violently discussing Portions is not very much in use with our Physicians, who after Bleeding, Anointings, and Pectorals, pass to no other Remedy. Yet I know one, to whom some ordinary Fellow gave something of this kind in Drink, who by having a plentiful Sweat raised was presently relieved, his Breast loosened, and he spit easily, when it was now the seventh day of the Disease and he had begun to Expectorate nothing, and was in danger to be strangled almost through difficulty of breathing. Ignorant Fellows also who empirically undertake the Cure of some Diseases, cure Pleurifies often by Sweating Medicines with good success. ¶ A Boy of twelve years of Age was ill of a Pleurisy of his right Side; he was bled five times, and other things were prescribed: On the seventh there was given him half a drachm of Chimney Soot in *Cardus* Water: Within two hours after taking this Medicine, all the symptoms, which were grievous, remitted very much, and the Patient was much better, and afterwards recovered by degrees. ¶ I have seen many, and especially Women, who for want of fitting Remedies were brought to extremity almost by a Pleurisy, cured by taking once or twice of *Quercetan's* Apple in twenty four hours, whereupon beyond expectation there follow'd either a plentiful Sweating, or liberal Expectoration. Indeed I could name several to whom, being almost desperate, I have prescribed this Medicine, and I never saw any event of it but good. ¶ An obstruction of the Vessels by viscid Phlegm, or Blood coagulated in them, shall be cured by using inwardly and outwardly such Medicines as dissolve the offending Humour and make it fluxile again. Amongst Internals Aromatick salts are the most profitable which are prepared of divers parts of Animals, as all and every of them being endued with a notable vertue to dissolve all coagulated and congealed things, and to reduce them to their former fluidity, and likewise to provoke Sweat, which being gently promoted withal, a resolution of the coagulated Humours is more easily, quickly, and happily obtained. Hence it is, that often upon the seasonable giving of one *Sudorifick* prepared of the foresaid volatil salts or the like, the Pleurisy, which is an inflammation of the Side, hath been happily cured without the opening of a Vein. And hence it is that mixtures made of such things, and taken seasonably a spoonful at a time by short intervals, have soon, safely and pleasantly cured, both the Pleurisy and Peripneumony, and also the Inflammations of other parts: As for instance: Take of the Waters of Parsley, Hyssop, and Fennil, of each an ounce, of Treacle Water half an ounce, of the Spirit of Sal Armoniack half a drachm, of Laudanum Opiate four grains, of the Syrup of red Poppy an ounce, mix them. The Spirit of Sal Armoniack, the volatil salt of Hartshorn, or any other may be used, and according to the greater or less acrimony thereof, more or less of it may be added to the mixture, and a greater or less quantity of the mixture may be taken at each time, and the Body may be kept in a warm place to promote the Medicin on every hand, and sometimes to facilitate Sweating, though it is not needful to provoke Sweat, seeing that does no good, but as the volatil and saline vertue of the Medicin penetrates then the easilier and quicker to the part affected and obstructed. To a Volatil salt may and ought to be referred Crabs Eyes, the Jaws of a Pike, Hartshorn, &c. seeing they abound therewith. In this case also all Metallick and Mineral

Sul-

Sulphurs, but such as are fixt, are profitable: wherefore hither is referred also *Antimonium Diaphoreticum* brought to some fixtness, though these things are good in this case on many accounts. Nor are only the Volatil salts of Animals profitable here, but all which are derived from the various parts of Plants called Scorbutical and Acrimonious, and emulate the virtues of the same, such as the Juices of Hedge-Mustard, Scurvygrass, both Garden and Water Cresses, &c. the Waters called Theriacal, if so be they have a vertue to loosen and dissolve coagulated Phlegm or con- creted Blood. Amongst External things these are good, *Unguentum Martiatum*, the compound Ointment of Marshmallows, &c. the Oils of White Lillies, Chamomel, Bricks, &c. which may be fitly mixt together and anointed on the outside of the affected part, premising or adding sometimes the rectified Spirit of Wine, as well the simple as the compound Aromatick. In this case also there may be applied outwardly Cataplasms, but rather such as are called Dissolvents, than Emollients and Ripeners; such namely as may incide and loosen the Coagulated Humour, and are prepared of Acrimonious and Aromatick Plants: As for example: Take of Onions roasted under the Ashes and bruised two ounces, the Leaves of Hedge-Mustard, Chervil, Garden Cresses, Elder, of each an handful and half, of the Flower of Beans and Lupines, of each an ounce, one Swallows Nest, of Album Græcum an ounce, boil them according to art in Butter-Milk to the consistence of a Cataplasma: This is to be applied indifferent warm, by the help whereof Internal Obstructions also may be opened. Note, that it must be renewed presently as soon as it begins to be dry.

XXX. That the Fluxed Matter may be digested, and yet incrassated, nothing is better than the Flower of red Poppy; which though some use indifferently, thinking it to be profitable in a Pleurisy from its whole substance, yet is it an hurtful-Medicin save in this case. It digests indeed moderately, but it has a vertue to incrassate, and therefore is good when the Fluxed-Matter is little, and only when the flowing Matter is thin; but if this hot and thin Matter be flown already for the greatest part, Incrassaters are to be let alone. ¶ Let the Flowers of red Poppy, of Blue Bottles, Burnet, Stags Pizle, the Powder of a Bores Tooth be given at the beginning of the Disease, not when it is come to Expectoration, for they straiten the Vessels through which the Blood flows to the part affected, and so does Coral.

XXXI. When in the year 1666. I passed through the Dales of the County of Newenburgh, to bid farewell to the Inhabitants amongst whom I had practised Physick, being about to return into my own Countrey, it happened that my dear Wife and Companion N. Joanna Spanheim being three Months gone with Child, falling from her Horse a mile or two from the City upon the Plain, hit her left Side against the Ground, wherein there began presently a great Pain with a Cough and difficulty of breathing, to all which a little while after was added a Fever. Notwithstanding we must need go forward to the City, where presently about the time of going to Bed we met happily with a Surgeon, whom I got to let her Blood on the same side her bruise was on. The next Morning, premising a Clyster, I gave her a draught of the Vulnerary Decoction, by the vertue whereof after a few hours some clods of Blood as big as an Hens Egg were expelled, and there forthwith followed health what was very much desired, even upon this account, that all things were prepared for our departure the next day, in which we were not prevented.

XXXII. *Antimonium Diaphoreticum* (see lib. 19. of Sudorifics) is a great Arcanum, and

greatly commended in the Pleurisy, whether true or spurious. In the former it notably disscusseth the collected Humours, absorbs the Acor, asswageth Pains, promotes Expectoration, and so satisfies all indications, especially if at first by a concise and true method of Cure Volatils were given, and this Medicin be afterwards joined with others, as Boars Tooth prepared Philosophically, (it is first boi'd for some days in simple Water or in a Copper Vesica, and then it is put in an hot Furnace, where its being chapt shews it to be well prepared) Crabs Eyes, and Opium it self, with which though it be given alone, it is a most sufficient Remedy. In the spurious or windy Pleurisy, how much *Antimonium Diaphoreticum* will do, those know, to whom its notable carminative vertue is manifest; for it is good outwardly, being mixt with disscussing Plasters, where Flatus insinuate themselves betwixt the Muscles; and also inwardly in Flatulent Tumours, especially in Children, for whose Gripes it is also excellent.

XXXIII. The Pleurisy is to be conquer'd by Specificks: but how these perform their operation, all are not agreed. Helmont, seeing he makes the next cause of every Pleurisy to be Extravasated Blood, which is caused by its acidity, does suitably determine that its Remedy cures in as much as it averts the Archeus from the conception of accefcence: And therefore he thinks that the said appropriate Remedies are friendly to the Archeus, that they correct the immediate cause in the Archeus, take away acidity, and dispose the Blood to a Diaphoresis, and ease the Pain by extinguishing the Acidity. Also the ferment of the Acidity being taken away, they resolve as much as may be of the Extravasated Blood, and do seasonably cast up the remainder by Cough, not designing to bring it to Pus. Which is the cause also why the same Remedies are given in bruises from falls, in as much as they resolve the Blood, that is, they take away the Spine or Thorn, remove the Poison, and in that regard incarn the place. Now there is nothing that more easily corrects, takes away and disposes to a Diaphoresis that acidity which is hostile to the Blood and Veins, than Hydrotick or Diaphoretick Specificks: such as are Goats Blood, the Powder of Stags or Bulls Pizle, the Juice of wild Succory, Poppy Flowers, Boars Tooth, Horse-Dung, the Herb Daisy, &c.

XXXIV. The next cause of a Pleurisy is the Blood stoppt through its roapiness in the smaller Vessels and Interstices of the Pleura, or else extravasated: (and the same is the next cause of a Peripneumony also:) Hence arises a preservatory indication designed against the Lentor and Effervescence of the Blood, which prescribes such Remedies as consisting of a Volatil or Alkalizate salt, do destroy the combinations that the acid, fixed, or otherwise Morbifick salts have entred into with other thicker particles. For which purpose the Eyes or Claws of Crabs, Boars Tooth, Carps Stones, the Jaws of a Pike, the Bone of a Stags Heart, a Stags Pizle, Sal prunella, the salt of Coral, the salt of Urine, or of Hartshorn, the Powder of dried Goats Blood, the infusion of Horse-Dung, the Spirit of Hartshorn, of Sal Armoniack, the Spirit of Tartar, mixtura simplex, bezoardicum minerale, *Antimonium Diaphoreticum*, the Flowers of Sal Armoniack are very famous Remedies in the Pleurisy.

XXXV. In March 1643. I begun to have a grievous pain in the mornings that seized upon my left Side and Breast-Bone, whence I had a great difficulty of breathing. I presently endeavour'd to disscuss it with hot Fomentations, though a Fever began to appear, which yet was little enough: after the Fomentation the pain was worse, therefore I let Blood out of the Arm of the same Side to ten ounces, which was very hot: Two hours after

Heura. Ron-
delet.

after Bleeding I took a Clyster, having taken some Gruel an hour before. After a second Mess of Gruel I repeated Bleeding to twelve ounces: for though the pain seemed to arise principally from Wind, yet I was afraid the greatneſs of the pain might draw a fluxion upon the part, which in two years before had been twice afflicted with a true Pleurisy. By these things the pain was somewhat abated; but persevering the following day, I took ano her Clyster of the Emollient Decoction, of *Diaphanicon* an ounce, *Aqua benedicta* four ounces, which gave me several Stools and one Vomit, and whilst I vomited the Wind contained in my Breast was suddenly scattered, so that I was quite freed from the pain of my Side and *Sternum*, and had need of no other Remedy.

River. cent.
3. obl. 3.

XXXVI. Boars Tooth, the Shavings of Ivory, the Jaw of a Pike, red Poppies and the like are so far from promising any help in a Pleurisy (which some call a Spurious or bastard one) that they seem to threaten the Disease it self, and to retain in the Breast that tough and clammy Matter with very great detriment and fear of suffocation. Therefore I wonder that Antipleuritic Pouders of the aforesaid things only, should be carried about and given indifferently in every Pleurisy. I have learn'd from Art it self that the Patients receive more hurt than benefit from these Pouders, if the *fumes* of the Disease be Phlegm.

H. Grube de
simpl. cogn.
p. 34.

XXXVII. Common Practitioners are wont to use Lambitives in the beginning of Pleurisies, which have a faculty to incrassate the Humour, that they may hinder the Fluxion to the part affected. These seem to me to offend in a double respect: first, because when they are called to Pleuritical Patients, the Fluxion is already made for the greatest part; so that to incrassate that which is made, is nothing else but to hinder spitting or digestion. Secondly, There are very often Bastard Pleurisies, when thick Humours flow down either from the Head, or from the whole Body, in which case Incrassaters are Poisons. Therefore the Matter of the Pleurisy, and the plenty of the Matter already flown are always to be observed before Incrassaters be given: And if that which flows be hot and thin, and be collected in a little quantity, 'tis convenient to prepare a Lambitive that has a vertue to hinder a new defluxion, and also to digest that which is already flown.

Saxonia.

XXXVIII. In a Bilious Pleurisy, which has a notable burning and violent heat joined with it, we must abstain from Honey and Sugar and all things which are apt to be turned into Choler and to increase the heat, and we must come to cooling Potions and Suppings, which yet must be loosening, not binding.

Petr. Sal.
comment.
in text. 91.
l. 2. de morb.

XXXIX. 'Tis some question whether Acid Potions be good: both because Vinegar is offensive to the Membranes; and also because if the Potions be pretty acid, where the Spittle is not easily brought up, there proceeds greater harm from the Viscosity which follows the not coughing up, than help from the irritation that accrews from the twitching of the Medicin: for upon this account did *Hippocrates* (3. acut.) condemn Oxymel for its acrimony. But perhaps, in *lib. de affection.* by the more Acid Potions he did not understand such as are very sharp, but those which being simply acid, may in respect of Muls and sweet Potions, be called more acid, which will be chiefly good in a Pleurisy depending on a Phlegmatick Matter, because in it the Phlegmatick Humour sticking to the Membrane like a Plaster, suffers not the Membrane to be twitched by Acid Potions.

Idem, com.
in l. 2. r. 27.
de morb.

XL. Some Practitioners in great want of sleep dare give *Narcotics*, as the Syrup of Poppy, *Philonium Romanum*, *Laudanum Opiatum*: Which yet in this Disease are pernicious, for they retain the Spittle and straiten the Breast, whence there often

follows hasty destruction. Yet this is to be understood of a full Dose of *Narcotics*; for if they be given in a small quantity they may do good, in a violent pain, a troublesome cough without getting any thing up, arising from a very thin Humour, and in continual watchings. In which cases I have often given one grain of *Laudanum Opiatum* with good success, and sometimes have repeated it several times. But its use is chiefly in the beginning of the Disease, for then the Humour that is a flowing into the part may be restrained, and an increase of the Disease hindered. ¶ The use of those Medicines which are made of *Opium*, *Hennbane*, and *Mandrake*, cures not the painful affection of the Pleurisy, but takes away the sense.

River.

¶ Being called on the seventh day to a Pleuritical Person that greatly wanted sleep, I gave him after Supper a little *Laudanum* with his pectoral decoction, and a little *Confectio Alkermes*; he rested pretty well that night, whereby Nature recovered new strength, &c. and he recovered about the seventeenth day. ¶ We must note that things taken inwardly are more available; for things applied outwardly hardly penetrate to the pained part, are very slow of operation, and in their passage to the Internal parts do incrassate the Humours, and upon this account do increase the pain and its cause.

Galen. 1.
acut. 33.

¶ In a dry Pleurisy and a Bilious Patient, *Laudanum* being twice given after Universals, cured the Disease by easing the pain, though the pain was very violent.

Fabr. Hild.

37.

XLI. That ancient Physician *Rhazes* has admonished us to take heed of hot things; for, says he, many increases happen to this Distemper by the mistake of unskilful Physicians: as when upon conjecture, that the Membrane that cloaths the Ribs is stuff'd with thick *Flatus*, they unseasonably give *Diamschu* or some Medicin that is like it in discussing and inciding, for by this unseasonable Curation they kill their Patients. ¶ I remember a Woman that began to be seized upon by a Pleurisy, to whom her Physician gave Treacle, with other heating things, and she was order'd to sweat upon the taking thereof; whereupon all things growing worse, she died at last of a *Peripneumony*.

Mayerne,
tract. inf. de
Laudano.

XLII. The difficulty about the use of Repriments at the beginning, is very great: For *Mesue* uses at the beginning a repressing Medicin, of *Roses*, *Balaustins*, &c. and he seems to have reason on his side; because every beginning Inflammation is treated with Revellents and Repriments; And *Galen*, 11. *Meth.* 17. having spoken before of the use of Astringents in an inflammation of the Liver, adds, In Inflammations of the Breast Astringents are not so convenient; he says not, they are altogether inconvenient, but, not so convenient. *Hippocrates* himself, 2. acut. 4. uses Barley and Bran in *Posea* (or Vinegar and Water:) Now Vinegar represses. Yet Repriments seem altogether suspected: first, In regard that Astringents harden the Matter that is already flown; Secondly, They repel the same into the Lungs: Now a *Peripneumony* is worse than a Pleurisy: Therefore *Galen* in the fore-cited place gives great Caution that such Inflammations of the *Thorax* be not repelled to the Lungs. And indeed such suspicions are of so great moment, that I durst never use Astringents in a Pleurisy. To *Mesue* we must say, what even himself confesses, that these Repriments are then only convenient, when the Matter is as yet not flown at all, when it is hot, thin and little: But if it be not as yet flown, how is it a Pleurisy? It is a trifling supposition: for it is not a Pleurisy, if some part, yea sometimes and generally the greatest part be not already flown. Therefore *Hippocrates* in the cited place uses not repressing Fomentations, wherein he is wrongly condemned by *Trallian*; but he uses that Fomentation to attenuate and incide that thick Matter which makes a Bastard Pleurisy.

Heurnings

Bruno Seid.
de morb.
incut. p. 50.

XLIII. Saxonia.

XLIII. That we may rightly understand the ver-
 tue of Fomentations, we ought to note that there
 are three principal Remedies of a Pleurisy, Fo-
 mentation, Venesection, and Purging; the first
 whereof fights with the Conjoint Cause, and withall
 sometimes stops the Antecedent; and Venesection
 and Purging take away either the Antecedent Cause
 or the Conjoint; so that in this respect Fomentation
 being conveniently applied, sometimes excels Ve-
 nesection, because Venesection is not convenient
 in every Pleurisy, but Fomentation is: but not
 every Fomentation for every Pleurisy, but some-
 times one, sometimes another according to the con-
 dition of the Matter, the Constitution of the Pa-
 tient, and the history of the Disease. For when
 the Matter is Bilious, warm Water is used; when
 it is thick and stubborn, a mixt Fomentation,
 which incides, attenuates and digests: When the
 Catarrh is thin, a dry Fomentation, either biting,
 or not. But if, says Hippocrates, the pain cease
 not upon Fomentation, (through the afflux of new
 Matter, from an Orgasm, Attraction, or Exclufion,
 namely, when one part unloads it self upon
 another) we ought not to spend much time in fo-
 menting, but we must make an end of heating, for
 this drieth the Lungs (by heating and exhauiting,
 because whilst that which is subtil is resolved, the
 remainder is curdled the more and made thicker)
 and causeth Suppuration. You will object, *aph. 2.*
52. If you do all things according to Reason and
 yet without success, you must not change whilst
 that remains which was seen at the beginning: but
 here it remains, for the Physician ought still to en-
 deavour to remove the pain and to restore the part.
 I answer, That the said Aphorism is to be under-
 stood, if so be there be no danger of a greater
 mischief. Hence appears the error of the Mo-
 derns, who not only prescribe hot Baths, but also
 apply Plasters that are notably heating. Therefore
 when you have made provision for the whole, ply
 your Fomentations; but if the Malady abate not,
 return to Venesection. Now there are two sorts of
 Fomentations, *Tryers*, and *Mitigators* of the pain.
Mitigators have no place in a true Pleurisy, unless
 the whole Body be first evacuated, for otherwise
 the impetus of the Humours will increase. Where-
 fore we shall then chiefly use Fomentations in the
 beginning of a pain in the Side, when we think
 that the Matter that is flown thenceinto may be ex-
 hausted thence, as not running so much about by its
 plenty: Wherefore observe whether the Patient
 have been accustomed to a spare Diet, or whether
 some great Evacuation have preceded. But where
 there is an Apyrexia, there will be no danger from
 the Fomentation, if the Body be not too full of
 Humours, or oppressed with their quality. But
 when we try the Malady by Fomentation, we do it
 before Evacuation, that it may appear whether
 plenty of Matter be in fault: If the pain be in-
 creased by Fomentation, presently open a Vein.
 But Mitigators must be used after Bleeding: Let
 these be such as may mollify and rarefy the part,
 and may resolve the Blood, if it be little, into the
 habit. Now there are divers manners of Fomenta-
 tions, for they are made with a Bladder, Sponge,
 or Cataplasim. On the first day we anoint the Side
 with the Oil of Violets; on the second with the
 Oil of Almonds; on the third with the Oil of Cha-
 momel; on the fourth we use a Cataplasim or
 Poultices, of Linseed, Fenugreek Seed, Mallow
 Seed, of the Roots of Marshmallows and of Cha-
 momel Flowers: on the fifth, if it tend to Suppu-
 ration, we add Suets or Greases: But if the Dis-
 ease be moist, and there be much cough'd up deep
 at the beginning, Bags of Millet, Bran, Salt and
 Cummin will be better: But if the Patient Ex-
 pectorate, we must never depart from moist Fo-
 mentations. And always observe this caution, that
 whilst 'tis doubtful whether it be only Wind, or a

true Pleurisy, you must presently come to the Oils
 of Chamomel and Rue, with the Seeds of Cummin
 and Dill, which yet we use rightly in the progress
 of the Disease also. If the pain be eased by
 Fomentations, consider exactly whether that come
 to pass upon account of the Fomentation: because
 upon the first Blandiment of the Fomentation the
 pain in a Phlegmon often grows milder, because
 the extended part is loosened, but by and by it
 returns fiercer when new Matter is sent into the
 Phlegmon. It sometimes happens that when the
 Matter is deeper imprinted, the pain is not miti-
 gated by Venesection, because the Membrane that
 cloaths the Ribs being thicker than usual, grants no
 exit to the Matter that has insinuated it self into it:
 in this case Fomentation is of principal use: And
 in all Fomentations take heed that by their weight
 they add not pain to pain. If you find that Fo-
 mentations do no good, use them not above two
 days, lest the thin Humour be exhausted out of the
 part affected. Again, If the Patient burn with an
Ætus from Cholerick Blood, see that in the be-
 ginning of the Disease you anoint with the Oil of
 Violets or with *Unguentum Resumptivum*; for in
 an Inflammation of the Breast Coolers and Astrin-
 gents are to be applied sparingly. For 'tis suffi-
 cient that by these things which are endued with a
 gentle astriction the Breast be strengthened, that the
 inflamed part, which is hot and pained, may not
 by attraction so easily receive the Matter: Now it
 does so when we use Looseners: Yet if all way be
 intercepted for the flowing Matter, it is driven
 into a certain Orgasm, and provokes a Peripneu-
 mony and Phthisis. If it be a Bastard Pleurisy,
 as if the Malady be seated in the Muscles, make a
 Plaster of Pitch and the Oil of Dill: and if the
 Matter be cold add two drachms of Sulphur. *Heuritis.*
 ¶ Hot Fomentations even in cold and windy pas-
 sions seem at the first to hurt, because the *Flatus*
 being attenuated they distend more, and the pain
 increases: but by continuance they cure the pain
 which at first they increased. ¶ Heating Reme-
 dies to be applied to the pained side are some of
 them simply Anodyne, others both Anodyne and
 Maturating: Anodynes may be administered in the
 beginning to assuage pain, and somewhat to dis-
 cuss the Matter, because seeing they are endued
 with no great heat, and rather loosen than obstruct,
 they may rather lenify than attract: Hippocrates
 commends these Heaters both in *lib. acut.* and in
2. de morb. But Concocting and Maturating Me-
 dicins, seeing they are apt not to loosen but ob-
 struct, not to evaporate the inward heat, but to
 increase and cherish it, are not convenient in the
 beginning, because then they increase the Fluxion
 and Inflammation: These are condemned.

XLIV. Many add Wax to Liniments, which yet
 is not convenient, because it obstructs the Pores;
 as neither are Mucilages which are Emplastick, be-
 cause they cool and bind.

XLV. Amongst the Remedies that use at one
 and the same time to move Spitting, Urine, and
 Sweat in Pleuritical Persons, is a *Bath of Sweet*
Water, which Hippocrates mentions *3. acut. 58.* by
 whose Authority both the *Arabians*, and *Latins*
 and *Greeks* are induced to commend it. But it
 seems to be suspected by me; for if it be made
 use of when the pain is urgent, when Spitting pro-
 ceeds not well, (which he seems to desire it should
 be, when he writes, that it eases pain and promotes
 spitting) at this time the Pleurisy is in its in-
 crease, or at least in the beginning of the state, at
 which time it will carry the Humours that are colli-
 quated in all the parts of the Body, to the part
 affected. Therefore *Galen*, *12. Meth. 13.* suspects
 it in an Inflammation of the parts of the Breast,
 lest the inflamed part being heated and relaxed by
 it, should receive the Fluxion. And if any say
 that it is to be used in the time of Concoction, and

only

Saxonia.

only in the declination, it will indeed be of no use: for in the declination the pain ceaseth, and the Spittle is already concocted and in a great measure brought forth: Therefore in a word, I do not approve of a Bath.

XLVI. Though the Body be dissolved, and all the faculties dejected in immoderate want of sleep; yet according to Hippocrates's Precept, 3. de morb. t. 56. sleep is greatly to be shunn'd, seeing by it, especially if long, most of all that which comes in the beginning of the Invasions, the Internal Inflammations of the Viscera are increased, because the Blood retires, then to the inner parts, as Hippocrates teaches, 6. Epid. sect. 5. t. 30. whence Persons become hotter when they are asleep, both the native and extraneous heat, retiring to the inwards. Add hereto, that seeing the Animal faculty is then made drowsy, the Pleurisy can neither be purged by spitting, nor the issuing Matter be hawked up, but remaining within, it increases the difficulty of breathing, obstructing the passages of the Breast by thick and tough Matter, which mischiefs are only declined by coughing, which we make use of only when we are awake. But Hippocrates says in the cited place, that sleep is very much to be kept off, but not altogether, because of the necessity of it, and the detriments of too great watchings.

XLVII. There oft happens a certain middle Disease, compounded of a Pleurisy and Peripneumony, yet more dangerous than a Pleurisy, in such whose Lungs being ill affected stick to their Ribs: For a Fluxion being poured into their Side, it is apt to burst in Lungs that are moribund and weak and cleaving to the Side. This is distinguished from a Pleurisy, because though it have a pain in the Side accompanying it, yet that pain is not proportionable to the Fever; and besides there is felt a grievous pain extending it self even to the middle of the Breast. Moreover upon once, twice, or thrice Bleeding the pain of the Side is allayed, but the Fever continues, as likewise doth the difficulty of breathing, and coughing up yellow or red Spittle.

Enchir. med. pract.

XLVIII. J. Prevotius observed that a Pleurisy of the left Side was for the most part deposited by Urine: And therefore he gave the milder Diureticks in this case with good success; amongst which *Diacuminum* was a familiar Remedy with him: Daphoricks never answer'd his desire: And when *Rulandus* extols these so greatly, without doubt he has an Eye to the Story of *Anaxion*, Epid. 3. Agr. 8.

Rhod. cent. 2. obs. 13.

XLIX. That is worth observation which *Aretaeus* hath noted: If, says he, the Pleuritical be out of danger, yet still cough a little, and an heat now and then return and molest them; we must hasten to make a thorough discussion; for what is left, either causes a Relapse, or turns to Suppuration.

L. Use great caution when the Phthisical are troubled with a pain in their Side: for sometimes stubborn *Flatus* get into their Lungs, seeing their Lungs that float with continual moisture, stick to the sides of the *Thorax*, as it they were preternaturally glued to them. Apply only Fomentations and *Sacculi* or Bags, Cupping-Glasses, and then a Plaster of Melilot. See Sect. XVII.

Hennius.

LI. The Liver in some Bodies is naturally knit to some of the short Ribs by Fibres; and therefore when the Liver is diseased in these Persons, there is a representation of a Pleurisy. In others there is collected a certain thick and viscid Matter in the Membranes of the Breast, also all the *Thorax* over, whence there is a great pain, a difficulty of Breathing and a counterfeit Pleurisy; for there is neither a pricking pain, nor is there a Fever kindled: as neither are there, if there be *Flatus* impacted in the Membranes, or in the Intercostal Muscles.

Sometimes likewise the Muscles are inflamed, but then here is another manner of pulse, namely a soft one; the pain is heavy, not pricking; and all things generally are lighter. The Membranes also that part the *Thorax* (called *Mediastinum*) if they be inflamed are as dangerous to Life as a true Pleurisy. In like manner when the lower Ribs are inflamed, the Midriff, and from hence the Stomach are very dangerously affected.

Holler. l. 1. de m. interna.

LII. A Soldier complains of a troublesome pricking in his Side: A Barber being called, supposing it to be the Colick, gives him a Purge, which wrought so by Stool for two days, that at length he voided a great deal of Blood. When he was almost spent, he consults a Physician, who considering all things diligently, fees and tells him that he's sick of a Pleurisy: He was presently let Blood, then he spit forth a laudable Pus, by which being relieved he recovered.

Thom. Barthol. cent. 3. obs. 74.

LIII. A Girl of eight years old began to be ill of a Cough and Fever, to which succeeded a pain in her Side, so that she was thought to be Pleuritical. On the fifth day of her illness she voided four Worms upon taking a Clyster: On the days following she voided several, both by the help of such things as she took to kill them, and also by Purgers. Whence it appears that Vapours raised from a putrid Matter (of which the Worms are generated) produce the pains of the Side, and a Cough and other symptoms resembling a Pleurisy.

River. cent. 1. obs. 75.

I had a Girl to my Patient who had all the symptoms that are usual in a Pleurisy; there was a pricking pain in the right side of her Breast, a little dry Cough that was raised on every small occasion, her Pulse felt hard, and was not altogether unlike a Saw and Recurring, she breathed short, and had a continual Fever. Observing that sometimes her Body was cold all over, and sometimes hot, with one or other Cheek red, upon giving her a Medicine to kill and bring forth the Worms, she presently voided many and recovered. See *Quercetan pharm. dogmat. rest. cap. 7.*

Gabricin. c. 13. l. de lumbrie.

LIV. Mr. N.'s Maid was troubled with a pricking pain in her Side, with a Cough and white Spittle, which yet twice or thrice appear'd Bloody. She could lie better on the pained Side, which was the right. She had no Fever, which was a sign 'twas no true Pleurisy, seeing such Inflammation cannot be without an Acute Fever. On the seventh day of her illness, seeing the pain had never intermitted, she spit Blood plentifully for some hours, whereupon there follow'd a Flux of her Terms, and thereupon a perfect solution of the Disease. I thought the cause of this Distemper to be an Acrimonious Humour translated into her Side by the Veins, which caused the pain without inflammation: Which Serous Humour being exagitated, opened some little Veins on the seventh day, whence happened her spitting of Blood: but Nature conquering, and sending off that Serous Matter to the Veins, there was made a solution of the Disease.

Laz. Riv. cent. 1. obs. 73.

LV. The Wife of Mr. N. was taken with a Pleurisy on her right Side, and that very grievous: About the later end of the seventh day and beginning of the eighth she was taken suddenly with so great a Palpitation, that her ordinary Physician thought it to be the last strugglings of Nature, and foretold that death would speedily follow. I was of opinion that that Palpitation proceeded from some putrid Matter evaporating, contained in the lower Belly: The event shew'd it to be so; for after two hours she had two very stinking Stools, upon which she was freed from the Palpitation. Her case was suspected to be full of danger, because the Disease had not been lessened in seven days time by any Remedies, nor so much as by repeated Bleeding: And now though the symptoms seemed to abate, there appeared a *Parotia* on the eleventh day, which the next day disappear'd, and she

Lazar. Riv.
cent. 1.
obl. 72.

she died on the thirteenth. Whence it appeared to have been a Malignant Pleurisy, or rather a Malignant Fever accompanied with a Pleurisy.

LVI. The Pleura is not only subject to Inflammation, which a Pleurisy, Empyema, and Vomica (or Imposthume) follow, but also to a certain pain which a salt Humour causeth. This may be distinguished from a Pleurisy, because though here be a dry Cough, yet there is no Fever, and also a free Respiration. I use to cure it by Bleeding and Sweating, if there be fear of a Pleurisy, I apply this Plaster outwardly: Take of the Marrow in a Cows Leg-Bone, and of Ducks Grease, of each three ounces, of the Mucilage of Marshmallows, Linseed, Fenugreek Seed, of each an ounce, of Frankincense, Mastick, of each half a drachm, ol. nucist. by expression two drachms, of yellow Wax as much as is sufficient, mix them.

Barbette
Anat. Pract.
p. m. 130.

LVII. Fernellius, Pathol. l. 5. c. 10. notes, that when a pain succeeds an Inflammation of the Lungs, an Ulcer, or Abscess of the Side, the pain being inward, firm, and permanent, it signifies that the affected Lungs do now adhere to the Pleura by the intervention of Phlegm or some clammy Sanies that flows out of the Diseased Lungs. In that case there is place for no other Remedies but those that are able to loose that Cohesion, and melt the clamminess of the Sanies or Phlegm, as Fomentations of warm Water, Milk, &c. contained in Bladders: Drying hot Fomentations do harm by increasing the clamminess of the Sanies and Phlegm.

LVIII. A young Man having been run in at the Back as far as his Lungs, was taken with an Acute Fever, with a pricking pain, and difficulty of breathing, so that he was esteemed Pleuritical: The next day the Membranes of his Lungs being inflamed, he complained of a pain reaching to the Orifice of the Wound behind. Hence J. D. Sala taking it for something else than a Pleurisy felt upon the part where the Wound had been made, and consulting with his Reason, pronounced the Fever to arise from a Vomica bred in the Lungs through a collection of Pus: nor did he guess amiss, for by the use of fitting Remedies all the Pus was brought up by coughing, and the Patient recovered very well.

Medicins especially made use of by eminent Physicians.

1. A drachm of the Powder of dried Burdock Roots taken in the Morning in warm Water, and sweating upon it, presently eases the pain and cures the Patient.

Al. Bened.

2. An infusion of Horse-Dung in thin White Wine for a Man, and of Mares Dung for a Woman, being drunk betimes in the morning, and the Patient composing himself to sleep after it, does excellently disperse the Tumour in a Pleurisy, by insensible transpiration. For there is a great discurssive vertue in Horse-Dung because of its sulphur, and the fixt and volatil salt that are found plentifully in it. ¶ The Blood drawn out of a Goats Stones is a most certain Remedy for a Bastard Pleurisy, both anointed outwardly, and taken to a drachm inwardly.

P. Joh. Fab.

3. Take of *Sai Prunella* two drachms, the Flowers of red Poppy powdered, red Coral, of each a drachm, of Sugar-Candy half an ounce: Make a Powder: The Dose is two drachms, drinking after it some red Poppy or Carduus Water. It is an excellent Remedy.

Fr. Ofw. Gr.

4. It is an excellent Remedy, to give on the second day a drachm of the Powder of the Seeds of Ladies Thistle.

Fr. Joel.

5. This is a very profitable Ointment for asswaging the pain: Take of the Ointment of Marshmallows an ounce, the Oil of Sweet Almonds half

an ounce: Anoint the pained part herewith warm, and while it is moist, sprinkle thereon some fine Powder of Chamomel Flowers, and lay over all a warm Colewort Leaf anointed with Butter or Hogs Grease, tying it on with bandage.

Z. Lusit.

6. I have seen many Pleuritical Persons cured with Pigeons Dung, taken to half a drachm, in some convenient Liquor.

Dom. Pand.
rol.

7. For mitigating the pain and procuring sweat this is admirable: Take of the Water of Chamomel Flowers four ounces, of Sugar two drachms; take this Draught for two or three mornings hot, and sleep upon it lying warm.

How and where we must use Astringents. XXIV.

I. **T**Here is a great difficulty in Women with Child in every respect; and I always use to say to my Scholars, There are two things in Physick which I am most troubled and solicitous about, wherein I am prest with the greatest difficulties, and almost falter and stumble, namely, when I Physick Women with Child, and Infants; for the Cure of Women with Child is doubtful, difficult, and full of anxiety. Wherefore I think that we should always walk with a Leaden Foot, and do all things with premeditation.

Epiph. Ferd.
hilt. 13.

II. Though most Physicians refuse the Care of Women with Child, yet they are not to be left destitute: yea, we may safely undertake their Cure, when they have a laudable Blood to nourish their Fœtus withal; but we may not hope so well in the Cacochemical, who are apt to miscarry upon taking of Physick.

J. Raym.
Forris, conf.
76. cent. 2.

III. Whether may Women with Child be let Blood in the Foot? This Question is founded in Acute Diseases, the Epilepsy, an Erysipelas of the Womb, great pains, burning Fevers, which depend on the Womb. Women according to Aristotle abound with Blood about their Womb. Therefore there is no doubt but that Blood is to be taken from a Woman with Child when she is ill of an Acute Disease, even though it injure and endanger the Fœtus, because it is better to study and provide for the health and safety of the Mother than of the Fœtus, seeing its Life depends on the Mothers: and Blood is to be let as often as the greatness of the Disease shall require it. But the Question consists in this, Whether Venesection in the Foot be convenient and safe? For if according to Hippocrates a Woman with Child miscarry upon Bleeding, much more when she is Bled in the Foot, because Food is thereby withdrawn from the Fœtus, according to Galen, in comment. For this kind of Remedy is designed for provoking the Terms, according to the same Galen, and to unload the Womb, and to revel from it whatsoever it contains that is troublesome and painful. 'Tis better therefore to draw as much Blood out of the Arm as is necessary, than out of the Foot, because through the Circulation all the Blood returns from the lower parts upwards to the Heart. And the Blood is contained in greater quantity above the Liver than below, by reason of the parts of the Breast, and of the Head which receives a great deal: Therefore Bleeding in the Arm may equally revel from the Womb, because the Liver makes the middle of the Body, according to Galen, and revulsion ought to be made to a contrary part. Besides, it empties the parts of the Breast and Head sooner and more commodiously. But if the first or second Venesection should be made in the Foot, while the Uterine Vessels are yet full, it would be tolerable; but it is not used but when the upper parts are already exhausted, and therefore the Blood that is contained about the Womb in the Hypogastrick Vessels, is revelled and withdrawn from the Fœtus: from whence an Abortion may follow, if it be defrauded of its nourishment. Moreover Venesection in the Foot is nearer to the Womb, than that in the Arm, and so is apter to cause Abortion: And Venesection in the Foot does draw by the Arteries the nearest way from the Womb, which that in the Arm does not do. Wherefore 'tis better in a Woman with Child to open a Vein in the Arm than in the Foot, unless the Physician intend to procure Abortion to preserve the Mother from imminent danger of

death. But if the Woman should be in the greatest danger of her Life, and without an intention of causing Abortion should need Bleeding in her Foot; her strength holding up, it were better to Bleed her therein from the sixth Month inclusively to the ninth, though the Fœtus be then bigger; because by the great providence of Nature Blood is contained (as in a Store-house) within the substance of the Fungous Womb, and in the Placenta that is now thick and large, enough for the nourishment of the Fœtus for some days: But in the other foregoing Months, when the Placenta is little and sticks not firmly to the sides of the Womb, that has not as yet acquired a thickness capacious enough, to suck up and contain the Blood, that is as yet fluid about the Womb in the Hypogastrick Vessels, by Bleeding in the Foot it may be recalled as in the Menstrual Purgation, and so be withdrawn from the Womb, and therefore an Abortion would follow.

Riolan. an-
thropogr. l.
6. in fine.

IV. The Diseases that seize upon Women not with Child, as Vomiting, want of Appetite and the like, in them need Purging rather than Bleeding; because they are caused by a Cacochymie abounding in the Stomach and the whole Body: But in Women with Child they need Bleeding more, because they are caused by the Blood retained from the very beginning of their being with Child. And Experience hath taught that the Vomiting which often afflicts Women with Child in the first Months, are aggravated by Purgations, but are much relieved by Bleeding, yea, are wholly removed, if it be repeated every Month till the symptom wear off.

River.

V. According to Hippocrates, aph. 1. sect. 4. one would think that we should reckon Purging to be safer than Bleeding; for he there permits Purging in a certain case and time; but on the contrary concerning Venesection he writes absolutely, aph. 10. that it causes Abortion. But Purgers do cause a great agitation, and generally have a quality that is injurious to the Body, and besides provoke the Terms, and cause Gripings: Whereas on the contrary Bleeding is administered with less perturbation of the Humours; nor does it hurt any otherwise but as it deprives the Fœtus of its aliment, which fear is vain if there be a Plethora. And it appears by Experience that Bleeding has better success than Purging, when there is present the same reason of Indicants and Permittents. Add, that many Acute Diseases spring from plenty of Blood, for which Bleeding is the properest Remedy.

VI. Hippocrates, aph. 1. sect. 4. hath defined the use of Purgation in Women with Child; Women with Child are to be Physick'd, if the Matter be Turgent, in the fourth Month, and till the seventh; but these later more sparingly: But we must have a care when the Fœtus is very young, or when it is full grown. Galen in comment. says, that Fœtus are like to the fruits of Trees; Now these when they are newly shaped or set, have but weak Stalks, and therefore they easily fall off when a violent Wind shakes them; but afterwards when they are grown somewhat bigger they are not so easily shaken off the Trees: and yet when they are come to their full growth and are ripe, they fall off of their own accord and without any extrinick violence. In like manner Women suffer Abortion in the first and last Months, because in those Months the Fœtus is not so firmly knit to the Womb. But in our times Purgers are administered almost in every Month of their being with Child, in Diseases which are produced by a predominance of Excrements and a Cacochymie, when the Matter is turgent, or concocted, as often as there impends greater danger on the part of the Cacochymie, than from the commotions raised by the Purge. Physicians have been made bolder herein upon the account of the gentle

River.

gentle and harmless Medicines that we use now adays, as Rhubarb, Myrobalans, *Cassia*, *Manna*, *Senna*, *Agarick*, and the like. Yet we must always have regard to *Hippocrates's* opinion, that Purgers may be given more safely in the middle Months, but are to be used more warily in the first and last.

¶ Being with Child hinders Purgation for fear of Abortion; and though even Acute Fevers be present, and the Matter be Turgent, yet the offending Humours may be corrected and evacuated by divers Remedies without strong Purgers. For such Medicines are common at this day, as prepare the Humours, and bring them to the ways of the Ducts, without making use of any violent Remedy. And we must know that in the Diseases of Women with Child there is sometimes a very great fermentation of the Blood, because of some Preternatural ferment raised in the mass of Blood, which Purging Medicines, as such, can no ways bridge; and moreover 'tis very doubtful as yet, whether that fermental Effluviu will follow the guidance of the Purgers. See *Zacut. M. P. H. l. 3. lib. 14. Fr. Hofm. m. m. p. 53. Schenkius obs. l. 4. p. 554.*

VII. *Cassia* is not to be given to Women with Child, as no more are most Diureticks, because through the nearness of the Womb with the Bladder, which they provoke to expulsion, they may do much harm: Besides, *Cassia* by its superfluous moisture relaxeth the Womb, and weakens the Coryledons; and 'tis also suspected for breeding Wind. *Zacutus* thinks that it may be so corrected by the addition of Spices and Carminatives, as to become harmless; but Experience witnesseth that it is not safe to use it.

VIII. And the Evacuation that is made by Clysters is altogether unsafe, because it may cause Abortion by compressing the Womb. When therefore there is need of them, and Women have been accustomed to this kind of Remedy, they ought to be made up in a less quantity, and to be made of those things which are endued with a vertue rather to mollify and loosen, than to purge strongly.

IX. The use of Pills ought always to be suspected, both because they disturb the Body more, and also because of the Aloes, which for its notable bitterness is offensive to the *Fetus*, and is believed to open the mouths of the Veins. But if its use seem necessary at any time in the more grievous Diseases of the Stomach, which are often wont to afflict Women with Child in their first months of being so, let it be well washed with Rose-Water, that its acrimony may be taken away; or let it be mixt with astringents and strengtheners, as Mastic and the like.

X. Diureticks, because they are apt to provoke the Terms also, ought to be suspected, and if the necessity of the Disease do sometimes require them, let the more gentle be chosen.

XI. The drinking of *Acidula* (or Mineral Waters) is to be denied, (*viz.* the Medicinal drinking, not the extraordinary, wherein a draught or two is granted for pleasure or to quench thirst) First, because by opening, inciding, attenuating, and absterging they provoke the Terms; whereby Aliment is withdrawn from the Womb: Secondly, because the Belly is thereby loosened; but things provoking to Stool are hurtful, *aph. 34. 5. and 27. 7.* Hereby the *Fetus* is deprived of Aliment, the bands whereby it is tied to the Womb are loosened, and the *Fetus* is offended by the frequent stretch of the Excrements as they pass by.

XII. Sudorifics, if they be of the milder sort, may be safely used, Experience teaching that they are beneficial to Women with Child that are infected with the Pox, or Plague, or the like Diseases: for when there are vicious Humours in the Body, if Nature be not infirm, such things help

more than they hurt, and Nature joins her self as a Companion with the Medicines against the Morbifick Causes, which being banished, the Spirits and Faculties are restored.

XIII. Concerning a Bath *Avicen* thus admonishes, *But if superfluities be multiplied in them, 'tis fitting they bathe often.* But indeed it is naught, unless towards the later end of the ninth month, for it dejects the Spirits, softens and loosens the bands that contain the *Fetus*, breeds Crudities, and which is worst, provokes the Terms, by unlocking the Vessels and fusing the Blood. But to sit in a Bath is profitable for those who are near their labour, for by it the Womb is dilated, the neighbouring parts are softened, and an easy passage is granted to the *Fetus*.

XIV. As often as a Woman with Child is struck with some violent affection of mind, a fright, anger, or sadness, whereby there is danger she should fall in Travail before her time; first a Vein must be opened in her Arm, especially if she be Plethorick, and a small quantity of Blood taken, that is, if her strength and Spirits permit; otherwise let her drink a Glass of Wine, &c. Secondly, Let the Spirits and Humours that are disturbed and tossed all the Body over, be allayed by Anodynes and Opiates administered prudently, sometimes Aromaticks, and sometimes Acidish Medicines being added according to the diversity of the Disease. Thirdly, If any other Disease, as Fluxes of the Belly, Vomit, &c. follow, let such Remedies be used as are proper for them.

Syl.

XV. A very thin Diet is not to be prescribed to Women with Child in Acute Diseases, lest the *Fetus* be defrauded of due nourishment; and yet we must not pass to that which is very thick, lest the Fever be increased thereby: Therefore we must keep a mean, and a thinner Diet is to be prescribed in the first months, and a thicker and somewhat more plentiful in the last months, for the necessity of the *Fetus*. If we err any way, 'tis safer to err in too full than in too spare a Diet; for health is to be expected from the strength of the Mother and *Fetus*.

XVI. I have more than once observed, that the use of Butter has been hurtful to Women with Child, as also to those who are subject to Fits of the Mother: wherefore I advise them to abstain from it.

P Borell.
obl. 26.
cent. 3.

XVII. Some disapprove of Exercise because it heats, dissolves the Spirits, raises a Fever, causes thirst, and procures abortion by precipitating the *Fetus*. But these things are to be understood of too much, or unseasonable Exercise; otherwise that which is moderate, discusses the Excrements that are collected by idleness; relieves the Faculties that are oppressed by the plenty of retained superfluities; diffuses the Blood and Spirits to the Members, whereby the whole Body becomes vigorous. But let it be omitted in the first month, because the *Fetus* is then contained but by weak bands: In the second let it be seldom and slow: In the third more brisk: In the fifth, sixth, and beginning of the seventh more frequent: In the later end of the seventh, the eighth, and to the middle of the ninth abate of it. Whether it may be granted when her full time is at hand, see the Title *Partus*.

XVIII. Women with Child that labour of a Pica or depraved Appetite, are not to have the same things prescribed them which are convenient for others; for neither Purgers, nor other Medicines that absterge violently are to be used, for fear of miscarriage. For seeing this symptom happens chiefly in the first months, it follows that we must proceed warily, especially seeing *Hippocrates* forbids purging about that time: And in the fourth month, about which time it would be safer to use Medicines, the Malady ceases of its own accord,

(* C c c c)

accord, the Matter being either spent by frequent Vomiting, or much alter'd by the concoctive faculty, (seeing such Women eat little because of the loathing that is joined with it) the stronger attraction of the *Fætus* helping, which through its growth draws and spends much Blood at that time. Therefore this Malady is no otherwise to be remedied but by a convenient Diet, ordered for attēperating of the offending Matter, by a slight absterſion, and gentle provocation to Vomit, namely, if Nature incline that way, not neglecting those things which may serve to strengthen the Stomach inwardly and outwardly. ¶ The *Pica* of Women with Child admits of neither Purging nor Vomiting, but only requires those things that Corroborate: the chief of which are the Water or Salt of Cinamon, and of Orange or Citron rinds, with the magistery of Corals and Perls. If the thing they long for cannot be got, that the *Fætus* may suffer no prejudice, presently give her to drink some of the Water of white Vine or Briony.

XIX. The Vomiting of corrupted Meat and of other Humours cannot hinder Bleeding, seeing it self is the Remedy of Vomiting. See before, *ſect. IV.*

XX. If *Nauſea* and Vomiting be very urgent, and be very afflictive to Women with Child, so that there be fear left some greater mischief supervene, *Opiats* and *Narcoticks* may be used, as both tempering the acrimony of the Humours, and also bridling their vicious Effervescence, likewise dulling all sense, and so powerfully restraining and staying over great and troublesome Vomiting; and by the help of these they are reduced to a convenient tranquillity, and their Stomach and small Gut are strengthened; by which means both other altering Remedies, and also even Aliments themselves may be taken with the better success: For indeed all these things are taken in vain while a violent loathing and vomiting continue, which is to be wholly allayed before either Aliments or gently altering Medicines can be retained.

Sylv. de le
Boe Prax.
l. 3. c. 6.

XXI. We must act cautiously and with premeditation in stopping of Vomiting; for we must not do that unless in case of evident necessity.

Fortis conf.

XXII. If a Flux of Blood happen to a Woman with Child that is hastening to the time of her Travail, by which she is much enfeebled, the mouth of the Womb is to be closed without delay, lest the ambient Air draw forth a greater quantity of Blood; and the Spirits that are spent are to be recruited, that she may be able to bear the pains of her Travail. Now her Travail is not to be promoted either by things taken in at the mouth, or by Clysters; for by these the flux of Blood would be increased: but 'tis necessary to pull forth the *Fætus* by force, putting your hand up into the Womb. The weakness of the neck of the Womb whose Ligaments are relaxed, favour this operation; so that the mouth thereof gapes as if often pains had preceded. Unless the Waters break forth of their own accord, the Membranes that contain the *Fætus* are to be gently burst by your Hand, and the *Fætus* being caught by the Legs must be pulled out. For in this case we must proceed no otherwise than if some House were on fire, in which case we break open the Doors if they be shut. There is only this way of safety both to the Woman and her Burthen, and the omission of it hath been destructive to many.

Obſetrix
Gallic. in
obſ.

XXIII. The Wife of N. thirty years old, in the beginning of her ninth Month received a slight blow on her Belly, and the next day moving her Arms strongly in making a Bed, there began a small flux of Blood from her Womb, which continued for two or three days, but ceased betwixt whiles: But on the twelfth day after, there flow'd out so great plenty of Blood, that in three or four hours time she was brought very low. First Bleeding her

in her Arm, astringent Clysters were order'd her, but the Flux continuing, and the Patient perceiving no motion of the *Fætus*, whence we thought it was dead, and that the Womb endeavouring to free it self of an unprofitable Burthen, contracted it self continually and expelled the Blood, but yet that it did not perform that motion so strongly as was necessary for the Birth; we judg'd it necessary to use all art for provoking the Birth, that the immoderate profusion of Blood might be stanch'd, which otherwise was like to bring the poor Woman to her end. Wherefore a Clyster was ordered of the Emollient decoction with *Catholicon* and *Diaphanicon* of each six drachms, of the Oil of Lilies three ounces, with a drachm of Salt, with which she was well purged, and presently after she had parted with it, the Flux of Blood was much lessened; which may seem strange, seeing such Clysters are likelier to increase the Flux: But I think this happened from hence, that the Womb was pressed by Excrements contained in the straight Gut, from which oppression so soon as it was freed, it begun to collect it self, and to restrain that preposterous motion, that it might betake it self to a more natural. But seeing after the Clyster was parted with, the Womb attempted nothing, but the Efflux of Blood still continued, and it was evident the *Fætus* was dead, to exclude it there was given a drachm of the salt of Vitriol in four ounces of Bugloss Water, which seemed proper in two respects, First, Because by raising a Vomit the Womb was also irritated to exclusion, because in Vomiting all the parts of the *Abdomen* do violently contract themselves: Secondly, Because the salt of Vitriol is endued with a very great astringent virtue, whereby it may conduce to the stanching of Blood. She Vomited twice pretty sorely, and cast up much Bilious, Phlegmatick, and Serous Stuff, and a little after her Travailing Pains came on, which having continued for four or five hours, this Potion was given to further the Birth: Take of *Dittany of Crete*, both Birthworts, and the Troches of Myrrhe, of each half a scruple, of Saffron and Cinamon of each twelve grains, of Confectio Alkermes half a drachm, of Cinamon Water half an ounce, of Orange Flower Water and Mugwort Water of each an ounce and half. Upon the taking of this within a quarter of an hour with very strong and twice or thrice repeated strainings she excluded the *Fætus*, whose Skin beginning to putrefy seem'd torn in divers places. A little while after she excluded the Secundines also halfe-rotten, her *Lochia* flowing moderately after that.

Riv. cent. 3.
obſ. 24.

XXIV. There is great difficulty about the use of *Astringents*, and on that account the Cure is very difficult: for if we retain the Blood by things that astringe, then we run into more cruel symptoms, because the clodded Blood being retained, breeds six hundred times more grievous symptoms, according to 6. *aph. 20.* For as much as Blood in the Vessels is friendly to Nature, so much injurious does it become afterwards when extravasated, for it becomes like Poison. How must we proceed therefore? I answer, That all Internal Remedies ought to be astringent, and the External, especially about the region of the Belly and Womb, by no means astringent; for by that means they should be destroyed languishing, especially, when they void clodded Blood: yet Astringents may be applied to the Reins.

The After-pains ought to be allayed. XI.
They cannot be cured unless the cause be known. XII.

I. Authors disagree much about Venesection in the Acute Diseases of Childbed Women; there are scarce two to be found that agree in the same opinion: Omitting Circumlocutions I shall in the following Theorems propound here that opinion which comes nearer the mind of the wiser Physicians, and succeeds the more happily in practice. An Acute Disease invades a Childbed Woman either in the beginning, or in the middle, or in the end of her lying in. If it happen in the beginning, and the Woman be plentifully purged, no other Evacuation of Blood is to be attempted than that which is directed by Nature working rightly and conveniently: But if her Purgations be suppressed or diminished, let the lower Veins be opened, and let Blood freely, because then the Evacuation ought to be large according to the precept of Nature. If an Acute Disease happen in the middle time, two things are to be considered; One, whether the Morbifick Matter be contained and rivetted in one particular part; or be dis-

persed through the Veins; the other, whether the Woman have had sufficient Purgation, or no. If the Disease be caused by a dispersed Matter, as in Fevers, and the Woman be not perfectly cleansed, the lower Veins are to be opened, because both the Morbifick Matter will be lessened, and the natural Flux provoked: But if she be sufficiently purged, and the Disease be strong, and the natural Evacuation be not sufficient for the Disease, the lower Veins are likewise to be opened in this case, and so much Blood is to be taken as may make both Evacuations amount to as much as the Disease requires, as Galen teacheth 9. meth. 5. If the Fever be very high, and there be a great burning, let that be done which we shall by and by advise to be done in a Disease from Matter fixed and putrefying in some particular place. In a particular Acute Disease, as a Pleurisy, Peripneumony, Quinsy, &c. we must note whether the Fluxion be only a beginning, so that the Disease is only imminent or beginning, and but a very small quantity of Blood is as yet collected in the part: For then the lower Veins are to be opened, that Revulsion being made to the most distant opposite parts, that preposterous motion of the Humours may be restrained: But if the Fluxion be already made, and the Inflammation bred in a great part, and the Inflammation be very high, whether the Woman be sufficiently cleansed or no, the upper Veins are presently to be opened on the same side with the part affected, because such Evacuation draws Blood out from the said part: But if the lower Veins should be opened, which are neither near to the part affected, nor can draw from it, both the Faculty will be injured by the Evacuation, and the Matter that is fixed in a particular part will not be diminished: And so you shall either draw forth almost all the Blood to reveal the Morbifick Matter from the part affected; or the Woman shall be killed by the Disease, before sufficient Revulsion be made. Nor must we fear lest by letting Blood in the upper Veins the Blood should be drawn back from the Womb, because in those cases the upper parts abound with Blood: and though much be evacuated, yet the Veins are not so emptied as to be compelled to attract new Blood from some other place. Yet for the greater caution it will not be unprofitable before Blood be let, to make Frictions in the Thighs, and then to make painful Ligatures in their middle, which must be kept tied till Blood be let, and loosed a little while after: and after that apply Cupping-Glasses to the same parts, or at least repeat the Frictions: hereby we may procure an Evacuation of the offending Matter, and a Conservation of the Natural Flux. The same is to be done in burning and violent Fevers, because though the Matter be dispersed, yet the burning is only about the Heart and Viscera, so that it cannot be extinguished so well by the opening of a small and remote Vein, as of a near and large one, such as the Basilica of the Arm is. This method of Cure is not only fitted to Childbed Women, but may be adapted also to other Women taken with an Acute Disease, and having their monthly Purgations. If the Disease happen in the end of Childbed, the same is to be done as in the middle, the same Conditions being observed: this being noted, that the more the Woman is distant from the beginning, the safer may the upper Veins be opened: but the nearer she is thereto, even in the middle time, we must do it with the greater premeditation; and if the Disease be not urgent, and her Natural Purgation be plentiful, let us abstain wholly: But if the Purgation be too little, we ought to open the lower Veins to make up the due quantity: And if the contrary shall happen, let that be observed which we said was to be done in an urgent Acute Disease.

 ex Petr. Sal.
 Diversi de
 affectu part.
 c. 23.

II. The

II. The use of Purgation in Childbed Women taken with an Acute Disease shall be concluded in the following Theorems. While the *Lochia* flow naturally, Purgation is never to be administered, for there is danger lest Nature should be diverted from her work: But if her Natural Purgations become preternatural and disorderly, we must consider whether they offend in quality or quantity. If they offend in quantity, and that too little, and the Woman be either not at all, or not sufficiently purged; after that all Remedies that are proper for promoting this sort of Purgations have been used in vain, and the Morbifick Matter appear concocted, eight, ten, or twelve days being past from her delivery, according to the greater or lesser urgency of the Disease, she may be purged with some gentle Medicin, wholly abstaining from the more violent. If the *Lochia* offend in quality, so that the Fluxion look white, or be of some other preternatural colour, the Matter being concocted, Purgation shall be administered safely towards the later end of their lying in. But this is always to be observed in general, the longer the Childbed Woman is distant from the time of her delivery, the safer may a Purge be administered; and on the contrary. For Experience has taught, that Women who have their Purgations suppressed, if after the seventh or ninth day they fall into a looseness, are generally recovered: But if a *Diarrhoea* happen on the first days, viz. the first, second, or fourth, they generally dye.

River.

III. In a Fever following the suppression of the *Lochia*, let cooling *Alteratives* be given, let Women prattle what they will; which yet must neither be acid nor altringent: The Whey of Asses Milk, the Juice of Endive or Succory Clarified, the distilled Waters of Endive, Succory, Borage, Maiden-hair.

Fortis, tract. de morb. mul. p. m. 106.

IV. *Rondeletius* taught, that the Powder of the dried Secundine being drunk in a convenient Liquor did presently allay the *After-pains*: And because Brutes use to devour it, they are therefore free from those pains, as he knew by Experience in his little Bitch, from which having taken away the Secundine, he said, he observed that these pains did also supervene.

Placrus, tract. rom. 2. p. m. 524.

V. A certain Childbed Woman exposing her self to the Winds and Air too unseasonably, fell into intolerable pains, and could not be recovered: At length there came an old Midwife, who called for three Nutmegs grossly bruised; then she set an Earthen Pot under the sick Woman with live Coals in it, and presently sprinkled the Powder of the Nutmegs thereon, bidding the Woman so place the Pot that was set under her, that she might receive into her Womb the smoak or nidour of the Powder through a Funnel whose straiter end was to reach to the Genital parts: At the same moment of time she also received the same smoak in at her Nose and Mouth from another Pot; which having penetrated, the Woman presently cries out, I must needs go to Stool: which she had hardly spoken, but there was heard such a hissing, as when Gun-Powder contained in some narrow Case or Squib is set on fire: which Wind having thus burst forth, forthwith in the very moment the Woman was freed from her pain. Being thus informed by Experience I have sometimes since then in the like case found the same Remedy profitable and beneficial.

Solenander, sect. 5. conf. 15. 166. 29.

VI. My dear Wife, *Johanna Spanhemia*, being always cruelly griped after her delivery, which Gripes no art could allay, although all things which use to be propounded were tried; at length in the month of May 1675. being happily brought to Bed of a Boy, and but just laid down in her Bed, being very thirsty after the pains of her Travail, she extorted from her Nurse a draught of very cold Pusian, when her Gripes were just a

coming, which were wholly repressed by this Remedy without any prejudice. I had lately the opportunity to try the same, with good success, in a Cholerick Woman, the Wife of a Clock-maker whose name was *Morellus*, her Purgations flowing very well afterward. Whether was the Orgasm of the Blood by this means appeased, which was making an hasty exit, and distending the Vessel, being turgent in them, or irritating them by its acrimony? Such a Drink may be very profitable in the Cholerick, by tempering the heat of the Blood.

VII. Those do amiss who give Childbed Women potch'd Eggs betimes in the morning and before Meals; for seeing *Hippocrates* (1. de morb. mul. sect. 2. vers. 156.) approves of them when the Purgations flow immoderately, it is an evident argument that they have a vertue to stop them, so that by their use the Purgations may be stopp'd when they flow as they should do, than which nothing can be imagined more hurtful.

Martianus.

VIII. Old and racy Wine is not safe for Childbed Women at the beginning, because the Pains of Travail are follow'd by a great Perturbation of the Humours in the Body, which might be carried up into the Head by the drinking of Wine: 'Tis also suspected lest some harm might accrew from it to the parts which belong to the Womb, or are adjoining, from whence an inward Inflammation might arise.

Idem.

IX. From the weakness of the Muscles of the Abdomen (which contribute much to the expulsion of the Excrements) Childbed Women are very subject to be *Costive*; and not only from their continual keeping their Bed, as is vulgarly supposed: For from the preceding Travail the Muscles of the Abdomen are as yet weak: In which case Looseners are given in vain, from the too great use whereof the Coats of the Stomach become too slippery, whence concoction is injur'd. Something of Turpentine, or Aloes or Rhubarb are more convenient for these, which both stimulate the Belly, and have a friendly Symplicity.

Hoefer. Herc. med. 1. 3. c. 5.

X. Cautious Women that attend upon Women in Travail, will not permit them to sleep presently after they are deliver'd, lest whilst they sleep, too much Blood should flow out without notice.

Idem, 1. 7. c. 5.

XI. Those Physicians are deceived that following the Opinion of some Womes, think that Womes *After-pains* are therefore profitable, because the flowing of the *Lochia* is promoted thereby; the contrary whereto often happens, seeing sometimes they do not flow, though these pains be never so violent. Add hereto that many Women have no such pains, and yet nevertheless their *Lochia* flow, and that indeed far better than when those pains are urgent.

Those are likewise deceived that follow Women in an Opinion, that these pains do seldom or never follow upon a Womes delivery of her first Child, but only upon the second; and that they become greater and greater every time a Woman lies in: For daily Experience shews the falsity hereof, at least in these Countreys, where yet many are possess'd with this opinion, which is not only erroneous, but also hurtful, especially the former, because by this means the Cure of these pains is neglected and hindered by many esteeming them to be profitable, though the neglect of them have so often been the cause of death to many Childbed Women.

Sylv. prax. 1. 3. c. 9. sect. 2. & 4.

XII. Wherefore it is of concern to know the true cause of the said Pains. Seeing they follow upon the delivery, the most frequent cause thereof is deservedly to be derived from those things which use to happen to Child-bearing Women in the time of their Travail. Now there are two things which are the most observable, the exclusion of the Fœtus, and the separating of the Secundines from

from the Womb, and their exit out of it. In the exclusion of the *Fetus*, that is, in the very delivery, 'tis sufficiently known that pains are caused, but such as grow less afterwards and vanish by little and little. But the After-pains we are speaking of are quite of another nature, beginning a ter the delivery is over. As to the separation of the *Secundines* from the Womb, as also their exit out of it, Women are sometimes wont to be pained anew thereby, because they are often knit pretty straitly and firmly to the Womb, and grow so to it, that they can hardly or not at all be separated therefrom without the tearing either of themselves or of the Womb. Now none is ignorant how acute pains are felt in excoriated and torn parts, especially as oft as any Liquor, and chiefly that which is acrimonious and biting, approaches them: Whence it is no wonder if after the strait connexion of the *Secundines* with the Womb, and the violent pulling off of the same, and so Excoriation of the Womb, and the afflux and efflux of the *Lochia*, great pains be caused there. But it is to be noted that those pains chiefly afflict Women both that are delicate and of an exquisite sense, and have their *Secundines* also straitly knit to the Womb, not to be separated therefrom without violence. We must observe moreover, if the Cure of these pains be neglected, that every time a Woman is brought to Bed they are sorer and sorer; which perhaps has given rise to that Erroneous Opinion concerning these Pains, which was mention'd above. Lastly we must observe, that Women with Child do either hasten, or are hastened too much to their delivery; so that before the *Fetus* is come to its full maturity, and the *Secundines* prepared for an easy separation from the Womb, the Birth is precipitated, whence both the *Fetus* is expelled with difficulty, and the *Secundines* separate from the Womb, and pass out of it with the like difficulty. Add hereto, that in these Countreys many Women with Child do too much indulge themselves in the use of Aliments that are of too thick and glutinous a substance, from which alike Blood being produced knits the *Secundines* straiter to the Womb; whence seeing the Blood grows more and more glutinous, 'tis no wonder that the *Secundines* should stick closer to the Womb every Labour than other. Therefore the primary cause of the pains after delivery, is the too strait connexion of the *Secundines* to the Womb, and thence the tearing of them from the Womb, and so the Excoriation of the Womb: But a second cause, and which joins it self to the former, is the Blood of the *Lochia* flowing through the torn and excoriated parts of the Womb, and biting and gnawing of them. And though all Blood, whilst it moistens the excoriated and torn parts of the Womb, causes pain in them; yet the same pain is not a little increased when the Blood is more acrimonious than usual from any cause, either through an acrimonious serum mixt with it, becoming so by the Bloods stagnating every where, and therefore also in the Vessels and Sinous Cavens of the Womb. Other causes may also contribute, as cold taken in the time of Labour, which stops the *Lochia* in part or wholly; whence the same Blood being made more acrimonious by its stay, causes a pain in the Womb, whether there succeed an Inflammation, or only the Serum flow forth, and that little and sharp, biting and gnawing violently the inner parts of the Womb. Cruel pains are likewise caused by *Flatus*, distending both the Womb it self, and also the thick Guts that border upon it. Moreover as a Fever is oft raised from violent pains in the Womb indisposed through hard Labour, or by an Inflammation thereof; so every Fever produces pains in the Womb, that is, when it is first indisposed; the which we see to happen in any other part.

The Physician may guess at the true causes of *After-pains* (besides other things) from the manner of the pain; for if they be rending, and return and afflict more grievously by Intervals, he shall judge them to arise from acidity and salines abounding in the Blood and carried to the Womb: If they be beating and burning, he shall suppose that the Blood stays and stagnates in the Womb, and that it inclines to an Inflammation, or is already inflamed: If they be distending, and the lower part of the *Abdomen* shall be observed to be stretched, he shall guess that the pains are produced from Wind. So when the *Lochia* have been before the pains, 'tis probable that these spring from the suppression of those, at least partly: When they flow too plentifully, he shall guess that the Vessels or large Orifices of the Womb are torn, especially if the *Secundines* were separated therefrom with difficulty. If the Belly be bound and there be rumblings in it, suspect *Flatus*: When it is loose, and especially when the Patient has many Stools with griping, 'tis probable the Pains have their rise from Acrimonious Humours that are carried not only to the Guts, but also to the Womb, as also if the privy be withal eroded and excoriated.

Wherefore as oft as the *After-pains* have their rise from the tearing and excoriation of the Womb through the violent expulsion of the *Secundines*, so often are such Medicins to be used as lenify, and consolidate the Excoriation, for which purpose all that are called *Vulneraries* are deservedly commended, amongst which when there is withal an over large flux of the *Lochia*, those that are somewhat astringent are to be chosen; to which both Anodynes and Narcoticks will be profitably joined, by the help whereof the vertue of the foregoing is not a little increased, and the pain allayed. If the Blood of the *Lochia* be more *serous* and sharp, let it be tempered with Anodynes which are to be used chiefly in the form of Emulsions, adding sometimes *Opium*, or *Laudanum Opiste*; after which, if the strength can bear it, give a gentle Hydragogue, and after that a Sudorifick made of such things as astringe gently, as *Avens*, *Tormentil*, &c. When the same Blood is rendered more acrimonious by its stay, then, because the acrimony which is then produced is acid, things that temper the said acrimony are to be used, but so as that they increase not the afflux of Blood, whence amongst *aromata* or Spices those are to be chosen which are least acrimonious, but are most kindly, and withal gently binding. If the *Lochia* be suppressed from taking cold, and the foresaid pains proceed from hence, those Medicins are to be used which cure the suppression of the *Lochia*: If notwithstanding that the *Lochia* flow, yet these pains be produced, then Sudorificks will be profitable, such as are not very Aromatick nor much astringent, lest the Flux be either increased too much, or stoppt, adding Opiats that ease the pain and increase the vertue of the Sudorificks: If an Inflammation of the Womb be begun from a suppression of the *Lochia*, it is to be cured by both inward and outward Remedies.

I. **A**mongst External Remedies expelling the Secundines, Hippocrates gives the chief place to Sternutatories, 1. 2. Epid. sect. 2. and aph. 5. 49. Galen gives the reason aph. 5. 35. that by their vehement shaking and tossing they partly excite Nature, and partly shake off such things as closely adhere to the parts of the Body: Namely when the Brain is violently moved, all the Viscera are shaken as well as it, and the Muscles of the Belly are contracted, which contribute notably both to the expulsion of the Fetus, and also of the Secundines. Yet here is need of caution; let Medicines precede that are taken by the Mouth, as Hearnus advises, 1. 1. Meth. and Aetius bids us abstain from them if the Patient be weak. ¶ My Wife from an outward violence miscarried of an Embryo of six weeks, an Inch long, that had all its Members shaped, so as that its Genitals and the Roots of the Hairs of the Head might be discerned, the Secundine staying behind: The mouth of the Womb being shut, did not admit the Midwives Hand: Amongst other Remedies I blew up into her Nose the Powder of the Flowers of the Lilies of the Valley; when she was about to sneeze I presently held her Nose and shut her Mouth, and her Breath bursting forth violently, the Secundines were expelled, and so my Wife was deliver'd from imminent danger of her Life.

II. Those offend who endeavour to bring down the Secundines by rude and strong Frictions with their Hand: They only by this means excoriate the Skin and so increase the Pains and Torments, whence there follow afterwards Watchings, Fevers, and other evils. Let it suffice to lay the Hand only strongly upon the Belly, especially when the Woman feels pains about the Pecten or bottom of the Belly, as Rod. a Castro advises, and stroak your Hands gently from the sides towards the middle of her Belly, as it were with a trembling Friction, as Borgefia admonishes, c. 14. obs. Gal.

III. N. Myrespus causes Vomiting with Soap, a raw Egg, and warm Water: Borgefia, obs. c. 14. causes Vomiting by putting the Finger down the Throat: As for my self, I suspect whether Vomiting be good, because it hinders the endeavour

or straining of the Childbed Woman, and pulls the Womb with the Stomach upward: Unless we think with Gardonius (p. 7. c. 17.) that the expulsive Faculties of the lower parts is excited thereby, which being stirred up expels hurtful things: I add that the Secundines are stirred thereby, and are then more easily expelled out of the Womb.

Idem.

IV. 'Tis doubtful whether or no we should stay a good while before we cut the Navel-string in two: For on the one side there is fear of a violent retention of the Secundines from an unseasonable cutting of the Navel-string; and on the other, if it be too long deferred, the Fetus will be in danger, or will become sickly. I say, If the Woman be nothing benefited by the Remedies taken within twenty four hours space, the Navel-string ought to be cut, and we must tie that part of it that still is joined to the Secundines, to the Womans Thigh very strongly, lest it retire to within the Cavity of the Womb. I deny not but an hasty cutting in two of the Navel-string is sometimes necessary, namely when the Umbilical Vessels are filled with a clammy Mucus or Phlegm, because these indicate the Fetus to be sickly. ¶ Rod. a Castro, 1. 4. c. 7. defers not the cutting of the Navel-string above six hours. No necessity compels us to stay so long, because the Midwife taking hold of the Navel-string after it is cut, may better draw away the Secundines with her Hand, than the weight of the Child could do while the string was whole. For when the Navel-string is cut in two, both the Midwife may more conveniently search for the Secundines, and the Fetus it self is kept more safely, and defended from External Injuries.

Zacut. Pr. hist. 1. 3. c. 19.

V. In all extraction lest some errour be committed and we fail of our desire, these necessary Cautions are to be noted: 1. We must take care not to pull directly, lest we bring forth the Womb also; but the Secundine is to be drawn this way and that way obliquely, and more and more strongly by degrees. 2. We must act with a gentle Hand, not with violence or on the sudden, for fear of Inflammation, lest the Soul and the Secundine be drawn out together. Let that Childbed Woman affright us, whom Foresius speaks of, 1. 28. obs. 80. who when the too bold Midwife did hastily pull out the Secundine, the Woman falling into a swoon died presently. 3. See that the mouth of the Bladder and the Membranes of the Womb be not hurt with your Nails.

Barthol. ubi supra.

VI. Sometimes Nature uses to help, who when the After-birth is left behind, expels it either presently whole, or afterwards when it is consumed with putrefaction. On the third day it was evacuated by a Woman of Larissa, on the same hour of the night in which the Child had been born, 5. Epid. hist. 13. A certain Woman, as Riverius relates, cent. 2. obs. 3. after ten weeks expelled by piecemeal the Secundine now parched. It is Hippocrates's opinion (1. de morb. mul.) that the Secundines do for the most part putrefy, yet pass out on the sixth or seventh day, or also later. This Opinion is abetted by Aetius, retr. 4. f. 4. c. 24. Agineta 1. 6. c. 73. If the Secundine cannot be brought forth, we ought not to be disturbed, for after a few days it will come out putrefied and dissolved into Sanies. Zecchi gives the same Counsel, consult. 68. But sometimes that hope is deceitful, and 'tis an uncertain Remedy to commit the business to Nature, when it comes not out presently after the Fetus: Delay is dangerous, nor can we promise to our selves that every ones strength will hold out, or assure our selves of the certainty of the desired success. Mercatus, 1. 4. c. 4. Rondeletius, c. 65. advise it to be done warily, and to inject betwixt whiles such things as detergo. L. a Fonte, consult. 118. alledges daily Expe-

Eiol. Buchi 1. 6. c. 36.

Experience, that the retention of the Secundines does daily produce the most grievous symptoms in Childbed Women, so that the greatest part of them die on the fourth day. Therefore it is dangerous to expect Suppuration, seeing 'tis doubtful what Nature will be able to do, and the symptoms are uncertain. By what happens when but a piece of the Secundine is left behind, we may make a bad prognostick of what will come to pass when none of it is brought forth; for Nature does not overcome even a piece without difficulty. There is oft no Suppuration, but death ensues upon the retention. ¶ Great Caution is to be observed in the use of Suppuraters, for the Secundine putrefying causes very grievous symptoms, Fevers, and those Malignant, whereupon death ensues; and 'tis better to promote the Excretion thereof by all the means we can, than to expect Suppuration: for even therefore is the staying of the Secundine dangerous, because it putrefies and suppurates. *Salus* relates that he saw a Secundine expelled putrefied, and yet the Woman was no better; which was a sign that there was a Putrefaction grown, that ceased not when the Secundine was expelled. But if there be no grievous symptom, and the Woman be weak, we must expect Suppuration even whether we will or no; but we ought never to promote it, lest Putrefaction increase.

Idem, ibid.

Primros.
de morb.
mul. l. 4.
c. 9.

VII. If we make question of the order of Remedies, by a great consent of Authors, the *Manual Operation* recommends it self first of all, next *Medicines*, and lastly *Suppuration*. *Fabr. Hildanus* prefers *Manual Operation* before Medicines on a double account, 1. because they ought to be deduced into act by the benefit of Nature, which being weakened by the preceding pains, before she can acquire new strength with time, the door of the Womb is shut, and the Secundine putrefies, and by its Putrefaction infects and corrupts the adjacent parts, and dejects the strength more and more: 2. because most expelling Medicines are hot, and do above measure heat the inner parts, whence follow a Fever, inquietudes, watchings, and other symptoms, and for the most part death it self. And the Operation (extraction) is to be hastened, if it be either Summer, or the Putrefaction acquire a Malignity; for the Women appear to be ready to dye when Putrid Vapours ascend to the Vitals, Stomach and Brain.

Idem.

VIII. *D. Animus* left for a Secret a Plaster to be applied to the Belly, of the white of an Egg and red Lead: which because it binds much, may well be question'd whether it do not rather detain the Secundines within. But because it constringes the Muscles of the Belly, which through the extension of the Womb and the straining in Travail were before debilitated, 'tis therefore credible such a Plaster may help: for these Muscles being constringed and contracted into themselves, by pressing the Womb from above downwards they make it more apt to expel the Secundines: even as the action of the same Muscles is not a little necessary for the expulsion of the Excrements of the Belly.

Hoeserus,
l. 7. c. 5.

IX. Seeing Medicines that expel the Secundines do also increase the Flux of the *Lochia*; hence Physicians are put into a quandary: wherefore *Rondeletius*, cap. 63. advises to give a drachm of *Carabe*, for it provokes Urine, expels the Secundines, and retains the flowing Blood: The same is confirmed by *Platerus*, *pract. l. 2. p. 449*.

Riol. Enchir.
l. 2. c. 36.

X. If all the *Placenta* be not extracted, it is in no wise deadly: and the place where it was pluckt off by force, does a while appear tumid, rough, and unequal, till all the Womb be drained again and reduced to its Natural Figure: all which things are to be diligently marked, especially in Childbed Women that are ill.

XI. I have observed the following Apozem taken to three ounces twice or thrice a day, to pro-

fit and recover the Patient when part of the *Placenta* has remained in the Womb after an Abortion, and has been accompanied with a continual Efflux of Blood for some months. Take of the Roots of *Bistort* two drachms, of the Leaves of *Majoran*, *Pennyroyal*, of each an handful, boil them in Water and White Wine of each as much as is sufficient for thirty ounces of strained Liquor, to which add three ounces of the Syrup of *Mugwort*, and one ounce of *Cinnamon Water*. I have seen a piece of the *Placenta* as big as ones Fist expelled by the help hereof, and the further Flux of the Blood was withal suppressed and cured.

Fr. Sylvius.

XII. *Job. Th. Schenkius* in his Botanic Lectures did once relate how a certain Countess had her *Secundine* stay three weeks after her delivery, without any notable prejudice: And then by the persuasion of an old Woman she took a decoction of Roman Chervil, and was soon eased of that burthen. And indeed I hardly know any Herb of like availableness in hard Travail and the stoppage of the Secundine, as Chervil and the greater *Sempervivum* (or House-leek:) and I know that every one who makes trial thereof rightly, will say the same.

Al. Herm.
com. milt.
cur. ann. 72.
obl. 117.

XIII. Concerning sleep we must note, that it is wholly to be kept off when the *Lochia* flow very plentifully: for by it many lose their Lives, because the heat being drawn inwards makes the Flux the greater: And if it be to be allowed at any time, some of those who attend ought to be ever and anon observing the Pulse and Respiration of the Patient.

River. Pract.
l. 15. c. 21.

XIV. After the Birth the capacity and thickness of the Womb are lessened by degrees by the effusion of the *Lochia*, which are nothing else but the expression of the Blood that is contained within the spongy Membranes of the Womb. But if that amplitude be not lessened, nor the Blood evacuated, it will then putrefy and inflame; the Womb will remain extended and hard as if it contained the *Fetus* still, and at length a deadly Gangrene ensues. Whether is this amplitude and hardness to be cured by Bleeding in the Arm, or in the Foot? *Fernelius* does boldly draw Blood out of the Arm; *Pereda* advises us to consider not whence the Blood flows, but into what part it hath flow'd, and bids us open the nearest Vein. 'Tis more profitable and secure to let Blood largely in the Foot accordingly as the strength can bear, not neglecting cooling Clysters, and other things that may irritate the Womb to excretion.

c. 36.

XV. When the *Lochia* either flow not at all, or they come to be suppressed by some External cold, they shall be cured by giving presently Medicines that dissolve Phlegm or Blood coagulated in the Orifice of the Womb; such as are all Aromatics, and those which are endued with a Volatil salt, chiefly those called Uterines, which are found to profit by long and manifold Experience: and if they be withal sudorifick, they will do more, and will the sooner and better take away that difficult and dangerous Disease. But when through the defect of the Flux of the *Lochia* a Fever is raised, which uses to be continual, and is often burning enough, we must take diligent heed not to increase the Febrile heat by those Aromatics; and therefore to these Portions Acids are to be added, distilled Vinegar, the Spirit of Salt, of Vitriol, &c. For observing this Temperament, we satisfy both Indications, seeing Acids are profitable for the Febrile heat, and the same as well as the Aromatics are good for dissolving the coagulated Phlegm; especially when there are added Crabs Eyes, *Antimon. Diaphoret.* and the like, which then may dissolve the Coagulated Blood also.

Sylv.

XVI. When the eruption of the *Lochia* is too large from the surface of the Womb being hurt by a violent pulling off of the Secundines, it shall be

cured.

cured by those things which heal Excoriation, and restrain the Efflux of Blood: As for Example, Take of Plantain Water half a pound, of the An-repilectick of Amsterdam, and Distilled Vinegar, of each half an ounce, of Lapis hamatites half a scruple, of red Coral one scruple, of Laudanum Opiate two grains, of the Syrup of Myrtles one ounce, mix them; give now and then a Spoonful of it, and by the help hereof both the Flux will be stayed and the Excoriation healed. Nor are Internals only convenient here, but Externals also, Ointments, &c. which have a lenient vertue because of the pains that arise from the Excoriation, and consolidate also, being anointed upon the lower part of the Abdomen, and sometimes also on the region of the Loins. With which Medicines, as well Internal as External, Opiats are profitably mixed, as not a little increasing their vertue, whence the ulcerated parts of the Womb are then the more happily and sooner consolidated, and the Flux stayed with better success.

Idem.

XVII. A Woman being eight months gone with Child was taken with a continual Fever: on the third day she miscarried, and after her delivery her Lochia were quite stopt, purple Spots appeared all over her Body, and her Fever was high. I prescribed Bleeding in the Ankle, cold opening Julaps, Frictions of the lower parts, Fomentations and a relaxing Liniment to the Pubes and Perinaeum; but all in vain, for towards the end of the second day after the Abortion, the Fever grew worse with raving, and by the changing of her Countenance she seem'd in danger of her Life. Then I order'd a Vein to be open'd in her Arm, and there came forth a corrupt Blood to ten ounces: I repeated Bleeding after four hours, and order'd her very cooling Julaps, of the decoction of Lettuce, Purslain, Sorrel, with Sal Prunella; she had also a cooling and Emollient Clyster; the next day her Fever was very small, her Lochia begun to flow, and in a few days she recover'd without other Remedies.

River. cent.
1. obl. 80.

XVIII. Some naturally have a larger, others a more sparing Flux of the Lochia; whence you may observe them to flow in some but for two, three, or four days, in others for eight, ten, or more; and that sometimes in a considerable quantity, and sometimes but in a small, whether that more plentiful or more spare Flux continue longer, or cease sooner: which is diligently to be observed by Physicians, that they be not presently disturbed at the Lochia their flowing more or less plentifully, nor endeavour either to stop or promote them without necessity. Now those Women who have their Terms or Monthly Purgations flow plentifully, have their Lochia or Childbed Purgations flow so also; and on the contrary. Wherefore as often as Physicians are called to Women in Childbed, and especially presently after their delivery, and become solicitous about the Flux of the Lochia; so often must they enquire concerning the manner and quantity of the Monthly Fluxion, whereby they may guess whether the Flux of the Lochia be to be thought natural, or more or less swerving therefrom. But that that may more appear, the Physician must enquire, whether the Woman endure any trouble or uneasiness; if she endure none, he has no reason to endeavour rashly to change the Flux of the Lochia what such soever it be: but if she do, he must see whether it may and ought to be attributed to a too plentiful, or too sparing a Flux of them: for she should in vain be toiled with altering the Flux of her Lochia (be it what such it will) when she suffers no detriment by it. Therefore from the two mentioned signs shall the prudent Physician guess whether the Flux of the Lochia (what such soever it be) be according to, or against Nature.

Fr. Syle.
Prax. 1. 3.
c. 10.

XIX. But the Flux of the Lochia is not then to be said to be suppress'd, or to be none at all, when the Blood flow'd forth plentifully during the Travail, and that is the reason why there flows little or none afterwards; because that which according to Nature should have flown forth only after the Birth, flow'd forth preternaturally during the Travail. Whence if no Flux of the Lochia be observed to follow the Birth, unless the Woman suffer some detriment thereby, their Expulsion is not to be endeavour'd by any Remedy, but the strength of the Woman is to be increased by

Idem, ibid.
sect. 14. &
32.

XX. But if besides the Efflux of Blood during Travail, the Woman took Cold in at her Womb, and there be fear lest she should suffer some mischief thereby, we must see to give her in time some Aromatick Sudorifick, by the help whereof that hurtful Cold may be expelled forth, and a greater mischief may be prevented. A pain and swelling in the Hypogastrium doth further urge the same thing, for this argues the Womb to be amiss: In which case, besides the Sudorifick, 'will be good to anoint the lowest part of the Belly with a Liniment, and if the Belly be costive, to inject a Carminative and Emollient Clyster. In this case no letting of Blood is requisite, unless there concur or succeed a pretty high Fever, which yields not to other Remedies, but is troublesome by its great heat.

Pulmonum Vomica, or an Imposthume of the Lungs.

The Contents.

The Curatory Method of a burst Tubercle or Imposthume. I.
An Instance of a successful Cure. II.

I. IF after the bursting of a Vomica (whereof a Man dies for the most part, though I have known several that from a Vomica bred insensibly, ripened, and at last burst, have caught up a great deal of sinking Pus; and when they have continued to spit such Matter daily for many weeks, yea months, have at length been entirely recover'd by the help of such Medicines as cleansed and dried up the Ulcer, and were proper for the Consumptive) and the spitting of Pus begun without declination of the Spirits and Strength, there be place given to any Curatory Method; The Curatory Indication will be, that the Matter of the Abscess be speedily spit up, and its sides cleansed, and consolidated as much as possible: the Preservatory, to prevent the conflux of new Matter to that nest, or other bordering places of the Lungs (whence a Phthisis might be generated:) And the Vital, to cure the Languishings of the Spirits and the collapsed Strength, and to restore frustrated Nutrition. For the first Indication, the Remedies commonly call'd Expectorating, are good, viz. such of them as being hotter and rougher will cleanse and dry more, and especially the Sulphureous, seeing a Fever is for the most part wanting in this case. 2. The Preservatory Indication, that cuts off the Morbifick Matter, endeavours the depuration of the Blood, and the strengthening of the Lungs; for which ends, Purgers, Vulnerary Decoctions, Distilled Waters, and Diet-drinks are proper. 3. The Vital Indication prescribes Cordial Remedies, Anodynes, and a fit manner of Diet. The forms of Medicines are almost the same in this case as for an Empyema after Section: and let the same Diet be ordered

ordered as in a beginning Phtisis. Asses Milk is not profitable also in this case.

Concerning the Cure of this Disease I have often observed that an Issue made in the Side has greatly profited. I remember two ill of this Disease, who after the Vomica of their Lungs was burst and they had cough'd up a great deal of Pus, were cured in a little time by this Remedy. In both out of the hole made in the Skin by Section, there flow'd in three or four days time pure Pus, and from that time their spitting such Matter diminished: And after that Efflux increasing daily had continued for some time, the spitting ceased wholly, and the Patients grew quite well.

II. A Gentleman of a middle Age, that was robust before and always healthful, without any manifest cause grew to be betwixt well and ill as it were; for being without Pain, Vomiting, or Cough (at least that was any thing considerable) he became in a little time languid, without appetite, un inclinable to sleep, thirsty, and hot about his Heart. After that divers methods of Cure had been tried in vain, the Disease shewed it self at length; for whilst one night being more restless than usual he turned himself strongly in his Bed, an Abscess breaking of a sudden in his Lungs, he expelled by Cough a vast quantity of very stinking Pus. The Vomica being burst, such Medicines were diligently given as might cleanse and heal the Abscess, might purify the Blood and clear the Lungs, and deliver them from an imminent Tabes; as my *TinBura* and *Spiritus Diasulphuris*, together with Pectoral and Vulnerary Decoctions and distilled Waters. Likewise *Lindus* and Balsamick Pills were taken from day to day in a constant method; and betwixt whiles Clysters, and gentle Catharticks and Diureticks were interposed. First Vaporations, then Suffumigations, both Sulphureous and Arsenical, were used morning and night. After that these had been used long and diligently without benefit, he consented at length to the opening of his Side: On the left side of his Sternum there appeared a Tumour betwixt the fifth and sixth Vertebra. In stead of a Caustick I applied hereto a Suppurative Plaster, and in three days the top of the Tumour became red and soft, out of which being opened the next day there first flow'd a thin Ichor, and a while after yellow and concocted Pus, and afterwards it continued to flow more plentifully: From that time his stinking Spittle decreased, and in fourteen days quite ceased, the Morbifick Matter finding both a more easy and more convenient exit by that hole. Though by the effect it was manifest that the Duct of that Orifice did lie open inwardly into the Breast, and perhaps to the middle of the Lungs, yet no Liquor that was injected by Syringe could penetrate or be driven thither; so secret and very intricate are the passages which Nature forms for her last relief, that no hurtful thing can enter in by that way whereby the Morbifick Matter is expelled. That Aperture of his Side was at length changed into an Issue, and a Pease or Wooden Pill being put in it every day, it continued to pour forth Ichor plentifully for half a year; and the Nobleman in the mean time getting quite rid of his Pectoral Infirmary, and recovering his robust habit of Body, became quite well in every respect. At last the Issue being translated into his Arm, he carried neither the Disease nor the Issue any longer in his Breast.

Idem.

An Intermittent Pulse.

The Contents.

The cause depends sometimes on the irregular motion of the Animal Spirits. I.

An instance of a Pulse returning upon the voiding of a Worm. II.

I. **T**Here are two distinct Reasons of the breeding of this Affection: for though the Pulse intermit sometimes, because the Heart for that time ceases from motion; yet when we judge by our feeling, it seems to intermit sometimes in the Wrist, whilst the Heart is felt to beat very frequently and incessantly in the Breast, because when that passion (its tremor) urges, only a very small portion of Blood is cast forth into the Aorta in every Diastole. Wherefore the Aorta being empty and flabby, and wanting a load to promote, that it may not act often in vain, it sometimes intermits its contraction. Moreover in Malignant or deadly Fevers, if at any time the Pulse be frequent and weak, it now and then also intermits; not that the Heart ceases sometimes from motion, (for it does then especially labour incessantly) but in as much as the Blood is not poured forth into the Aorta in a sufficient quantity at every Diastole; so that this having not enough to bestow its labour upon, idles sometimes. But moreover, the Pulse does sometimes intermit, because the contraction of the Heart it self is suspended for some turn, or its pause is twice as long, which indeed any one shall easily perceive in himself or in another by laying his Hand upon his Breast; yea those who labour under a weight or oppression of their Breast, do plainly perceive of themselves how often their Heart ceases from motion. Moreover this Affection does every where seize upon not so much the languishing, and those who are ready to die, or are dangerously sick, as those who are strong enough, and in most regards very well: Wherefore it ought not according to the Vulgar Opinion to be taken always for an altogether destructive sign. From what has been said I think it appears, that the cause of this Affection depends not on the mixture or crisis of the Blood, but only on the irregular dispensing of the Animal Spirits out of the Cerebel into the Cardiac Nerves, and from thence into the Tendons of the Heart. For we may suppose, that through those Nerves being somewhat obstructed, the Animal Spirits descend not to the Tendons of this Muscle in a sufficiently full stream or Influx: wherefore when their store is a little defective, the Pulse of the Heart ceases now and then for one turn, till being by and by recruited with a fresh store of Spirits its action may be renewed. Though this Affection do not want present inconvenience or danger, and requires no very hasty Cure; yet for preservations sake, lest more grievous Diseases follow, some Remedies and Curatory Method ought to be used; at least let the Diet be rightly ordered in every regard during the remainder of the Patients Life: Moreover let a light Course of Physick be prescribed to be observed solemnly every Spring and Fall; namely to the end that, as much as may be, any Morbid Seminaries cast into the Brain, or apt to be bred there, may be taken away and prevented. Hither we refer the Preservatory Method and Medicines which use to be prescribed against Fits of the Apoplexy.

Wills.

II. Mr. N. a Man of sixty, was ill of a Dy-
sentery for many days, and afterwards of a Ter-
tian Ague; and at length when he seem'd to begin
to recover, his Pulse appeared to be intermitting
for three or four days, with anxiety of mind,

and dejection of his Spirits: The Cause betray'd
it self, which was a Worm as thick as ones Finger,
and half as long as ones Arm; upon the voiding
whereof the Pulse returned to its former state.

A

A GUIDE TO THE Practical Physician.

BOOK XV.

Of Diseases beginning with the Letter R.

Rachitis, the Rickets.

The Content.

The Description, Cause, and Cure.

I. **T**HE Rickets are a Disease proper to Children, and peculiar almost to the *English* Nation: The signs thereof are a swelling of the Belly about the Stomach, especially on the right side, under the region of the Liver; the Epiphyses of the Bones at the Joints are too bulky for their Age, or in comparison to the rest of the Body, especially those of the Arms and Legs; The Bones themselves are flexible almost like Wax, so that they cannot sustain the weight of the Body, and therefore their Legs and Thighs, (as also often the Back-Bone) become crooked; Their Head grows too big in proportion to their Bodies; and their Chest is strait, and their Breast-Bone at first depressed, but afterwards sharp.

The containing Cause is a too thick, clammy, viscid, obstructive, moist, and cold alimentary Juice in the Bowels, namely (in one word) the Cheesy part of the Blood: and the more serous

part of the Blood in the Bones and Cartilages, in the more notable Cavities and External parts. And the Disease it self seems to consist in the position of a thicker, Cheesy, and obstructive Blood in the Bowels; and also in a defect of Nutritious Juice owing to the Bones and External parts, and in an afflux of serous Humour in lieu thereof. The Antecedent Cause, which makes and moves the containing, is the weakness of the Pulses, or a weak Circulation of the Blood, which doth not sufficiently irradiate the mass of Blood with an influent heat, for the preservation of its Heterogeneous parts in perfect mixture, but they are coagulated and heaped up in divers parts. The Procatartick causes are either in the Parents, or Nurses, or Infants. In the Parents the Causes are a *Gonorrhœa*, the *Scirvy*, Kings Evil, the *Lumbago*, or other long and especially cold and moist Diseases of the Brain and Genitals. In the Nurses all such things may be causes as make their Milk thick, viscid, and obstructive. And to the generation and hastening of this Distemper may contribute the bad custom of hiring Nurses to suckle the new-born Infants, whose Milk (as being old) is not fibrous and thick; whereas the serous *Colostræ* (or first Milk) of the Mother were far better for the tender Infant, who has need of Purging as well as Nutrition. For the new-born Infant abounds with Phlegmatick Excre-

ments in its Belly, and requires a Medicamentous Milk, such as the Mothers is for the first Months, which may both purge and nourish. The Procatartick Causes in the Infants are to be fetched from our thick and moist Air, and from the peculiar manner of nourishing and treating our Infants. For no where that I know of is Flesh granted to Infants so largely and so soon as in England. This Disease is most frequent amongst the Children of Persons of Quality; next amongst those of the poorest sort; and least amongst those of a middle Condition. The cause of the first I reckon to be the intemperance of the Parents, and because hired Nurses have the care of their Children; and of the second, (besides bad Diet) want of Fire, long soaking in their Excrements, and the use of cold and not well dried Cloths.

As to the Prognostick, such as are born Ricketty, or fall into them presently after they are born, die all. There are more Girls have them than Boys, but the former recover sooner and more surely. Those whose Surres do not close, but their Brain feels like a Quagmire, generally die. Those that can go, are more easy to cure. When the Neck can hardly bear the Head, or where there is a great difficulty of breathing, they seldom escape; but when the Lungs are suppurated, never.

The whole Cure is performed by satisfying these Indications: viz. the thick and clammy Humours which obstruct, and retard the Circulation of the Blood, are to be prepared and evacuated; the serous Humours are to be carried off; the Circulation of the Blood, or the influent heat is to be increased in the outer parts: and lastly the External Symptoms are to be taken away by appropriate Remedies. These are reckoned to be Specificks in this Disease, the Root of Osmund Royal, the Livers of Rooks dried in an Oven after the Bread is drawn, and powdered; also Frogs Livers. Our Women anoint the Spine and all the Limbs every day once with this ointment: Take of Salt, the Leaves of Chamomel, Rosemary, Sow-thistle and Lavender, of each two handfuls, of Wormwood and Laurel, of each one handful, of black Snails bruised a pound, boil them in May Butter till they are all slabby, and then strain them. Then they sprinkle some of the Powder of the Root of Osmund Royal in all that they eat or drink. Lastly they give twice a day some of the decoction of the said Root, and of Speedwell, Yarrow, Harts-tongue, Raisins, Lyktyrhize, and Aniseeds. If you will observe a Methodical Cure: Purge with Syrup of Roses, Syrup of Sucory with Rhubarb, the Augullan Syrup, the Syrup of Roses with Agarick, the infusion of Senna, and of Rhubarb, the Powder of Rhubarb. But their tender Bodies are not at the beginning to be toiled with frequent Purging, seeing the Matter is so clammy that it will not follow them: therefore after a gentle clearing of the first ways, we must come to appropriate and Experienced Preparers; amongst which the following is much commended. Take of Rosemary half an handful, of Liverwort, Scabious, Agrimony, Maidenhair, of each an handful, of Speedwell three handfuls, of the Root of Osmund Royal four ounces, of Corianders an handful, of Aniseeds four spoonfuls, Boil them in six pints of Spring Water to three pints: Add to the strained Liquor of Sugar Candy as much as suffices to sweeten it: and let lie in it two drachms of yellow Saunders grossly powdered and tied up in a Rag. Let the Patient drink a draught hereof in the morning, at four in the afternoon, and in the evening. After seven days, unless a Purgation follow of it self, add to the former Decoction two drachms of Rhubarb, and of the Syrup of Roses with Agarick as much as suffices; of which let him drink for seven days more, and then re-

turn to the former Decoction. Then make one Issue or more; especially make one in the Neck. Let him be kept warm and dry.

Rickets: where you have particular Remedies for all the symptoms. See also Dr. Giffson's accurate Treatise of the Rickets.

Raucedo, or Hoarsness.

The Contents.

A Pertinacious one cured by help of a Seton. I.
The efficacy of the Syrup of Hedge-Mustard. II.
When caused by Exhalations and Vapours, it requires a different way of Cure. III.

I. **O**NE was ill of a Hoarsness and Erosion of the Almonds of his Ears, by reason of a thick and sharp Catarrh: He committed himself to a Physician, who advised him to have a Seton made, for revulsion and evacuation of the sharp Humours; but another Physician withstood it; and in the mean time the Disease increased. At length he came to me at Lausanne, I advised him to a Seton likewise; by which Remedy chiefly, under GOD, he was cured.

Hildanus.

II. *Syrupus de Eryfino Lobelii* (called *Syrupus Prædicatorum*) is commended, which the Author says is *Laudatissimus Arteriacus*, and he writes, *hist. Stirp. pag. 103.* that by taking of it he cured a young Woman who had had a Hoarsness ten years, and that others who have laboured of a tedious and almost incurable Hoarsness, have been cured by this Syrup of Hedge-Mustard. And I do affirm, that I have often experienced the goodness of this Medicin in a very difficult Hoarsness after a Catarrh: And therefore all Shops should have it ready prepared: Take of green Hedge-Mustard (the whole) six handfuls, Root of Elecampane, Coltsfoot, then full of Juice, Lyktyrhize, of each one handful and an half, of the Cordial Flowers, Flowers of Rosemary, *Stachas* or Berony, of each half an handful, Aniseeds six drachms, Stoned Raisins two drachms. Boil them in a sufficient quantity of Barly Water, and of Hydromel and Juice of Hedge-Mustard of each six ounces to two pounds or three. Add to the Colature a sufficient quantity of Sugar. Make a Syrup according to Art.

S. Schultzeus, M.D. Cur. ann. 72. obs. 153.

III. I have observed that a most grievous Hoarsness, which lasted for several months with a total deprivation of Voice, was cured only with Spirit of Sal Ammoniac, by giving a few drops of it every day in the ordinary Drink. And from the singular Cure of this particular Hoarsness I reckoned, it had its rise from a Saline Muriatick Spirit, not so much eroding the parts allotted for Voice, as disaffecting them some inexplicable way, which would not give way at all to gross Medicins, but yielded easily to this Spirituous one: That is, since common Medicins that were proper to correct and carry off Salt Muriatick or Acid Humours, were almost used in vain in this loss of Voice, I might very well think, it was not produced by the gross and Corporeal Humours, but by some in the form of a Spirit or Exhalation: And therefore that it must in like manner be cured with Spirituous Medicins; but sub-contrary, and therefore with Salts, not fixt, but volatil, which had a power to correct and amend, both the Acid Salt, Muriatick and Glutinous Humours, and the Spirits and Exhalations of them, and therefore with Spirit of Sal Ammoniac; which the good success and Cure confirmed, though it went on but slowly.

Renum

Renum Affectus, or Diseases of the Kidneys.

The Contents.

We must be prudent in the use of Diureticks. I.

Whether the vertue of outward Applications reach them. II.

Many Diseases ascribed to other causes, derive their original from some fault in them. III.

Renum Inflammatio, or an Inflammation of the Kidneys.

What Vein must be opened in an Inflammation of the Kidneys? IV.

A Purge is proper in the declension of the Disease. V.

Cassia is hurtful. VI.

Suppositories are better than Clysters. VII.

Repellents and Attrahents must not be put in Clysters. VIII.

When Diureticks are proper? IX.

When the Kidneys may be opened in the Loins? X.

External Coolers must not be abused. XI.

Renum Intemperies, or Intemperature of the Kidneys.

Drinking of warm Water is good for a hot Intemperature of the Kidneys. XII.

Cooling Topicks must often be renewed. XIII.

Renum Prolapsus, or a slipping forward of the Kidneys.

It is difficult to know, when the Kidneys are slipped forward. XIV.

Renum Ulcus, or an Ulcer of the Kidneys.

Sometimes a Vomit is good for Ulcerated Kidneys. XV.

Some Purgatives do harm. XVI.

Whether it be good to drink Milk? XVII.

Horsehound is an Enemy. XVIII.

An Ulcer is very difficult to cure. XIX.

Renum Dolor, or Pain in the Kidneys.

A desperate pain of the Kidneys eased by opening of the Hemorrhoids. XX.

Clysters must have no windy things in them. XXI.

Renum Imbecillitas, or Weakness in the Kidneys.

The Signs of Weakness in the Kidneys, and its Cure. XXII.

I. WE must never go to work with Diureticks, especially with violent ones, in Diseases of the Kidneys. (See Tit. of Diureticks, BOOK XIX.)

II. Although Galen 6. Epidem. sect. i. comm. 6. write, that Medicines applied to the Kidneys are of no use, both because their substance is very thick, and because of the many parts that lie over them, which hinder the vertue of the Medicin from penetrating: Yet this is no sufficient Obstacle, because Medicines by long application do at length exert their virtues upon the inmost parts, as the same Galen 6. tuend. sanit. cap. 14. has observed.

III. The Noble Lord N. forty five years old, had been troubled for some months with a salt Catarrh about his Genitals and Anus. After he had been more than enough tormented for three whole months with the severity of his Disease, and with Medicines, he repaired to me as to his last refuge. I reckoned, that the cause of this Disease ought not to be laid to the alone intemperature of the Liver, as is now the custom of Empiricks; but to the bad constitution of the Kidneys, because of which a salt Excrement being long detained in the Body, uses to breed such things, and that Openers, not Coolers, ought to be made use of. For often after immoderate or unseasonable Venery, and in such as live upon a gross, feculent, and salt Diet, the Kidneys are affected in this manner; Hereby the

Expulsive Faculty being spoiled, and the passages of the Kidneys obstructed, the salt Excrement is forced to go back by the Veins, and is cast off thence by sweat through the Skin, where, according to the various nature of the thing, whence it proceeds, sometimes it is dissolved, sometimes coagulated; sometimes it is of one nature, sometimes of another. But in a short time the said Nobleman recovered his health by the means following; The first day he took tincture of Corals; and Specificum Stomachicum, (which some take to be the Flowers of Sal Ammoniac) both of which purge the Blood, and strengthen the Inwards, the Kidneys especially. To make the first region clean, I gave Decoctum Catholicum purgans and refrigerans for several days. Ourwardly Balsamus Saturni, and Calcinatum majus dulcificatum in a short time completed the Cure.

Potterius, cent. 2. cap. 64.

Renum Inflammatio, or an Inflammation of the Kidneys.

IV. Blood must be let in the Arm, when the Inflammation is new, with a flux of Humours and plenitude of the whole, as Forestus, obs. 30. l. 2. says. But it must not be done, when the Inflammation is of any continuance, and no Fluxion of Humours, or plenitude of Body with it: because it is then requisite, that the Matter be evacuated and derived by the next places, which is by Bleeding in the lower Veins.

Horstius.

V. Though a Purge be not proper in the beginning, lest the disturbed Humours should flow more to the parts affected, so that if a violent looseness come at that time, it must be stopt: Yet when the Inflammation is a little laid, and the Disease is declining, a gentle purge may be proper, of Manna, Rhubarb, Diaprunum Simplex, Catholicon, and Syrup of Roses, with a decoction of Lettuce, Purslain, and other cooling things.

Riverius.

VI. But I would not advise you to give Cassia, as most do, for I cannot chuse but suspect it, since it is a little hot, and carries the Humours to the part affected.

Rondeletius.

VII. In this Disease a Suppository is more proper than a Clyster; yet a Clyster may be given in a small quantity: for a large one distends the Guts, and so, the Kidneys being pressed, the pain is increased.

Idem.

VIII. We must abstain also from those Clysters, which have a repelling faculty; as also from such as are very drawing and irritative; for so Nature will be incited to send more to those parts.

Metcatus.

IX. As for provoking of Urine, you must only do it, when the Inflammations are perfectly concocted: otherwise you will but exasperate, and increase the Afflux. Wherefore we must let it alone, till the Pain be laid, and the Fluxion ceased. And therefore the greater cold Seeds must be omitted in Emulsions, because, seeing they are Diuretick, they might carry something towards those parts, especially while the Fluxion is still in motion; for in the declension they may be of use.

Idem.

X. If it appear, that the Tumour tends to the outside of the Loins, and if pain and throbbing be felt by the touch, upon the Kidneys, so that it is evidently apparent, the Ambient Membrane is rather inflamed, than the substance of the Kidneys, (for in this case only, I think, opening of the Kidneys in the Loins is safe; for, I reckon, that the Kidneys themselves when opened with a red hot Iron, do seldom or never heal, and though Life remain, it is but calamitous and miserable) it is the best way to perforate the part affected over the Kidney, with a red hot Iron, that the virulent Matter may get out. And this may be done by applying Plasters first, which may draw out the Pus to the outside of the Kidney, and may attenuate the part, that the opening may more easily be performed.

Idem.

Idem. XI. We must not insist long on cooling things, lest the dispersing of the Conjoint Matter be hindered, or Scirrhus Tumors should grow.
Zecchius. ¶ Coolers and Astringents outwardly do but keep in the Superfluous Excrements.

Renum Intemperies, or Intemperature of the Kidneys.

XII. Nothing keeps the Kidneys so free from Recrements, and so temperate, as to drink six or seven ounces of fair Water boiled, before Meat, twice, or at least once a day: For their fiery heat is at length extinguished by the coolness of the Water, so that afterwards they cannot breed the Stone.
Zecchius.

XIII. There are some, who once every day apply Oil of Roses or *Infrigidans Galeni* to the Kidneys, for cooling of them. But this may be doubted, because within four or five hours time these Topicks cool no more: For in that time the heat of the part has naturally so exceeded them, and they are become so like and familiar, that they have in a manner lost their whole power of reaction. For Alteratives do not act as Food, which only nourishes and augments the strength, when it is conquered, but before they are conquered; for Example, cooling Alteratives while they react, do cool: But when they are exceeded, the contention and alteration ceases; and from thenceforth no cooling can be expected from them.
Sanctorius.

Renum Prolapsus, or a Slipping forward of the Kidneys.

XIV. Sometimes one of the Kidneys is found slip forward into the *Hypogastrium*, which can scarce be distinguished from the falling down of the Spleen. (See *Tit. de Lienis Affectibus*, BOOK X.)

Renum Ulcus, or an Ulcer of the Kidneys.

XV. Though *Avicenna* highly commend a Vomit for Ulcerated Kidneys, because, as he says, it cleanses and evacuates, and makes revulsion from the Kidneys: And though, as some report, this Disease has been often cured with this Remedy; yet we must take notice, that it must be given only to such as are easy to Vomit: Otherwise the Ulcer would be irritated by its violence. *Rondeletius* advises to give it after Meal, because then it is more easy; he gives Water and Oil warm, and to relax the Stomach, he anoints the mouth thereof with Oil of White Lilies.

XVI. If any one make an Electuary, to evacuate the common Recrements, let him omit *Senna*, *Agarick*, and *Tartar*, if there be an Ulcer in the Kidneys or the Bladder; for they exasperate the parts affected; and so doth *Carthamus*.
Rondeletius.

XVII. Whether is Milk proper? Physicians hold the Affirmative, but with a certain limitation: for in the beginning of an Exulceration, in as much as there is need of greater absterfion, the Antients prescribed Asses or Mares Milk, with Honey. Now a days Goats Milk is given with Sugar as a thing, that by its Nivrous substance has a very absterfion faculty: But if it appear, that the Ulcer is cleansed, Cows Milk should rather be given. For this Remedy, as *Mercatus* says, is both Food and very effectual Physick, for by its ferous part it is absterfion, by the caseous it consolidates, and by the butyrous and fat part it allwages pain and the Disease, and repairs the strength. Nor is it any obstacle, that Milk passes difficultly to the Kidneys, and chiefly hurts the Bowels: for the first is easily helped, if Juice of Lemons and other things, that carry to the Kidneys, be mixt with the Milk: the other need not to be feared, since Milk

is given after Universals. Therefore *Mercurialis* says, When Ulcers are pretty foul, that Milk is proper, which is most absterfion, as Asses, Mares, and Camels Milk: But when they are not so foul, that Milk is proper, which is not so absterfion, and breeds Flesh more, as Goats Milk: At last, when the Ulcers are quite cleansed, that is proper, which nourishes most, as Sheeps or Cows Milk.

Horstius, Qu. 3. Dec. 8.

XVIII. Let Horehound be never so much commended by Botanick Authors for several Diseases, and especially for such as are Chronical and Contumacious in Cure; yet Physicians ought to be circumspect how they use it, since *Dioscorides*, 3. *de re medica* cap. 19. and *Pliny*, lib. 20. cap. 22. do hold, that it hurts the Kidneys, and that it must be avoided in Ulcers of the Kidneys and Bladder. Wherefore since it is evident from *Galen*, that the Colick and the Stone have almost the same signs, or that the Symptoms of these two Diseases can hardly be distinguished one from the other, I would advise no Man to Horehound, when there is the least suspicion, that the Kidneys are amiss, much less, if they be already exulcerated, as being a thing, in my judgment, offensive to the Kidneys in its whole substance. And why, in its whole substance? Because Experience, not Reason, has taught us it is so.

S. Pauli.

XIX. I question, whether there be any hopes of curing an Ulcer in the Kidneys; I do not remember that I or any Man else ever cured one. However something may be given to allwage the Malady, and hinder it from growing worse: To which purpose I have found nothing better than *Balsamus Sulphuris* both *anisatus* and *succinatus*, *jupiperinus* and *terebinthinatus*, but made with the Oil of true Turpentine, not the common; but the *Succinatus* is the best in this case. ¶ I remember I cured an Ulcer in the Kidneys Anno 1662. in the Illustrious and Noble Mr. *de Molendins*, Deputy Governor of *Newenburgh*, who besides a sense of heaviness in the region of his Loins voided Pus and Blood, yea, and Bodies like Worms, and by the Advice also of the Doctors of *Paris* he was cured, besides Bloodletting and Cupping, &c. by the frequent use of Trochises of *Alkekengi* with, and without *Opium*, and also with Chalybeate Milk.

Sylvius de le Boc.

Renum Dolor, or Pain in the Kidneys.

XX. I saw a Man, who was afflicted with an intolerable pain in his Kidneys, which could be eased neither by Phlebotomy, nor Purgings, nor by any outward applications, but by opening the Hemorrhoids. For the Matter that stuck in the Kidneys, caused it; and as soon as way was made, the pain ceased. Yet it does not follow, that the Hemorrhoids must presently be opened, if any one be so afflicted; but if they swell, we may open them boldly.

XXI. In pains of the Kidneys such things must be omitted in Clysters, as breed Wind: And for this reason neither *Cassia* nor *Diacatholicon* must be put in them.

Hollerius.

Solenander.

Renum Imbecillitas, or Weakness in the Kidneys.

XXII. A young Man Twenty eight years old, had for several months always made a red Urine, thin enough in consistence, and almost like to the Water in a high Fever. The Physicians used Medicines, as for an over heated Liver. At length he came to me, and seeing he appeared not to be in a Fever, I asked him, whether at any time he had had a Fever? On the contrary, he answered, as if he had been continually cold for some months, his Body was extenuated, his Spirits low, with shortness of Breath, and what he had taken, had done him no good. Therefore I had a mind, that

He

he shou'd leave his Urine till the next day, that I might consider the Sediment, which was indeed as red as Blood (for it was nothing else but Blood) the rest of the upper part was but low coloured, of a pale yellow, an argument that there was no Fever. Therefore I concluded there was no heat in the Liver, but that the Kidneys were weakened, and that the mouths of the Veins being too open, did let out the thin Blood. Therefore I altered the method of Cure, and used things to strengthen the Kidneys, and bind the Veins: he used a good Diet, and drank Goats Milk: And so the Urine left off being red, and his Body began to thrive, and his strength to come to him: And at length the young Man recoverd.

Dodonæus,
obs. 32.

(See *Calculus Renum*, BOOK III.)

Renunciatio, or Inquest.

The Contents.

Judgment concerning a dead Body, by what mischance it died. I.

Judgment concerning a Childs being smothered. II.

Concerning a wounded Man, whether he received the Wounds alive or dead? III.

Concerning drowned People. IV.

Of a Body killed by Poison. V.

(See A. Paræus of Inquest, and Codronchius his Book De Methodo Testificandi.)

I. IF a dead Body be found in the House or abroad, and the Question be, Whether it was slain by Thunder, or came by some other Mischance? If by Thunder, the Body smells of Sulphur, so that Dogs, nor nothing else will touch it. Under the part, whether it be whole or wounded, the Bones are broken, and the Wound is black. The Body falls on the wounded side; Brute Beasts fall on the contrary side. If one be Thunderstruck waking, he has his Eyes shut; if sleeping, on the contrary. It does not corrupt.

II. One may know a Child has been smothered, if it was well before; If it froth at the Mouth and Nostrils; And if the Lungs, when they are dissected, be frothy.

III. If it be enquired, Whether a Wounded Body received the Wounds alive or dead? If alive, the lips of the Wound are red and Bloody, and the place about it is black and blue.

IV. He that lies drowned, if the Body were cast in alive, all the Belly is swelled with Water, Mucous Matter comes out at the Nose, Froth comes out at the Mouth, and the Fingers ends are as it were excoriated.

V. If a Man, naturally abounding with good Humours, and who keeps a wholesom Diet, die suddenly; If his Body appear black or blue, or of party colours, or flabby, and stinking, it must be concluded that he has taken Poison.

Respiratio Læsa, or Shortness of Breath.

The Contents.

A Vein may be opened in a fit of an Asthma. I.

Whether Purges be then proper? II.

Out of the Fit we may purge violently. III.

Vomits are sometimes proper. IV.

An Orthopnea cured with Scammoniæ Medicins. V.

Whether Clysters may be given? VI.

Expectoraters ought to be mild. VII.

Whether Diureticks be good? VIII.

Cock-Broth must not respect the Lungs only; but the Head, as the Mandant part. IX.

Spirit of Sulphur is not proper for all. X.

When the Fit is coming, we must have a care of Expectoraters. XI.

The Cure of an Asthma. XII.

For what and when Intercipients are proper? XIII.

We must proceed to burning in an inveterate Asthma. XIV.

Whether both an attenuating and spare Diet be proper? XV.

An Asthma is sometimes caused by Wind. XVI.

One caused by Metallick Fumes, must be cured by appropriate Medicins. XVII.

Respiration is often hindered by the fault of the Stomach. XVIII.

It may be hurt by a cause in the Neck. XIX.

An Asthma caused by a Convulsive motion of the Nerves of the Lungs. XX.

The Cure of a Scorbuteck Asthma. XXI.

I. A Vein must be immediately opened in the Fit of an Asthma, if Blood seem to abound but indifferently; for when the Veins are emptied of Blood, the Breath will be more free. But if the Disease be old, and Blood hath been often let, we must abstain from it, lest, when the innate heat is abated, a greater stock of Phlegm should follow. Bleeding in the Foot is excellent, when this Disease is Sympathick. ¶ Bleeding must not wholly be neglected, which Galen allows to hinder Suffocation, and Hippocrates prescribes in a dry *Oribopnea*: Yet we must abstain from it in the Fit of an *Oribopnea*, because then the strength is low. And Blood may especially be let, when the Patient is hot and moist of Complexion, and the whole Body abounds with Humours. We must Bleed but sparingly in the Arm; or rather the Hemorrhoids may be opened by and by, if it shall be needful, as sympathizing with the Breast.

II. Some dissuade the giving of Purges in the Fit; because that Humour especially which causes the Asthma, is thick and viscid, and cannot easily be evacuated, till first it be prepared; and it must be evacuated by degrees, as must be done in all other Phlegmatick Diseases. 2. Because of the urgent danger of strangling, seeing it may be feared, lest the Matter agitated by a Purge, should not run to the lower Belly, but rather to the part affected, and so increase the danger of Suffocation. On the contrary *Carolus Piso* thinks that a Purge should be given immediately after Bleeding for aversion sake, seeing Purging cannot be deferred without danger of Suffocation; And the Humour being fluid enough of it self, needs no great preparation. But here is need of a distinction; and the nature of the Humour must be considered: For if the Humour be thick and viscid, it is to no purpose to give a Purge immediately; and it is rather disturbed than carried off, whereby the Fit is increased: But if the Humour be thin and serous, and poured out of the Veins upon the Lungs, which *Piso* presupposes, one may very well Purge at the beginning.

III. It must be observed, that the strongest Medicins are proper in this Disease, because the Matter is highly peccant, and of long continuance. Therefore *Paulus* Purges with very strong Medicins, and that constantly; and he approves even of *Coloquintida* (No wonder, if few now be cured, when we give only a little Agarick). *Elastrum* therefore may not only be given in a Dropsy, but also in an Asthma and Orthopnea, seeing they are caused by gross Matter. *Galen* also 7. 227. 2.

cap. ult. approves of the most violent things. We may thus prescribe with *Galen*; Take of Mustard one drachm, common Salt half an ounce, *Elatarium* fifteen grains; grind them together with Water, and make Trochisks. *Galen* makes eight Trochisks, so that in every Trochisc there are almost two grains of *Elatarium*, but not quite two. And that the Cure may be safe, Clysters must be given before we give these Trochisks; and after the Trochisks six ounces of *Mussa* must be given. Practitioners in our time commonly give Pills once in thirty days; but they cure no Man. Therefore after *Galen's* Example, if the Disease be contagious, it is my advice, if not every other day, at least every fourth or fifth day, to give one of the said Trochisks.

Capiuacci.

IV. Though some condemn Vomits, yet they are very proper, as frequent Experience shews; and oftentimes the Fit is taken off with this Remedy alone. The best Medicin of this sort is Tobacco Water one ounce, which may be made into a Syrup with Sugar; the Dose two Spoonfulls. Salt also of *Vitriol* and *Aqua-Benedicta* may be given. And the reason why Vomits are so good in this case, is very plain. Because while the thin Phlegm that falls from the Head, insinuates it self into the *Aspera Arteria* and the *Bronchia* of the Lungs, the thicker part of it falls into the Stomach; and sticks so close to the sides of it, that it can hardly be got off. In the mean time while the faint heat of the Stomach moves that Matter, gross Wind is bred, which puffing up the Stomach, does press upon the Diaphragm, and cause a difficulty of Breathing. Whence it comes to pass that when the Stomach is emptied, the Fit either quite ceases, or does wonderfully abate.

Rivierus.

V. After *Adr. Spigelius*, who was much given to Experiments, had found in dissecting of *Orthopnoick* Persons, that the Coat of the *Aspera Arteria* was inflamed, by reason of a thin and bitious Matter, that was fixt there; He eased Fits of a tedious *Orthopnoea*, with Scammoniæ Medicines, as *Pilulæ Cochæ*, *Auræ*, and others of the same kind.

Rhodius, cent. 2. obs. 28.

VI. *Ludovicus Septalius* does not admit of Clysters; because when the strength is low, and there is imminent danger of Suffocation, they cannot conveniently be given: But yet strength is not always so low as not to admit of a Clyster, which makes a very good revulsion from the Breast. Therefore sharp Clysters must frequently be given, but in a small quantity, lest the distended Guts should press upon the Diaphragm.

Rivierus.

VII. In Pectoral Medicines this must always be endeavoured, that they be kindly and temperate: for if over hot things be given, in the beginning especially, the thinner part of the Phlegm is dissolved, and the thicker is rendered unfit for Expectoration. Oftentimes also Matter is drawn from other places to the Breast by very hot Remedies. And if any one rashly use too strong Resolvents, if the dissolved Humour suddenly fall down, there is danger of Suffocation. Gentle things therefore must be made use of, which conduce to mollify and dilate the Breast; and the use of them must be frequent; for rough Phlegm does not easily suffer it self to be softened and attenuated.

G. Hofm.

VIII. Diureticks may have place in curing a Fit of an *Asbma*, not only when it is imminent, but in the Intervals. And I assert this, not only because it is very true for the most part, that the same Medicines serve both for cure and prevention; but also because it has been experienced that in the very Fit, some have at length been freed from it, not by coughing up of any Matter, but only by making abundance of thick and troubled Urine. For daily Experience teaches, that the Matter which is contained within the Cavity of the Breast

and Lungs is voided by the passage of the Bladder, to the Patients great relief. But in the Intervals and long after a Paroxysm, we have no reason to doubt that Diureticks are proper: for by them the Noxious Humours are averted from the Breast, Head, and Veins to the passage of Urine, before they fix in the Breast, the place of Respiration. And we often see, that they whose Head is subject to be stuffed either by External or Internal Causes, and chiefly while it is hot, if they make much Urine, do find themselves far better in their Head and upper parts. If therefore one be troubled with a Fit of an *Asbma*, and make thicker and more Urine than he used, and thereby begin to be eased of his straits of Breath, no Matter being expectorated by Cough, who can make a question of it, if Diureticks be given with Pectorals, but that the Patient will far sooner be cured?

Crucius de Quæstis.

IX. Care must be taken of the Head as the part Mandant, and of the Lungs, as fuscipient, and sometimes constantly productive of the Matter, by correcting the moist intemperature of both, and by strengthening the lax Lungs. For which purpose *Avicenna* commends Broth of an old Cock, beaten, drawn, and a little salted; alter'd with Hyssope, Lungwort, and Oak of *Jerusalem*, given for a month, first giving a Bolus, made of Turpentine and Powder of Iris. But because it can do the Head little or no good, therefore a Sudorific Decoction will be far more effectual; Take of Wood of *Guajacum*, Mistletoe of the Oak of each two ounces, common Water four pounds. Mix them. Make an Infusion twenty four hours; then boil half away. Keep the Colature for three Doses. It must be given in the Morning an hour before you would sweat, first giving this Bolus; Take of Extract of Elecampane Root one scruple, Flower of Brimstone half a scruple. Mix them. Make a Bolus. Let him sweat in a Stove, that the Head may sweat; notwithstanding the danger of Suffocation, which is usually objected: for that holds good only when the *Orthopnoea* is present. But if the Breath grows short in the Stove, as it sometimes happens in the first days, let the Patient presently go to Bed and sweat; and afterwards sweating will be well born a longer time, even in a Stove. When the sweat is ended, that the drying of the Lungs may be completed, Purging Sulphureous Waters must be given for ten or twelve days: And they will be very good to pump the Head withal.

Fortis.

X. Spirit of Sulphur is given for an *Asbma*: But here we must distinguish between one Idiopathic, for which Spirit of Sulphur may not be used, and one Sympathick, fixt about the *Hypochondria*, for which Spirit of Sulphur may give its assistance. This Spirit will be of greater virtue, if it be distilled with Gum Ammoniac.

F. Hofm.

XI. When an *Orthopnoea* is present, we must act with great caution, lest the Patients be suddenly killed with unseasonable Remedies: Yea, seeing the Physician cannot always be present, the Patient must be instructed how he may be a Physician to himself. Therefore, when an *Orthopnoea* is coming, this must especially be observed, that at that time the Expectoration of the Matter must not be attempted, but by Internal and External Laxatives it must be carried from the *Bronchia* to the Cavity of the Lungs: For while we endeavour to get up the Catarrhal Matter that falls from the Head, and rises from the other Cavities, we bring the same in more abundance to the *Bronchia*, whereby the passage of the Breath being wholly stoppt, the Patient is quite strangled. I have observed this to have happened twice to Physicians. Wherefore first of all Rest must immediately be prescribed, using only Frictions to the lower parts, to hinder the ascent of the Matter sticking in the Cavity: Then let Oil of sweet Almonds, new drawn with-

out

out Fire, be in readiness, of which he may take about half a spoonful between whiles: The Cawl of a Wether, &c. may be applied to the Breast, and to make it more laxative, it may be sprinkled with Oil of Sweet Almonds: Or a great Sponge may be applied to it, dipt in a decoction of Mal-low Root, Marshmallow, White Lily, Lykyrrhize, and Fenugreek Seeds, which must not be quite wrung out, and it must be often applied pretty warm, nor must it be suffered to grow cold. But when the Fit is going off, some gentle Expectorant must be given, to wit, when the Matter begins to be concocted, and to be discharged out of the narrow *Bronchia*; for then ease will be found by coughing and excretion of the Matter.

Fortis.

Asthmatis Therapia, or the Cure of an Asthma.

XII. In the Cure of an *Asthma* there are two primary Indications, the *Curatory*, and the *Preservatory*: The first teaches what must be done in the Fit, that the Patient may be delivered out of present danger: The other shews what must be done out of the Fit, for removing of the Morbifick Cause, lest this Disease return often or violently. Therefore when the Fit is upon one, we must endeavour, 1. That in respect both of the Air and the Lungs, more free breathing may be procured; and 2. That the Organs of Respiration may be recalled and checkt in their spasms begun, and usually stubbornly persisting. As to the former, let the Patient be placed with his Body upright, in an open and airy place, free from Fumes and from the Breath of the by-standers: Then we must do our endeavour, that the Lungs being made free from all stoppage and Internal Oppression, and also from External Compression, may fetch the Breath and let it go again freely. To these ends, that the swelling of the lower Bowels may not press upon or straiten the *Præcordia*, the Belly must be emptied with a Clyster, the clothes must be opened. And moreover, because in this case People are usually oppressed, either by the Blood being too Turgescent within the Pneumonick Vessels, or by *Serum*, falling from the Arteries and Glands upon the Tracheal Ducts, the rage of both Humours must be appeased. Therefore, if the strength will bear it, and if the Pulse be strong enough, Bleeding is often proper. Moreover things that discharge the *Serum* and Superfluities of the *Æstuating* Blood by Urine and Sweat, must be carefully used. To which end Apozemes, &c. which they call Pectoral, are highly serviceable: And Testaceous Ponders, Preparations of *Millepedes*, Spirits and Volatil Salts, are taken with success. And in the mean time beside these things, such must be given as open and smooth the passages of the Windpipe, and cause Expectoration; and which may moreover, if there shall be occasion, stop the Catarrh that falls down upon them; to which end *Linæur*, Pectoral Decoctions, and Fumigations are proper. As to the other intention of Cure, to wit, that the Organs of Respiration may quietly return from the Spasms they are fallen into, to their ordinary Functions, (unless this follow spontaneously, after the *Æstuations* of the Blood and *Serum* in the Lungs are quieted) (For we have shewn not only by Reasoning, but by Observations, that a Convulsive *Asthma* is often caused, when the Morbifick Matter, falling upon the Pneumonick Nerves, sticks somewhere in their passages, especially about their Plexus: Upon which, when abundance is gathered, and begins to disperse and move, for that reason the Spirits thereabout, and such as are affluent to the Organs of Respiration, are disturbed, and driven into irregularities; and by and by those Spirits affect others that dwell in the Pectoral and Pulmonary Fibres, and excite them to irregular and Asthmatical Spasms) we must use Antispas-

modicks and Anodynes; for Medicines that are usually given in Hysterick Fits, use to do good in a Convulsive *Asthma*: Spirit of Hartshorn, Soor, and especially of Sal Ammoniack distilled with Gum Ammoniack; also Tinctures of Gum Ammoniack, Sulphur, Castor, *Asa foetida*, Syrup of Gum Ammoniack, Sulphur, Oxymel of Squis and the like, which because they are either of an ingrateful smell or taste, they do as it were dissipate the Spirits, and withdraw them from tumults, and sometimes do much good. But if the Spirits raging in this manner cannot be quieted, we may proceed to Narcoticks, that when some are dispersed, the rest may be reduced to good order. For unless the stoppage of the Lungs, with great oppression at the Heart do hinder, Opiates sometimes do much good. In horrible Fits of this Disease, when other Medicines would do little good, I have often given *Diacodium*, yea, and *Laudanum Tartarizatum* with good success. But they must be given with great caution, because, since they hinder Respiration more (which is already difficult and impeded) they often endanger Life. Moreover, that the Pneumonick Spirits may be recalled from their Spasms, it is sometimes convenient to create trouble to the Spirits in other places; for when any are afflicted any where, usually the rest being smitten lay aside their disorders. Wherefore Blisters, Cuppings, Ligatures and painful Frictions give relief: yea, for this Reason Vomits taken in the middle of the Fit, do good. Thus far of the method in the Fit. The other Preservatory Indication, intending the removal of the Morbifick Cause, has two distinct ends of Cure; The one endeavours to amend the conformation of the Lungs, if it be any way hurt or vitiated; and the other to remove the disorders of the moving parts, and of the Spirits belonging to them. Both these Indications may be satisfied, if the Remedies, called Pectoral, be joined with Antispasmodicks, and if the use of these Remedies be inserted with other Medicines, that respect the Preparation of the whole Body, and the emerging Symptoms.

Willis.

XIII. There are not wanting some, who use Intercipients in a Periodical difficulty of Breathing, about the time of the Fit; in using of which notwithstanding we must act cautiously, seeing they may thicken and fix the Matter in the *Bronchia*, if any be there; which is the reason why Opiates in an *Asthma* are utterly condemned by *Galen*. ¶ Yet if the Disease continue, we must endeavour to intercept the Matter, which the following Medicin will do excellently well; Take of *Laudanum Nepenthes Quercetani* one grain or one and an half, *Diapenidum* one drachm: Let it be taken one hour after Meal: And if you cannot have *Laudanum*, you may take one scruple of *Philonium* in its stead.

Fortis.

Idem.

XIV. In an inveterate *Asthma*, which will not yield to other Medicines, burning in the Neck, Breast, and Back is commended (for unless we proceed to burning, they die) about the middle between the *Vertebra* and the middle between the Ribs. And the Burnings must be pretty broad, between superficial and deep; and the Ulcers must be suffered to run a long time. If the fluent Matter come from the Head, we must burn in the Coronal Suture; if from the whole, the Arms and Legs must be burnt. The Burnings must be made in the intermediate spaces of the *Vertebra* and the Ribs; for the Bones hinder the going out of the Matter.

Capivac.

XV. It is a Question, Whether an Attenuating Diet be proper for Asthmatics, because *Galen*, lib. de Attenuante victu, writes, that he has cured Shortness of Breath and other Chronical Diseases, by means of it, without any Medicines. *Hippocrates* is alledged on the contrary, aph. 1. 4. that

(* G g g g)

in

in long Diseases a spare and exquisite Diet, is ever untare. But the case is plain, the *λεπτή διαίτα*, or spare Diet, which *Hippocrates* speaks of in the said Aphorism, is one thing: for he has only regard to the form and quantity of Diet; to wit, when Meat easy of concoction, and in a small quantity, and less than the Patient is able to concoct, is given him; to which a full Diet is opposed: *λεπτήν τροφήν* and *λεπτοπυλὴν διαίτην*, or an Attenuating Diet is another thing. This respects only the Quality, which extenuates viscid and gross Humours in the Body: An Incrassating Diet is opposed to this. *Galen* treats of an Attenuating Diet in a particular Book, in which he describes Meats to be attenuating, because they bite the Senses and are sharp; and he reckons up those Meats: And it is certain, that such Meats are good for Asthmatics. But whether a spare Diet be proper is very doubtful, because according to *Hippocrates in Morbis*, it is not very safe.

Sennertus.

XVI. Sometimes Wind does distend the Lungs so violently, that it would cause Strangling, unless it were prevented by tapping between the fourth and fifth Rib of the Breast, which is often done at *Paris* to the Patients great benefit, and ease of the Breast; though no Water come, but Wind bursts out with a violent disposure. *Hippocrates* calls them, whose Breast is distended with Wind, *πνευματικά*.

Riolanus.

XVII. A Goldsmith's Child was ill of almost a desperate Asthma, and no Medicines proper for this Disease, would do him any good. At length when I was called, I presently suspected the Malignity of a Mercurial Fume had produced this Disease, because the Father acknowledged that for several days about the beginning of this Disease he had been Gilding Plate, while the Child was by. I therefore by and by gave him twelve grains of *Mercurius Dulcis*, once and again, by the benefit whereof the Child was delivered from imminent danger of Strangling.

Horstius.

XVIII. The Figure of the Stomach is in a manner oblong; because a Man's Back is broad, whence it is, that the roundness of the Stomach runs into a length. They that have a round Stomach, do immediately after Meal breathe difficultly, the Stomach pressing upon the Diaphragm according to *Galen in Arte parva*. If these People eat often and little, they are rid of that difficulty in breathing.

XIX. There is a Branch of a Nerve sent from the fourth, fifth, and sixth Vertebra of the Neck to the Diaphragm. Wherefore if this should cease, or be deficient in motion from the Head of this Nerve's being affected, either by compression or a blow, upon which a Scirrhus disposition should arise; then, to reduce the Diaphragm to a good Condition, we must have recourse to the Neck, not to the Breast.

Sanctorius.

XX. Sometimes I have observed grievous Fits of an Asthma come, without any remarkable fault in the Lungs: So that truly I have sometimes thought this Disease to be merely Convulsive, and that the Fits of it were raised, only because the ferous Matter, full of explosive Particles, entering the Nerves of the Lungs which perform the *Diastole*, joined it self with the Spirits there: Which afterwards through plenitude or irritation, flying out thick and for a good while, the Lungs are kept stiff as it were, and puffed up; so that they can neither perform the work of Inspiration nor Expiration: But when the Fit is over, and before it begins, the Breath is taken free and equal enough, and no Cough nor any signs of a Valetudinary disposition of the Lungs do appear. In many that are taken with this Disease Vomits especially do good, as the famous *Riverius* observes; But the Reason is this, because such Physick, greatly shaking and irritating the Emunctories about the first ways,

do strongly squeeze out and carry off the Recrements of the Blood and Nervous Juice from them, which are apt to be forced and stagnate into the Nerves. *Zacutus* does not without reason highly commend Issues sometimes in the *Bregma*, sometimes in the Neck, or about the Armpits. Preparations of *Mullepedes*, that is, either in form of a dry Powder, or of a distilled Liquor, seldom fail of success: for such recall the superfluities of the Serum from the Head and Nerves, and carry them to the Urinary Passages. Gentle Purges are also good, as is a decoction of an old Cock, and other things appropriate to an Asthma. (See the Section following.)

Willis.

XXI. Of all the dire Symptoms of Scorbutick Persons difficulty of Breathing and straitness of the Breast, coming by Fits, are the worst. I think they for the most part arise either from a sudden stagnation of the Blood, that is just growing grumous in the narrow passages of the Lungs, or from a Convulsive irritation of the Nerves, which serve the Organs of Respiration. In the first case there is an exceeding distention of the Lungs, and thence as it were an immobility, with a sublivid redness in the Face, a dimness of sight, swooning, a low, weak, intermitting Pulse, accompanied with despair of the Patients recovery. But in the later case the Pulse of the Heart and Arteries is not very irregular, the Party is troubled with a dry Cough, together with an anxious straitness about the Heart, and deep sighs, stopping the Breath. For when the Blood, because of its thickness, stagnates in its Circulation through the strait passages of the Lungs, such things are proper, as by powerfully attenuating, inciding, and moving it, do restore it to a requisite fluidity, and to a more expedite Circular motion. 1. Carminative Clysters, for Revulsion. 2. Blood-letting, where there are signs of a Plethora; for so, when the Blood is diminished, the rest will more easily be attenuated, and will pass the straits of the Lungs with a quicker motion. 3. Hot Thoracicks mixt with Antiscorbuticks of the same virtue. Tincture of Saffron, Elecampane, Castor, *Elixir Proprietatis*, *Confectio Alkermes*, Flowers of Sal Ammoniac, *Benzoin*, Volatil Salt of Vipers, Horfe-dung, Spirit of Sal Ammoniac; A spoonful either by it self or in some convenient Vehicle, in a small but a repeated Dose: for these do excellently keep off the Fit, by keeping the Blood from Coagulation. For it is found by Experience that Coagulated Blood is dissolved by a Volatil Salt, diluted with Water; and besides Volatil Salts, there is not any thing found fit to prevent or dissolve this Coagulation. For a Scorbutick Asthma from a Convulsion of the Pneumonick Nerves (See the foregoing Section) Antispasmodicks promise a Cure, which are experienced to have the faculties of dulling, suppressing, and discussing this irritating acrimony of the Humours or Vapours. For this these things are cried up, Spirit of Sal Ammoniac, Hartshorn, Soor, Castor, *Spiritus Lavendulae composuit*, mixt with appropriate Liquors, and taken in repeated draughts, while difficulty of Breathing is urgent; Castor also, *Galbanum*, *Asa fetida*, and their Tinctures drawn with *Aqua Raphani compos.* or *Lumbricorum*. But in such a shortness of Breath, which threatens to choak the Patient, there is no more present Remedy (See *Charleton*, Section XII.) than a few grains of *Laudanum Opiatum* dissolved in good Canary Wine, and infused till the Tincture is extracted, and a spoonful of it given now and then.

Rheu-

Rheumatismus, or a Rheumatism.

When Purgations must be prescribed? II.
The benefit of Diureticks. III.
Sudorifics are not proper at all times. IV.
We must take care to strengthen the parts. V.
Cured in a young Man. VI.

I. **B**lood must be let every day at the beginning, till the Disease and pains abate. Nor is it any matter, if you Bleed for ten or twelve days, or for more; since it is peculiar to this Disease, for the Patient not to be weakened by Bleeding. Therefore it is my custom, when I prescribe Bleeding so often, to add this restriction, that it be continued every day, till the pains be abated, or the strength be much wasted; and when no decay of strength arises upon it, Patients do freely admit it. The condition of the Blood causes this Tolerance, which comes out always very purrid. Experience shews the benefit, since by repeated Bleeding, the Disease, which in its own nature is long, is often conquered in a short time; Besides, a large Hemorrhagy supervening often cures it.

II. Purging in the beginning, increase, and state of this Disease, gives no relief; yea, it does harm; As it happens in all Inflammatory Diseases. But in the declension it is necessary, and must often be prescribed, and with gentle Medicins, that the Cacoehymie, stagnating in the Body, may be carried off. If gentle things be insufficient, wholly to eradicate this Disease, which is often contumacious, we must, if there be no Fever, have recourse to stronger things. I have always cured this Disease, when other things could not do the work, by giving about twenty grains of *Mercurius dulcis* six times sublimed, with ten grains of Scammony or Resin of Julap. ¶ One Clyster made of Emetick Wine cured a Woman of this Disease.

III. In Rheumatick Diseases, when a bad and sharp, ferous Matter, bred by a hot intemperature subservient to Sanguification, is discharged into the External habit of the Body, with a wandering pain of the Bones, and with a sense of heat and heaviness all over the Body, and sometimes also into the inner parts, Diureticks are very good to dry it up; and that by Hippocrates his advice, *lib. de Humor. Do not sput up, says he, the dissolved Humours within, but dry up the superfluous, and when you have a mind to carry them off, or otherwise, it is best to use Attenuants, because so you may more easily purge them by Stool, or by Urine, than if you had restrained them and kept them in by Astringents.* And by Galen's consent, 15. *Simplic. 13.* By Diureticks, says he, the Blood is not only attenuated, but is melted and separated, just as in Milk, in which what is ferous and thin is separated, what is thick is curdled and exactly united.

IV. Sudorifics, as well as Purgatives, do no good, but much harm, in the beginning, increase and state: Ordinary Physicians experience this, who mistaking it for a true Catarrh, and being tired with the contumacy of this Disease, have recourse to these things; whereby the Disease is doubled, and the pains are increased. But in the declension, Generals premised, and when there is no Fever, they do much good.

V. After sufficient Evacuation, yea, at the very time of Evacuation, we must endeavour to strengthen the principal Parts and the whole Body. And these Strengtheners must be cooling, by reason of the hot intemperature of the Liver, the original of a Rheumatism. There is great store of them. I shall propound four, that are very effectual and not ungrateful. 1. Tincture of Corals; two ounces whereof may be taken two hours before Breakfast in the morning, those days when no other Medicins are used. 2. Conserve of Hips, which is grateful to the taste, cools, and with a small astriction strengthens the Liver. 3. *Electuarium trium Santalorum, quadruplicato Rheo.* 4. Tincture of Roses, which things must be used by turns, that Nature may not be used to one.

VI. A young Man was taken with an universal Rheumatism, that seized almost all his joints, with a continual Fever, and great crudity of Urine: He had used Remedies for six weeks; yet the pains ran up and down divers parts, and often returned: He was Bled ten times, he took cooling and in-craffating Juleps, he was gently purged twice or thrice: At length he took a *Bolus* of Conserve of Roses, with *Calomelanos* 20 grains, extract of Julap six grains every third day; he voided much ferous and Phlegmatick Matter. When he had taken this Medicin four times, his Pains were quite removed. Afterwards the Edematous Swellings, which remained in some of his Limbs, especially in his Feet, were dissolved with dissolving and strengthening Plasters.

Ructus, or Belching.

The Contents.

Not always an effect of Cold. I.
A sower one cured with an easie Medicin. II.
A constant one conquered by strong purging. III.

I. **S**ometimes Obstructions are latent in the Mesentery, bred of Crudities in the Stomach, which grow dry and adust, while in process of time, they are by the heat of the Liver, when the moister part is consumed, turned into a Terrene and Melancholick Nature; whence the Belly is bound; there is Belching and painful Wind, which uses to grow worse with hot things, because it partakes rather of the Nature of an Exhalation than of a Vapour; which usually occasions a mistake in many Physicians.

II. Mr. N. had been a long time troubled with sower Belching, and took several things to no purpose, yea, he fell away daily: I told him, his Disease was not so difficult to cure; but that it might be conquered for the value of a Farthing. And I ordered him to swallow five or six whole Pepper-Corns in the morning fasting, five hours before Dinner. When he had done this for three or four days, he felt nothing more of his sower Belching; his Stomach came to him, and his digestion was good; upon which his whole Body appeared to be refreshed.

III. Constant Belching was so troublesome and difficult to one Man, that he seemed to be at death's door, when I was called to him. He had used many Medicins in vain. At first I gave him ten grains of *Rhazes* his *Pilula Iliacæ*, whereby some bad and ferid Humours being purged, he seemed to be better; a few days after he took fifteen grains; and the third time, one scruple. When he had taken this, and had purged the bad Humours, he that lay ready to die confined to his Bed, walked wherever he pleased, and eat his Victuals with a good Stomach.

We may let blood after too much Venus. VII.
Medicines.

I. **A** VICENNA, l. 2. Tr. 22.c. 133. holds that Camphire extinguishes Venus, when he sayes, that Camphire cooles the Seminary vessels, curdles and thickens the Seed and so hinders Coition: Wherefore if it be applied to the Testicles and Loins, it restrains and extinguishes all Venereal provocations. Many subscribe to this opinion. Even the vulgar are come to the knowledge of this, and therefore when they would fatten Swine without Castration they give them a drachm or two of Camphire to eat, and so they extinguish Venus. § Julius Caesar Scaliger Exercit. 104. §. 8. gave a Greyhound Bitch, when she was proud, Camphire in her Meat and Drink, he put some in her Nostrils, and hung some continually about her Neck; he ordered some to be put into her Womb, yet she took the Dog, was with whelp, and brought forth. I can truly say I have tried the same thing more then once. There is in our Neighbourhood a Lusty, Lecherous young Fellow, to whom (that I might show some incredulous Persons their vanity) I ordered Camphire for some weeks in his meat and drink; yet he did not at all leave his loving Nature to the Girls. They that are of the contrary

Opinion build on a false Hypothesis, as if Camphire were cold; and suppose it be so, yet what is the consequence? Both Rue and Agnus castus make Venus dull, yet they are not of a cold temper.

Ch. Pauli-
nas in C. an-
ni 76, Obs.
231.

II. If they that labour of a Cachexy or Atrophy be prone and strong to Venus, things that are cold and dry, or dry and very hot, must not be prescribed to extinguish Seed. For it does not depend upon the heat or plenty of Seed; but because the Seed is flatulent, by much distending the Member, it makes a show of repletion, and so by dilating the Member, disposes to expulsion, but the flatulencies are caused by a heat, weak through Catochymie: And they that labour under an Atrophy, or sleep ill, do suffer this Symptome. Therefore we must contract the lower parts, and disperse flatulencies, by increasing the Heat, and helping the concoctive faculty of the Liver, Stomach and Veins. And Medicines may be best prepared in form of a Powder, without much Sugar. For Sugar and Honey and other sweet things, lax the Stomach, breed wind, and especially when they are joyned with moisture. Dry leaves of Mint may be given, for then it is an excellent Remedy. For Mint diminishes Seed and strengthens the Stomach with a gentle astriction, and heats, and because Seed makes men bold and courageous, it is vulgarly said, That in time of War Mint must neither be eaten nor sown. Besides, astringent Inunctions should be laid to the Kidneys and Privities, to bind those Parts.

Rondeletius.

III. I have known several, and among the rest two Noble-men, who used Cantharides, the one to gratifie his Whore, the other his new married Wife, but wholly with ill success: For the first fell into a most dangerous pissing of Bloods of which he was Cured with great difficulty: And the other the second day after he was married, died of an Apoplexy.

Ph. Salmuth.

IV. They whose Seed is sharp, are excited to Venus of their own accord, and quickly emit their Seed, or it runs from them, because of its thinness, without any great sense, and the Member becomes detumescent and languid before the second coition, or before the Woman is ready for expulsion. For

A a a the

Rondeletius,
P. 1002.

the Cure, we must neither give things that provoke *Venus*, nor that extinguish it, but such as thicken the Seed and increase flatulency. And boyled Chesnuts, Apples, Rice boyled in Milk, Pine nuts, &c. make the Spirits thick.

V. A certain Nobleman came to me to request a Remedy for his Impotency. He was able to lye with elderly Women, but was insufficient to get a Maiden-head, because at the very first touch he lost his Seed, but it was weak and watry, like whey. He was of a good habit of Body and Fleeshy. I said, because I could not in so healthy a body see any other cause of his Impotency, that I thought he had an Ulcer in the *Intestinum rectum*, and that from thence the *Parastate* and the other Vessels necessary for the preparation and ejaculation of Seed, being continually blasted with a putrid vapor, were not sufficient to breed so much Seed as was sufficient for a long tension of the Member, and a florid coition. While they wondered that I should mention such a cause, I told them I had formerly seen the same case in Italy, and that I remembered I had read of the like in *Hist. Mirab. Marcel. Donati*. I immediately ordered a Suppository only of Honey, and it came out befmeared with much Pus. Then I ordered some brine to be injected by a Syringe, which he said, after several injections, that is, when the Ulcer was cleansed, made him smart much, I judged, when the Ulcer was healed, that he would be well. But he neglected the Cure, and died.

Spadac. Obs.
10.

Ph. Salmuth.

VI. I have learned from Soldiers, that while they were led through Rivers, so as that water came up to their genitals, that they were thereby made more Effeminate.

VII. They are not to be harkened to, who after over much *Venus* forbid bleeding. Of which opinion I was formerly, while I follow'd my Masters rules to a tittle, from which I immediately declined, when I began to act my reason with Judgment, and to the great benefit of several, who either immediately, or the next day after coition, have fallen into grievous Feavers and tedious pain in the Kidneys. From whom truly I did not take much less blood, then if Coition had not preceded; taking my Indication rather from the nature of the Disease and its greatness, and from the fulness of the Veins, than from a false opinion of superfluous evacuation. Because the languidness of strength, which follows coition, is not caused so much by evacuation of the sanguineous matter (although Seed be bred of Blood) as from the wasting the strength of the Body by the toil and heat, which necessarily attend Coition. But admit, that not only the vital Spirits, but also the animal and natural be spent sooner and in greater plenty by superfluous *Venus* than by any other laborious exercise of the Body, Whether therefore is there so great an evacuation made of the matter that is in the venous kind, that if Inflammations arise in the Kidneys, which are often caused by too much Coition, blood should not be let, when the said Inflammations are raised by afflux of hotter Blood into the said parts, and the Loins that are heated with too much motion? Certainly no, yea, it ought to be taken away immediately while it is fluid, lest being by long staying fixt to the part it cause an abscess. Nor must we spare Bleeding, if a Feaver take one without pain of the Loins, if the greatness of the Disease require it, since they that are given to *Venus*, for the most part fair high, to enable themselves.

Botalius.

Medicines especially made use of by eminent Physicians.

Against Salacity.

1. Glow-worms which shine in the Night, if they be eaten, take away *Venus* wholly. It is a peculiar

Remedy, if 3 drachms or half an ounce of Coriander be taken with a little water and Sugar.

2. Omitting purging, this Decoction is very much commended, Take of white water Lilly 1 ounce and an half, Purslain, Lettuce, Mint each 1 handful, Rue 3 drachms, seed of *Agnus castus* 1 drachm and an half, flowers of white water Lilly 1 pugil, boyl them in water. To one pound of the Colature add of Syrup of Poppy, of water Lilly each half an ounce, mix them.

P. Forestus.

3. Distilled Oyl of Rue is excellent taken inwardly and applied outwardly, in a few drops.

Hartmannus.

4. The use of Salt Nitre in the water of water-Lilly morning and evening is admirably good, in too great Salacity.

Hofmannus.

5. This is an excellent Remedy; Take Oyl of Roses 1 drachm and an half, Chamomil half an ounce, juice of Nightshade, or Housleek or Purslain half an ounce, *Argenti summa* and Cerus each 2 drachms, a little Wax and Vinegar. Mix them, make an Unguent.

N. Pige.

6. The immersion of the virile Member in cold water makes it immediately fall.

Fel. Platerus.

Against Impotency.

1. Take the Patient's Urine, as much as you please, boyl it in a pot covered, and if anyone have bewitched him, he that did it will be in great anxiety, will discover himself, and take off the Incantment.

Joh. Agrico-
la.

2. If a live Mullet be suffocated in Wine, and a Man drink of it, *Athenus* holds he will be unable to use *Veneri*.

J. Caf. Ba-
ricellus.

3. Take of Mel *Anacardinum*, fresh Butter each half an ounce. Boyl them together till they grow thick stirring them well. The dose is the quantity of a Pease as you go to bed. It excites *Venus* wonderfully.

4. If the right great Toe be anointed with Oyl in which *Cantharides* have been dissolved, it will cause an admirable erection.

P. Bayrus.

5. *Orchis* Root, whose Root is cover'd with a red skin, but is white within, does powerfully excite *Venus* especially given in Wine.

Crollius.

6. The continual use of Essence of Amber is of admirable efficacy in curing Impotency to *Venus*. For there is nothing more effectual for restoring the innate Spirits.

Pet. Joh.
Faber.

7. *Extractum Diasatyrionis* is most excellent in this case, yea and the Extract of the Roots of *Satyrion* itself, if a Pill of it be given is excellent to excite coition.

Rod. & Fon-
seca.

8. Partridges dung dissolved in its Gall, and anointed on the *Glans* does wonderfully encrease *Venus*.

Grulingius.

9. The sperm of a Stag killed in Coition is a great *arcanum* to provoke *Venus*.

Hofmannus.

10. Take of Oyl or Essence of Saffron 8 or 10 drops, a little *Aurum fulminans* well edulcorated, let it be given in Malmsey Wine when the party goes to bed. It strengthens *Venus* to admiration. Essence or Tincture of Salt impregnated with Sol is an excellent strengthener in Impotency.

Cunrad.
Kunrath.

11. Nettle seed boyled in Butter and given for 3 dayes powerfully helps in Coition.

Joh. Mar-
quardus.

12. This is a most effectual Unguent; Take of Oyl of Elder 1 drachm, *Pyrethrum*, *Euphorbium* each 1 drachm, Musk 5 grains, let the Palms of the Hands, the Soles of the Feet, and the Genital be anointed.

Hieron. Mer-
curialis.

13. Nothing is found more effectual than the anointing the Region of the Womb with Oyl of flying Ants, which is thus made; Take of flying Ants two ounces, infuse them in Oyl 40 dayes in the heat of the Sun.

Riverius.

14. This is a Venereal *Arcanum* of great virtue; Take of Civet 2 grains, anoint the *Glans* therewith, It is a wonder with what strength it tickles and erecis

Guern. Rol-
finc.

erefts the Mans member, and with what pleasure to the Woman, that scent is received, so that it is accounted by some as a secret.

15. Hazle Nuts long steeped in Honey are very good for the distension of the Penis. ¶ Also the tongue of a Goose in its whole substance stimulates Venus.

16. This is an admirable Unguent for Coition; Take Oyl of Frogs, Oyl of *Cape canina*, Oyl of winged Ants, *Oleum sesaminum* each 1 drachm, Pyrethrum, Staves-acre, Nettle-seed each 1 drachm and an half, let them be powdered and boyled in the foresaid Oyls; add of Wax what is sufficient. Make an Oyntment; Wherewith the Stones, Reins, *perineum* and *peffen* must be anointed. ¶ If you would render a Woman very delectable, and so as to love you much in Coition, take of *Euphorbium*, Pyrethrum, Cubebs and Pepper each a like quantity, powder them and incorporate them, when you would lye with a Woman anoint the Yard, and do the work.

Salivatio Morbosa, or a morbid Salivation.

The Contents.

Its Causes and Cure. I.

When it is spontaneous, sometimes not to be stoppt. II.

I. **W**E at this time can speak far more clearly and distinctly, then they of old concerning Salivation, since not only the Passages and Vessels that carry the spittle into the Mouth, are known to Anatomists not long ago, but also the parts in which the same is prepared, or separated from the blood, to wit, the Glands, and not indeed the conglobated ones, to and from which Lymphatick Vessels are carried, but conglomerated ones, which are endued with certain ways and ducts, thorough which they pour their liquors, that are useful for the Body, into some determinate cavity. As therefore in the natural and healthy state of Man only spittle is carried from the conglomerated maxillary Glands into the mouth, so oftentimes in his preternatural and morbid state either a pituitous and viscid, or a serous and thin humour is carried along with the Spittle. Especially in these Countries salivation comes frequently of it self, not only to Infants, when they are breeding their Teeth, but to many Scorbutick and Melancholick Persons, who turn great spitters. And I have often seen the same happen in a Thrush. ¶ The Humours that are most frequently evacuated of their own accord by Salivation, are for the most part pituitous, as well the thin as the glutinous. Sometimes also they are acid and salt, for such are easily and intimately mixed with Phlegm, and all these have some affinity with Spittle. But as it happens to many Melancholick Persons, that they void abundance of thin Spittle, and therefore they are called Spitters. So a great many old Men who are full of Phlegm, and that glutinous enough, do in like manner void abundance of Spittle, but thicker and insipid, whereby indeed they suffer some trouble, but no great harm. But there are not wanting some, from whom not only gentle, and almost insipid, but sharp, yea extream sharp hamors, sometimes more fluid, sometimes more tough, run out at their mouth, which not only corrode and corrupt linnen and woollen Cloathes, but any Leather; and every Night for a long time, and for many years most miserably afflict the Patients till their death, and at last are the cause thereof. I have seen several such, and when, to my grief, I never see any of them Cured either by my self or others, although now and then I have given some ease, but

never performed a Cure; and most of them do find sharp Vapours arise from the lower parts, which most miserably rack the Head about the Temples; these cruel rackings are usually attended with the Flux of a most sharp humour out of the Mouth whereby the Gumbs and other Parts about the Mouth, are corroded rather then consumed. And such Persons are seldom eased by Purges, but find more benefit from Anodynes and Narcoticks, and other things, which temper and concentrate sharp humors.

II. And as all the sorts of Spontaneous Salivation are Symptomatick; so I have frequently observed in these Countries Spontaneous Salivations, but critical ones, and such as happily rid the Patients of chronical Diseases. And no wonder, for as all chronical Diseases have their rise from a tenacious, thick, glutinous and viscous Phlegm, or at least have it joyned with their primary cause, and the rise of this same Humour is mostly owing to Spittle, so the evacuation of it with the Spittle seems more easie, seeing when it is joyned with the mass of Blood, it is again separated from it of its own accord, that it may be voided with the Spittle.

I. **A**S to what concerns pustulous Eruptions, as the Glandulous humour may be depraved several wayes, so especially these three, and therefore usually falls into a coagulative disposition with the Serum that is newly poured out of the Blood. First of all, the Blood it self being very impure, and also dissolved, leaves its corruption and recrements plentifully in the cutaneous Glands, which there assuming the nature of a more corruptive ferment, do ferment and variously coagulate with other juices that either come thither or pass that way, and so produce not only Itches but several sorts of Leprosies. Therefore often and constant eating of salt Fish or Flesh, and dried in the Smoak or the Sun; also incongruous Drinks and Poysons, do commonly cause cutaneous eruptions, and those often times horrible ones. Secondly, the humour gathered in the cutaneous Glands, sometimes by mere stagnation becomes not only Itchy, but oftentimes Corruptive, wherefore not only they that have been long kept in Prison, but also they that have lived a Sedentary Life, and are used to filth and stink, live obnoxious to these Diseases; inasmuch as the Cutaneous Liquor being not at all eventilated, is corrupted by mere stagnation, and so obtains the nature of a corruptive Ferment, to which moreover an addition of Putrefaction is made by the Blood in like manner depraved.

A a a a

depraved

Sylvius de le
Boe. Appad.
prax. irad.
3. § 306.

depraved. Thirdly, if perhaps these causes be wanting, so as the Glandulous humour of the Skin has contracted no fault neither from the Blood, nor from its own stagnation, yet it is certain that the virulent infection communicated from without, does nevertheless render it prolifick as to these Diseases. This is exceedingly manifest from vulgar observation, inasmuch as they that are best in health, and have as good a Constitution as can be, scarce ever sleep without harm, in the same Bed with an Itchy Person, or where an Itchy Person has lain, nor only so, but Itchy Persons Linnen washed in the same washing with other mens often impart their infection. Certainly the Infection of no one Disease is more easily and certainly propagated (the Plague only excepted) then this of the Itch.

Willis.

II. Whether is Bleeding convenient? The Conciliator answers affirmatively, but with a limitation, that is, when the matter of the Itch is yet contained within the Body; for when the matter of it is blood mixt with sharp humours, it follows that bleeding is a convenient Remedy. Besides the effect is not taken away till first the cause be removed, which may this way properly be done. Yea, for an Universal Disease, such as the Itch is, an Universal Remedy, such as letting Blood is, seems convenient. But when nothing more of the peccant humour is in the Veins, there is no need of Bleeding. Distinguish therefore between the Itch that is already come, which is not increased by any further afflux of matter, and one that is but in coming.

III. Two primary Indications occur concerning the Cure of the Itch; The first Curatory, which respects two things, That the Glandulous humour (its corruptive ferment being utterly extinct) may be reduced to a right temper. Secondly, that the Pores and passages of the Skin being freed from the Ichorus Concretions, may recover their former strength and thorough passage. The second Indication, which is Preservatory, has a care of two things; First, to prevent the Impurities and Corruptive Infection of the Itch, as they fall from the Skin (while the ferment is in subduing) from regurgitating into the Blood and Nervous Liquor, and not only from causing disorders in them, but moreover (as it is often usual) from bringing some more grievous mischief upon the Brain and Heart; Secondly, to endeavour that the Infection of the Humours and noble Parts first contracted from the Itchy matter, while the faults in the Skin are amending, may be eradicated. All these intentions of Cure may be complicated together, by using inward and outward Remedies both at once, or they may be used first one and then another; namely, that the Morbifick matter being defeated, may not be able to run any whither and lye hid in any hole, but may totally be removed out of every corner by Medicines aimed at both inwardly and outwardly. Therefore Purges ought both to begin and make an end of this method of Cure. Although *Helmont* treats a Cathartick Medicine with high disdain, and as it were leads it in Triumph, because of it self it does not Cure the Itch: yet we may affirm, that this Disease is scarce ever easily, but never safely Cured, without this sort of Physick.

Willis.

Borellus,
Cent. 2. Obs.
92.

IV. A certain man, who was troubled with an exceeding Itching, washed his Body with an infusion of Sublimate: but within a few hours there were Blisters raised all over his Body: in a little while after he was so troubled with faintings and swoonings, that he was very nigh death, but being rubbed with Cordial things, he escaped. ¶ A Monk neglecting Universals, killed the Itch with Oyntments, presently upon which defluxions of Salt Humours supervening, and falling upon his Lungs, he spate Blood at times, and at length an

Hætick coming upon him he died. When he was dead his Lungs were found altogether corrupted, and most of them hardened into a *Scirrhus*. *Velchius Obs. 65.*

V. He that would Cure the Itch, must first of all cleanse the Blood; for it lodges in the Saline, Vitriolate, and Aluminous impurities thereof. And *Mercurius dulcis*, and *Vite*, *Arcanum Corallinum*, *Extractum Panchymagogum*, and the like exterging things perform the Cure. *Hartmannus.*

VI. But if there be any Obstruction, it must first be removed before you purge, without which an inveterate Itch will scarce give way. *Idem.*

VII. If the Itch be contumacious and itch very much, sweats happily Cure it, given for 20 dayes one after another, raised with the white, fixt flowers of Antimony, in a decoction or spirit of *Guaiacum*. Thus I cured a student in Physick, and a certain *Bohemian*. *Idem.*

VIII. Yet we must abstain, if the affection come from a hot and dry intemperature of the Liver, for by the administration of hot things it grows more effervescent, a greater aduotion of atrabilarious humours succeeding. A certain Student being troubled with a dry Itch all over him, whose body was of a hot Constitution, by the use of this decoction; Take of *China*, *Sassa parilla* each 6 drachms, wood of *Sassafras*, roots of *Rhodium*, *Cichory*, *Scorzonera* each 1 ounce, infuse them in 12 pounds of water, boyl half away, was so inflamed all over his Body, that he was forced to desist from his Cure. Besides I have observed as bad an event of Cure in other Itchy Persons, and them that were troubled with the *Lepra Græcorum*, although so great an excess of hot things were not committed. *Augustinus Thonerus, Obs. 3. l. 4.*

IX. A Senator of *Ulm*, while he tarried at *Geneva*, was infected with the Itch, by the advice of the Physicians 18 Cupping-Glasses were set at one time to divers out parts of his Body. When *Mr M Muller* was infected with the Itch, while he lived at *Venice*, 24 Cupping-Glasses were by the advice of his Physicians applied to him, and both of them were made free of their nastiness with good success. But though these Cures succeeded according to desire, nevertheless if any Physician should attempt to go upon such a process of Cure among us, he must never expect, that his advice would be followed. *Idem, Obs. 2.*

X. When I could Cure the Itch in the hands, especially in the right, by no Medicines, I took it away by making an Issue in the right Arm. *Glandepius.*

XI. Empiricks make a Girdle two inches broad of a list of Cloth, anointed with crude Mercury killed the vulgar way, and Hogs-lard, to be girt about the naked Loins, for them that are infected with the Itch, and who would in their Travels be free from Lice. A lusty Matron of about 40 years old, fat and of a moist constitution of Body, when in the Month of *February* she had put on such a Girdle for a small Itch, and had worn it for three Weeks night and day, she indeed was rid of her Itch, but there followed a Salivation, exulceration of the Gums, heaviness in the Head, which was followed by a Catarrh upon the left side, and a weakness of the same. It is certain this Disease came through the abuse of Mercury, which carried the Humours from the lower parts of the Body to the Head. *Hildanus, Cent. 5. Obs. 93.*

¶ But *Petræus* in *Nosolog. Harmonic. tom. 1. p. 395.* says, that Mercurial Unguents may be safely and successfully used in a contumacious Itch, if Universals be premised and the unprofitable and hurtful juice be exterminated the Body, yet such Topicks must not be made up of a mass of infinite Medicines, for so they will work with better success and quicker effect. These Mercurial Medicines rightly prepared, and outwardly applied, are so far from hindring Nature's motion, that they rather precipitate the verminous, putrid, salt and briny humours, which is the reason why of Mercury Sublimate and live Mercury, there comes *Mercurius dulcis*, because

because it has a virtue of changing the temper of, precipitating and also edulcorating corrosive Salts. And if any Symptomes arise at any time, they do not so much proceed from the Mercury, as from the mass of ill Humours, and Remedies applied amiss. Therefore Th. Bartholinus his Countrey Fellow cured all them with his Girdle, that had got their Bodies clear by the frequent use of Medicines, but he could not save the Cacothymick from death. This Rustick tempered Mercury with distilled Oyl of Juniper, and made it into a Mass, he spread it on a Girdle, and commended it for all Malignant affections, Cancers, malignant Ulcers, and Pains in the Limbs. In some places it is a Custome to mix Arcanum Corallinum with Oyntment of Roses in the Pox, and they account the same an Arcanum in a contumacious Itch.

XII. A filthy Itch troubled a young Man, with felons frequently breaking out, of which Ails he could not be cured by Bleeding and several Purges for Six Months time. At length I gave him 1 scruple of Mercurius dulcis, with half a scruple of Diagridium, which purged him very well, and within a few dayes he was clear.

XIII. A Reverend Father had contracted a filthy Itch all over his Body for 5 or 6 years, for which he had tried infinite Medicines to no purpose. I in so contumacious a Disease used only the Flesh of Vipers: sometimes he eat them boyled in water with a little Salt, and drank the Broth after them: sometimes he had them baked and turned to a Powder, which Powder he used with his Meat, together with Sugar, Cinnamon, or other things. In the whole Summer he eat above 160 Vipers: Whereby his Skin was renewed, and he became wholly, as it were another Man: And he that once appeared a very old Man, became as it were, young again, that is stronger then usual, and fitter to do any business. The use of Vipers is scarce ever beneficial under a long time.

XIV. There is a sort of Itch, which Fallopius calls Volatick, because it seems to fly all over the Skin: It has been certainly observed that one has overrun the whole Body in one Night. It is usually accounted by Physicians for an Efflorescence of the Blood. How truly the Cure does show, which they are so far from Curing, that on the contrary the Evil has grown stronger and stronger to death, refusing all Medicines. In this case, necessary purges and sweats being premised, there is a desired Secret in the Blood, which comes just after delivery from the Womb, together with the after-burthen, where all, or only some part of it, if namely the place affected be washed therewith. This Remedy is of so great efficacy, that it is seldom necessary to repeat it, and presently the volatick Itch falls off dead. I have with this cured infinite People, who have been infected with a dangerous Itch. Unctions are here not at all convenient.

Medicines especially made use of by eminent Physicians.

1. This is very proper, which I experienced in a young man, who had a great inveterate Itch, and very rough about his Legs, which reached from his Knees to the tip of his Toes; Take Linseed, beat it with water, lay it on thick, and use it constantly.

2. An excellent Oyntment of Salt of Saturn against the Itch; Take of Sal Saturni 1 ounce, Mastich half an ounce, Allum 1 drachm, Oyl Olive what is sufficient. Mix them, make an Unguent. It quickly heals and dries up the Itch.

3. The Itch is easily and pleasantly cured with this. Take of Oyl of Ben 3 drachms, Spirit of Salt half a drachm, Musk 2 grains, Wax what is sufficient. Make an Unguent.

4. A wonderful Oyntment for the Itch; Take of Turpentine washed in Rose water 3 ounces, Oyl of Roses 6 drachms, the juice of 3 Oranges, the Yolks of 3 Eggs. Make an Unguent; it has been experienced in an old and dry Itch; It may also be allowed to be admirable, because it expells the Itch by Urine, and makes a Man piss black Urine every Morning.

5. Take of live Sulphur 2 ounces, Gum Juniper, which Bookfellers use, root of white Hellebore powdered each 2 drachms; juice of Spurge, Oyl of Linseed each 1 ounce. Beat what should be beaten very fine, boyl them over the fire into the form of an Unguent, and strain them out, cast away the dregs, and keep the rest for use. After Bathing anoint the Hams, the inside of the bending of the Arm, the Palms of the Hands and Wrists, under the Arm-pits and Soles of the Feet, rubbing those places with store of Oyntment, and then go into a warm Bed for an hour or two, and let him be anoynted 3 times every other day. I have experienced this Itch in the worst old Itch that could be.

6. This is an excellent Remedy for the Itch; Take Salt of Tartar purified with Spirit of wine, and dissolved in a Cellar, joyn it with Sal Ammoniac and it cures the Itch. If it be mixt with the Tartar till it grow red, it will become more effectual to cure the Itch.

7. Take of green Elecampane half a pound, Hogslard 5 ounces. Beat them together, Boyl them on a gentle fire. Make an Unguent, with which the Pustules may be anointed. This Unguent is of admirable vertue, so that it operates like an Incantment.

8. When a certain Matron laboured of a contumacious Itch, which she had contracted by Contagion, I ordered her to take the small twigs of Birch (in defect of the leaves) and cut them into short pieces, but to hew the greater boughs into chips, and to boyl Bark and all in such a quantity of water, as that she might sit in a Tub full of it, up to her Neck, wherein I mixt 2 parts of crude Tartar and one part of Nitre; with which by God's blessing, after her Body had been first well prepared, she was wholly delivered from her Itch.

9. Whey, especially of Goats milk is in this case very useful, which indeed in a moist Itch may be given at first with 2 ounces of juice of Roses, that it may both purge and then for 4 or 5 dayes attenuate. If the Itch be dry, 2 or 3 ounces of juice of Fumitory may be added, or also 2 ounces of an Emulsion of Melon Seeds, which way it is a most efficacious Medicine for the Scab and Itch.

¶ This is an experienced Medicine in any Itch; Take the root of sharp-pointed Dock green, of Elecampane green each half a pound, Hogslard 3 ounces, beat them in a Morter, boyl them a little on a gentle fire, then strain them out violently, and make an Unguent.

10. This is a most excellent Oyntment. Take of the inner yellow rind of black Alder 3 handfuls, fresh Butter 1 pound, the best Wine half a pound. Boyl them to the Consumption of the watry part, strain it violently through a linnen Cloth. Keep it for use, it Cures the Itch admirably, especially in the younger sort. But the Body must first be well purged.

(Scorbutus,

Scorbutus, or the Scurvy.

The Contents.

- Northern People alone are not subject to it. I.
 Blood must be taken but in a small quantity. II.
 When the Spots appear, a Vein may be bled. III.
 Purging must be seldom and gradual. IV.
 Things that act by a Specifick virtue must be used. V.
 Their Heat and Acrimony must be corrected. VI.
 The Juice of Plants is to be preferred before Decoction. VII.
 Its Cure differs not much from the Cure of Hypochondriack Melancholy. VIII.
 Sugared things do harm. IX.
 Many Diseases are taken for Scorbutick, which are not so. X.
 The preservatory Method in a Salino-Sulphureous dyscrasy. XI.
 In a Sulphureo-Saline. XII.
 Of the Curatory Method for the Scurvy, whereby we oppose the Disease and the most urgent Symptomes. XIII.
 Of the vital Indication, wherein are Comprehended Cordial Medicines, Opiates, and Diet, requisite in the Scurvy. XIV.
 Medicines.

EXperience has taught us, that our Country does not altogether want the Scurvy; for although it be not attended with all the Circumstances, which are reckoned up by Northern Authors, yet it affords some Symptomes, which are sufficient to establish its nature, many whereof we have observed in several Patients. 1. The first and most evident sign, the affection of the Mouth, Gums, and Teeth: In the Gums there is a redness, itching, putrefaction, bleeding, and stinking smell: which affections are sometimes communicated to the jawes and palate; and also to the Teeth, which are found loose and black. 2. Spots coming in the Arms and Legs. 3. Difficulty of breathing and straitness of Breast, by gross Vapors coming to the Diaphragm, and by the swelling of the *Pancreas*, that is filled with some thick humour. 4. A spontaneous lassitude, and heaviness of Body. 5. Various Urines, sometimes thick with a red and thick sediment, without any suspicion of the Stone; sometimes thin. 6. A weak and unequal Pulse, and almost fornicating. 7. Pains seizing several parts of the Body, sometimes the Loins, whence it is sometimes called *Lumbago* by some. 8. Divers hurts of motion, so that sometimes a Palsie arises, sometimes Tremulous and Convulsive motions. 9. A Flux, simple, or bloody. 10. A stinking Breath. 11. Frequent shivering, not attended by any Heat. 12. Agues far differing from the Characters of common Agues. 13. Swellings in divers parts of the Body, sometimes hard, sometimes soft. 14. Extreame Atrophy.

Rivarius.

Sennertus.

II. This Disease, as *Galen* advises, admits not of plentiful Bleeding. And if this Disease have taken root, and there be a great corruption of the Blood and Cacochym, with no abundance of Blood, and if it hath seized the whole Body, so as that already break out, and other external Signs appear in the Body here and there, bleeding must not be ventured on, lest the more pure and subtil Blood running out, and the more viscid and thick remaining in the Veins, the Patient's strength be weakened: But we must then rather fall on preparing and evacuating the Scorbutick Cacochymic.

III. Many reckon it an unpardonable mistake to let Blood in Scorbutick Spots, being only intent upon Anti-scorbuticks, because of the Scorbutick malignity, which is held to exclude this generous

Remedy. But although Blood-letting be not proper for a Scorbutick Malignity of it self: yet I do not see why, in the beginning, while strength is yet good, and while the Disease has not as yet Infected the whole mass of Blood, a Vein may not be bled in the Scurvy by accident, as well as in other Cacochymies; to the end, that part of the ill Blood being taken away, the Body may be relieved, and so the remainder may more easily be brought under and conquered; especially since Nature shows the same, who sometimes in the Scurvy pours out Blood not only by the Hemorrhoids and *Menses*, but also by other Veins, as by the Nose, Feet, &c. Nevertheless, this Disease admits not of large Bleeding, but a repetition of it is best, in several places, thrice at least, but at some dayes distance.

Frid. Hoffmannus, m. l. i. c. 12.

IV. As for preparation and purgation, since the Scurvy will not bear strong purgatives, but is rather exasperated by them, as *Eugalenus* informs us, and all learned Physicians, being so taught by experience, testify, that the bad Humours cannot be evacuated all at once, Gradual purgation is the best to be insisted on, so, to wit, that the matter may first be prepared and concocted, and the corruption and putrefaction of the Humours may be conquered and restrained, and then gentle purgation may be made. And seeing the Scorbutick matter is not all of the same substance, but is mixt of divers humours, we may again come to preparation, and then, if there be need, the prepared Humours may again be evacuated by fit Medicines. But if this should not be observed, and purgatives should be given, while the matter were crude, and the specific corruption of the Humours not as yet conquered, the matter being moved and disturbed would produce great anxieties. Yea, it has been observed, that several have recovered without the use of Purgatives, by using of attenuating and inciding Anti-scorbuticks.

Sennertus.

V. It is not for nothing that *Eugalenus* informs us, that several times Physicians, otherwise learned, have laboured in vain in curing this Disease, which they understood not rightly, who without doubt used both aperient, alterative, evacuating and strengthening things, but in vain, because they understood not a Scorbutick Cacochymie. For all aperients and alteratives of the Melancholick Humour, are not here sufficient; but such things must ever be used and mixt withal, as respect the nature of this Humour.

Sennertus.

VI. Since divers other Humours abounding in the Body may be mixt with the crude and gross Humour, that is the cause of the Scurvy, and they oftentimes choleric and hot, and since the Humours detained in the *Hypochondria* do as it were ferment, and grow hot, we must have a care, that we exasperate not the Evil by over hot Medicines, especially in more Southernly Climes, where the Melancholick humour is adust and approaching to the nature of black Choler: Therefore such Medicines are not improperly given in Whey.

Idem.

VII. Authors do well caution us about Medicines proper for the Scurvy, that there is greater efficacy in Juices than in Decoctions, which experience testifies. For they have their efficacy from a volatil Salt, which is dissipated by boiling, and for the most part vanishes in drying: But in Juices and Conserves it remains in a manner intire. Much less should Extracts be preferred: For although no unprofitable ones may be prepared out of some Plants; yet since their virtue chiefly consists in a volatil Salt, it cannot be, but it must be wasted: For this Salt unites it self with Spirit of Wine, or with whatever other Liquor is used in the Extraction, and flies away with it, and so the Body is left destitute of this Salt, and in a great measure ineffectual.

Hoffmannus.

VIII. The same Cure must be insisted on in this Disease, as in Hypochondriack ones, seeing it is bred of the same humour, but further receding from a natural state. Therefore for the most part it stands in need of more powerful Remedies.

Riverius.

IX. All sugared things are enemies to Scorbutick and Hypochondriack persons; and therefore let us abstain from the use of them; for not only as they lye in the *Hypochondria* of Scorbutick Persons, they turn into dross near akin to Salts, but according to *Celsus* l. 4. c. 9. they are enemies to the Spleen, for they move bile, ferment the Humours and breed Obstructions in the Bowels. And by the use of them, according to *Hippocrates* *ἡσυχία καὶ μέλας γίνεται ὁ σπλῆν*, that is, the Spleen is swelled and made great. Wherefore both *Dornrellius* *presat.* *Dispenfat.* and *Greg. Hofstius* l. 7. *Observat.* forbids them Scorbutick Persons.

Mœbius, In-
stit. p. 522.Hofmannus,
m. p. 348.

X. I will tell you freely, that although I do not question, but the Scurvey is truly found in these Northern Parts, yet I am verily perswaded, it does not so frequently occur as is commonly believed: And that many (not to say most) of those Diseases, on whose account we blame the Scurvey, are the effects of Diseases, that are in breeding, but not yet bred, and which have not as yet put on any certain type, or the unhappy reliques of some Disease that is not as yet wholly conquered, whereby the Blood and other Humours are tainted; for example, In what bodies any matter, apt to produce the Gout, is newly bred, but not as yet fallen upon the Joynts, divers Symptoms will show themselves, which will give suspicion of the Scurvey, till a Gout now formed, and actually exerting it self, leave no room for further doubting. What I have said of the Gout, I would have understood of the Dropsie, concerning which Disease although it be vulgarly said, Where the Scurvey ends, the Dropsie begins, yet this rule must very often be no otherwise taken, than that as soon as ever the Dropsie shows it self by manifest signs, then the pre-conceived opinion of the Scurvy immediately falls to the ground. The same may be said of very many other chronical Diseases, which are but growing, and which therefore have not formed themselves any type, or of them also, which although they be partly got away, yet they seem not to be wholly conquered and exterminated. And indeed, unless we allow this, the name of the Scurvy, as it now goes, will encrease vastly, and will serve for almost all Diseases. Whereas if we would make it our business, to search narrowly into the inwards of every Disease, and bring it from behind the Veil of irregular Symptoms, it would presently show its nature, and might easily be placed in that family, to which it belongs. And the method whereby such Diseases should be driven away, ought not to be accommodated to these counterfeit Symptoms, but to the Disease it self, whatever it is, as perfectly formed, and then actually existing.

Sydenham.

XI. As for the Cure of the Scurvy, since not only one simple preternatural affection; but a legion of such must be forced away; therefore the method of Cure ought to touch upon manifold Indications, and those variously complicated, and subordinate, which yet I have thought good after the vulgar manner to reduce to these three heads, namely as they are preservatory, which respect and remove the cause of the Disease, and Curatory, which remove the Disease it self and its Symptoms, and lastly vital, which maintain and restore the strength and Spirits of the Patient. At the beginning of the Cure we ought to aim at the cause of the Disease; for when it, like the root, is cut or pulled up, presently the stock, boughs and fruit wither away. Since therefore we have shown that the cause of the Scurvy is founded upon a Dyscrasie in the Blood, to wit, either Sulphureo-Saline, or Salino-Sulphureous, we must do our endeavour, that

the Dyscrasie of either nature may be amended:

To this purpose, First, Impediments must be removed, and then the Primary intention must be put in execution, for both which ends Remedies are taken from Diet, Surgery and Pharmacy. As to Diet, a special course of it shall be appointed below; in the mean time we will proceed to the rest. The reduction of the Blood to a due temper by appropriate Medicines is especially hindered for these two reasons, that is, First, because it is continually furnished with a store of bad nutritious Juice; Then Secondly the recrements that are bred in it, are not sufficiently voided by the proper emunctories. There we must take care that the work of Chylification may be performed aright in the first wayes, then that the vaporous recrements may be purged away by Transpiration, the serous by the Kidneys and Lymphæducts, the bilious by the Gall-bladder, the atrabilarious by the Spleen, and others of what kind soever they be, by their proper emunctories. Then, when these offices are rightly performed, we must endeavour to reduce the Dyscrasie of the Blood, by specifick Medicines, and especially such as have a volatil Salt in them. The Remedies that respect each of these intentions may be complicated together, and ought to be used both at once, but in what manner and modes of administration, we must yet more particularly show.

1. We must have a care that Chylification be rightly performed in the first ways, that the load of Excrementitious matter gathered there may be cast off, that the destroyed or depraved ferments may be restored, that the passages and pores that are any ways stoppt or obstructed, may be opened. To these ends Cathartick, digestive and aperient Medicines are designed. 2. That the excrements gathered in the mass of Blood, when they are not sufficiently discharged by their proper emunctories, may now and then be carried off by other ways, most convenient. For this matter Catharticks, Diaphoreticks, and Diureticks are convenient. 3. That the Scorbutick Dyscrasie of the Blood may be amended by Phlebotomy and Specifick Remedies. Wherefore that the whole of preservatory Indication may be reduced in short, I shall comprehend the Pharmaceutick apparatus in narrow terms, that is, as it consists of Catharticks, Digestives and Antiscorbuticks, to which Phlebotomy may be added, as there shall be occasion. And I shall give some forms or prescriptions, and also the manner of using them. If the Stomach (as it is usually) being loaden with a sower or nidorous viscid matter, have an inclination to throw off the filth thereof by reaching and vomiting, and if the Patient have been able formerly to bear such evacuation well enough, nothing hinders, so the strength be not too much wasted, the giving of a Vomit. To the stronger an infusion of *Crocus Metallorum*, or *Mercurius vitæ*, or *Tartarus emeticus* *Nynsichti*, or *Sulphur Antimonii Glauberi* may be given. They that are of a weak constitution, and tender, may take *vinum scilliticum*, or *Gilla Theophrasti*; upon which given in a small dose, they may drink a large quantity of whey, and when the Stomach is filled till they reach, they may put their Finger or a Feather in their Throat, and they will vomit easily, and it may be repeated as often as they list. By this way of vomiting, the mere contents of the Stomach, being cleansed from its folds, are discharged: nor are painful or convulsive twitchings, or swooning (which are usually caused by Stybiates) raised in the Bowels thereabout, or in the Membranes. I have advised them, whose Stomach because of bad digestion, easily gathers a load of Phlegm or of some other degenerate matter, (and often with good success) to take such a Vomit once a Month, as being both safe and wholesome. Where there is no room for a Vomit, we must begin with purging; at least after the interposition

of a few days this evacuation must succeed the former. What is commonly inculcated by Authors concerning preparation of the Humours, I either reckon it needless, or, the circulation of the Blood being not understood, wholly erroneous: but instead of this intention, things that restore the ferments of the Bowels, and alter the frame of the Blood, may be used in their stead: so as in the mean time the filth of the first ways, and the recrementitious superfluities of both the Sanguineous and Nervous Liquor may be discharged; First a gentle purge may be given, and afterwards according to the strength of the Patient it may either be repeated once a Week or oftener or seldom; and the strength of the Medicine may be proportioned according to the success of the first Dose. If the constitution of the Patient be hot, and the Scurvy appear to be founded, in an adult, that is, a Sulphureo saline Dyscrasy of the Blood, all aloëtics and diagrydiates must be avoided, and only more temperate Medicines made of *Senna*, *Rheubarb*, and such like, which do not disturb the Blood and Humours, must be given. For Pills, Take of leaves of *Senna* 1 ounce, *Rheubarb* 6 drachms, *Dodder* of time 3 drachms, Root of *Polypody* of the Oak, English *Rheubarb* dried each half an ounce, yellow *Sanders* 2 drachms, *Celtick Spike* half a drachm, Salt of *Wormwood* 2 drachms. Being shred and bruised, let them be digested in a body in sand with White wine and Fumitory water each 1 pound (or with 2 pounds of our magisterial Antiscorbutick water) for 2 days, let the clear colature be evaporated in a gentle heat in *Balneo*, to the consistence of Honey, then add of the powder of leaves of *Senna*, *Rheubarb* each 1 drachm and an half. *Species diatriæ Santalæ* 1 drachm, Cream of Tartar 1 drachm and an half. Make a mass for Pills. The dose from half a drachm to a whole one. Or such an infusion may be made, and evaporated with a gentle heat to the consistency of a Syrup, adding towards the latter end of clarified Manna and whitest Sugar each 2 drachms. Make a Syrup. The Dose is a spoonful or two in some convenient vehicle. Or 4 or 6 drachms of the said Tincture may be given for a Dose, adding cream of Tartar half a drachm, and if it want sweetning, Syrup of Apples 3 drachms. Or 6 drachms of pickt *Corinths* may be put in the foresaid Tincture, let them be digested hot, till the *Corinths* swell, which being taken out, the Liquor may be evaporated to the consistency of a Syrup, adding of Sugar and clarified Manna each 1 ounce and a half. Then put in the *Corinths* again, and keep the Medicine in a Glass bottle well stoppt. The Dose is a spoonful or two. Or, to the foresaid Tincture evaporated half away add of fresh *Cassa*, Pulp of *Tamarinds* drawn with antiscorbutick water each 3 ounces conserve of *Violets*, *Damask Roses* each 2 ounces. *Pulvis sennæ compositus major* 1 drachm, powder of *Rheubarb* half an ounce, Cream of Tartar, *Species diatriæ Santalæ* each 2 drachms. Let them be well mixt in a Mortar till they be reduced into the form of an Electuary. The Dose is about the quantity of a Walnut, more or less, according to the success in Operation. They whose queazy Stomach does not admit Medicines, but in a small quantity and an elegant form, may take this; Take of Refine of *Scammony* from 4 grains to 8, Cream of Tartar half a scruple, *Celtick Spike* 6 grains, mix them, make a powder. Give it in a spoonful of *Panada*, or make it into Pills. If they that are sick of the Scurvy, be of a cold constitution, and the Disease appear to be founded in a nitro-sulphureous disposition, like roapy Wines, sharp Catharticks and such as have hot particles may be given them; Take of *Pil. Stomach. cum Gum.* 2 drachms, refine of *Jalap* 20 grains, *Tartarum vitriolatum* 16 grains, Oyl of *Juniper* half a scruple. With a sufficient quantity of Gum Ammoniac dis-

solved in *aqua lumbicorum* make 16 Pills. Take 4 at a time, once in a Week. Or, Take of *Pilul. Tartar. Bontii* 1 drachm and an half, Resin of *Jalap* 12 grains, Salt of Tartar half a scruple, with a sufficient quantity of *Syrupus Augustanus* make 12 Pills. Or, Take of *Extract. Pil. Ruffi* 1 drachm, Extract of black Hellebore 1 scruple, Salt of Tartar half a drachm, with a sufficient quantity of Gum Ammoniac dissolved, make 9 Pills. Take 3 for a Dose. Take of leaves of *Senna* 1 ounce, *Rheubarb* 6 drachms, *Mechoacan*, *Turbith*, Gum, each half an ounce, fibres of black Hellebore 3 drachms, Salt of Tartar 2 ounces, yellow *Sanders* 1 drachm and an half, *Winter bark* 2 drachms. Being shred and bruised, let them be digested in 2 pounds of white Wine for 2 days. Make a clear colature without expression, and either let 6 ounces of it be taken by it self, or let it be reduced into an Extract, or Syrup, or Electuary as the Tincture described above, adding of *Pulvis Arbuticus* or *Diasenna* a sufficient quantity, &c. Or, such a Tincture as this may be made, which may be given to strong men, to the quantity of a spoonful or a spoonful and an half; Take of Salt of Tartar 1 ounce, small Spirit of Wine 1 pound and an half. Let them be digested till it grow yellow, Then when it is poured off the dreggs, infuse therein of leaves of black Hellebore steeped in Vinegar 1 ounce, yellow *Sanders* 1 drachm, the yellow rind of Oranges 1 drachm and an half. Make a hot and close digestion for 3 dayes. Let the clear colature be distilled in *Balneo* to half, and let the remaining Liquor be kept for use. Or, Take of the root of sharp pointed Dock, *Polypody* of the Oak, Nettle, Chervil, each 6 drachms, leaves of Eupatory, Speedwell, each 1 handful, *Sanders* white and yellow each 1 drachm and an half, *Carthamus* 1 ounce, Tartar of white Wine half an ounce, boyl them in 2 pounds and an half of Spring-water to half. Add of Rhenish wine 1 pound, and let it be presently strained, To which put of the best *Senna* half an ounce, *Rheubarb* 6 drachms, leaves of black Hellebore half an ounce, the yellow of Oranges two drachms, Make a close and warm infusion for 12 hours. Let the Colature be kept in a Glass stoppt. The Dose from 5 drachms to 6. Within 4 or 5 dayes they may be repeated, as occasion shall require. Too often and violent purging destroys the strength, spoils the Bowels, and in the mean time removes not the Disease.

After once or twice purging, if bleeding be indicated, let it be done in the Arm, or in the Hemorrhoid Veins by Leeches: It is not much matter which Vein is opened, for the opening of the *Salvælla* is not of such moment, as is commonly believed. All the tedious controversies among Authors about bleeding the Jecorary, or Cephalick, or any other, which should be best, are at an end, since the Circulation of the Blood is known. Phlebotomy is indicated by the plenty and badness of Blood, which it is better to take away in small quantities at several times, than to take a great deal at once. For when the Sanguineous Liquor becomes very impure, it is more certainly amended by no sort of Remedy, than by letting of it often and in a small quantity: because as often as the old corrupt Blood is taken away, new, which is better and more pure succeeds. In the interim care must be had, that it be not taken away in too great a quantity at once; for when its store is hardly diminished, sanguification fails, so that a Drop-sie or Cachexy follows.

Therefore since the greatest pains in Physick should be bestowed upon eradicating the cause of the Scurvy especially and upon its own account; for this end, moreover Digestives and Specifick Remedies, or Antiscorbuticks, as we intimated but now, must be used at all times, except the purging dayes, to which, if there be need, Diaphoreticks or Diureticks may be added. There are

are in Authors many sorts of Receipts of Medicines, that perform these Intentions. I have a mind here to recite some of the choicest, which I have thought good to distinguish into two Classes, according to the twofold nature of the Scorbutick cause, namely, the Sulphureo-Saline, and the Salino Sulphureous Dyscrasie; and first of all, I shall treat of those that are proper for the latter sort of Distemper, that is, where need is of Medicines endued with a certain incitation, and very full of volatile Salt.

Digestive Remedies, which restore the ferment of the Stomach, and help the functions of it and other parts serving for chylicification; and Antiscorbuticks or Specificks, which remove the Dyscrasie of the Blood, are either joyned in the same composition, or at least are taken successively on the same day. Among Digestive Medicines there are justly reckoned, Cream of Tartar, salt and tincture of Crystal, *Tartarus Vitriolatus*, *Chalybeatus*, *Elixir proprietatis*, *Mixtura simplex*. The use of any of these twice aday does much good. Moreover, you may easily mix magisterial Tinctures and Elixirs, of divers sorts, both digestive and appropriate to the Scurvy, with the two following *Menstrua*; Take of rectified Spirit of Vitriol 6 ounces, alkalifate Spirit of Wine 16 ounces. Mix them and distill them in a Glass retort, with 3 Cohobations. Keep it for use in a Glass well stopp'd. *Elixir proprietatis* is better made and more easily, with the said *Menstruum*, than the common way. Take of Winter Bark, *Lignum Aloes*, lesser Galangal root each 2 drachms, Cinnamon, Cloves, Cubebs each 1 drachm, Seed of Bishopsweed, Creffes each half a drachm. When they are bruised pour on them the foresaid *Mensstruum* till it stand 3 Inches above. Digest them in a body in a sand Furnace 6 dayes. Keep the Colature in a Glass well stop't. The Dose is 20 drops in Canary or some proper Liqueur, twice a day. Take of the whitest Amber, Gum Ivie, *Caranna*, *Tacamahaca*, each 1 drachm, Saffron half a drachm, Cloves, Nutmeg each 2 scruples. When they are bruised pour on them the foresaid *Mensstruum* and draw the Tincture according to art. The Dose is 20 drops as before. Take of blew Salt of Tartar 4 ounces, digest it in a body with 1 pound of Alkalifate Spirit of Wine to the extraction of the Tincture. This may be another *Mensstruum*, with which you may make Elixirs out of Gums, Spices, &c. in the same manner as you did with the former *Mensstruum*.

While these sort of Medicines are given Evening and Morning, another sort of Medicines that are Antiscorbutick must be given at medical hours, that is, at eight before noon, and four after, which for the most part we give in a solid and liquid form together, taking the solid first and drinking the liquid upon it. There are several forms and compositions of both sorts.

ELECTUARIES.

Take of conserve of Scurvy-grafs, Roman Wormwood, Fumitory, each 2 ounces, powder of Winter's Bark, root of Angelica, Wake Robin each 2 drachms, *Species diatrium Santalon* 1 drachm and an half, powder of Crabs Eyes 1 drachm, salt of Wormwood 2 drachms. With a sufficient quantity of Syrup of Citron rind make an Electuary. Take of the Conserve of Scurvy-grafs leaves, Brooklime, made with an equal quantity of Sugar, each 3 ounces, Troches of Capers, of Rhubarb, each 2 drachms, salt of Wormwood, Scurvy-grafs each 1 drachm. With a sufficient quantity of Syrup of Juice of Scurvy-grafs make an Electuary. I usually prescribe Conserve of the outer Peels of Lemons and Oranges, of the purple flowers of the Ash-Tree, of the flowers and leaves of Lady-smock,

of the root of sharp pointed Dock and English Rhubarb, made with an equal quantity of Sugar, which being mixt either among themselves or with other Conserve and Powders, may go to the making up of such Electuaries as these. Take of the Conserve of the yellow of Oranges, of Lemons, of flowers of Ash each 2 ounces, root of *Contrayerva* 1 drachm and an half, lesser Galangal half a drachm, root of Aron 2 drachms, *Species Aromat. Rosat.* 1 drachm, salt of Wormwood 2 drachms. With a sufficient quantity of Syrup of Nutmegs make an Electuary. The Dose of these Medicines is about the quantity of a Nutmeg, drinking some appropriate Liqueur upon it. For Country people and the poorer sort, who desire Medicines easie to be had and cheap, I prescribe in this manner: Take of leaves of Scurvy-grafs, Brooklime each 4 ounces, the whitest Sugar 8 ounces. Pound them together in a Mortar, adding of powder of Winter's bark half an ounce, Tartar calcined with Nitre three drachms. With a sufficient quantity of Canary make an Electuary. The Dose is, the quantity of a Walnut every day twice, drinking some appropriate Liqueur upon it. Take of Leaves of Scurvy-grafs 1 pound, stoned Raisins, the whitest Sugar each half a pound, *secula* of Horse-radish root 2 drachms. Pound them together in a Mortar, and reduce them into the form of an Electuary. The Dose is the quantity of a Walnut twice or thrice a day.

CONFECTIONS.

Take of *Pulvis Ari Compositus* 1 ounce, powder of Winter's bark half an ounce, *Species diatrium Santalon*, troches of Capers each 2 drachms, salt of Wormwood, Scurvy-grafs each 1 drachm and an half, candied Orange Peel 3 ounces. Pound them together in a Mortar. Then add of the whitest Sugar dissolved in a sufficient quantity of *agua umbri-corum* 3 ounces. Make a Confection according to Art. Take of candied Eringo and *Scorzonera* root each 2 drachms, preserved Walnuts, Myrobalans each N^o. 2. Electuary of Saffaphras 6 drachms, powder of Cubebs, Cardamum each 2 drachms, powder of root of Zedoary, *Angelica*, each 1 drachm and an half, Salt of Wormwood 2 drachms. With a sufficient quantity of Syrup of Walnuts make a Confection. Take of the powder of root of *China*, wood of *Sassaphras* each half an ounce, yellow and white Sanders each 2 drachms, seed of Rocket, Cubebs, Creffes, Granes of Paradise each 1 drachm and an half, *Species Dialacca*, powder of Cinnamon, Orrice, lesser Galangale each 1 drachm, salt of Wormwood 2 drachms, Conserve of the yellow of Orange, and *Saccharum anthosatum* dissolved in a sufficient quantity of Snail-water 3 drachms. Make a Confection according to Art. The Dose is the quantity of a Nutmeg twice a day, drinking some appropriate Liqueur upon it. In some cases of the Scurvy, where the use of steel is indicated, either 3 drachms of Steel prepared with Sulphur, or 2 drachms of Vitriol of Mars may be added to any of these prescriptions; either Confection or Electuary; and after taking the Medicine once or twice a day, the Body may be exercised according to its strength.

POWDERS.

Take of *Pulvis Ari Compositus* 1 ounce and an half, Winter's Bark half an ounce, Cubebs, Granes of Paradise, Cardamome each 2 drachms, Salt of Wormwood 3 drachms, Lozenges of Oranges 3 ounces. Make a powder according to Art. The Dose 1 drachm in an appropriate Liqueur. To the foresaid powder add of the Kernel of the Indian

B b b b

Nut

Nut *Cacao* half a pound. Reduce it into a Mass or Paste in a hot Mortar. The Dose is about two drachms, as you take Chocolate, that is boyled in Spring water wherein Rosemary leaves, or *Scorzonera* root, or shavings of Ivory or Hartshorn have been boyled.

PILLS.

They that like Medicines in a small Dose and in the form of a Pill. Take of root of Virginian Snakeweed, *Contrayerva* each 2 drachms, *Winter's Bark*, *Cubebbs*, *Rocket seed* each 3 drachms, salt of Wormwood, Scurvy-grass each 1 drachm and an half, extract or Rob of Juniper half an ounce. With as much Syrup of Nutmeg as is sufficient, make it into Pills. The Dose is 4 Pills twice a day with some appropriate Liquor.

LOZENGES.

For the more delicate, Lozenges or Sweet meats may be prescribed in this manner. Take of powder of *Winter's Bark*, Crabs Eyes each 1 drachm and an half, powder of Pearl half a drachm, whiteft Sugar dissolved in a sufficient quantity of *aqua lumbicorum*, and boyled up for Lozenges 6 ounces, Spirit of Scurvy-grass 2 drachms. Make Lozenges according to Art, each of which must weigh half a drachm. Let him take about 1 drachm drinking some appropriate Liquor upon it.

Ora ge Lozenges sold by the Apothecaries in OXFORD.

Take of Peel of Oranges, Lemons, Citrons candied, each 1 ounce, Eringo root candied half an ounce, Pine and Pistachio Nuts each N^o. 20. Sweet Almonds blanched N^o. 10. Powder of Anniseed half an ounce, candied Ginger 2 ounces, *Species Aromatici*, *Rosat*, Nutmeg each 1 drachm and an half. Root of Galangale 1 drachm, Cloves N^o. 10. Ambergrease 4 grains, Musk, Civet each 2 grains, the whiteft Sugar dissolved in Rose water, and boyled up for Lozenges 1 pound and an half. Make Lozenges according to Art. Thus much for Medicines that use to be given to Scorbutick Persons in a solid form, or a thick substance. And that they may do the more good, and be carried more easily into the Mass of Blood, liquid Medicines for the most part are prescribed to be drunk upon them; the most usual forms whereof follow.

1. Decoctions.

Although Decoctions be the most familiar sort of Medicine, yet they are rarely used in the Scurvy, because Simples, which are especially proper for this Disease, as Scurvy-grass, Brooklime, &c. lose their virtue, which they receive from their volatil Salt, by boyling. Nevertheless, because Medicines are easily and quickly prepared this way, they may sometime be admitted. And besides experience testifies, that some of them have been effectual. This easie Medicine is commended by several Authors for Country People and the poor; Take of leaves of Water Cresses 3 handfuls, the lesser Sorrel 2 handfuls. Let them be shred, and steeped in 6 pounds of Milk and boyled to the consumption of a third Part. Let 6 or 8 ounces be taken twice a day. The Decoction of Wormwood is commended by *Engalenus* and others. I have often tried the following Remedy with good success; Take of tops of Broom 3 handfuls, let them be cut small and boyled in three

pounds of strong Beer to half. Let 2 or 3 ounces be given twice a day.

2. Infusions.

An Infusion added to the Decoction makes a most excellent Medicine; Take of root of *Scorzonera*, Chervil each 1 ounce, leaves of Agrimony, Ground-pine each half an handful, burnt Hartshorn 2 drachms, Raisins half an handful, boyl them in 3 pounds of Spring-water to the consumption of a third part. Add of Rhenish Wine half a pound, and presently strain it into a Glass Vessel, to which put leaves of Scurvy-grass, Brooklime, bruised, each half a handful, Orange peel candied and cut small half an ounce: Make a close and warm Infusion for 6 hours. Let the Colature be kept in Bottles stoppt. The Dose is 6 ounces twice a day after a solid Medicine. Take of Whey made with white Wine or Sider 1 pound and an half, let there be boyled in it of Burdock root, Eringo root candied, each 6 drachms, preserved Juniper berries half an ounce. Let the Liquor be boyled to the consumption of a third part, and strained into a Flagon, in which put leaves of Scurvy-grass, Brooklime each 1 handful. Make a hot and close Infusion for 6 hours. The Dose is half a pound twice a day, after a solid Medicine. Also Infusions made by themselves are sometimes of excellent use. Take of Scurvy-grass 1 handful, shavings of Horserhadiish root half an handful, *Winter's bark* bruised 2 drachms. Let them be put in a Glass with white Wine or Syder and Scurvy-grass water each 1 pound. Make an Infusion in a Cellar for 2 or 3 dayes, The Dose is 6 or 8 ounces twice a day, as before.

3. Juices and Expressions.

The most commendable way of using Antiscorbutick Herbs or Fruits is, to take the Juices and Expressions of them by themselves, or with some other proper Liquors twice or thrice a day: for so it is presumed, the virtue of the Medicine is given intire and untainted. Take of Water-Cresses, Brooklime each 3 handfuls, when they are bruised, strain out the juice, keep it in a Glass stoppt. The Dose is from an ounce and an half to 3 ounces, twice a day in a draught of Beer, Wine, or distilled water. Take of leaves of Scurvy-grass 4 handfuls, Wood-forrel 2 handfuls. When they are bruised, and the juice strained out, it quickly grows clear, when it is stoppt up in a Glass: for the sowerness of the Wood-forrel precipitates the grosser parts of the Scurvy-grass. The same succeeds if the juice of Orange be mixt with the juice of Scurvy-grass. The Dose is 2 or 3 ounces twice a day. Take of Scurvy-grass 4 handfuls, Brooklime, water-Cresses each 2 handfuls, long Pepper 3 drachms, shavings of Horserhadiish 2 ounces. Put them all in a glazed pot, with 2 pounds of Rhenish wine, or, if you had rather, Spanish: stop the mouth of it well, and let them stand for 2 dayes in a cool Cellar. Then make a strong expression. The Dose is 3 ounces twice a day after a solid Medicine. Take of Scurvy-grass 3 handfuls, Brooklime, Water-Cresses, Wood-forrel each 1 handful. When they are bruised pour to them Snail and Worm water each 6 ounces. Make a strong Expression, which must be kept in a Glass stoppt. The Dose is 2 ounces twice a day.

4. Syrups.

4. Syrups.

Syrups are not so well approved on in the Scurvy for the same reason as Decoctions, for as much, to wit, as the virtue of the most efficacious simples evaporates in boiling: yet because some may have occasion for such a Medicine, to sweeten some appropriate Liquors, I will here propose our preparation, reserving as much as may be, the virtue of the Ingredients. Therefore take of the leaves of Garden Scurvy-grass 6 handfuls, the Peels of 4 Oranges and of two Lemons, shaven thin, shaving of Horse-radish half an handful, powder of long Pepper 3 drachms. When they are all bruised together, strain out the juice, which being put up in a Glass well stopp'd, let it be set in a cool Cellar, till it clarify by settling, then let the clear Liquor be poured off by inclination into another Glass, and being close stopp'd let it be kept in *Balneo Mariæ*, in the mean time for each ounce take an ounce and an half of Sugar; and let the whole quantity be dissolved in *aquæ lumbricorum* and boiled up fit for Lozenges; to which by and by let the foresaid Liquor be poured hot by degrees, and mixt with a *Spatula*. As soon as it is incorporated, let the composition be taken from the Fire, and when it is cold, let it be put in a Glass. Let this Bag be hung in the Glass; Take of Cinnamon bruised 1 drachm and an half, seed of Cresses, Rocket powdered each 1 drachm. Mix them.

5. Distilled Waters.

Distilled waters, because they are a neat and a pleasant Remedy, have the greatest share in making up Antiscorbutick prescriptions. There are some such very useful and curious Remedies in our Dispensatory, such as *Aquæ Rûphani composita lumbricorum*, and *limacum Magistralis*. Besides famous receipts of such waters given us by *Quercetan*, *Dornicellius*, *Sennertius*, *Doringius* and other Authors. Moreover it is very easie for any Physician to prescribe such Receipts, proper for every Patient's condition, according to the occasion: For there are in them Antiscorbutick Ingredients, and moreover such things as respect some particular accidents and Diseases, to which, when they are shred and bruised, some convenient Liquor, as white Wine, Syder or Whey made with either of them, is poured, then the whole mixture is distilled in such Organs as they distil Rose-water. I shall here subjoin a Receipt or two which I make use of. Take of the Leaves of both the Scurvy-grasses, Brooklime, Water-Cresses, Broom-tops, each 3 handfuls, Leaves of Germander, Ground pine each 2 handfuls, Horse-radish root half a pound, Root of Aron, Angelica, Masterwort each 4 ounces; *Calamus Aromaticus* 1 ounce, Cinnamon, Cloves each half an ounce. When they are bruised and shred, pour to them of the best Syder 8 pounds, let them be digested for 2 days in a glazed pot stopp'd: then let them be distilled in a common distillatory: and let the Waters first and last drawn be mixt. In Winter time, when green Herbs are scarce, you may prescribe in this manner; Take of Leaves of Scurvy-grass 4 handfuls, tops of Broom, Pine, Juniper each 3 handfuls, *Winter's bark* 4 ounces. When they are bruised pour 8 pounds of white Wine, or Syder, or Whey made with either of them, and let them be distilled. The Simple water distilled off Aron Leaves in Spring time, is an effectual Medicine against the Scurvy, if 3 or 4 ounces of it be given every day twice with some other Medicine. The Simple water of Scurvy-grass, poured again to the fresh Leaves bruised, and

distilled off again, and so repeated by frequent cohobations, becomes an effectual Remedy. Furthermore, a burning Spirit of Scurvy-grass is prepared in this manner; Take of Leaves of Scurvy-grass as much as you please, bruise it, and make it up into Balls, such as are made of Woad for the Dyers, then let these Balls be put in a glazed pot, and pour either Scurvy-grass water or Wine, till it stand 4 Inches above, and set it exactly stopp'd in a cool place 3 or 4 dayes: Then let the whole matter be distilled by Alembick: The distilled water may be rectified in a Body. The burning Spirit comes first, 15 or 20 drops whereof may be given in some convenient vehicle.

6. Antiscorbutick Wines and Beer.

I use to make a Simple Antiscorbutick Wine of excellent use in this manner, in the Spring or Summer time. Take of Leaves of Scurvy-grass gathered in a serene time, as much as you please: Juice it, and fill a Vessel of 3 or 4 Gallons. Put a spoonful or two of yeast, and let it work for 2 dayes: Then stop the Vessel, and let it stand in a Wine Cellar for 6 Months: Then let the clear Liquor, a little yellow like Spanish Wine, be drawn off into Bottles, and kept for use. It lasts uncorrupt for several years. The Dose is 3 or 4 ounces twice a day. Medicated Wines, a Glass or two of which may be taken at medical hours, or at Dinner every day may be made in this manner. Take of Scurvy-grass 4 handfuls, of shavings of Horse-radish 4 ounces, *Winter's bark* bruised half an ounce, the outer rinds of 4 Oranges and so many Lemons. Put them in a Glass with 12 pounds of White Wine, Rhenish, or small Canary. Let the Vessel be stopp'd and kept in a cool place. Pour off the Wine clear, when you have occasion to use it. It is more usual to prescribe Scorbutick Persons a medicated Ale or Beer for their ordinary drink. Get some Wort for a four Gallon Vessel, instead of Hops boyl 3 handfuls of Pine or Firr tops in it. After it has done working, put 3 handful of Scurvy-grass Leaves in it, of the root of sharp-pointed Dock prepared 4 ounces, Peels of 4 Oranges, when it has settled a Week and is clear, let it be drunk. Such Physick Drinks as these may be diversly prepared with other Ingredients, according to the temperament of the Patient, and the Disease, which sort of Remedy, because the Medicamentous particles, which alter the Dyscrasie of the Blood are continually carried into its Mass together with the Alimentous, often do a great deal of good. Willis, de Scorbutus.

XII. In some Scorbutick Persons the use of Scurvy grass, Horse-radish, *Winter's bark* and other sharp things, that have a volatil Salt in them, are found to do a great deal of harm: Wherefore in such cases, where the morbifick cause consists in a hot Dyscrasie of the Blood, like fretted Wines, temperate Medicines, and such as do not move the particles of the Humours, that are apt to ferment of themselves are good, wherefore I shall treat of Medicines for this parallel to the former, and begin with solid Medicines.

ELECTUARIES.

Take of Conserve of Brook-lime, Lady-smock made with an equal quantity of Sugar each 3 drachms, *Species diatriam Santalum*, *diarrhodon Abbatis* each 1 drachm and an half, powder of Ivory 1 drachm, Pearl half a drachm, Salt of Wormwood, Tamarisk each 1 drachm. With a sufficient quantity of Syrup of Corals make an Electuary. Take of Conserve of Wood-forrel, of Hips each 4 ounces (or Conserve of root of sharp-pointed Dock,

B b b 2

root

root of Cichory each 3 ounces) Trochises of Rhubarb 2 drachms, *Spec. diamargarit. frigid.* 1 drachm and an half, bark of Tamarisk 1 drachm, *Sal prunellæ* 1 drachm and an half, preserved Myrobolans N^o. 2. With a sufficient quantity of Syrup of Myrobolans make an Eleſtuary. I use to prescribe this easie Medicine for the poorer sort; Take of Leaves of Brooklime 6 ounces, Wood-forrel 2 ounces, whitest Sugar 8 ounces, let them be pounded, adding of powder of sweet Fenil seeds half an ounce, powder of Ivory 2 drachms, *Sal prunellæ* 1 drachm. With a sufficient quantity of Syrup of juice of Brooklime make an Eleſtuary.

CONFECTIONS.

Take of the powder of the root of *China*, male Peony each 1 ounce, white and yellow Sanders each 3 drachms, Ivory 1 drachm and an half, Coral sprinkled with the juice of Oranges, and ground on a Marble 2 drachms, whitest Tartar 1 drachm, whitest Sugar dissolved in a sufficient quantity of compound *Scordium* water 6 ounces. Make a Confection. Take of the root of candied Eriugo, candied *Scorzonera* each 3 ounces, *pulvis Ari compos.* half an ounce, *Species diatrion Santalon* 2 drachms, *Sal prunellæ* 1 drachm and an half. With a sufficient quantity of Syrup of Clove gilliflowers make a Confection.

POWDERS.

Take of powder of the leaves of Ground-pine, *Ari compos.* each 1 ounce and an half, powder of Ivory, red Coral prepared with juice of Oranges each 2 ounces, lozenges of Oranges 2 ounces. Mix them. Make a powder. The Dose 1 spoonful twice a day.

PILLS.

Take of *Spec. diatrion Santalon*, *diamargarit. frigid.* each 2 drachms, seeds of Citron, *Carduus* bruised each 1 ounce, root of Dittany of Crete, male Peony each 1 drachm and an half, Salt of Tamarisk 2 drachms, with a sufficient quantity of Gelly of Harts horn or of Snakes skins make a mass.

LOZENGES.

Take of *Spec. diatrion Santalon*, *diamargarit. frigid.* each 1 drachm and an half, powder of Pearl, of red Coral prepared, powder of Ivory each 1 drachm, Sugar dissolved in *Scordium* water, and boyled up for Lozenges 6 ounces. Make Lozenges according to Art. But if the use of Steel be indicated with such temperate Antiscorbuticks, 2 drachms of *Magisterium Martis Mynsichti* or of Extract of Steel of our preparation may be added to the Eleſtuary, or Confection, or Mass of Pills. In some cases about 2 drachms and an half or 3 drachms of *crocus Martis* may be added to such a Composition; yet it is better to make the Liquors, that are to be drunk on the solid Medicines, chalybeate then the foresaid compositions. Now it remains to give some receipts of the Liquors.

Decoctions.

In a Scurvy, that comes after a long Fever, such Decoctions as purifie the Blood and plentifully provoke Urine, are given with success. Take of root of Chervil, *Scorzonera*, Sorrel, Parsly, each 1 ounce, Leaves of Liverwort, Harts-tongue, each 1 hand-

ful, burnt Harts-horn 2 drachms, parings of 3 Apples, Corinths 2 ounces, Liquorish 3 drachms. Boyl them in 4 pounds of Spring water to a Consumption of a third part. The Dose is 6 ounces after a solid Medicine. To Country People and the poorer sort, that after a Fever they may not fall into the Scurvy, I use to prescribe the following draught twice a day, namely, to take of root and leaves of Dandelion 1 handful and an half, of Posset drink 1 pound and an half. Boyl them to the consumption of a third part, strain it for 2 Doses. Or, Take of root of Dandelion half an handful, seeds of Citron, *Carduus* each 1 drachm. Boyl them in a pound and an half of Pippin, or Syder posset Drink, to the consumption of a third part.

Infusions.

The Apozems but now prescribed, will become much better against the Scurvy, if they be made without Liquorish, and strained into a Flagon, in which a handful of Brooklime and Scurvy-grass Leaves, or Lady smock may be put, and then a hot and close Infusion made for 6 hours. When the liquor is strained, keep it in Vessels close stoppt. The Dose is 6 ounces twice or thrice a day. And Chalybeate Infusions are often used, namely Salt, magistery or extract of Steel may be infused in some decoction or distilled water; moreover, as natural Spaws, so also artificial ones of our preparation of Steel dissolved in Spring-water, and impregnated with infusion of Antiscorbuticks, are drunk with great benefit.

Juices and Expressions.

Take of Leaves of Brooklime, Water Cresses each 4 handfuls, Wood-forrel 2 handfuls. When they are bruised, strain out the juice, if it be stoppt close in a Glas, it will quickly clarify and settle. The Dose is an ounce and an half to 2 ounces, with some convenient vehicle. Take of Brooklime 4 handfuls, Leaves of *Engliſh* Rhubarb 2 handfuls, bruise them, and strain out the juice. Take of Leaves of Brooklime, Water Cresses, Lady-smock, lesser Celandine, Sorrel each 2 handfuls. When they are bruised, strain out the juice, add a 4th part of juice of Oranges. Keep it in a Glas.

Syrups.

As often as a Syrup is required to be added to any other Composition, we use Syrup of juice of Wood-forrel, or Fumitory, or Coral, or a magistery Syrup of juice of Brooklime may be made the same way, as is prescribed above for juice of Scurvy-grass.

Distilled Waters.

More temperate distilled waters are made by changing either the ingredients, or the *Menstruum*, or both. As to the former, we may proceed in this manner. Take of Leaves of Brooklime, Water Cresses, Fumitory, Harts-tongue, Liver-wort, Balm, tops of Tamarisk, Cypress each 3 handfuls, of all the Sanders bruised each half an ounce, root of sharp-pointed Dock, Polypody of the Oak each 2 ounces, the outer rind of 4 Oranges, of cleansed Snails 2 pounds. When they are cut and bruised, pour to them 6 pounds of Whey made with Syder. Distil them in a common Distillatory. 2. Let the *Menstruum* be weaker and the ingredients moderately hot; Take of Leaves of Scurvy-grass,

Scurvy-grass, Lady-smock, Water Cresses each 3 handfuls, Peels of 4 Oranges, Snails 1 pound, when they are chopt very small, pour to them of Whey or new Milk, 6 pounds, distill them the common way. 3. In a Scorbutick Atrophy and Consumptive disposition, where nothing hot ought to be admitted, which may exagitate the Blood, humors and spirits, both the Ingredients and the *Menstruum* must be temperate and sweetners of the Blood; Take of Leaves of Brooklime, Lady-smock, Harts-tongue, Maiden hair, Liverwort, Speedwell, Agrimony each 2 handfuls, cleansed Snails 1 pound and an half (or the pulp of a Capon or a Sheeps Heart shred) parboyled and shred. When they are all bruised together, pour to them of new Milk or Fumitory water 6 pounds, and distill them the common way.

Physick Wines and Beer.

Although the use of Wine in a Scurvy, caused by a hot or Sulphureo-Saline Dyscrasie of the Blood, may not seem so convenient, yet if at any time either a weak Stomach, or long custome require the drinking of small Wine at least, such a Liquor may be made more temperate and in some measure medicated. For first of all small Wines may be given, diluted with water, impregnated with an Infusion of Balm, Borage, Burnet or other such things. Moreover Wines may be made of juice of Currans, Cherries, or other horary Fruits, which when they are ripened by fermentation, are very grateful to the Stomach and cleanse the Blood; then Syder, the familiar, and almost natural Wine of our Country, defecated this way, when it is mild and sweet without any acidity, does much good in the Scurvy. Furthermore, when the Lees are taken from this Liquor and it is put up in small Vessels, several sorts of Ingredients may be infused in it, such as tops of Pine or Firr, flowers of Tamarisk, also shavings of Harts-horn or Ivory, which sweeten the Liquor and keep it from fowring; in as much, to wit, as the particles of the fluid Salt up and down the Syder, which are apt to cause sowerness, are by infusing the said Ingredients, suspended. More temperate Physick Ales may be prescribed in this manner; Let a 5 or 6 gallon Vessel be got ready for small Ale, in which instead of Hops, let tops of Pine, Firr, Tamarisk, or shavings of any of the Woods be boyled; then after working let some roots of sharp-pointed Dock, (than which certainly there is no better Remedy for the Scurvy) be put in the Vessel. To these sometimes there may be added Leaves of Brooklime, Water-Cresses, Winter Cresses, &c. also pome-Citrons or Oranges cut into slices. Leaves of Harts-tongue put into a Barrel of middling Beer, after it has done working, give it both a grateful tast and smell.

XIII. The method already laid down timely begun, and rightly insisted on, often does the business, in as much as the cause or root of the Disease being taken away, the Ails depending thereon vanish of themselves. Yet we cannot always hold a direct course, but must sometimes turn aside to accidents and symptoms, to the most urgent whereof we shall have respect.

Of the Cure of difficulty of breathing, and Asthmatick Paroxysms.

Difficulty of breathing with straitness of Breast and Asthmatick Paroxysms, must be immediately removed with proper Remedies, prescribed out of the general method, for otherwise the Patient's life would quickly be endangered. And since such

evils usually arise either from the Bloods stagnating in the Heart, or from the pneumonick Nerves being hindered in their function, therefore they are cured either by Cordial, or Antispasmodick Medicines. Spirit of Harts-horn, Soot, Blood, Mans Skull; also tinctures of Castor, Antimony, or Sulphur, flowers of Sal Ammoniack, of Benzoin, and *Elixir proprietatis* are of excellent use in these cases, which Medicines may be given frequently in a Dose of some Antiscorbutick Liquor good against such Diseases. For the quieting a mere spasmodick difficulty, if at any time it come suddenly, I have not experienced a more present Remedy than 10 or 12 drops of our tincture of *Laudanum opiatum* given in some convenient Liquor, for when sleep comes on, the Spirits abate their disorders, and in the mean time being refreshed, they afterward resume their pristine tasks in due order. Sharp Clysters, which give many stools, as also Sudorifick Decoctions, and Diureticks do often give relief; Take of root of Burdock, Butter-bur, Chervil, each 1 ounce, Leaves of Maiden-hair, Germander each 1 handful, Seeds of Burdock, *Carthamus* each 3 ounces, Raisins 2 ounces. When they are stoned and bruised, boyl them in Spring water to the consumption of a third part. Add of White Wine 4 ounces, strain them into a Flagon, to which put of Leaves of Scurvy-grass shred 1 handful, Elecampane root Candied and cut very small half a drachm. Make a close and hot Infusion for 3 hours. The Dose is 6 ounces twice or thrice a day.

Of ails of the Stomach, that usually come upon the Scurvy.

Scorbutick Persons are sometimes troubled with a great fulness and pain of the Stomach, and loathing and belching, and sometimes frequent vomiting. Which Diseases arise sometimes from chyle degenerating there into putrefaction, oftentimes from Morbifick matter, either carried from the Blood or Nervous juice, and left within the cavity of the Stomach, or fixt in its Nervous folds and Membranes: In such cases if a viscid nidorous matter, or any other way troublesome be cast up by vomiting, and there be suspicion, that the cause is within the Cavity of the Stomach, it will be convenient to give a gentle vomit of Wine of Squills, or Salt of Vitriol, or to purge off the peccant Humour, with extract or infusion of Rhubarb, adding a little Salt or Cream of Tartar; but if the matter stick close among the Membranes or Nervous folds, Diaphoreticks, or things that stop the effervescency of the Salts are rather convenient. *Elixir proprietatis* or flowers of Sal Ammoniac, or Spirit of Soot may be often taken with *agua raphani composita*, *lunbricorum*, or any other Antiscorbutick Liquor. In the mean time once or twice a day a fomentation of Wormwood, Centaury, Chamomil flowers, Gentian root, and other things boyled in White Wine may be applied to the region of the Stomach with woollen Clothes dipt therein hot and a little wrung out. The use of Clysters is convenient. Opiates also often do a great deal of good.

Of the Belly-ache and Scorbutick Colick.

No Disease almost requires more speedily help from Medicine, then the Colick and Gripes which often happen in the Scurvy. Against these evils Clysters of divers sorts, Fomentations, liniments and Cataplasms are used. The use of Opiates is found very necessary here. Certainly in this case that rule of *Riverius*, to give purging Pills mixt with *Laudanum* has place especially, for after sleep

is caused, and plentiful purging, the Flt is often at an end. But testaceous powders, by which acid Salts are imbibed or fixt, do very much conduce to drive away the Morbifick cause, for example; Take of powder of Crabs eyes, Egg-shells each 1 drachm and an half, Pearl 1 ounce. Make a powder, divide it into 12 Doses, of which one sixth part may be taken once an hour, with some Scorbütick water, or with a Decoction of Root and Seeds of Burdock, as is described before, or with posset drink, wherein Roots and Seeds of Burdock, Leaves of sweet Marjoram and Saxifrage have been boyled, and Leaves of Scurvy-grass infused. In a Scorbütick Colick, and in the Diseases of the Stomach but now mentioned, the use of purging Spaw-waters, such as ours of *Epsom* and *Barnet*, are excellent good.

Of a Loosness and Bloody Flux.

An inveterate Loosness, such as frequently happens to Scorbütick Persons, must by no means be stoppt with astringent Medicines, nor is easily cured with Alteratives or any Antiscorbüticks. Spaw waters impregnated with Iron or Vitriol are the best Remedy for this Disease, next to these are artificial Spaws or Chalybeate Medicines, which use to give great relief. *Crocus Martis* rightly prepared may well be preferred before all the rest. I have often used the following method with good success. First of all give a purge of the powder or infusion of Rhubarb adding astringent Aromatics, and let it be repeated sometimes at the interval of 3 or 4 dayes, the other dayes let the quantity of a Nutmeg of the following Eleatuary be taken in the morning and at 4 of the Clock; Take of Conserve of common Wormwood made with an equal quantity of Sugar 6 ounces (in a hot Constitution, instead hereof, Conserve of red Roses may be taken) *Species diarrhodon Abbatis* two drachms, Sanders white and red powdered each 1 drachm, the best *Crocus Martis* half an ounce. With a sufficient quantity of Syrup of Steel make an Eleatuary. In Dysenteries and a *Tenesmus* we may proceed in the like method: Spaw waters, if they may be had, must especially be used. Moreover Clysters of vulnerary Decoctions may be often used. I lately cured one of a long and grievous Dysentery, who had for a long time voided every day an ounce of Blood by Stool, with this Remedy; Take of the best Rhubarb in powder 1 ounce, red Sanders powdered 2 drachms, Cinnamon 1 drachm, *Crocus Martis* 3 drachms, *Lucatella's* Balsome what is sufficient. Make a mass for Pills; he took 4 Pills, sometimes every day, sometimes every other day for a fortnight and he was perfectly cured. I also prescribed him a Physick Beer of an Infusion of roots of sharp pointed Dock, and Leaves of Brooklime to drink constantly.

Of the Vertigo, Swooning and other Ails usually attending the same in the Scurvy.

A *Vertigo* frequently comes upon an inveterate Scurvy, which is usually accompanied with frequent Swooning; and almost a constant dread of it, and moreover with a numbness in the Limbs, and a pricking running hither and thither. Which sort of Ails proceed from the failure of the Animal Spirits sometimes in the very fountain, sometimes among the Nerves, both Cardiack, and which serve other parts, and seeing they depend upon the Brain and Nervous kind, being much pestered with a Scorbütick Salt, they are not easily cured. Cephalick Remedies, such as are proper in the *Vertigo* and Paralytick Diseases cau-

fed by themselves, must be used mixt with Antiscorbüticks. Having therefore first of all made provision for the whole by fitting Catharticks, and such as are proper in the Scurvy, you may proceed in this manner with appropriate Medicines against the said Ails. At the beginning of the Cure apply Leeches to the Hamorrhoid Veins, and, unless something contra-indicate, let the same be often afterwards repeated. Take of the powder of the Root of male peony half an ounce, red Coral prepared 2 ounces, Man's Skull, Elk's hoof each 1 drachm. Mix them. Take of the best Sugar dissolved in compound Peony water or in Horse-radish water, boyled up fit for Lozenges 8 ounces, oyl of Amber well rectified half a drachm. Make Lozenges according to Art. Take a drachm and an half or two drachms morning and evening, drinking thereupon a draught of the distilled water following; Take of Leaves of Scurvy-grass, Brooklime, Cresses, Lilly conval, Sage, Rosemary, Betony each 3 handfuls, green Walnuts 1 pound, Peels of 6 Oranges and of 4 Lemons, fresh Roots of male Peony 1 pound and an half. When they are bruised and shred, pour to them of Phlegm of Vitriol 1 pound, Whey made with Cider 5 pounds. Distil them after the common way, let all the water be mixt together. The Dose is from 3 to 4 ounces.

Of Hamorrhagies.

Hamorrhagies in the Scurvy often threaten great danger of the Patients being hastened to his end thereby; while Blood bursts out sometimes at the Nose, sometimes by the *Menses* or Hamorrhoids, almost to Swooning; Besides, sometimes it being cast out of the Lungs or Stomach, gives suspicion either of an Ulcer, or at least of a great debility in the part affected. Wherefore Bloody excretions, if they either be immoderate or come in an inconvenient place, must for the present be stoppt, and for the future prevented. For stopping of Blood, when it bursts out immoderately, the method is well enough known, and there is nothing to be done in this Case more peculiar because of the Scurvy, than when it comes upon other occasions. Yet, to prevent Hamorrhagies, Remedies may be used, which take off the Acrimony of the Blood, and straiten the Mouths of the Vessels, which are too lax and gaping. Each intention may be well performed by Chalybeate Medicines. The use of Vitriolick Spaws is most proper for this business: Moreover Infusions, Extracts, Salts, and such preparations of Steel, which especially contain the Saline or Vitriolick nature of Iron are ever good against Hamorrhagies. Take of Conserve of red Roses, of Hips each 3 ounces, *Species diarrhodon Abbatis*, *Diatrion* each 1 drachm and an half, Salt of Steel 1 drachm, *Crocus Martis* well prepared 2 drachms, red Coral prepared 1 drachm and an half. With a sufficient quantity of Syrup of Steel make an Eleatuary. Thrice a day take the quantity of a Nutmeg, drinking thereupon a draught of some appropriate Liquor. I use to prescribe for the Poor in this manner; Take of the tops of Cypress, Nettle each 2 ounces, Brooklime 2 ounces, bruise them in a Mortar with 10 ounces of the whitest Sugar, then add of Scales of Iron very finely powdered 1 ounce, powder of white and red Sanders each 2 drachms. With a sufficient quantity of juice of Nettle make an Eleatuary. The Dose is the quantity of a Nutmeg twice a day. Take of the defilled water, or Decoction of some temperate Anti-scorbutick two pounds, of our preparation of Steel 2 drachms. Mix them in a glass. The Dose is 3 or 4 ounces. Take of Nettle tops, Leaves of Brooklime each 4 handfuls. When they are bruised, strain out the juice,

juice, keep it in a Glass. The Dose is 2 or 3 ounces twice a day, with some distilled Antiscorbutick water.

Of faults in the Mouth arising from the Scurvy.

Whenever the Scorbutick Infection has seized the Mouth, so as the Gums swell, and the flesh of them become fungous, immediately Remedies, which drive away putrefaction from them, must be diligently used: Among these, Washes for the Mouth, and Liniments are of especial use, both when the Disease begins about these Parts, and when it grows worse; which nevertheless, as they respect divers intentions, so they use to be diversly prepared, to wit, the flesh of the Gums, when it first swells, must be freed from the Incurfions of a Salt and corrupt Blood and Serum: afterwards the Flesh grown flaccid and shrunk from the Teeth must be defended from putrefaction, and that it may stick closer to the Teeth, there must be astringent; for these and other intentions Gargarisms or Mouth-washes of divers sorts may be used: Of all which the chief ingredients are Vegetables boyled, and Minerals infused: The Herbs and Roots that are boyled in some proper Liquor, either Water or Wine, are for the most part either sharp, or bitter, or styptick: and then such Decoctions are impregnated, either with a Volatil, Lixivial, Vitriolate, Chalybeate or Aluminous Salt. 1. When therefore the Flesh of the Gums, by reason of a defluxion of Salt and corrupt Blood and Serum, first begins to swell and grow fungous; Take of the middle rind of Elder, Elm, each half an handful, Leaves of Savory, Sage, Rocket, Cresses each 1 handful, Roots of Pellitory of Spain 2 drachms, being shred and bruised, boyl them in 3 pounds of Lime-water to the consumption of a third part: If edulcoration be required, add of Honey of Roses 2 ounces. Make a Gargarism. Or, take of tried Vitriol 1 ounce (our Country People call it Captain Green's powder) Spring-water 2 pounds, mix them in a Glass, shake it, and when the Liquor is settled and clear use it. Or, Make a Lix. of ashes of Broom or Rosemary, or of calcined Tartar or Nitre; in 3 pounds of this boyl of the Leaves of Savory, Time, Rosemary, Sage each 1 handful. Let the colature be poured upon 2 handfuls of Scurvy-grass Leaves. Make a hot and close Infusion for 3 hours, strain it again and keep it to wash the Mouth often in a day. For the same intention also Liniments at times, and especially at Night may be applied, that their virtue may be communicated to the Patients even while they sleep. There is extant a Famous prescription frequent among Authors, and approved by long experience. Take of Leaves of Columbine, crisp Mint, Sage, Nutmeg, Myrrh (which yet sometimes is omitted) each 2 drachms, burnt Allum half an ounce, Virgin Honey 4 ounces or what is sufficient, make a Liniment according to Art. 2. If at any time the flaccid Flesh of the Gums part from the roots of the Teeth, a gentle scarification is often used; moreover let the Mouth be washed with this Decoction; Take of tops of Bramble Cypress, Leaves of Sanicle, Ladies smock each 1 handful, boyl them in water, wherein Iron has been quenched, 3 pounds, to the consumption of a third, add to the colature of Honey of Roses 2 ounces. Mix them. Such a Liniment as this may be applied; Take of the powder of Florentine Orrice, Leaves of Sage, St. John's-wort each 2 drachms, bole Armonick, *Sal prunellæ* each 1 drachms, Virgin Honey hot what is sufficient, incorporate them well by stirring. 3. When the Gums are putrid and corrupt, and the Teeth are rotten and loose, and send out a nasty stink, stronger Medicines, and such as exceedingly resist putre-

faction, may be used; an Infusion of Camphorate vitriol, or *Lapis Medicamentosus* are especially proper in this Case. Or, Take of root of Gentian, round Birthwort cut each half an ounce, Leaves of lesser Centaury, Sea Wormwood, Savory; Columbine each 1 handful, boyl them in some lime or lixivial water, and sometimes wherein Iron has been quenched or Allum dissolved 3 pounds, to the consumption of a third part. To the Colature add 2 or 3 ounces of crude Honey. Mix them. 4. If the falling of the Teeth be chiefly feared; Take of the bark of the root of the wild Sloe-Tree 1 ounce, Tormentil, and of Bistort whole each an handful, Pomegranate rind and flowers each half an ounce, boyl them in 3 pounds of Spring water, the best Honey 2 ounces. Mix them. Take of Camphorate Vitriol, burnt Harts-horn each 1 drachm, Nutmeg half a drachm, the best Honey what is sufficient. Make a Liniment. Or, Take of the Powder of root of Bistort, Pomegranate rind, Bole-Armonick, burnt Allum each 1 drachm, Honey of Roses what is sufficient, add of Spirit of Vitriol 1 scruple. Make an ointment. 5. If at any time (as is sometimes usual) putrid and deep Ulcers seize the Gums or other Parts of the Mouth, the foresaid stronger Medicines must be often used: Moreover a rag dipt in *Unguentum Egyptiacum* dissolved in Spirit of Wine, or in an Infusion of *Lapis medicamentosus* or Sublimate, may sometimes be applied. In these cases the Cure must be left to a skilful Surgeon.

Of Pains that usually infest the Legs, and other Limbs sometimes, at Night especially.

Against these Pains, because sometimes they are very bitter, beside the general method of curing the Scurvy, specifick Remedies, and such as oppose this Symptom, are indicated, therefore in such a case, when a man has been well purged, and bled (if need be) it is convenient to set upon the Disease both by Medicines inwardly and applications outwardly. As to the former, things that move Sweat and Urine, often give relief, inasmuch as they carry another way the lixivial and acid recrement of the Blood and Nervous juice, which used to meet in the part affected: especially if such things be used as vindicate both these Humors from that bad disposition, as well saline as acid: Testaceous powders of Crabs Eyes, mandible of a Pike, also Spirit and Flowers of Sal Ammoniack, Spirit of Blood, Tincture of Antimony, Coral, Decoctions of root and seed of Burdock, Groundpine, Germander, are very good. Which sort of Remedies may be taken with distilled Antiscorbutick waters twice or thrice a day. Distilled water of Horse-dung, adding Scurvy-grass, Brooklime, *Iva arthritica* and the like, does sometimes a great deal of good. In the mean time Fomentations, Liniments, Cataplasms or Applications of other kind, which ease pain, may be outwardly applied.

Of the wandring Scorbutick Gout.

Concerning this affection *Eugalenus*, *Wierus*, *Medicus Camperis* and *Gregorius Horstius* have writ on purpose. It is said to be very frequent in the North-parts of Holland, of which they take a certain sign by applying a live Worm to the place pained, for it begins immediately to leap, wriggle and slide off, and usually dies, which indeed I have often by experience observed in this Disease among our own Country-men. The reason of which experiment (as I think) is this, we make the cause of the Pain and Swelling in the part affected to be, because Saline or lixivial Feculencies that are left by the Blood, and also by the Nervous Liquor, in the same

same place, do mutually ferment, just as Spirit of Vitriol, mixt with deliquated Salt of Tartar, more-over as from such struggling and agitation of dissimilar particles Pain and Swelling are caused, so indeed very sharp, and as it were corrosive *effluvia* do plentifully fly out, which kill the Worm, when it is applied to the pained place, just as if it were hung over these ebullient Liquors. Because of the effect of this experiment, the Cure of the Disease is managed by Worms, that is, by Medicines made of them; which yet I know not, whether taken inwardly they will as certainly cure the Disease, as they applied outwardly are killed by the Disease. However Worms, as also Snails, Sows, and other exanguous Animals inasmuch as they abound with a volatil Salt, so they often yield a Medicine effectual enough. *Henricus Petrus* tells of two Remedies for this Disease much used in *Westphalia*. 1. Take 9 Worms, bruised with 2 spoonfuls of Wine in a Mortar, and strained through a Cloth, to these add half a pint of Wine, Take 3 spoonfuls. Morning, Noon and Night for several dayes. 2. Take 2 or 3 sprigs of Savine, Virgin Honey 2 spoonfuls, Boyl them in a pint of Wine, till it sink 2 Inches. Let 4 or 5 spoonfuls of the colature be taken thrice a day. A certain vulgar potion, cited by *Horsius*, is near of kin to the first Medicine, it is called *Potio Monasteriensis*; Take of Sage, Betony, Rue each 5 Leaves, a little Savine and two roots of Devils bit. Bruise them with water of Elder flowers, and let the juice strained out be given to cause a Sweat. The like prescription also is propounded by *Medicus Campensis* in *Forestus*. Certainly in this Disease *Aqua Iunbricorum magistralis* set down in the London Dispensatory is excellent good. I have often used Spirit and Salt of Harts-horn, Spirit of Blood, and flowers of Sal Ammoniac with good success. Moreover Testaceous powders, to wit, of Crabs Eyes, Corals, Pearl, and Vegetables, which are reckoned Antidotes for the Gout, as Root of Birthwort, Leaves of Ground pine, Germander, and the like joyned with Antiscorbuticks, are good for the cure of this Disease. Beside outward Anodynes to assuage the pain, which are used in form of Liniment, Fomentation or Cataplasin, oyl of Worms, Frogs and Toads, are often very beneficial. I had it from an excellent Person, who was very subject to this Disease, that a water distilled off the Contents in the Stomach of an Ox newly killed, and taken out, and applied warm with Clothes in manner of a Fomentation, does give most certain relief.

*Of Convulsive and Paralytick Affections,
that usually come upon the Scurvy.*

If at any time the Scorbutick Infection break into the Brain and Nervous kind, and very much infect the irragious Liquor of either Province, for this reason indeed divers affections, and especially Paralytick and Spasmodick ones usually arise: namely, according as the Morbifick matter, brought by the regiment, is either narcotick or explosive. Which sort of affections, although in this case they be Symptomack, yet when they grow worse, they challenge to themselves both the name and better part of the Cure; so that the Patient may be rather said to be sick of the Palsie or Convulsion than of the Scurvy; Medicines also proper for these Diseases should be preferred before all other at that time, however requisite for other intentions. To cure such Diseases brought upon the Scurvy, we should make it our business, that Remedies appropriate to them, may be rightly complicated with Antiscorbuticks.

Of an Atrophy, and also the Scorbutick Fever, which is either the cause or effect of it.

There are 3 kinds of causing, depending in a certain order, of one or more of which a Scorbutick Atrophy, without a Consumption of the Lungs, is usually produced, to wit, either the Chyle is perverted through the fault of the first wayes, so that either not enough, or not good, is carried to the Blood. Or secondly, when it is brought thither, yet by the fault of the Blood it is not rightly changed into Blood and nutritious juice. Or thirdly, the nutritious juice being rightly prepared in the mass of Blood, through the fault of the Nervous Liquor, is not rightly assimilated to the solid parts. Remedies proper for this Symptome, either respect the emendation of the first wayes, or of the fore-said Humours. As to the former, it sometimes happens that through the broken tone or vitiated ferment of the Stomach, what food is taken, is not rightly concocted, but turns into an useless putrilage. For such ails, gentle Catharticks, Digestives, and Strengtheners may be used. Yet the work of Chylification is oftner hindered by a Scirrhus Tumor, rising sometimes in the Stomach, sometimes in the Mesentery, and other Parts thereabout: In this case opening and dissolving things are proper, the use of Spaws is before any other Remedy. Moreover Fomentations, Liniments, or Plaisters must be outwardly applied. Furthermore sometimes it happens, that without any Tumor arising in the Bowels, the lacteal Vessels are so much obstructed with a thick & viscid matter settled in them, that a sufficient store of Chyle, though made laudable and with plenty sufficient, cannot be carried to the Blood: In this case the Belly is for the most part very loose, the stools are white and like curdled Milk, and not tinged with bile or stinking like other Peoples Excrements. The reason whereof is, because the depauperated Blood breeds but little yellow bile, from the pouring out of which in the Guts, the colour and stink of the Excrements proceed. In this case Spaws are chiefly proper, and when openers are given inwardly, Liniments, Fomentations, and Bathings may be used outwardly. For a *Marasmus* arising from the Blood's degenerating from its frame, these things are good, Ases or Cows Milk diluted with Barley water or some proper distilled water, often do good, Broth or Milk with Snails boyled in them: Moreover Waters distilled off Milk or Whey with Snails and temperate Antiscorbutick Herbs, are very good in this case; for this purpose also Decoctions of vulnerary and Antiscorbutick Herbs are taken with good success. In the mean time frictions to the out parts may be used every day with Clothes bedewed with *unguentum resumptivum*, or fresh Oyl of sweet Almonds and warmed. When the Atrophy arises from the fault of the affected Blood, and therefore perverting the nutritious juice, for the most part it has an erratick Fever joyned with Night Sweats, inasmuch namely as the Mass of Blood is forced by that degenerate juice into unequal and uncertain Effervescencies, and so the troublesome matter is cast off by Night sweat. In this case, when a spare diet is ordered, Decoctions and distilled waters, which melt and purifie the Blood, may be often taken mixt with Antiscorbuticks; Take of the shavings of Ivory, of Harts-horn each 2 drachms and an half, candied Eringo roots 6 drachms, root of Chervil, Dandelion, each half an ounce, Leaves of Harts-tongue, Liverwort each 1 handful, 1 Apple sliced, Raisins 1 handful, boyl them in 3 pounds of Spring water to the consumption of a third part. Let the colature be poured

to 2 handfuls of Leaves of Brooklime bruised, *Sal prunelle* 1 drachm, and an half or fixt Nitre 1 drachm. Make a hot and close Infusion for 3 hours. Take 4 or 6 ounces thrice a day. Take of Leaves of Brooklime 4 pounds, Sorrel, Dandelion the whole each 2 handfuls, Snails cleansed 1 pound, two Orange Peels. When they are shred and bruised, pour to them of new Milk or Whey made with Syder or fresh juice of Apples 6 pounds. Destil them the common way. Take 3 ounces twice or thrice a day.

Of the Rheumatism.

We conclude that this Disease comes from the congress and mutual effervescency of Salts that are of a divers original and nature, namely of a fixt one coming from the Blood, and an acid from the Nervous Liquor. The subjects of both these Salts are superfluous fæculencies, left by the foresaid Humours, when they are forced into a turgescency, and poured sometimes into this, sometimes into the other part. Wherefore that the Disease may be cured, both the turgescency of the Humours must be stopt, and their superfluous fæculencies purged out, also the Salts either way degenerate must be reduced to a state of volatility. For the two first intentions a gentle purge, and Blood-letting is required in the first place, and accordingly as they can bear it, must sometime be repeated, and also Diureticks and Diaphoreticks, which may in some measure convey away the Saline serosities, must now and then be given, which evacuations that they may be made more sedately, and be the better bore by the assistance of nature, Opiates must be frequently made use of. For the other Scope, upon which the chief hinge of the Cure does hang, alteratives, and especially such as are endued with a Volatil Salt, are very good: Wherefore in this Case there is a vulgar but no contemptible Medicine, to give an Infusion of a Stone Horse dung in white Wine or some distilled water to 3 or 4 ounces twice a day. I have given Spirit of Harts horn and of Blood often in these Cases, to the Patient's great advantage.

Of the Dropsie.

Whereas we judge there is a twofold Dropsie comes upon the Scurvy, that is an habitual and an occasional one; about the Cure of the former we commonly lose our Labour: for no Remedies are able to restore the Liver and Lungs, and other Parts sometimes wholly vitiated, and the frame of the Blood when it is utterly subverted. In such a Case, if any thing can be found to be done, the bounds of Medicine are very narrow: for there is no place left for Catharticks, nor Diaphoreticks, nor for strong evacuation of any sort: We must insist especially, and almost only on Cordials and Diureticks. To these ends Elixirs, Tinctures, Elestaries, Powders, Infusions, Decoctions, distilled Waters, &c. which consist partly of Antihydropsicks, partly of Antiscorbuticks. A Scorbutick Dropsie, from an evident cause, or raised on a sudden from some occasion, does often admit of Cure, which indeed that it may succeed the more easily, the Tumults of nature ought first to be quieted, and its disorders restrained: wherefore if watchings do still annoy them, Sleep must be procured by use of Opiates, and now and then as often as there shall be occasion, forced. As soon as they are able to be purged, the following powder may be taken, and at due intervals may sometimes be repeated; in the mean time let the Body be kept Solutive by the frequent use of Clysters; Take of *Mercurius dulcis* 1 scruple, resin of Jalap from 5 grains to 10,

Cloves half a scruple; let it be given in a spoonful of Panada. At other times Diureticks, and sometimes Diaphoreticks may be carefully given; Take of the Tincture of Salt of Tartar impregnated with an Infusion of *millepedes* as much as you please, give a scruple or two twice a day with some appropriate Liquor. Take of the Spirit of *Sal Ammoniac* what you please. The Dose is from half a scruple to 15 drops, in the same manner. Take of *millepedes* prepared 3 drachms, Salt of Tartar 2 drachms, Nutmeg 1 drachm, mix them, make a powder. The Dose is half a scruple twice a day in some proper Liquor. Or, Take of Bees dried and powdered 2 drachms, seed of *Ammi* powdered 1 drachm, oyl of Juniper 1 scruple, Turpentine what is sufficient. Make a mass of Pills. The Dose is from 1 scruple to half a drachm, twice a day drinking thereupon some Specifick Liquor. Take of Leaves of both Scurvy grasses, Water Cresses, Pepperwort, Arsmart, each 3 handfuls, Root of Aron, Bryony, Florentine Orrice each 4 ounces, middle rind of Elder 2 handfuls, *Winter's bark* 2 ounces, the outer rind of 4 Oranges, 3 Lemons, fresh Juniper berries 4 ounces, when they are shred and bruised, pour to them of Rhenish Wine 4 pounds, Wine of the juice of Elder berries 2 pounds. Destil them the common way, let the whole water be mixt. The Dose is 3 or 4 ounces twice a day after a Dose of some Medicine prescribed before. Decoctions and Physick Ales may be made, as before prescribed, adding Antihydropsick Ingredients.

Of Rattling of the Bones.

There yet remains a Symptome, which sometimes, though rarely befalls a Scorbutick Person, to wit, the rattling of the Bones. I have known some, but not above 3 or 4, who having been a long time Sick of the Scurvy, have felt the hurt of it, not only in the Humours and Flethy Parts, but in the very Bones: For whenever they bended their Limbs any way, the heads of the Bones, when they rubbed one against another, made a rattling, as if they had been bare; furthermore when they lay down in their Bed, and turned themselves there from side to side, you might hear a great rattling from the Collision of the *Vertebrae*, as if you had been jumbling a Skeleton, which affrighted the Patients themselves. The conjunct cause of this perhaps might seem to be, because when the soft Interstice of the Bones, that is, the Fat, Membranes and Ligaments are much wasted, the junctures of them, like empty Mill-stones, make a noise by rubbing one against another. Yet it is evident, the matter is otherwise, for there is no such rattling of the Bones in extream Consumptive Persons, nor are they alwayes, that are troubled with this ail, Consumptive: Wherefore we must rather say, that the immediate cause of this Symptome is the dryness of the Bones, or want of the Marrow properly so called, which ought to be contained within the Cavity of the Bones, and especially in the heads of them; for seeing all bones owze out Marrow or some unctuous matter every where, either at their great Cavities or Pores and narrow passages, we reckon the use of this to be, as well that the Bones being irrigated thereby, may become less brittle, as more over, that this Humour owzing out at the Nodes of the Bones, may supple all the Joynts, and so facilitate their motion, as the joynts of Machins are greased with fat; wherefore the heads of the Bones, being destitute of this Marrow, make a noise like Coach Wheels, when they are seldom greased. But if you will inquire into the Procatartick cause of this Disease, why this unctuous obliniment of the Joynts is deficient: This indeed must be imputed either to some fault in the Blood, as if it did not duly supply the Bones with aliment

partaking of Sulphur as well as Salt; which indeed is not very likely, because the mass of Blood even in Scorbutick Persons, contains particles of both the foresaid kinds, and besides, they that have this rattling of their Bones, do shew a Skin and Muscles full enough of fat. Or secondly, it rather seems that the unctuous Humour, wherewith the Joynts are supplied, is wanting through the fault of the Bones themselves, because, to wit, their Pores and Passages are so obstructed by some extraneous matter perhaps dreggy or tartareous, carried by the Blood, that they do not sufficiently receive the Balsame designed them, nor does it ouze out to moisten their Joynts. Nor will it be easie (because the matter is wholly in the dark) to inquire the particular reasons of this Ail; nor to proceed in this Aitiology beyond such a conjecture as this. Nor are we left at a stand, when we come to the cure of this Disease; for although the primary Indication, that is, the moistning of the Bones and Joynts be obvious enough, yet in what manner and with what Remedies it may be done, it does not so plainly appear. For in this Case I have known several Sorts of Medicines, and various modes of administration tried altogether to no purpose. A certain ingenious Person, who had been most grievously troubled with this Disease for many years, tried the advice of many and indeed Famous Physicians, beside the usual Remedies, for the Scurvy (together with frequent Bleedings and Purgings, whereby he found no relief) he moreover tried various and great courses of Physick, without any success at all: for after he had tried one Physicians method for some Months to no purpose, he by and by betook himself to another, and so afterwards to several: In the mean time a new method was always prescribed by each, not tried by the former, Fomentations, Liniments, and Frictions are daily applied to all his Joynts. One while he goes to Bath; then he drinks the Waters sometimes one, sometimes another. Which doing no good, he takes a Chalybeate course, then a Decoction of the more temperate Woods, then a Milk diet, further, he was always taking Eleſtuaries, distilled Waters, Apozemes, and other Remedies made of Antiscorbuticks: And when he had in this manner for above 3 years constantly almost, lived Medically and miserably; he was not a jot the better, as to the Cure of his foresaid Ail; but in the mean time he was pretty strong and had a good Stomach, he Married a Wife; and as to the other more common Symptoms of the Scurvy he was better: Hence you may see how pertinacious a Disease the rattling of the Bones is, and that it scarce gives way to any Remedies, which I have experienced in others who have been ill of this Disease, and have wholly eluded all the pains of the Physician.

Idem.

XIV. We have already largely explained both the preservatory and curatory Indications, which concern the Cure of the Scurvy. It yet remains to speak of the Vital Indication, that is, to declare in what method, and with what Remedies the Patients strength, when apt to sink, may be supported, or when decayed or spent, may be restored. For these ends Cordials and Opiates must be prescribed to be taken, according to the Patients exigences, and moreover a restorative course of Diet, if at any time it be necessary, and ever Antiscorbuticks must be prescribed. As to Cordial Medicines, which put the Blood stagnating in the Heart, in motion, kindle its flame half put out, and restore animal Spirits oppressed or distracted, to their due liberty and irradiation; it is obvious that several Medicines, properly called Antiscorbuticks, do perform these intentions, such are namely *Aqua raphani composita*, Snail water, and *lunbricorum Magistralis*, Spirit of Harts-horn, Soot, testaceous powders, and many other things, which may be taken not only

at certain hours, and according to the method and order prescribed, but as there shall be occasion, whenever swooning and fainting happen, and with good success. Yet besides, they that are observed to be very subject to passions of the Heart, frequent swoonings, loathing, vomiting, trembling, Vertigo and other horrible Symptoms, should also have ready other manner of Medicines, which are more properly called Cordials, whereby all sinking of the Spirits may immediately be relieved. To this purpose these things are very proper, *Elixir vite Qu. majus*, the second water in distilling of the said *Elixir*, a spoonful of it may be given sweetned, also *Aqua Mirabilis*, *Aqua Bezoartica*, *Aqua Gilberti temperata*, Treacle water, Cinnamon water; to each of which, or compounded one with another *Confessio Alkermes*, *Confessio de Hyacintho*, powder of Pearl, or magistery of Coral, Syrup of Clove-gilly-flowers or of Coral, or of Citron rind, or of Cinnamon may be added. Of these and other such sort of Medicines divers forms may be prescribed, for example, Take of Treacle water, *Mirabilis* each 3 ounces, Balm 4 ounces, Syrup of Clove-gilly-flowers 1 ounce and an half, *Confessio Alkermes* 1 drachm. Mix them. The Dose 3 or 4 spoonfuls. Or, Take of *Aqua mirabilis* 6 ounces, Snail and Walnut water each 2 ounces, powder of Pearl 1 scruple, *Confessio de Hyacintho* 1 drachm, Syrup of Clove-gilly-flowers 1 ounce. Mix them. When Scorbutick Women are troubled with Hysterick Fits, and Men with Convulsions, Take of Water of Balm, Pennyroyal each 3 ounces, Compound water of Briony 4 ounces, Tincture of Castor half an ounce, Tincture of Saffron 1 drachm, Syrup of Glove-gilly-flowers 1 drachm and an half, of Castor tied in a rag and hung in the Glass 1 drachm. The Dose 3 or 4 spoonfuls. For them that desire their Cordials rather in a solid form, Eleſtuaries or Lozenges may be prescribed; Take of *Flos tunice* 3 ounces, *Confessio Alkermes* half an ounce, powder of Pearl 1 drachm. With a sufficient quantity of Syrup of Corals, make an Eleſtuary. Take of *Species diamantharum frigid. diarrhodon Abbatis* each 1 drachm and an half, powder of Pearl 1 drachm, whitest Sugar dissolved in Treacle water and boyled to the consistency of Lozenges 4 ounces, oyl of Cinnamon 6 drops. Make Lozenges according to Art. As for Opiates and Anodyne Medicines, in some ails of Scorbutick Persons I had rather be deprived of any sort of Medicine beside, than of the use of them: for I have not found a more excellent Remedy not only for pain and pertinacious watching, but in Asthmatick Paroxysms, Vomiting, Looseness, and also in the Vertigo and Convulsive passions; whenever nature is beyond measure irritated, than to procure Sleep by giving a safe narcotick. In the mean time great care must be taken, not to give them, if any thing in the constitution of the Patient, or in the condition of the Disease, or time, forbid the giving of such a Medicine. Beside the usual Hypnoticks in Dispensatories, to wit, *Laudanum opiatum*, *Nepenthe*, *Philonium*, *Diacodium* and Syrup of red Poppy, I know moreover two preparations of Opium, which I use to give in form of a Tincture or liquid Extract from 10 to 20 drops in some appropriate Liquor. The diet or course of Life, to be observed by Scorbutick Persons, is of very great moment in the method of Cure; which if neglected, or managed amiss, other prescriptions of Physick conduce little or nothing to health. A dietetick regiment extends to divers things, but it is especially concerned about Air and the site of ones Habitation, meat and drink and motion and rest of the Body. As to the first, such Mansions and Places of Habitation as in respect of the Air or Soil breed the Scurvy, must be avoided, they that desire either to cure or prevent this Disease, must make it their business to chuse an Air moderately hot and dry, which also must be thin and pure, and sufficiently eventilated.

Meats

Meats of good juice and of easie Concoction are proper, the gross and viscid, mouldy and rusty, also unfermented food, or much compounded, pulse, Milk meats, unripe fruits must be avoided. I am so far against all things preserved in Sugar, and that have much Sugar in them, that I think the invention of it and its immoderate use has contributed very much to the vast increase of the Scurvy in this last age: For this Concrete consists of a very sharp and corrosive Salt, yet allayed with Sulphur, as appears plainly from the spagyricall Analysis of it. For Sugar distilled by itself yields a Liquor scarce Inferior to *Aqua Stygia*: And if you distil it in a Copper Still mixt with a great quantity of fair water, although the fixt Salt ascend not so much; yet a very hot and pungent Liquor will come over like the strongest *Aqua vite*. Since therefore we eat such a quantity of Sugar mixt with almost all our Viſuals, it is very likely, that by the daily use of it, the Blood and Humours are made Salt and sharp, and therefore Scorbutick. A certain Famous Author has ascribed the cause of the Consumption in England to the immoderate use of Sugar among us: I know not, but that the cause of the frequent Scurvy may rather be derived from hence. Let the drink be midling Beer, mild and well clarified, and besides altered with Antiscorbutick Ingredients, without an ingrateful tast; it must not be thick and sweet, nor over stale and fower: This may be drunk in a moderate quantity, and almost only at set times of Dinner and Supper. The custome which has prevailed among many, that when they get out of their Bed, they immediately take a large Mornings draught (as they commonly call it) which is very pernicious. For by this means, seeing the Sanguiferous Vessels are over filled, with a stock of fresh Chyle, poured in almost at once, and Crudities and Morbifick faculties are bred in the Blood, and the Sanguifick faculty is much weakned, truly it were better for most Men (unless they whose Stomach, while it is empty, uses to be troublesomely Contracted and Corrugated) to fast till Dinner. Nor is the common custome, of Mens swilling their full Cups immediately after meals, less pernicious. Wine and Syder, so they be mild, sincere and not adulterated, taken in a moderate quantity do no harm, but if they be adulterated, roapy, harsh, or cagre, nothing is more hurtful, and injurious to our health. Exercise and Labor are of such excellent benefit as well for the cure as prevention of the Scurvy, that many either preserve or recover their health by this Remedy alone: For the Blood and Nervous juice of such as are idle, and lead a sedentary life, like standing waters, contract slime and filth. But by the constant and much exercise of the Body, the Humours and Spirits grow clear and vigorous, the excrementitious and heterogeneous particles evaporate, the obstructions of the inwards are opened, and their tone is strengthened.

Medicines especially made use of by eminent Physicians.

1. When I could get no constant ease, at last I took some Cream, Chamomil flowers, Water Cresses and Juniper Berries boyled in Milk, and applied the Cataplasin hot, and by Gods blessing I think I have found a Panacæon for all Scorbutick pains. ¶ Take of Elder flowers 2 handfuls, boyl them in Wine, add 2 drachms of Soap, and make a sufficient quantity of lye, a cloth dipt in which, and applied, mitigated the pain powerfully.

2. For a painful Scurvy. All things premised that should be premised, let a Decoction of Worms be taken to cause a Sweat, afterwards let the joynts be rubbed with this Spirit. Take of

Flowers of Lilly Conval 2 handfuls, Rosemary 1 handful, Castor, Seeds of Scurvy-grass each 6 drachms, Rocket half an ounce, infuse them in the best rectified Spirit of Wine 8 ounces; set them in the Sun for 3 dayes, strain them out well, add of Spirit of Worms 2 ounces and an half, Camphire 1 drachm and an half. Mix them, with these things I have successfully Cured Scorbutick Gouts.

3. Our Syrup for the Scurvy is made of juice of Brooklime and Scurvy-grass with Sugar. I have not found a better Medicine for the Scurvy. ¶ For the pain of Scorbutick joynts, I applied a bag full of roasted Salt, roasted Millet, Bran and Chamomil Flowers, and when the Bag was applied the pain ceased as if it had been charmed.

4. The Essence of wild Pine; Take of the tender Branches of wild Pine or Fir a sufficient quantity, boyl them in a sufficient quantity of common water for an hour or two. Digest and thicken the Colature to the consistence of an Extract, pour to it Spirit of Scurvy-grass or of some other Antiscorbutick Herb, afterwards digest and filtre it, and you will have an Essence. The Dose whereof is from 20 to 30 grains in a due Vehicle. It is highly commended in the Scurvy and Contracture.

5. Wall Rue has an excellent efficacy in Curing the Scurvy, with which all the Soldiers having the Scurvy, who were besieged in a certain Castle, were cured. ¶ An Infusion of Brooklime and Scurvy-grass in Whey of Goat's Milk, is a vulgar Medicine, but does truly a great deal of good in the Scurvy. ¶ Goose dung is also commended in this case, from the juice of which Soldiers troubled with the Scurvy in a Siege, found great relief.

6. This is a Secret, Take of the middle yellow rind of the root of Sloe-Tree 4 handfuls, Pepper powdered 2 spoonfuls, boyl them with Beer and Water, with this Decoction hot wash the Mouth, repeating it several times, then Take of the juice of Water-Cresses, pour to it some Wine, mix them, and keep them, wash and rub the Mouth and Gums often with this. ¶ Take the juice of Squills, rub the Teeth and Gums, so the Scurvy is cured.

7. Among Diureticks, which are used for the Scurvy, *Penotus* his opening Spirit bears the Bell from all others. I make it thus, Take the Spirit of Goslarian Vitriol 3 pounds and an half, Salt of Tartar 2 pounds and an half, calcined Flints 6 pounds, put them in an Earthen Retort and destil them, increasing the Fire by degrees; let the caput mortuum be boyled, and the Spirit be impregnated with the Salt when it is boyled out, of which and Potters clay make balls, which being put again into a Retort, let them be destilled, and the destilled Spirit be rectified and kept for use. ¶ *Cuesellius* thus prepared his Narcotick Arcanum; Take of Vitriol finely pulverized, and dried in a certain heat to whiteness half a pound, pour to it 30 ounces of rectified Spirit of Wine, set it in Horse dung for a Month, when it is poured from the Dregs, distil it in *Balneo Maria*, till the residue of a yellow Liquor, like the distilled Oyl, keep this, when it is cast forth. This is far better and safer, as the Author affirms, then *Laudanum Opiatum*. The Dose is 12 grains in some convenient Liquor.

8. The common People in Holland commend a well known and easie Medicine, made of the Leaves of Marsh Trefoil, for most Scorbutick Persons, especially such as are inclined to the Dropsie, with very good success. I gave to a certain Scorbutick Person, who had a Palsie, Consumption, and Spots, an infusion of marsh Trefoil, by the use of which alone he was perfectly well in 14 days. I have done the same in others.

(See before § XII, XIII, XIV. *Willis* his Cure of the Scurvy.)

Scroti Gangrena, or a Gangrene of the Cod.

A Man about 40 years old, being drunk with Wine, fell suddenly into a swelling of his Cod, with an acute Fever and a sudden failure of Strength, he got a Surgeon to cure it, who when he observed the blackness of that Part and the exulceration of the whole Penis, yea and danger, because there was a manifest Gangrene, being doubtful of the Cure, desired the advice of a Physician. When I was called, having first given him a Clyster, because he had not been at Stool for 2 days, I prescribed him a Cataplasim of Scordium, Rue, Meal of Lupines, and of Bitter Vetch, with Oxyssel, Wine, &c. I gave him *Diasenna Fracassorii*, and now and then Treacle-Water, because I observed some Malignity communicated to the Heart; for without it he could scarce breathe. The next day when we took off the Cataplasim, we found the outer Cuticle separated, and the third day the *Scrotum* open of it self: and about night ten pounds of Water run out. The fourth day his Stones were all bare, for the *Scrotum* was fallen away from the *penis* to the *perineum*. Here we advised, what should be done, and by drying and incarnating Remedies we prevailed so far in 14 days time, that we had not only guarded the Stones, with a *Scrotum*, but Nature also had clothed the *Scrotum* with new hair, the whole *glans* came again to the *penis*, all the Ulcers of the *penis* were healed, and he was able afterwards to act the part of a Man.

One forty years old, a strong Man and of very good habit of Body, when in Summer-time he had heated himself excessively, and had drunk a great draught of cold Water, was within a few days taken with a continual Fever, of which he was rather cured by the benefit of Nature than by Art, in the mean time the intemperature and fault of his Liver remained, wherefore a little after he fell into a Cachexy, for he was first taken with a Jaundice, then with a Dropsy. Dr. *Cronenburgius* used all things necessary; at last a serous Humor falling into the *Scrotum*, they called Dr. *Slotanus* to consult: Both of them use their utmost Industry, in the mean time the swelling of the Cod ceases not, but by degrees the Native heat being extinct, it turns to a Gangrene in the Part. They scarify the *Scrotum* all over with a Lancet, and wash it with Salt and Treacle dissolved in Vinegar, not neglecting *Unguentum Aegyptiacum*, and a Cataplasim, of meal of Lupines, of Darnel, Aloes, Myrrhe, *Scordium*, and other things that resist putrefaction. They prescribe a very good course of Diet, Strengtheners and Openers of obstructions, inwardly and outwardly: In the mean time, when the Water ran plentifully out of the *Scrotum*, the Patient grew better. At length the gangrened *Scrotum* part of it fell away by the benefit of Nature and Medicines, part also, which was gangrened, was cut off with a Razor, so that the Stones might be seen bare, the Ulcer remained open for some Months. In the mean time Nature by this way evacuated whatever excrementitious Humors were in the Bowels, so that the Noble Parts were perfectly restored, and the Patient fully cured of his Disease.

Singultus, or the Hickup.

The Contents.

The Cure must be varied according to the variety of Causes. I. A Periodical one, which would only give way to Bleeding. II. A Tedious one stop. III. The Efficacy of Opiales. IV. To what Place outward Applications must be made. V. Antimonial Vomits are best in this Case. VI. Vomits repeated do good. VII. Medicines.

I. B. Sylvaticus, gave to one, that had had the Hickup grievously for seven days, *Hiera Rhodius* with Oxyssel: when he had voided above 12 ounces of Phlegm, he was perfectly well. ¶ Several who have been almost killed with the Hickup, after purging for 5 days with *hiera picra*, have put an end to the Hickup. ¶ One who had had the Hickup 20 days and was in great danger of Death, was at length saved by an infusion of *Mechoacan*. ¶ A Boy ten years old, Hickuped day and night for 8 days, I gave him water of Green-Nuts, distilled with Radish first steeped in Vinegar. Although he did not Vomit, yet his Hickup ceased; after the second Draught about night he was wholly freed of it. ¶ A Surgeon falling Sick was in a little time so troubled with Hickuping at turns day and night, that he could neither Eat, Speak nor Sleep as he ought: When he had taken a strong Chymical Vomit, he at several times voided a vast quantity of æruginous and black Choler; and his Hickup wholly ceased. ¶ A Colonel, when he was exceeding Hot, quenched his Thirst with cold water, mixt with Nitre, a good quantity at once, upon which he fell into a violent Hickup. The Water was thrown off by a Vomit; Stomach-Water was given him; a Cataplasim of Stomachicks was applied to his Stomach; at length when some *confectio anacardina* and *lignum Aloes* was given him, he left Hickuping the third day. ¶ A Girl thirteen years of Age had been afflicted a whole year with a very troublesome Hickup: the Symptome had troubled her the whole foregoing Winter, she was free of it in the Summer, about Autumn it came again with its former Cruelty. I gave her of *Calomolamos* 16 grains, of *Diagridium* 8 grains, that day her Disease was taken away. ¶ A Man of 40 years old was taken with an Hickup, which was attended with strange Symptomes. In the Dog days he had so swilled himself with cold water that through the immoderate Cold, he fell into the Convulsion of the Stomach. After I had tried all manner of Remedies, I thought a hot Bath might correct this intemperature: From which, being made of Bay, Wild-Time &c. he received such benefit, that within 5 days he was well. In the mean time a Bag was applied to the region of his Stomach in which the foresaid Herbs were put. ¶ N. being sick of a Malignant Fever was tormented with a grievous Hickup: having tried several things I prescribe 2 grains of *Laudanum* with an Emulsion of the 4 Seeds, wherein a drachm of *Sal prunella* was dissolved. Within an hour the Hickup ceased and returned no more. ¶ I cured one that was ill of a grievous Hickup with one Draught of Seed of Dill, Carroway, Purslain, and white Poppy boyled in Small Beer. ¶ *Erysimachus* the Physician cured *Aristophanes* of the Hickup by Sneezing, when he could not be cured by holding his Breath. ¶ *Rainutus Farnesius* being almost killed with a deadly Hickup, was cured by applying a Weather new opened to his Stomach. ¶ A Severinus young

Idem

Forestus

Plato

young Man having wrenched the eleventh *vertebra* of his back, which is over against the upper Orifice of the Stomach, was grievously afflicted with a perpetual Vomiting, and there was no place for Remedies. ¶ The Sympathick Hiccup, which arises from Sympathy with a Rupture incarcerated, and is often attended with black Vomiting, follows the Patients till Death, and is not curable but by restoring the Rupture. The same judgment may be given of an Hiccup coming upon an Inflammation of the Liver. ¶ One that had been vext 3 whole Months with the Hiccup, could not be cured with any Remedies, till the extremity of his Rib, which was found turned in, and run into the Stomach without any sense or pain, was gently raised. ¶ One that had the Hiccup from Windiness, recovered by this following Remedy, Take of *Philonium* 1 scruple, *diagalanga* 2 scruples, give it in Wine. This did another good; Take of the best Treacle 1 drachm, powder of Dittany half a drachm, give it with a little Wine. ¶ A Hiccup in Feavers sometimes follows the intemperate use of cooling Juleps, as I have observed several so held through the unadvised Rashness of their Physicians; and I removed this Symptome, contrary to the Opinion of them all, by drinking Wine.

II. A Maid, healthy in all other respects, was commonly once a year for the most part at one set time afflicted with a Pertinacious Hiccup, that despised all Medicines. At length a Remedy was found, bleeding freely in the Arm. It may be, because some Flatulent thing, joyned with something sharp, which disturbed the Blood-vessels of the Diaphragm, and by consent the Nerves also, might find a Passage by opening a Vein so near.

III. I have several times cured even the most Contumacious Hiccup with this Mixture; Take of Quince Wine, Tincture of Roses each 1 ounce, Syrup of Quinces half an ounce, Extract of Zeodary 15 grains, distilled Oyl of Orange-Peel 4 grains, *Laudanum Opiatum* 4 grains. Mix them. The potion must be taken by spoonfuls.

IV. Opiates above all things conduce to the cure of any Hiccup, not only as they qualifie all sharp Humors, but more over as they obtund the sense of the Stomach, and it may be, also make the Animal Spirits more torpid to Motion, if so be they be used by turns in a small quantity, and so long, till the Hiccup either cease or be notably diminished; for example, Take of Mint Water 2 ounces, simple Treacle-water half an ounce, *Confessio Alkermes* 1 drachm, *Laudanum Opiatum* 2 grains, Syrup of Mint 1 drachm, Mix them. Give a spoonful.

V. *Galen* §. de loc. affect. c. 4. sayes, that Patients sometimes perceive a weakness of the Gullet, when what they take is a long time and with great difficulty in getting down the Gullet to the Stomach, which sometimes at the first essay get down easily, then again they are forced down, as if they stuck, like as when one has eaten sowre Pears, which by their stypticity straiten the Gullet lying on the Back, and hinder the going down: Then if they be clapped on the *vertebrae* of the Back with ones Hand or between the Shoulders, upon which the Gullet rests, whatever sticks is forced down into the Stomach, whereby at length the *larynx* is dilated and can take in the Air freely. Therefore the Ancient Physicians were not amiss, who, when they were to cure the Hiccup, or any diseases of the Mouth, of the Stomach or Gullet, made not their outward Applications to the *Epi-gastrium*, but applied them to the Back and *vertebrae* of the Neck, which *Aetius lib. 15. c. 147.* very learnedly teaches, If, saith he, the Hiccup be continued, we must use Sneezing and Cupping-glasses also over all the Spine, and especially about

the greater *vertebrae* of the Diaphragm, that is, the 12th and 13th *vertebra* of the Back, and draw it to the Spine: For the continual application of Cupping-glasses, often rectifies and opens the Mouth of the Stomach, contracted and as it were obliquely twisted by the Hiccup. It is also very good to bind the extreme Parts and dip them in Water. This Doctrine of *Aetius Galen* maintains by an agreeing suffrage 11. *Metb.* I call the Gullet in this place the Stomach, saith he, which the Greeks properly call the Stomach; sometimes also they so call the Mouth of the Stomach, as when they say, A Man swoons stomachically. But we apply a Cataplasim for the Gullet, which is properly called the Stomach, to the Spine and not to the Breast. We do the same also, when the Mouth of the Stomach has an Inflammation, because it rests upon the Spine, along the Neck and Breast to the Belly. Wherefore Nurses, when Infants and Children are troubled with Vomiting and Turning of the Stomach, they think the Gullet and the Mouth of the Stomach are convulse, and they set a Cupping-glass to the Belly, and they garter up the Skin about the twelfth *vertebra* of the Back, they take it in their Fingers and lift it up; or they force it into a Cupping-glass or Jug with Tow kindled, as *Aetius* does, which one would think succeeded well, and the Vomit stopt because the Gullet and Mouth of the Stomach were restored to their former seat.

VI. As often as hurtful or sharp Food or Physick, or rather Poison is contained in the Stomach, and causes the Hiccup, it ought to be expelled either by Vomit, upwards, a shorter way, or by Purging, downwards, a longer way, which may be understood also of any Humours in the Stomach or small Guts, which cause the Hiccup. I prefer among Vomits, Antimonials before all the rest, both because they do with success evacuate all Humors promiscuously; and because they are most amicable to Humane Nature, reducing all the Humors in Man by some peculiar way to a very laudable State by degrees; if so be that too great a quantity of them be not taken at once.

VII. When after Narcoticks have been conveniently used, and a Vomit taken, and little or nothing is voided upwards or downwards, and the Hiccup continues; if the signs of bad Humours being in the Stomach or in the Guts nigh, which cause this Ail, you may then safely either the same day, but in a less quantity, or the next day in little a larger quantity give a Vomit; to the end the peccant Humors may either be further corrected, or discharged upwards or downwards or both ways. For so the cure of the Hiccup will be performed safely, not unpleasantly and soon enough, which is truly rational and dogmatical, relying especially on Experience, and on sound Reason, not on a faint and commentitious one, and therefore on a false one.

Medicines especially made use of by eminent Physicians.

1. There are many who by affrighting People unawares in the Hiccup, obtain their end; others advise to rub the Ear long with the little Finger. And *Zysimachus* has given out, that Sprinkling with cold Water and holding ones Breath, stops the Hiccup.

2. Among the stronger sort of Remedies for the Hiccup, there is Powder of Dittany (if it arise from Cold or Wind) with Cretan or Falernian Wine. But a Decoction of Dill, about 3 Glasses of it drunk at once, wonderfully stops the Hiccup with pain.

3. This

Pod. à Fon-
feca.

3. This Fomentation is very good, if Castor, Pepper and Mustard boyled in strong Vinegar, be applied with a Sponge to the Stomach.

Lat. à Font.

4. This is Asepius his famous Remedy: Take of Galangale, Saffron, Spikenard, green Roses, Marsh-mallows, each 4 scruples, *Afarum*, Aloes each 2 scruples, *Opium* 1 scruple, with juice of Fleawort make little balls. The Dose 1 scruple every Morning.

(See s. 1. of the Hickup.)

Sitis, or Thirst.

The Contents.

The Method of cure is not alwayes the same. I.
Sweet and Sugared things increase rather than quench Thirst. II.
The use of Nitre. III.
Medicines.

I. **T**HIRST is a Passion of the Mouth of the Stomach, which is sometimes afflicted by Sympathy, sometimes by it self: If by it self, all agree it must be removed by drinking: If by Sympathy with the Lungs, not drinking of Water, but inspiration of cold Air alone is sufficient to assuage it. Nor is it sufficient to know that the primary Affection is in the Lungs, and the consent in the Stomach, we must consider also, whether the Thirst, that is caused in the Stomach, be proper by consent, so as that it be partly caused, and partly causing by reason of the Fomenting it by the Lungs: for not only Coolers and Moistners should be directed to the Lungs, but to the Stomach also. Continuance of time and a soft habit declare that an Idiopathy is made: Because that all Sympathy, if it continue long, and the part affected be lost, becomes Idiopathy. ¶ The Hermetick Physicians contend that immoderate Thirst comes from thirsty Spirits, bred of sulphureous Impurities, which will not be sated with simple Cooling and Moistning, but with other Spirits analogous to themselves: Thus we see in Ague-fits, intense Thirst is a little stopt by drinking a great quantity of Water, which yet more easily gives way to acid Spirits of Vitriol, Sulphur, Salt and the like, mixt with a far less quantity of Water. ¶ If an irregular Thirst arise, such as is usually caused by the Dropsie, while the Stomach receives Nitrous, Salt, or a Putrid, Vapor or Humor from the *Peritonæum*, it cannot be stopt by drinking (but the plenty of the Salt or Nitrous Humor will be increased, whereby it is also increased and exasperated) but by such things as dull the Sense of the Mouth of the Stomach, or qualifie and make gentle the Humors and Vapors; so Starch and the Water of it, so Mucilages, and sometimes fat Things, do good to Admiration: But when the faulty Thirst comes from the heat of the Lungs, you may cure it by inspiration of cold Air and often Washing the Mouth with very cold Water. ¶ Both watry things, which dilute and carry to the Urinary Passages the lixivious Salt of the Bile, and Acids, which powerfully break and turn its Acrimony, and Oily things which smooth the same Acrimony, to wit, Milk and Emulsions made of Oily Seeds, cure increased Thirst above all other things: And the Watry things may conveniently be joynd both with the acid and Oily ones, and so they will do the more good. ¶ It sometime happens that Thirst is increased by the *Serum*, where, because Water abounds in the Body together with the lixivial Salt, plentiful drinking is not convenient, but an acid Spirit, such as Spirit of Salt, *aperitious Penoti*, &c. diluted, taken by

spoonfuls, whereby the hurtful Acrimony of the lixivious Salt is powerfully amended. ¶ The Cause of it is the Nidorous ferment of the Stomach, made over salt and sharp, as we see it happens in Feavers, Salt Catarrhs, the Dropsie, &c. The Stomach, since it has a Coat common with the Gullet and Palate, easily communicates its Quality to them, and also causes Thirst. Want of Moisture is not sufficient to cause Thirst, wherefore Thirst ceases not by drinking, unless it carry along with it a *Medium*, Analogous to seize the ferment; Wherefore Acids quench a false Thirst, just as Water quenches the Fire. Well rectified Spirit of Vitriol, Spirit of Sulphur and the like ease Thirst in Fevers. It quenches Thirst to shut ones Mouth, hold ones Tongue, and to take the cool Air and Drink. ¶ For the same Cure will not serve all sorts; For that which is caused by the heat of the Lungs and Breast, the inspiration of cold Air is fitter than Drink, and that rather very cold, than much of it. ¶ If Thirst come through the fault of the Reins, as it does in a *Diabetes*, I think you cannot use a better Remedy in this Case, than one that causes rest, or stupifies, or at least lessens Sense. So for such this is good, to take every other Night an ounce and an half of Syrup of Poppy with Barly water or a decoction of Mallows. To which purpose it is good also to lick some of the same in the day-time. Syrup of Purslain is also good and *de mucilagibus*, and whatever takes off the sharpness of Sense. ¶ Although *Hippocrates*, *aphor.* 24. *sest.* 5. seems to forbid Milk to the Thirsty, yet it must be understood of them only who are excessive Thirsty through too much Heat: and a mass of putrid and cholerick Humors in whom Milk is easily corrupted, and not of them who are Thirsty through Heat and Consumption; for in the same Aphorism he allows Milk to Hectick Persons, though in a Fever. *Galen*, l. 7. *Metb.* prescribes the use of Milk and the warm Bath to hetticks.

II. They are in an Error, who, when they see sick People almost killed with Thirst, give them things candied with Sugar, and Conserve, as of the Sowr part of Citron, &c. which although perhaps without Sugar they might quench Thirst, yet with it they will never quench Thirst. Children know that Sugar increases Thirst: It is better to take nothing at all, because if the Tongue were not fouled with these sweet Things, it would not for some hours be so Thirsty. Therefore I wonder, that Physicians, though they see it daily, do not abstain from it.

III. Nitre and *Sal prunellæ* have a Virtue to quench Thirst and Heat. *Hartman* in his *Praxis* mixes 1 ounce of it prepared with a pint of Liquor or Water, for a drink for Feaverish Persons. I scarce go above 5 scruples, for it weakens the Stomach a little, and therefore sometimes causes a Looseness; but it may be given from half a drachm to an whole one, without harm, especially with Sugar, whereby its bitterness is mitigated.

Medicines especially made use of by eminent Physicians.

1. Linseed, and Quince seed tied up in a rag like a little Ball, and steeped in Violet water, if it be held in the Mouth, wonderfully quenches Thirst.
2. These Pills wonderfully quench Thirst; Take of seeds of Melon, Cucumbers, candied Lettuce-stalk, *Diacodium* in a solid Form, and Sugar 2 drachms, Sacch. candi violat. Trag. each 1 drachm. With the White of an Egg make Pills. Hold one under the Tongue, and let it dissolve by little and little in the Mouth and then swallow it. ¶ Pieces of

Compounded Aqua Vitæ must be given with great care. VIII.

I. Sometimes in great want of rest, sleep is so long prolonged, and so sound, that it may seem a sleepy Disease, and deceive the Physician both in length of time and deepness of the sleep, as in those that are over tired, or have over watched, or over wrought themselves. So I saw one who after he had lain sick 34 days, and had not changed his Linnen all the time of his Disease, when he had changed it, and was laid in a soft and clean Bed, slept 36 hours continually. He was thought to be carotick, but he was not so; for at length he awaked, took meat, and the next day was well.

Indovicus,
l. 1. cap. 2.

II. To open the outer jugular by a Skilful Surgeon, is good in sleepy Diseases, and is proved from many Histories. Some prefer 2 or 3 Leeches applied along that Vein, to the angle of the lower Jaw, where it stands up and may be seen.

Riolanus.

III. In deep Sleep it is good to eat Cresses either boyled in Broth, or raw in Sallets: for there is nothing dries the Brain more than Cresses: whence came the Proverb to drowzy Persons, go eat Cresses. Where I cannot but wonder, why *Fernelius* cap. 2. lib. 2. *Pathol.* writes that Cresses cause Sleep.

Rondeletius.
cap. 19.

IV. Drinking of Coffee, seeing it is very effectual in keeping off drowziness, something must be said here of its effects, and the reason of its working. From the Eastern People, to whom it has been long ago familiar, it is become customary among us. I think the nature of it consists in this, that it presently communicates its adust particles (with which it abounds, according to both its taste and scent) to the Blood, and then to the Nervous juice, which therefore by their incongruity and mobility or restlessness do both keep open the Pores of the outer part of the Brain, and add certain goads and

pricks to the Spirits, which are deprived of any other chain or torpidness, whereby they are the longer excited to perform their offices. For to fall asleep these two things are necessarily required, of which sometimes the one, sometimes the other is the greater sharer in causing it: Namely, all the Pores and Passages of the out part of the Brain, must be very much stuffed and filled, from the Liquor which overflows there out of the Blood, and therefore must be stoppt: Then besides, to accomplish this effect, it is necessary that the animal Spirits, being excluded from these passages, and moreover oftentimes loaden with nutritious and serous Particles, must betake themselves to the middle of the Brain there to lye quiet. In the performance of these tasks necessary to Sleep, the order is not alwayes one and the same; for sometimes the Animal Spirits do first and of their own accord forsake these spaces, the Nervous juice running immediately into the vacant places: And sometimes the Nervous juice mixt plentifully with the Serum first invades these passages, driving thence the Spirits, though against their will, and forcing them inwards. But the operation of Coffee seems contrary to both these effects: for immediately upon drinking of it, its adust Particles, that are very nimble and restless, being carried into the Blood, do put its Liquor a little in fusion and force the serous Liquor to the Kidneys and habit of the Body: Moreover when they arrive at the Brain, they easily open its Pores, which by their mobility they keep very open; whilst they joyning with the Spirits, despoyl them of all their other Particles, as well Sleepy as Nutritious, and so being light and fleet do put them every where into motion, and cause them to be expanded through the whole compass of the Brain, when it is free from all gravative oppletion and obstruction. Yet in the mean time while the Spirits are in this manner constantly and unweariedly exercised, the Nervous juices are deprived of access and assimilation, their stores are not sufficiently and after their wonted manner recruited, indeed the old Spirits are rendered more nimble and unwearied, but the recruits of new ones are diminished. Hence it may most easily appear, that this drink, though in common use, and in some cases very useful and medical, perhaps in others is hurtful and not so wholesome. And that the matter is so, not only reason but vulgar observation does commonly shew, in as much as excessive Coffee-drinkers oftentimes grow lean, and subject to the Palsie and impotency to *Venus*. The first effect is so frequent and every where known, that we only therefore forbid them the drinking of Coffee, because it inclines to leanness: Because, when the Blood by continual and too frequent use becomes sharp and retortid, it is therefore less fit for to nourish. As to the Diseases of the Brain and Nervous kind, I reckon, that when I am sometime called to cure them, no man prescribes it to be drunk so frequently, as I: for it is my custom to send them more to the Coffee-Houses than to Apothecaries Shops. Truly in most Cephalick Sickneses, that is, Head-ache, Vertigo, Lethargy, Catarrhe and the like, where there is a moist Brain, but a slowness and torpidness of the Animal Spirits, with a cold constitution, or not very hot, and a watry Blood, Coffee is often drunk with advantage: for drunk every day, it clarifies and illustrates both parts of the Soul, and dispels all mists of the Functions whatever. But on the contrary, they that are lean, and of a Choleric Constitution or Melancholick, who have a sharp and retortid Blood, a hot Brain, and too eager and restless animal Spirits, ought altogether to abstain from that drink, because it further perverts the Spirits and Humours, and renders them altogether unapt and unable to undergo any Functions. For I have observed many who have not had sufficient plenty of

Spirits,

Spirits, and besides troubled with the *Vertigo*, palpitation of the Heart, trembling of the Limbs or numbness, have been worse as to those Diseases upon drinking of Coffee, and have presently perceived an unusual languidness in their whole Body.

Willis.

V. A Maid about 20 years old, was about the beginning of Autumn held with a double Tertian for 12 dayes, and was cured of it by Remedies. Her Fits returned again, but some new Symptomes came in the Fit, namely, much Sleep, redness of Face, prominence of Eyes, a pricking pain in the left side, and a great difficulty in swallowing. I suspected an hysterick affection was complicated with the Ague fit, and I prescribed her hysterick Remedies, notwithstanding which, the Disease continued. After a few dayes the Symptomes returned without the Ague, which confirmed my opinion, for the pain of her left side went to her right, sometimes pricking pains appeared in divers parts of the *Abdomen*, with a pain in the Stomach, and loathing, and sometimes a Fit of the Mother. Before the Fit came, she took by my advice 4 little Pills of *Laudanum*, and a little after, the Fit came; but within 2 hours, when the *Laudanum* began to work all things abated, she was well the whole Night, whereas the foregoing she had been tormented. Hence this Paradox may be gathered, that a Sleepy Disease may be Cured by the use of *Laudanum*.

Riverius,
Cent. 2. Obs.
26.

VI. In a *Coma* our chief endeavour must be, to prevent the efflux of new morbid matter into the Brain, and to discuss and get out what is got thither already. Moreover the animal Spirits must be awakened, and all torpidness and sleepyness taken from them: To this end we must Purge, Bleed, Cup, Blister, make application of revulsives and discutients, give Cephalick Medicines, and such especially as are indued with a volatil Salt, and use several other wayes of Administration. But if this Disease follow some other Sickness, or come upon any Man, whose Body is already much wasted, his Blood vitiated, or much depauperated, we must first consider well of Bleeding and Purging before we do either, nay, for the most part we must abstain from them: yet sometimes, that the conjunct cause of the Disease, or the matter fixt in the Brain may be put in Motion, it may be convenient to take away a small quantity of Blood, either by setting Lecches to the Fore Head or Temples, or by Cupping and Scarifying the Shoulders.

Willis.

VII. I saw a lusty young Priest taken with a *Coma* after a relapse into a Fever, with a tremor in one side, without sense, for want of Strength in the Parts. When he had taken a very sharp Clyster, with 3 drachms of *Coloquimida*, and 2 ounces of Honey of Roses and Salt in it, without any effect; *Prævotius* ordered him 7 Blisters, which doing little good, they proceeded to make a cautery in his Head behind, upon which he amended.

J. Rhodius,
Cent. 1. Obs.
26.

VIII. The strong scented stillatitious Liquor of Lavender rubbed on the Forehead and temples, revives those that are taken with a small *Catalepsis*, a *Hemiplexia*, and now and then with the falling Sickness, and oftentimes with Swooning. But where there is plenty of Humours, especially if they be mixt with the Blood, the use of this is not safe; nor of any composition drawn off Wine, in which such Herbs, Flowers, or Seeds, and certain Spices have been macerated, which most People give indifferently. For by the use of these hot things, which fill the Head, the Disease is increased and the Patient endangered, especially when Bleeding and Purging go not before. I thought fit to give this caution, because commonly some unlearned Physicians, and over bold Apothecaries do immediately give such Compositions and things of the like nature, not only to Apoplectick Persons, but also to those that are Sleepy and in a Fever, than

which nothing worse can be given, for they do a great deal of harm, and often kill the Patient.

What the Virtue of Pessaries should be? XIII.

Medicines.

I. Much is written by Hippocrates libro de Sterilibus, and in his Aphorisms of the causes of Barrenness, and of its manifold Cure: But *Scilicet*. 5. lib. 2. *Epidem.* all the Cures of these causes are in a manner reduced to these 2 heads, Fomentations, and Parges; The Barren, saith he, must Foment and Purge: for *σφοδρα* and *σφοδρα*, which he there uses, signifie a purging Medicine, when it is used alone and nothing is added to it, which may signifie some other sort of Medicine. But by the name of Fomentation, I would have understood whatever is applyed inwardly or outwardly by way of Cataplasin, Irrigation, Clysters, Pessary, or Fumigation; as by the name of Purging I would have understood both Vomiting and Purging. For every cause of Barrenness is either a fault of Composition, or of Temperament, or an Ulcer of the Womb, or a Cacoehymie of the whole Body. Among the faults of the Composition of the Womb there is the smallness and grossness of the Womb, the straitness and hardness of the mouth of the Womb, so that it is not dilated sufficiently, or a perversion of the Mouth of the Womb, or the wideness of it, so that it gapes, and does not retain, or straitness of the Vessels of the Womb, so that for this reason the Menstruous evacuations do not come into it, or the laxity of it, so that they run too much out. In fault of temperament there is too much heat, which consumes the Seed; or cold, which does not concoct it; or dryness, which consumes the Seed and nourishment of the *Fetus*; or moisture which hinders its retention, which also Ulcers of the Womb do hinder. Cacoehymies, when they are poured into the Womb, corrupt the Seed; when they are not poured, they do not hinder Conception yet they make a bad juice for the *Fetus*, and therefore either cause Abortion, or a Diseased *Fetus*. Vitiated Compositions, if they be contracted from the first generation, are usually incurable; but if they are caused by other Diseases, they may be Cured by curing of these Diseases. Cacoehymies require Purging: All intemperatures of the Womb which are joyned with an Humour, or with a Cacoehymie of the whole Body, and especially Ulcers, require Purging, and then Fomentations, Affusions, Injections, and Pessaries: And all these things must for heat be cold, for cold hot, for moisture dry, for dryness moist, and for Ulcers, such as the Cure of Ulcers requires. There-fore

Vallesius. fore it is evident that the whole Cure of barren Women consists in Fomentations and Purges.

II. If a Woman Conceive not through Salacity, which is caused by the acrimony and heat of Seed, she must be fed with gross Diet, such as thickens the Blood, and the Seed. It is good to eat Fruits, as Pears, Apples, and Chestnuts, which breed gross Humors and Vapors, and retard that violence.

Rondeletius. III. Many Women Conceive not, because they have moist and foul Wombs, so that they neither eagerly receive Seed, nor are able to retain it; which disposition indeed is contrary to that wherein they want the Menstrua, that the Womb may be open (for there is a two fold Cause, why newly after the evacuation of the Menstrua Conception is easy in moist Women, both because the Mouth of the Womb, and the Veins and Arteries which end there having been opened remain so, and because when the Womb has been newly evacuated, it draws any Moisture more greedily) This may easily be known, by what comes out, for mucous matter frequently comes from such. Hippocrates lib. 2. Epid. sect. 3. says this is cured by a dry course of Diet. Here by Diet must be understood the whole course of ones Life, where in the whole Method of Cure is comprehended. Because in this affection the Diet which consists in Meat and Drink is not sufficient. The Cure must in this, as in other Diseases, be contrary to the Affection: So that hence it is manifest, that there is not only one way of curing barren Women, as vulgar Physicians have persuaded themselves, but that it is various and manifold according to the cause of Barrenness. For it is proper only to moisten some, and Heat others, and to cool and moisten others.

Vallesius. IV. Moist Women use Stoves, and they that have a hard or cold Womb, Bathes: But they must use them a little before their Menfes come.

Rondeletius. V. Hippocrates, lib. 2. Epid. sect. 6. advises to give a Woman that she may conceive, Polypi to eat, roasted in the Flame, very hot, and almost half burnt, and to beat Egyptian Nitre, and Coriander, and Cummin together, and to make Balls of them and apply them to the pudendum. But this Cure is not proper for all Barren Women, but only for such as are Cold, and have but little Seed: For the Polypus is a most salacious Animal, and goes into a Consumption through too much coition: and such things must needs increase Seed, for they consist of such a juice, and are apt to be turned into the same: And what he here orders to be given is heating and therefore tentiginous. Although I should leave out Cummin, because it wastes Flatulencies, as does Rue.

Vallesius. VI. Among the faults of Composition, it is evident from Hippocrates his Doctrine that the chief and most effectual Cause of Barrenness is the turning aside of the Mouth of the Womb, the Causes and Cure whereof he shews lib. de sterilibus & de Natura muliebr. If the Womb, turn on one side, says he, a Cough takes them, the Pain ascends, and the Womb lies like a Ball, is sore when it is touched, like an Ulcer, And after many such things, he orders, to purge Women, and to wash in warm Water, and to use hot Things, And a little after, If the Womb be turned aside, and the Mouth it self be empty, &c. When a Woman is so, you must give her a Purge, and wash with warm Water, and foment her. The whole therefore of the Cure in this Case consists in the reduction of the Womb to its former place; which indeed cannot be done, except either the Humors be purged (by reason whereof, the Womb is made lax,) or dried up by application, and the Pain be eased, and the part made softer that it may with less Pain be reduced to its place without Inflammation. Therefore you must first purge the Body, and use fomentations and emollient Things, then have the Womb reduced by the Midwife's fingers, and last of all let her rub her Hands this way and that, over all her Belly,

towards the Navil, with Oyl all over the region of the Womb, with a gentle compression, till you find the Womb separated from the Part to which it sticks and reduced to its former Seat. Yet have a care in this Work, that the Menstrua be not near, nor great store of Humors in the Womb, lest something worse grow upon the evil was there before. You must have first a care of this, and then anoint the Belly with Oyl of Rue, white Lillies, Orice, Chamæmill, Bayberies, strowing some of the Powders of the same Things, &c. To accompany with a Man will be good, whereby the Neck of the Womb is better untwisted.

VII. Fumes are good for such Women, as through Cold have little or no Menstrua, especially if it be joyned with an aqueous humidity. Fumes of Spices, saith Hippocrates bring down the Muliebria: But Steams are good for them, the Mouth of whose Wombs is stoped with Cold, so that they cannot receive the Seed. Yet all of them have this quality to abate the Cold of the Womb, that the Seed be not extinguished.

VIII. Hippocrates lib. de Natur. Mulier. § 19. bids us attenuate, and give a Medicine that purges downwards, and apply to the Womb things that purge it downwards, and that cause Flatulencies. But you cannot extenuate the Body, before you have often purged the Body and Womb, by which Purging I suppose all discussing and drying up of the Humor must be understood. Nor is this to be slighted, and that cause Flatulencies; for it must be believed that whatever things do dilate, and any way distend the Womb, and lay the Passages of it more open, which are pressed with Fat and the Cawl, are good Medicines for the Womb: which without doubt I think is done by such things as cause Flatulencies, because they are apt to distend the Part where they are.

IX. In cold and moist Women this Elestuary will be proper, whether the Moisture be in the whole Body or only in the Womb. Take of the conserve of Eryngo and Citron rind, each 1 ounce, conserve of Rosemary and candied Ginger each 1 ounce and an half, ashes of a Bulls pizzle, and ashes of a Hare's Womb, each half an ounce, Pulvis diagalang, diamosch, dulcis, diambri. each 3 drachms, Pine and Hazle Nuts each 3 drachms, a little Sugar, with a sufficient quantity of Syrup of Citron Peel make an Elestuary. Of which take the quantity of an Hazle Nut, a good while after Meat, when she goes, to sleep. This Conserve is most proper for such as are cold and moist all their Body over: for if the Womb only were cold and moist, it were better to dry it by receiving a Fume through a Tunnel: And it may be made of odoriferous Driers, and light obstruents. The Elestuary will be proper for such, if the Dose of the Pine and Hazle Nuts, after they have been steeped in Milk and a little Honey mixt together, be increased, now and then renewing the Milk, that it grow not fowr. Such an one will restore the dried Body and breed store of Seed. In these Elestuaries many other drying Things are used, which if they were taken dry by themselves would rather do harm than good; but because they are mixt with Syrups, and tempered with sweet things, are proper, as shavings of Ivory, Goat's-horn, seed of Hartwort, pith of Ash seeds (they call it Birds tongue) and Sparrows-brains may be added, but they are better taken with Meat than Mixt with the fore-said Things; for they do good because they breed much Seed, which they cannot do, if they be taken in a small quantity. It were better to take the brain of a Pig, or a Hog, well boyled with some wild Marjoram, and after to eat it fried in a Frying-pan: for it nourishes much, and increases Seed. Elestuaries for salacious Women must be made of gentle astruents, and things that breed store of Seed not very hot, as, Take of preserved Myrobalans

balans *Emblici*, and *Chebuli*, each No 2. Citron Peel candied with Sugar (the rest with Honey) 1 drachm, Pine Nuts steeped in Milk, seed of Ash so steeped each half an ounce, with Syrup of sweet-smelling Apples make an Electuary, adding of shavings of Ivory and Goats-horn each 2 drachms. They that are not propense to *Venus* may wear Amber or Musk about them and perfumed Gloves, and they may lay them at Night especially under their Pillows, unless they be subject to Fits of the Mother, for then it were better to tie these sweet things to the Hips.

Rondeletius.

X. If Sweats be frequently provoked in moist Women, because they evacuate the whole Body, it will be very good for them: Upon which account they may sometime drink a Decoction of *Guajacum* sparingly, after the usual manner: Which while a Woman used by my Prescription, she was with Child before she had done taking it.

Plateras.

XI. The use of drying Natural Bathes for a Month's time and above, is the last refuge of Barren Women: To which they go on that account, and sit several hours in them, and Sweat. Which will be more effectual, if they be by Nature also actually hot, as those that are Aluminous and Nitrous, and smell of Lime, called Lead-Bathes, which are common. Sulphureous Bathes, also which, because they have a very emollient Faculty, are the last Remedy in the natural hardness of the Womb, which make sound Women Barren, and because they dry, they will also be good for others; the Salt Water of the Sea also and of Wells, heated by Art and used, will do good either by themselves, or with some convenient decoction.

Idem.

XII. When the Woman has been prepared by Medicines, that she may more easily Conceive, several things should be observed. First, that the time most opportune for Conception is, when the Woman is well cleared of her *Menstrua*, that is, when they cease, for then she more easily receives, retains, and cherishes it. But if the Woman be thin and have little Blood, it is better to lye with her before they come, or in the time of interval. So *Ætius* must be understood, when he writes that a Woman must be laid with, when her *Menses* are at hand. Secondly, it should be considered concerning Coition, that it should be after Meat and before Sleep, for succeeding Sleep relieves the Weariness, and helps retention of the Seed. *Hippocrates* indeed advises to *Venus* after Sleep, Labor, Meat, Sleep, *Venus*, all Moderate: But he has respect to Health not Conception.

Primirosius
de m. m. 4.
c. 1.

XIII. After the Womb is exactly purged, Pessaries should be made, which dilate the inner Mouth of the Womb, and things applied, that straiten the outer. The Womb will be dilated with the following Unguent; Take of the grease of Hen, Goose and Duck each 1 drachm, Oyl of bitter Almonds, Chamæmil each 1 ounce, Orrice root 2 drachms, both the Birth-worts, *Asarum* each 1 drachm, Storax 2 drachms, Pitch 1 ounce, new Wax what is sufficient, make an Unguent. After the use of it, let her use a Pessary of Galls of the Goat or Wolf, with Musk, Castor, and Civet: For all these things lax, draw the Womb downwards, heat, and stimulate *Venus*. Outwardly the Part is straitened with fomentations made of Astringent Roots, Herbs, and Flowers and other odoriferous Things. The use whereof is at going into Bed, after the Monthly purgation, and use of other Remedies, a little before she lies with a Man.

Rondeletius.

Medicines especially made use of by eminent Physicians.

1. In Barrenness let the Man and the Woman for some dayes take upon a fasting Stomach,

the Powder of a Bore's stones, dried in the Shade, with the Broth of an old Cock, truly in a short time they will obtain their desire, as I have more than once tried in several Barren People, whatever the Cause was.

Jul. Cesar
Baricellus.

2. To help Conception, I highly commend both a decoction of Vipers, and of the Womb of a Hare, with Nutmeg, *nux Indica*, shavings of Ivory, Cloves, Cinnamon, Bistort, first making an Infusion of these.

Claudius.

3. They cry up this following for an infallible Medicine; Take of root of Eryngo, leaves of Mother-wort, Avena, what is sufficient, boyl them in red Wine. The Dose is a glass warm Morning and Evening, with 1 drachm of *Tripheba magna* without *Opium*, for 9 dayes.

Corbæus

4. A most certain Remedy to help Conception; Take the stones of a Ram prepared in Wine and dried, the Womb of an Hare prepared, Mace, Cloves, seed of *Anni* each 2 drachms, Saffron 1 drachm and an half, the kernells of Hazle and Pistachio Nuts each 6 drachms. Bruise them and boyl them in 2 Pounds of Malmsey Wine, to the Consumption of a third, two ounces must be given for 3 dayes after the Months, and the fourth let her lye with her Husband, and she will Conceive.

Grulinius.

5. Salt of Satyrion is very good for Women (as its Essence is for Men) to make them Conceive quickly, if half a scruple of it be given frequently in Malmsey Wine or *Agua Vita*, after the Flux of the *Menses*. I have cured many Women with this Secret in a short time, and Men with the Essence of Ants.

J. Hareman
dux.

6. This Pessary is extremely commended by learned Men, namely, Beat Garlick with Oyl of Spike, wrap it up in a long Rag, put it deep into the Womb, when it is taken out, the *Menses* will come plentifully, and the Womb will find much Pleasure, and be cleansed, so that this has made way for Conception, a long time despaired of.

Lud. Mer
catus.

7. *Simon Pauli*, says that Speedwell is good for Barren Women.

Stranguria, or the Strangury.

The Contents.

Whether Blood may be let? I.

How we must purge? II.

It must sometime be Cured with heating Things. III.

When it is caused by drinking new Beer, it is cured by drinking Wine. IV.

The efficacy of an Issue in the Leg, when it comes from the impotency of the retentive Faculty. V.

Medicines.

I. **W**HETHER Blood may be let or no in the Strangury, upon any occasion, where there is no Fever (for if there be one; no question need be made of it) is much controverted. *Hippocrates* teaches 6. aphor. 56. and 7. 48. that dropping and difficulty of Urine may be cured by opening the inner Vein of the Ham. Which shows, that Blood may be let; and we shall forbear, now that the Circulation of the blood is found, to go upon Controversie about which Vein should be opened.

II. If the Strangury arise from sharp Bile or salt Phlegm, we must take great care to diminish the Humor, to translate it another way, to mix and temper it; and first of all before any other Remedy to purge the Body with some gentle Physick. If salt Phlegm abound, whether it fall from the Head, as it often does; or being bred in the Belly, and mixt

mixt with bile, it become such; or if it proceed from putrefaction, we must take care by a Vomit once or twice a week to divert it from the usual passages, and also to diminish it. But if it be bitter Choler, you must Purge twice or thrice with an Infusion of Rhenubarb, in a good quantity of Mallow water. But if the Strangury proceed from impotency of the retentive faculty, which from a cold and moist intemperature, or only a moist, being made weak, cannot hold the Urine the accustomed time; you must purge plentifully at the very first coming of the Disease, and afterwards at times and intervals, contriving not only to waste the humour but to divert it another way.

III. The causes of the Strangury are by *Galen* 3 *apb.* 16. reduced to two Heads, weakness of the retentive faculty and sharpness of Urine, which latter happens frequently. Therefore it is queried, whether also Aromatics be proper in such a case? The Negative seems probable, because fire should not be added to fire. If there be heat and acrimony of peccant Humours, upon which score the Disease is called Heat of Urine, it seems rather to be corrected by emollient and cooling things. But although it be frequently caused by the acrimony of *Serum*; yet it does not follow that the antecedent cause, to which the cure is directed, is always heat, because it may, yea and frequently does so happen, that the grossness of cold Humours serves to gather and retain the Acrimony, so that a sharp Urine breeds the Strangury, not as such, but as its passage out, which its sharpness hastens, is hindered by reason of the gross parts mixt therewith: For as sharp and bilious Humours breed not a dysentery, when they cause a looseness, unless there be a viscidum withal, which makes them stick to the sides of the Guts, and exulcerate the same, so also the *Serum* of its own nature possessing a peculiar Acrimony, breeds not the Strangury, unless some peccant Humours be joyned with it. For this reason new Beer causes the Strangury by its thickness and viscidum, obstructing the Urinary passages, and consequently sharpening the *Serum* by the Acrimony of the *faces* not depurated; in which case to give generous Wine does good, because it heats, attenuates, concocts crudities, and so corrects the antecedent cause: For this reason the use of Aromatics is often not inconvenient, when, to wit, it depends on such an antecedent cold and obstructing cause, notwithstanding that the proximate peccant matter is sharp and perhaps hot: for it often happens, that in a hot Disease, a hot Remedy is prescribed, not in respect of the Disease, but of the antecedent causes.

IV. Rhenish Wine alwayes did me good in the Strangury caused by drinking new Beer. If I could not get Wine and was forced to drink new Beer, I was eased of my trouble by taking Nutmeg. When some had fallen into that mischief, they cured themselves only by anointing their Navil with the fat of a Candle. Others cured themselves by taking only a spoonful of *Oxymel*. But I have experienced that the smell of the leaves of black Currant Trees, and much more a Decoction of them mends this fault.

V. If you find, that no Remedies will do in this sort of Strangury, you must make an Issue in one Leg, by which the Phlegm imbibed by those parts may run out, which uses to be a present Remedy.

2. Salt of Antimony is a secret in the dysury and Strangury.

3. Spirit of Turpentine quickly takes away all difficulty of Urine. The Dose is from 9 or 10 drops to 12 in Cinnamon water.

4. I have often seen them that were Sick of the Strangury relieved of a violent pain by taking a drachm of the powder of Crabs Eyes in White Wine.

5. A little fat of a Goat put into the Navil easily cures the Strangury. ¶ Oyl of Mastich drop warm into the Navil takes it away quickly. ¶ Amber, especially the white, powdered and given in Wine, or boyled in Beer is good for the Stone and Strangury; for it presently opens the passages and expels the calculous matter. ¶ Several have been cured in the manner following; Take Rose-water beat up with the white of an Egg and give it to drink.

6. I have learned this, that Spirit of Spanish Salt, drawn in the extreme Heat of a reverberatory, with Potters clay, taken in white Wine, that was drawn out of the Vessel a day before, does not only take away the mortal Stranguries of old Men, and because it is wholly diuretick hath cured several; but moreover they that have had an extraordinary Stone fall out of the Kidney, and stayed some Months in the Bladder, have at length voided it in small pieces by Urine. And it is made of Salt, first melted, and then freed by the Fire from its superfluity, then the Salt is beaten, and dissolved among slices of Radish, and then dried again, and then distilled with as much Potters Earth in a violent Fire of reverberatory, having a care that nothing expire.

7. To anoint the Belly with Beef tallow, takes away the Strangury caused by drinking Beer.

8. A glass of the clarified juice of Pellitory of the Wall is admirable, if it be from a Stone or thick matter.

9. *Rulandus* his certain experiment for the Strangury; Take Sheeps Wool carded and made into the form of a Plaster, to which add some Goats dung mixt with a Boy's Urine, apply it below the Navil, it never fails.

10. Outwardly to temper the Acrimony of the Humours, and heat of the Bowels, a Bath of sweet water is very good, in the Morning before Dinner, especially with leaves of Violet, water Lilly, Lettuce, Mallows, Nightshade, &c.

11. This is excellent good against difficulty in making water; Take 2 ounces of Privet water Morning and Evening.

12. One found great benefit by 6 drops of rectified oyl of Amber in 3 spoonfuls of Parsly water, or Cock broth.

13. I successfully cured the Strangury through the resolution of the Muscle in the Neck of the Bladder, by putting a Woman in hot Oyl, in which the leaves of Laurel, Betony, Sage, Rosemary, wild Marjoram, Penny-royal, Flowers of Chamomil, and Cassidony were boyled, after she had sate in it, I made her an admirable Oyntment of Oyl of Worms, Lily, and Fox, in which fat Whelps were boyled, till the Flesh came from the Bone, when I had strained it, I put in *Styrax Calamita*, *Benjoin*, *Opoponax*, *Olibanum*, Mace, Nutmeg, rectified aqua vite, Goose grease and Wax, which when she had used some Months, she was cured.

14. Powder of dried Acorns given in Wine is a present Remedy for the Strangury.

Medicines especially made use of by eminent Physicians.

1. One drachm of the flesh of a Hedge-hog dried in the Sun and given in Wine, brings away much Urine without trouble.

Medicines.

I. BECAUSE there is a great likeness between the Kings-Evil and hardened Glands (for they are alike both in place and matter,) therefore we must do our endeavour to distinguish the one from the other. They differ first, because the matter of the Glands is more subtil and thin, of the Kings-Evil more gross and viscid, and more contumacious, and hence it is, that whenever a thin and subtil matter is incrassated, of Glands they become the Kings-Evil. Which is Galen's meaning 1. *de loc. aff.* 3. when he says, that Glands sometimes turn into the Kings-Evil. Secondly, because indurated Glands are more separable from the adjoining Flesh, so that by the touch you may easily know it from the Glands: But the Kings-Evil is so propagated into the adjoining Flesh, that it is a very hard thing to distinguish it. 3. Because the Kings-Evil has a Coat, but the Glands are alwayes without one. Rogerius the Surgeon advises to take Ivy Leaves, and Citron, and pound them together, and lay them to the Swelling: and if the Swelling fall in 3 days time, he says it is a sign they are Glands, and not the Kings-Evil; but if they grow worse with the application, so as to be red and ake, it is a sign they are not Glands, but the Kings-Evil.

II. We must observe concerning Purging of Children, since Infancy is very infirm, it must be treated with very gentle Medicines, and it is my advice rather to Purge often gently, than to give strong Medicines. For so I Cured a Noble Boy of the Kings-Evil. Therefore they that commend *Pilule fatidæ*, *de Euphorbio*, and such Medicines for Children are not to be heeded. I confess, they are tolerable in grown People. ¶ Physicians for the most part accomodate their usual Purges in the Kings-Evil to Phlegmatick desfluxions, whence they reckon it arises, not only if it be in the Neck, but in any other part of the Body, and direct them chiefly to purge Phlegm. But as such a Body is either Plethorick or Caco-chymick, or otherwise full of ill Humours, I accomodate my Medicines to evacuate them, especially if they be the cause of it; and when there is a great mass, or pravity of Humours, and the Kings-Evil is bad and breaks out in many places, then I give stronger Purges. ¶ As to evacuation, unless there be other occasion for it, it ought not, as commonly it is, to be so much insisted on for one Swelling, as if the Body were full of the Scroffles, especially since otherwise there is small hope of Cure.

III. I find divers opinions concerning Vomiting. *Ætius*, whom *Avicenna* follows, commends Vomiting; but others wholly condemn it. I find some who go

a middle way, and say, it is not good before Purging, but after. But I am of opinion, that none should Vomit in the Kings-Evil; and I am of this opinion for this reason. Because though the antecedent matter may in some measure be diminished by Vomiting, yet the impacted matter is so far from being thereby removed, that it is rather the more exasperated. Besides, it is certain, that the Head is extremely filled with Vomiting. For look but on those that Vomit, and you may see the jugular Veins strut, and the whole Head swell and grow hot; so that without all question the Head is filled with Vomiting. Which made *Hippocrates lib. de loc. in hom.* greatly to condemn vomiting in Diseases of the Ears and Eyes, and for the same reason, why it is not proper for Diseases of the Ears, it may not be proper for Diseases near the Ears.

IV. To stop the matter, which is in Flux, Frictions, Cuppings, Vesicatories applied to the Head are proper; and as soon as I observe Swellings arise in the Necks of Children, I find no more present Remedy, than to exulcerate the Skin of the Head: for this is the most proper diversion and evacuation; But we must have a care not to draw Blisters in Childrens Heads with *Cambarides*, for as I have often observed, in this age they often cause great torture, and pissing of Blood: But it is better to do it with Mustard, Nettles, Hony-suckle; yet with great moderation and prudence.

V. But whether in stopping the matter, which is in flux, may we use astringent and repelling Medicines? *Galen ad Glauconem*, speaking to him, tells him, that he gave astringent Medicines for the Kings-Evil; and, as *Alexius* interprets it, repellent. From which place any one may gather that the use of them is proper; but never except in the beginning. Besides in *Rhases lib. de Apostem.* it is found that Plantain is very good in the Cure of the Kings-Evil. But now Plantain is a Medicine that binds and repels: Wherefore the use of such Medicines seems convenient in curing the Kings-Evil. But there are reasons on the contrary side, because whether we have regard to the matter, or the places suffering, we are very far from any reason for ever using them: for the matter is cold, thick and impact, and therefore can by no means be repelled: and in respect of the place they are not convenient, because if we find the matter subtil, and hot, since it is the place of the Glands, and next to the Brain it self, the matter must never be repelled from these places, lest it be forced from a more ignoble part into the Brain. Therefore *Galen 3. 3. K. T.* says we must never use repelling Medicines in the *Parotides*. And he in 14. *m. m.* says in express terms, that no other cure should be used in the Kings-Evil, than such as is good for a *Scirrhus* and hardened Tumours, in which he advises to act only by emollients and dissolvers, and all Physicians have followed this way: yea *Ætius* says that the Kings-Evil beginning in Children must be softened, dissolved and discussed, so that no scope is left for them, who think that the use of Astringent Medicines may be convenient in the beginning of the Kings-Evil. But they that understand *Galen* speaking in his own Language, may easily remove this Scruple, because all Interpreters have been mistaken in this place: For the word which he uses, *τὰς μετὰ τὴν ἀφροδίτην*, they have very ill translated to astringe, for it rather signifies to restrain, or diminish, or make smooth; so that *Galen's* opinion in that place is, that he gave Medicines, which restrain and keep down the Scroffles, and this may easily be gathered to be true, because in the same Book cap. 4. he uses the very same word, and the Interpreter has translated it very right in that place: It must not therefore be thought that clear-sighted *Galen* could be mistaken in so plain a case, as to use astringents in the Kings-Evil. But what shall we say

say to *Rhases*? I say that Plantain may be used either green or dry. In the green the absterfive faculty is almost wholly drowned in the moisture, but in the dry it is great. Which when *Galen* 6. *Simplic. med. cap. de Arnoglossa* would teach us, he says that the Leaves and Roots of Plantain dried, are good to open obstructions in the Liver and Kidneys; Therefore when *Rhases* commends Plantain, he means the dry, because it cleanses, dissolves, and discusses. ¶ Yet *Rondeletius* *pract. l. 2. c. 4.* affirms that he has cured several of the Kings-Evil beginning, by laying Cypress nuts upon the part, according to *Dioscorides* his precept. ¶ *Wharton* also *Adenogr. c. 40.* says, that the external cure of the Kings-Evil, which is managed by repellents and discutients, is not without hazard, because the matter may very easily recur to the inner parts, and breed there more dangerous Swellings of the same sort, or may encrease these that were bred there before.

VI. Sometimes Sweating is proper, if abundance of Scroffles dispersed up and down the Body do show there are excrementitious ill Humours, especially in Phlegmatick and moist Bodies. But in hot and Cholerick Bodies sweating is not so proper, for it only more inflames the Body and Humours: In which case Surgeons rashly think to cure by this one Remedy, as they think they can all external Diseases, and so they often emaciate Mens Bodies to no purpose.

VII. As we find that Narcoticks outwardly applied have a great dissolving faculty, so also, if applied in the Kings-Evil, they will do much: As leaves of Mandrake, Henbane, Poppy, bruised, or roasted a little under Coals or boiled or used any other way by themselves. Also Mandrake root, or powder added thereto &c. The rubbing also of the Scroffles till they grow red, does also conduce something to the dissolution of them; And if it be used before the application of Topicks, it better disposes them to receive their virtue.

VIII. By a potential Cautey, which making an eschar in the Skin without pain opens the Scroffles, I have often got them out: Or I have laid them bare, that they might be better suppured by applying Medicines; But it is dangerous to attempt this by actual Cauteries, seeing an Inflammation might easily follow. Yet in any ignoble place they might very well be opened in this manner.

IX. The cure of the Kings-Evil consists in this, that the matter already gathered, be perfectly taken away, and that what is in gathering be prevented from gathering. Concerning what is gathered, we must consider, whether it be only pituitous, or also hot; if hot matter be mixt with it, all hold that suppuration must be attempted; but if it be pituitous, we must again consider whether it be very thick or but moderate: If it be very thick and viscid, the cure can be expected no other way, but by putrefaction, the instrument and fire: But if it be moderately thick, the cure consists in this, that the matter be dissolved and dissipated.

X. A certain Woman had the Scroffles all over her Neck, and she was cured in a Months time. A powder of equal parts of Sugar, Ginger and Turpeth was given her, which purges Phlegm particularly from the remote parts. After *ceratum oxaleum* was applied, they were softened with oyl of Lizards; Take green Lizards as many as you will, boyl them in common oyl, till they be burnt, and the oyl turn black: let the colature be put in a Glass and set in the Sun till the dreggs subside, the oyl grow clear and it be of a brown colour. Then I gave every Morning for 30 dayes of the Eleuary, which *H. Saxonia* and *J. Præpositus* reckon as a most sure secret; Take some common or green Lizards, cut off their Heads and tails and take out the Guts, infuse them in strong white

Wine Vinegar 40 dayes by themselves: Then dry them and steep them in other Vinegar; and dry them again either in the shade or Sun; and reduce them to powder: which being done, with one ounce of the powder mix 4 ounces of Honey. The Dose for Children is 2 drachms, for grown Persons half an ounce, six drachms, or an ounce at most for 30 or 40 dayes. I have tried the admirable virtue, of that Unguent which *Aguapendent* has. *Pentat. l. 1. c. 21.* for the open Scroffles, in a certain Nun, who had ulcerated Scroffles in her Breast, and in a Maid, who had them in her Neck. ¶ A Maid about 18 years old had strumous Swellings in her Neck, which by using Remedies a long time had been suppured, and afterwards healed up; but there remained some share of it very hard, which could not be dissolved by *Emplastrum de Vigo*, *Mercurio quadruplicato*. Then I prescribed of the foresaid Plaster, Roman Vitriol, and Gum Ammoniac dissolved in Vinegar, and thickned with a sufficient quantity of Turpentine, whereby they were dissolved in a month; using in the mean time convenient diet and evacuation.

XI. We forbear not to cut out Scroffles, though they be crude and hard Tumours, but then they must be moveable, and not fastened to the Flesh, and we may draw them out with our Fingers, as we do *stomatata* and such things, having cut them from the Skin, and severed them round, with a knife broad and sharp pointed and crooked backwards, according to *Galen* 14. *m. m. cap. 11.* I have tried this Chirurgical way of Cure with success in hundreds. ¶ A Girl about ten years old had a struma on the right side of her Throat, which sticking close to the *aspera arteria* and the recurrent Nerve, did a little hinder her Breathing and her Voice. Her Mother entreated me to cut it out, because she thought it might be done without danger, seeing it was not so big as a Gooses Egg. But I refused to meddle with it, for fear of an Hemorrhagy, or spoiling or loosing her Voice; for the jugular Veins, and the recurrent Nerve of that side, seemed to be involved in this struma. Not long after a rash fellow adventured on the operation. But as soon as ever he made use of his razor, the Maid died immediately.

XII. Although *Laurentius* reckon the Scroffles curable; yet I must say, they are very difficult to cure, or incurable: for if you apply slight things, the hardness of the Humour resists them, if strong, burning, causticks, yea fire it self, to melt and waste the glutinous Humour, that will draw the Blood to the heated part, by virtue whereof those clammy Humours will be concocted, and when concocted, will remain the harder, as I have found by my own experience, and what mortal Man can be found so vain glorious, as to boast (as some have done) that they can cure them by Topicks, when they have their original not behind the Ears, but from the inner Bowels?

XIII. This is observable, that although they be most exactly cured, they do return again and again. I think there are two Causes of this Event, the first is the thickness, viscosity and contumacy of the matter whereof they are made; for although we use our utmost care and diligence to root them out, and to extirpate the matter of the Scroffles, yet their Contumacy is such, that for the most part some share of the matter is left behind, which is as a certain fond, which not only destroys the temper of the Part, but also infects and corrupts the nutriment as it comes to the Parts, so that it affords plenteous nourishment to this Disease. The second is the Bladder, which is so firmly fastned, that it can scarce be got out, wherefore when it is left it is filled again with some ill Matter or Humor, and gives occasion for the breeding of it anew, yea although by the Artists care the Bladder be got all out, yet there always remain the

Sculterus

54.

Severinus,

Fabricius
Hildanus,

Fontanus.

the roots as ligaments from which it sprouts anew, and consequently the Disease: For if, as Hippocrates sayes, when the Blood is congeled, it is covered with a certain Coat, which if it be taken away, a new one comes in its stead, and if this be taken away, so a third; how much more may the Bladder grow again, if any Root or Branch of it remain?

Mercurialis.

XIV. The Scroffles rarely appear in any great number outwardly, unless they be rooted inwardly in the Mesentery, as Riolanus Ench. c. 18. l. 2. sayes, And Wharton Adenogr. c. 40. observes, that they who are troubled with the Scroffles outwardly have them also very much inwardly. Also Julius Pollux the Grammarian l. 2. c. 98. has told us that Scroffles grow in the Mesentery. For which reason Langius l. 3. Ep. 4. asserts that those mineral Waters, are the wholesomest, which taste of Lees of Wine, which, as Arnaldus sayes, not only dissolves these inward pituitous and stumous abscesses, but the outward also. Barbette in his Praxis commends Acids and volatile Salts taken inwardly; which Deckers in his Notes advises to be gentle and temperate; which accurate Practitioners have observed otherwise to do more hurt than good, for example, Spirit of Salt, Nitre, &c. rectified with Spirit of Wine and sweetned by Cohobation: He commends above all others, Spirit of Sal Ammoniac, inwardly and outwardly mixt with a due vehicle.

Medicines especially made use of by eminent Physicians.

1. Drink every day out of a Mans Skull, and the Kings-Evil will then vanish. ¶ The Mustrome that grows on a Birch-tree, put in Wine and drunk, has a singular Virtue in gradually curing and wasting the Kings-Evil.

Agricola.

2. It has been observed that Scroffles and other Tumors fall, if the Part affected be rubbed with a dead Man's Hand, for so the Swellings gradually vanish, as the dead Body rots by degrees.

Th. Bartholinus.

3. Root of Vervain hung about the Neck of one that has the Kings-Evil, gives wonderful and unexpected relief. ¶ They say Silver-Knapweed is marvellous good; also red Poppy steeped in Wine, and bruised, and the Mucilage applied to the Swelling, is a Medicine that does good by tempering, and has those Virtues which we require in Medicines for the Kings-Evil, over drying things being excluded.

Baricellus.

4. Three Toads boyled in Oyl Olive in a glazed Earthen Vessel, make an excellent Oyl, for the Kings Evil; but the Fumes of them, while the Oyl is in making are dangerous: Therefore keep that Vessel close, and have a care. First they apply Arsenick to the Scroffles, and blister them, then corrode the Part with sublimate, and use the said Oyl, which will be yet better, if you infuse the salt of Toads in it.

Borellus.

5. This Potion has been oftentried, which not only takes away the Kings-Evil, but all Mucosities of the Throat; Take of Broom-flower Water 3 ounces, drink it warm with Sugar in the Morning. The Powder of Broom-flowers does the same mixt with Honey of Roses.

Sebast. Corralio.

6. The lesser Celandine has 4 or 5 grains like Wheat growing to its root, which are used to draw out the Scroffles with great success.

Crollius.

7. Their Cure depends upon the Meazles of Hogs, which may be calcined and sprinkled on them, and Oyntments may be made of them, which are very good for the Cure of these Swellings and these Unguents may be fortified with distilled Oyl of Hogs-Lard, or distilled Oyl of Hogs-Meazles,

which is a specifick against the Kings-Evil.

Joh. Pet. Faber.

8. If the Kings-Evil must be taken away by causticks, there is no better Medicine to take them away, than sublimated Arsenick; but you must have a care, that the Parts near the Swellings do not Putrefie or Inflame.

Gull. Fabricius.

9. An excellent Electuary to take away the Kings-Evil, is thus made: Take of the Bones of a Hen, the flesh whereof has been boyled off, dry them, and powder them. Take of this Powder and Seed of *Sesamum* each alike, as much as you will, with Honey make an Electuary. Take a drachm at a time Morning and Evening all the decrease of the Moon till the new, and then repeat it the following decrease of the Moon.

Rod. à Fonsec.

10. The use of the Powder of Sponge will cause it to decrease, if you drink as much as you can take upon a Knife's point, in Cinnamon-water. The Sponge must not be burnt, for then its seminal Virtue is destroyed.

Grembr.

11. This is admirable for the Kings-Evil, Throat-rupture, *Parotides*, and all hardness. Take the leaves of Cypress, neither the tenderest nor the hardest, reduce them to powder, Sprinkle them with strong Wine, and turn them, till the Body of them turn to dreggs. Lay it upon the Scroffles or Rupture and the third day take the Medicine, you will find the place contracted, which must be squeezed out with the Fingers. Let this Medicine be repeated, and on the Seventh or Ninth day at farthest, the Kings-Evil will be gone to a Miracle.

Hollerius.

12. Take of root of Fern, Spleenwort, Dwarf-elder each 3 ounces, cut them and boyl them in the best Wine, then pour away the Wine, bruise the Roots, and add of live Sulphur 1 ounce, ashes of Cockle-shells, 2 drachms. With equal parts of Honey and Vinegar reduce them into the Form of a Cataplasim, lay it upon the Scroffles, it consumes them wonderfully.

Fr. Joel.

13. There is scarce any Plant of so great Power in softning and dissolving Swellings in the Kings-Evil, &c. as the bulb of Cornflag and Hogs-Lard outwardly applied.

Laurentbergius.

14. It has been found by experience, that burnt Allum powdered, if half a drachm of it have been given in Wine alone, or mixt with other discutient and drying Powders, has done much good in this Case.

Platerus.

15. Root of Figwort eaten for 10 dayes every Morning fasting cures the Kings-Evil.

Arnold. Villanoanus.

Stupor, or Numbness.

The Contents.

Sweat must be promoted, if it be from a Melancholick Humor. I.

Some is cured by Bleeding. II.

It is to be cured especially by Bathing. III.

The Numbness of the Thighs ending in the voiding of Stones. IV.

I. **W**HEN the whole Body is evacuated, the matter comprehended in the Nerves must be digested, to which end Sweating is reckoned altogether necessary: for the portion of the Melancholick Humor, which is the cause of Numbness, is serous and acid rather than thick, and may therefore be got away by Sweat. But you must be very careful in composing the decoction, so that it may be drying in the passive, and temperate in the active Qualities. Wherefore *Sassa* may be the basis of the decoction, to which may be added *China*, Mastic-tree, wood of Rosemary and Tamarisk,

risk, making the infusion in Chicory and Betony-water, and when it is almost boyled add an handful of Ground-pine.

II. Hippocrates cured *Stimargus* his Maid of Trembling by plentiful Bleeding: So I have several times cured Plethorick Bodies of Trembling and Numbness by repeated Bleeding.

III. Pumping requires, the Head should be exactly Purged; a Sheeps-skin can but make lax and resolve a little. The putting a Limb into an Ox new killed, is good rather for shrunk Sinews, than for such as are lax and full of Moisture. But here is occasion for some Medicine, that is of subtil Parts, very penetrating and dissolving, but not hardning, because the Nervous kind is hard and dense. Such a s is Sulphur, wherefore sulphureous Bathes are a Remedy of great use, used for several dayes. And because they penetrate and dissolve the Humors, but do not strengthen the Parts, therefore afterwards a strengthening Bathe must be used.

IV. I lately had a Nobleman under Cure, who brought the Advice of the Physicians, that had by common consent prescribed him Medicines for the Palsy. When I predicted, to him that within four dayes he would be eased by voiding fragments of a Stone, he laughed at me and my Prediction, because no Body else had told him of any such thing, nor had he ever voided any Gravel; Yet at length with much ado he was perswaded, and found that I foretold truth. And the Cause is this, the Branch of the *vena cava* descending, one goes to the Kidney, another to the Thigh, and a third to the Stones: Therefore upon the plenitude or compression of that which feeds the Thigh, a Numbness follows; as when the other, which comes to the Stones, swells, and is therefore made shorter, a Stone is contracted.

Sudor nimius, or too much Sweating.

The Contents.

Unseasonable Sweating stop'd by cooling inwardly. I.

A Nocturnal one cured by Purgings. II.

The way of stopping it in Fevers. III.

The stopping of a salt, bitter and acid One. IV.

When the outward use of Allum may be allowed. V.

The way of stopping too great a Sweat. VI.

A Pertinacious one cured in an old Man. VII.

I. **T**HE Wife of N. after she had been cured of a Fever, sweat every Night. I prescribed her a cooling Julep of Chicory and Bugloss Waters with Syrup of Apples, and she Sweat no more after that. Whence I gather that Sweating in ones Sleep is not alwayes a sign of luxuriant Humors, but sometimes of Heat; for healthy People, that are of an hot Constitution, often sweat in the Night: Besides, the foresaid Woman was cured without any evacuation, Natural or Artificial.

II. A Man 40 years old of a melancholick Complexion, had been troubled with Night Sweats a long time, which lasted 4 or 5 dayes, and then gave over, returning twice or thrice in a Month. They proceeded from a quantity of Serum gathered at intervalls, and discharged to the Skin. He took twice a Month Powder of Jalap and Creme of Tartar, each half a drachm, which being continued for 3 Months, he was rid of his tedious Ail.

III. Sweat, either excessive or hurtful in it self, which weakens a Man still more and more, will abate, and at length cease. 1. By keeping the Body moderately covered, yet not Naked. 2. By ha-

ving a care of any volatil Salt, and Spirituous Acid, such as Vinegar. 3. By using such things as fix the Acid, as Chalk, Corall, &c. On this Ground I often in the Year 1670 gave to several that were Sick of an Epidemick Feaver, and fell into sweating Night and Day, which every day decayed their strength, the following Electuary, upon taking of which twice or thrice a day, to the quantity of a Nutmeg, they were cured by degrees of their Sweat, and their quartane Ague, or of any other, if it remained, and they got strength. Take of Conserve of red Roses 2 ounces, *confectio hyacinthi* 1 drachm, *Dia-cordium* 2 drachms, red Corall prepared 2 scruples, Syrup of Myrtles what is sufficient. Mix them, Make an Electuary.

IV. A salt Muriatick Sweat will be amended with Medicines that correct a Muriatick Saltiness, and sometimes by Purgatives; A bitter Sweat indicates that Bile must be diminished by Cholagogues: The matter of an Acid Sweat will be concentrated with Corall, Chalk, Crabs-eyes and the like, and then diminished by Hydragogues.

V. In a Diaphoretick Sweat, the external use of Allum with great circumspection ought not to be rejected, if a Shirt dipt in a solution of Allum, and dried again, be put on, but I commend it only in the declension of the Disease.

VI. It is evident, that there is often too great a Sweating, for nothing is more common than for some that are Sick of a Consumption or Scurvy, and others, who difficultly recover of Feavers, yea, for some without any Disease, or evident Occasion, to run with Sweat. The Consumptive and Scorbutick are obnoxious; because when the Blood is infected with some impure Corruption, or is disordered, and therefore cannot rightly concoct and assimilate the alible Juice, that is continually poured into its Mass, it severs and casts out by sweat this Juice so degenerate, and now and then with other Recrements heaped up to Plenitude. The Cure depends altogether on the cure of the Disease, whereof it is a Symptome. In the mean time in this Cure, as to what concerns a course of Diet, an useful and necessary Indication is taken from this Symptome, namely, that when Nightly and plenteous Sweats attend these Diseases, a Diet may be kept of aliments that are very small, as Milk, Oat-Meal grewel, Barly-creme, and the like, whose smooth and soft Particles the Blood may be able to bear, and not of Flesh and strong Meats.

2. Too much Sweating is the effect sometimes of another Disease, that went before and is extinct. I knew a young Man, who, when a quartan Ague left him, fell into such profuse and long Sweats, that he was in a Consumption, this Man, after he had tried several Remedies in vain, recovered by using Asses and Cows Milk. In such Cases as these, the Blood perpetually rejecting, and as it were vomiting out its contents by the Mouths of the Arteries, does not only cast out the Chyle, immediately as it is poured out of the Bowels; but moreover taking both the Nervous juice and the sustenance of the solid Parts, to feed its self, it by and by loathing them all, expells them together with the nutritious Juice by the Pores of the Skin. The cheif Cause of this affection seems to consist in the dyscrasie and debility of the Blood, in as much namely, as its liquor, like Milk growing sour, is apt to melt, and be precipitated into serosities, wherefore both its own separations, and the Humors also, which are added elsewhere, when they cannot be assimilated, are immediately separated: And when the Pores of the Skin are very wide, they are cast out rather by Sweat than by any other way of excretion. Such excessive Sweating uses to arise not only from the depraved Temper and Fermentation of the Blood, but sometimes from its depraved Flame: Both when the Blood fermenting Feverishly through excess of Sulphur, does

Sylvius de
Boe. Prae. l.

27.

now

now and then break out into Sweat: And when through the defect of it, the Blood being depauperated, and made Waterish, is not so much kindled, therefore as often as it is hurried into a rapid Motion, by some ascitic heat, or the motion of the Body, its ferocities are dissolved into Sweat. Sulphur is wanting in the Blood, either because it is wasted, as after long Fevers; or because enough is not bred for want of Food; this latter may be observed in scarcity of Provision, or after keeping of Lent, for immediately upon Running or Walking fast the sweat bursts out. Yea Cattle when they are fed with new Hay, upon the least Labor sweat much, and are soon tired. The Indications of Cure are especially these three. 1. To remove or correct the dyscrasies or debilities of the Humors. 2. To contract a little the Pores that are too open. 3. To derive the Serum and Watrish recrements of the Blood to the Kidneys. The first of these is performed by such things as destroy the prepotency of an acid Salt in the Blood: also such as promote the exaltation of the Sulphur (if perhaps it should be deficient) To which ends Antiscorbuticks, Chalybeates, and Medicines endued with a Volatil Nitrous, and Alkalizate Salt, often do good. The second intention, consisting in a due constitution of the Pores is commonly performed only by outward administration.

Willis.

VI. An old Man 72 years of Age was in the year 1657 very ill of a Diaphoretick Sweat, so that he was all over in it almost Night and Day, and what ever he eat or drank, he immediately perceived it pass out at the Pores of the Skin. The Cause of this Disease was abundance of serous Humors, complicated with the Scurvy, which were gathered in the Mass of Blood, by a depraved and vitious fermentation in the Organs designed for Sanguification, which did not transmute the acid Salts of the Meat into volatil Salts. The Disease had lasted 3 Months, before my Advice was taken, but it was quickly cured by me, only with Ivory, without Fire, and an Emulsion made of the four greater cold Seeds and Cichory and Bugloss-water: giving now and then Jalap and Crytall of Tartar: Forbearing Wine, Sower Meats, and other things that breed Scorbutick Blood. He lived until he was fourscore and three years old.

Hofmannus.

Suffocatio, or Suffocation or Strangling.

The Contents.

- Bleeding is often convenient. I.
 Fear of Suffocation from the Lungs distended with Wind. II.
 How they that are Strangled with an Halter may be recovered. III.
 By what means they that have been Suffocated in the Water, have been brought to Life again. IV.
 The Cure of those that are Choaked with Smoak. V.
 With the Steam of Must. VI.
 With the Veins too full of Blood. VII.
 With Worms coming into ones Throat. VIII.
 With the swelling of the Thymus. IX.
 With poisonous Muskhornes. X.
 Men may be taken with Fits, like Hysterick ones. XI.
 An easy Remedy in fear of Strangling. XII.

1. For them that are Strangled or Choaked, the suffocating Humor having recourse to the Throat, either because the Blood is forcibly carried to the Heart or Brain, whether it come from the Womb or from some other Place, Bleeding is never amiss in this Symtome, that is, if you find the Pulse strong and the Veins full. Bleeding is also good

when it comes from drinking cold Water, as *Discorides* advises, for Bleeding is not convenient because the Water is alwayes hot, or because Infectious, but because there is much in the Veins.

Bocallus.

II. Sometimes Wind distends the Lungs so violently, that it causes Suffocation, unless help be given by opening the Breast by *Paracentesis*, which is often done at *Paris*, to the great advantage of the Patient and the ease of the Breast, though no Water run out, but Wind break out violently. *Hippocrates*, calls them *πνευματίας*, whose Breast is distended with Wind.

Riolanus.

III. *Anne Green* a lusty young Woman about 22 years of Age, was tried for killing her Child, and hung on the Gallows for half an hour. Her kindred who stood by, that she might be dispatched of her punishment by a speedy Death, some of them beat the poor Wretch on the Breast, others hung on her Feet, and others lift up her Body, that as it fell down again, it might draw the Halter closer; She was reckoned by all People to be Dead, and was taken from the Gallows. The Physicians waited for the Body, to dissect it, but *Dr. Petty*, and *Dr. Willis*, who were to dissect it, observing her to breathe, altered their Minds, and consulted how they might save her Life. They directed all there Care, to procure the free and accustomed Motion of the Blood: Therefore forcing open her Mouth, they poured in Spirits and Waters, which in a small quantity do very efficaciously strengthen the Heart: They diminished the quantity of Blood, which would otherwise have been burthenfome to the oppressed Heart, and took at several times repeated, in all to the quantity of 20 ounces, that the Heart might, when eased of the abundance of Blood, more easily and readily distribute the rest into the whole Body, and might the more eagerly draw to it self, that which stagnated in the Veins, or moved too dull: They laid Cataplasms round her Neck, and anointed her all over with Oyls and hot Spirits, that the Bruises might be dissolved, and that the Blood might pass more freely to the Head by the *Carotides*, and repass by the Jugulars. They ordered Clysters full of Spices to be given her; both that they might get out the Excrements, which perhaps might be troublesome to the Guts, and might prove more prejudicial to other Parts; and that they might quicken the Motion of the dull Blood in the mesenterick Vessels. Upon this, she first scratched her Hands, by and by she could open her Eyes, and move several Parts, and was able to Cough. Afterwards being further helped by the dexterity of the Physicians, she could understand the by standers talk, observe, and laugh. She found a Pain and numbness in the bruised Parts: and in a few dayes time she was well, and was able to go about her Affairs.

Wepferus.

IV. A Girl not three years old fell into a Vessel full of Soap-water, and being full of it she seemed to Breathe her last, she slept profoundly, rattled, and scarce drawing any Breath was quite Choaked, such a murmuring Noise coming upon her, as is usual in People that are dying. I was called, and I ordered that a Decoction of Barly unhusked, Liquorish and Figs should continually be poured in a little warm; and when she had Vomited gently, and had cast up all the Soap-water, and freed her in a few hours from Suffocation; her Mother, if I had not hindered her, had given her Rhenish Wine, which indeed is amicable to Nature, but it might not only have easily carried the poisonous Matter in the Soap to the Heart, but it might easily have raised an inflammation and a Fever.

In the year 1577. when a great many Boyes and Girles had got upon an old rotten Bridge to see a Soldier that was fallen into the Water; The Bridge broke and a great number fell into the Water, and were

were in danger of their Lives; to whom when I was called, they all escaped by taking a Decoction of Chamæmil Flowers in Beer, by which we made them sweat in Bed: which I did to several others, and they all recovered.

Forestus.

My Son *Frederick Bonet*, 20 Months old, she that tended him having left him, was walking over a Pit full of new quenched Lime, and being thrust by one about his own Age, he fell into it. She who had the care of him coming immediately, jumped into the Pit, threw him upon the edge of it, and she herself could scarce get out by reason of the deepness of the Pit, and softness of the Lime. She immediately poured some Wine that happened to be in the way, into his Mouth, when he breathed not at all, but seemed as one dead, by means whereof he vomited the Water, and some signs of life appeared. By and by, left the Acrimony of the Lime, wherewith his whole Body was smeared, should hurt him, she cut the Girdle wherewith his Clothes were tied, and put him naked into a Pale of Water, and washed him all over. A little after his Face grew fiery red and swelled, and he fell into a Fever, for which reason seeing he was Plethorick and strong, a Vein was opened with a Lancet, upon which the swelling and redness forthwith abated. Our next care was, that the Bowels might suffer no damage by the base and sharp Quality of the Lime, therefore Oyl of sweet Almonds with Syrup of Violets of many Infusions was given him, and emulsions of Almonds were prescribed him; Clysters were given him &c. By the efficacy of which Remedies, and by the Blessing of Almighty GOD, he was safe in two dayes time. There remained only a privation of his sight, which the other Physicians, who were called into Consultation, ascribed to the corrugation and dryness of the Membranes caused by the Lime; I ascribed it only to the sticking together of his Eyelids, which were wonderfully swelled. The fifth day after his mishap decided the Controversy: The Child loved a Foal that was in the Neighbourhood, the humming whereof when he heard, as it passed by, he would have it brought to him; when he perceived it was near him, he rubbed open his Eyelids, with that violence, that, to our great joy, we quickly perceived he had not lost his Sight. The pleasant remembrance of my dearest Son's Recovery induced me to rehearse the whole Story, though not altogether so much to the matter in hand.

V. He that is Suffocated and destroyed by Smoak, will be cured by the correction of hot and fatning Things. (*Haly pract. l. 6. c. 4.*) i. e. of very nutritive Things, as some interpret: I think indeed they prescribe fat Things, because of the sharpness of the Smoak. A fume also of some cordial Spice, with a mixture of cold things therewith, is good; such as Water-Lily, and Poppy, because they resist the manifest quality of the Smoak, which is hot and dry. And some in this Case order Bleeding after two dayes. But such, and they that are pent up in a stinking Air, must immediately be carried into the open Air, and be refreshed with sweet Scents. ¶ A Country Fellow, when he had admitted the smoak of a Coal to the Sealing of a Room, that was newly Built and Plastered, and had laid there one Night, was found in the Morning almost Dead, without Pulse, Motion or Sense, all cold, with froathing about the Mouth. Although I reckoned there was no place for Remedies, yet however I would try the Cure. And first of all, I bled him in both the Arms: I applied Cupping-glasses to his Hips and Legs, and then dolorifick Ligatures. I also ordered Suppositories; and when at first the Blood would not run, I ordered Clothes wet in warm Water to be applied to the Incision, upon which the Blood by little and little began to run. And because

Forestus. l. 13. Obs. 26.

the Pulse returning a little in the very opening of the Vein, indicated that I should suffer the Blood to run freely, I took away almost 2 Pounds. While these things were in doing I ordered him to be fanned, and cold Water to be thrown in his Face: Afterwards, when his Pulse grew better, I ordered him an Issue to be made in his Neck, by which Remedies he recovered in a short time.

D. Panarolus. Pent. 1. Obs. 19.

VI. I think, they that are suffocated with the steam of Must, are hurt rather in their Brain than Heart; for some in the like Cases have after their Cure gone mad and fallen into a Fever. And besides, I have observed such Steams, as they came from the Fats, have pierced the Root of my Nose, like Needles. Thus by the steams of Sulphur, Birds fall from the Trees. If any Man be called to visit such Patients, let him order cold Water to be thrown upon them, let them be kept long unburied, because many have been buried alive. ¶ I judge, that in Beer, upon the account of the Hop, yea, and of the Mault, as also in Must, sulphureous narcotick exhalations do evaporate by Fermentation, as it usually happens in metallick Mines, and medicated Springs that are shut up. But how may we immediately relieve such, this is our business? Immediately therefore the ambient Air must be ventilated on all hands, by which means I remember a Woman that was thus Suffocated (being treated as one Apoplestick) when the Doors and Windows were set open, and the Croud of People about her removed, came to her self again; and now for these ten years has not suffered the like. Let the Mouth, if shut, be forced open, and let Treacle dissolved in *Aqua Vitæ*, or in some cephalick Spirit be poured in: Let Sneezing be provoked with powder of *Euphorbium* and Pepper: Let a Vomit be given of some emetick Syrup, or a decoction of Radish and *Afarum*: Let the extreme Parts be rubbed with spirit of Lily convall, and let new Spirits be created by Cordials and Cephalicks.

Borellus. cent. 2. Obs. 5.

G. Horstius.

VII. I visited a Patient very near Death, Sleepy, without Sense or Motion about 30 years old. And when as there appeared some hope in letting him Blood, because he was a full bodied Man; yet because the senior Physician refused it, it was omitted, but that the innate Heat, as he said, might be raised again, he prescribed a Clyster, Ligatures, Blisters, Cordials, &c. which when daily administered, the Patient died. When his Body was opened, there was no internal hurt, but all his Veins were turgid and swollen to an immense bigness, so that some Veins, which in others are small, were in this Body as thick as ones Thumb: Therefore the Suffocation of the native Heat came from the abundance of Blood.

Panarolus. Pent. 1. Obs. 18.

VIII. A Cellar-keeper of *Anhalt* complained of a straitness of his Throat, as if he were choaked. By reason of the Life he led, there was suspicion of Fumes arising from some bad Matter that stuck in the Coats of his Stomach. Pills were prescribed him, which while they wrought upwards also, he vomited Worms, and afterwards was very well.

Salmuth. cent. 2. Obs. 40.

IX. Suffocations may happen even to Men from the Swelling of the Gland called *Thymus*; but the swelling of it does often choak hysterick Women, unless they be relieved by Bleeding.

Riolanus.

X. If there be imminent danger of Suffocation from poysonous Mushromes, a Vomit must immediately be given of decoction of Radish and *Oxymel*: Or half a drachm of Salt of Vitriol may be given with three ounces of *Oxymel*: Afterwards let Wormwood and Baulm be infused in Wine and give the Wine. *Sanctorius* says, nothing is better than Oyl of Citron Peel. When Suffocation had taken *Pausanias* his Girl, *lib. 7. Epid.* after eating a Mushrome Honey and Water hot, and Vomiting, and Bathing,

Eccc

did

did her good: In the Bathe she vomited up the Mushrome; and when the Symptomes ceased, she fell into a Sweat. A Matron being almost Choaked with bad Mushromes, had breathed her last, had not I relieved her with Oyl drawn from Citron Peel, the Passages of her Breath were so much stoppt with gross Fumes from the bad Mushromes.

Blasius ap-
pend. ad Ve-
lingii Anat.
part. § 190.

XI. I think it is no absurdity to say, that Men sometimes have Fits like to Hysterick ones: The Cause whereof proceeds from the small Gut, in which through the vitious effervescency of concurrent Humors, especially of a too austere pancreatic Juice, Wind and Vapors of the same Nature arise: And when they rise to the Oesophagus, they so straiten it, that the Patients apprehend themselves in danger of Choaking.

Höfserus l.
11. c. 2.

XII. In the greatest fear of Suffocation in Flatulent and hysterick Fits, put the Patient's Feet in warm Water, and you will immediately find him breathe better.

l. 4. c. 10.

I. IN a Fit from the retention of the *Menses* a Vein may be Breathed. Not many days ago I had a Woman in Cure, who was taken with a Fit eight times a day, and another Physician, who was there, would not admit of Bleeding; yet she was Bled against the Physicians Will, and she Recovered immediately. Wherefore in such a Case we may Bleed with boldness, otherwise many Women might Perish.

A Castr. l. 2
c. 1.

II. Cupping glasses, with much Fire, must be set to the Thighs without Scarification; and then to the Groin on each side, for when they are set to these Parts, they draw the Womb down, because of the Ligaments. But they must not be set above the Navil, as some, through a great Mistake, do: for either they will draw the Womb up, or keep it up, when it is so: Yet they may be applied between the os pubis and the Navil on each side.

III. *Aetius* commends a Vomit, but it may be a question whether it be convenient: For if the morbid Cause be lodged in the Womb, it is scarce

credible, that it should be drawn to the Stomach through so many windings and turnings and so be evacuated. To evacuate the antecedent Cause by reason it does not as yet cause a Fit, will do but little good. Besides, Vomiting in the Fit draws the Humors upwards, and disturbs those in the Womb, and so may make the Fit the worse. Nevertheless it is certain that a Vomit does good as well in the Fit, as out of it: for as Sneezing does good by the Motion and Agitation, so does a Vomit: for in the act of Vomiting, not only the morbid Humors, which cause the Mischief, are evacuated, but also by the straining of the Muscles of the abdomen, the Womb is forced downwards, and the Vapors arising thence are dissipated. And seeing the Womb is easily offended with all manner of things, the Cause does not alwayes ly in it, but sometimes in other Parts also, which provoke the Womb by their caeochymie, to inordinate Motions, as hysterick Women often complain of ails in their Spleen. If therefore the Cause ly any where else than in the Womb, it may be excluded by Vomit, and so it will be convenient, as well upon account of the conjunct, as antecedent Cause.

Primicofius,
de morb.
Mul. l. 3. c. 6.
11.

IV. I have long since by experience found that such Symptomes as these are much exasperated and increased, and others also superadded, by sharp and violent Medicines. Wherefore it is my Advice, that you alwayes use gentle Medicines in them (although the Fits be Violent) by which Method I have seen several restored to Health beyond expectation. ¶ That the Womb is grievously affected by the Guts, has been my Observation, for when a Purge has been given to them that are subject to Fits, they are usually most grievously afflicted. ¶ If Fits arise from corrupt and poysonous Humors, there is no better Remedy then often to purge the Body, according to the Condition and Nature of the peccant Humor. Here we must consider from what Parts such Excrements flow into the Womb, and what they are, that we may help so great an Evil. A Vomit seems here peculiarly convenient in my Opinion, because when all the Excrements of the first ways are purged, revulsion is made from the Womb: but not so in other Causes: because neither abundance of Blood nor Seed can be amended by Vomiting, unless by Accident. ¶ *Pilula fatide majores*, though they be purging; yet half a drachm of them may be advantageously given in the Fit: for they evacuate gently, and use not to purge, till the Fit is first over; so that you need fear no danger from the Working.

Mercatorius
de indic.
Med. l. 1. c. 6.
Hurnius

Augenias

Riverius

V. *Camerarius in horto suo* is the Author, that Angelica with Zeodary given in Wine is an excellent Remedy against Fits of the Mother: Which as Reason denies to be good for every Hysterick Woman, so Experience will prove, that it is good for this and the other individual; for some Hysterick Women are refreshed with grateful smells, as, Balsame, Cinnamon, Amber and Musk; on the contrary, some are brought into great danger by *assa fatida*, Castor, and the most common and famous Remedies for uterine Symptomes. Of which Matter I shall produce two contrary, but singular Examples. A few years since I was called to a Matron, who was taken with exceeding violent hysterick Symptomes: To whom when I advised, that they should besides a Galbanum Plaster, which the Women had applied before I came, give her also some Hysterick water, and should hang about her Neck a piece of Castor, tied in a thin Silk, that they should burn some Partridge Feathers or roste some Nutmeg; Then she replied with a whispering Voice, Must I then, who cannot bear the smell of an hysterick Plaster, bear moreover these stinking Things? Certainly I shall be Killed, who use to be refreshed with the smell of a Nutmeg, but unburnt. Wherefore I carefully enquired of her, whether or no she was offended with

with *Spanish* or *Italian* Gloves, that smelled of Liquid Amber? But she replied, that nothing could come more grateful to her. I ordered therefore the *Galbanum* Plaster to be pulled off, and to apply in its room another sweeter scented, of *Tacamahaca*, and instead of *Hysterick* waters smelling of *Castor*, I recommended to her *Citron*, *Cinnamon* water usual in this place, in a spoonful or two of which I gave a scruple of *facula Bryoniae*, and indeed the Symptoms abated, till she applied the following Liniment, taken up in Cotton to her *clitoris*; Take of black Balsome of *Peru*, Oyl of *Jasmin* not rank each 2 drachms, the best *Civet* half a scruple. Upon the use whereof her most urgent Symptoms as the Inflation and rumbling of the *Hypochondria* and of all her Belly, *Vertigo*, difficulty of Breathing, Swooning, &c. ceased; yea, she was free of whole Months, whereas before, now and then she was taken with them, and especially when her *Menfes* were at hand. The latter History contrary to the former is thus; Once when I went into the Country, it happened that I turned into the Royal Mannor of *Ipsbury*, and there I found some of my familiar Friends making merry; being admitted into the Parlor, where the Women were; and holding in my left Hand the Herb *Monarda* or *Orebia odorata moschata* Jo. *Brachini*, which smells of Saffron and Musk, tied in a Nofegay, lo, all the rest being silent, one of them, all on a sudden, began to complain of the fragrantcy of my Nofegay, and desired me to put it away, affirming she could not bear it, and I readily obeyed her, fearing that she being Barren (for Barren Women and old Maids, it is plain, are subject to uterine Symptoms) might fall into Fits. Therefore they that practise Physick must avoid sweet scents, when for the most part the weaker Sex is easily offended with sweet scents, but not at all with strong ones.

VI. Whether it be lawful to use Titillations and Frictions, and so to irritate Nature to void the Seed, let Divines inquire. It is no absurdity to believe it lawful, because then the Seed is voided, against the Womens will, and without their consent; and such Seed is not at all prolifick, but the poyson of the Body: not only an useles, but also a noxious excrement, as we take away Blood, the matter of Seed, and all Morbifick matter: And the Cure cannot otherwise succeed: Why may not it be lawful in the like manner to evacuate Seed, when it proves the cause of so dangerous a Symptome, as we do other Morbifick causes?

VII. It is an usual thing also for some to stop the Mouth and Nose, and to stop the Breath, that so Nature may be excited, which is said to have been the opinion of *Haly*: which yet to me seems dangerous: for when Breathing is almost abolished, it cannot be wholly stopt and intercepted without hazard of the animal. Some think this Remedy is not of use in the *Pæroxyfin*, but just before it comes; because by the retention of the Breath the upper Parts force their excrements to the lower, as appears in making water and going to stool, and in such as have a Rupture: for by holding ones Breath they are expelled with more violence. It is probable also that the same happens to the Womb. Yet *Vallesius* approves of it in the Fit, so the holding ones Breath be but short, gentle and interpolated, for so the innate heat being strengthened, disperses *Hysterick* Vapors, and drives the Womb to the lower parts. But *Sylvius* is so far from thinking that the Breath should be held, that he rather thinks it the best way to blow in ones Noftrils, for he says, that makes the Womb go down immediately.

VIII. A certain healthy, and corpulent Woman, after she had taken a Medicine to make her Conceive, was taken with a pain in her Belly and with griping in the Guts, and she swelled: There was shortness of Breath, and perplexity of pain, and she swooned five

times, so that she seemed dead: nor did her present pain or difficulty of breathing abate by giving her a Vomit with cold water. But about 30 *Amphora* of cold water were poured on her Body, and truly this only seemed to do her good, and afterward Bile came plentifully downwards: But while the pain lasted, she could not go to stool, and she lived. About 30 *Amphora* of cold water were poured on her Body. A wonderful thing, and which could never have been attempted, but by a generous Physician: for an *Amphora* holds eight *Congii*, a *Congius* holds six *Sextarii*, and a *Sextarius* holds twenty ounces.

IX. Chymists commend *Vitriolum Martis* for this Disease, and they give a grain or two of it with a double quantity of Sugar for many dayes in Wine or some proper Liquor, yea, it may be given to 12 grains with some proper Conserve. Cream of Tartar given frequently is very good to cure this Disease. These two Medicines do good not only by opening but by cooling: For in this Disease there is often a hot intemperature fixt to the Womb, arising from Blood retained within its Veins and heated. As *Galen* says there is an Inflammation of the *Hypochondria* in *Hypochondriack* Melancholy, from the Blood retained therein by obstructions and over heated. Therefore things which may cool the Womb are most proper here, such as *Semicupes*, Vinegar and water taken in at the Mouth and by way of Clyster, and such like. A *Cholerick* Woman 20 years old; when she was oppressed with a Fit and had her Face red, was immediately Cured by a Clyster of Vinegar and water. A certain Maid was suddenly taken with a most grievous pain, which afflicted her Right side and Loyns so cruelly, that she was forced to roar out continually. Because there was no Fever, I believed it was an hysterick affection: I therefore immediately gave her a Glas of Oxycrate, which within a quarter of an hour she Vomited up again with much Phlegm: When her Vomiting was over, she drunk another glass of Oxycrate, and her pain immediately vanished, and she was perfectly cured. ¶ Here the History may be added, related by *Harvey* in his *tract. de partu* of a Woman who was long sick of *Hysterick* Symptoms, that would yield to no sort of Remedies, who after many years at length recovered her health by the falling out of the Womb; Because the Womb being exposed to the external Air, was cooled, and so its inflammation and hot intemperature was abated.

X. The following Pills are very good in a very violent fit and use certainly to stop it; Take of *Assa fetida* 1 scruple, *Castor* 6 grains, *Laudanum* 3 grains. Make 3 or 4 Pills, let her take them presently. ¶ *Horsius* tom. 2. p. 398. advises well, that in making up *Laudanum opiatum*, part of it be kept without Saffron, that it may more safely be given, which has often cured sick Women to a Miracle.

XI. Blisters applied to the Hips are of use to prevent Fits: But I have often observed that *Sinapisms* applied to the Hips 2 or 3 hours before the Fit have diverted it, which is a Remedy of less trouble.

XII. Like as, where the said Suffocation is urgent, *Castor* is deservedly preferred before many other things, and its Tincture with rectified Spirit of Wine, and Spirit of Sal Ammoniack; so, where Cold is very urgent as well outwardly as inwardly, as in a *Syncope* and Diseases of that nature, above all things that I have hitherto yet known I commend the distilled oyl of Cloves, which is not ingrateful, nor do I disapprove of the oyl of Turpentine, which is less grateful, seeing mixt with Spirit of Vitriol it raises an effervescency accompanied with great heat. Let this mixture serve for an example; Take of Water of Penny-royal 2 ounces, *Theriacalis simplex* 6 drachms, Tincture of *Castor* 2 drachms, distilled oyl of Mace, of Amber

each 3 drops, Syrup of Fennil half an ounce. Give it by spoonfuls, it is good also in Hypochondriack Diseases. One scruple of Spirit of Sal Ammoniac may be added to this mixture, which will make it much stronger; or a narrow mouthed Glass containing the said Spirit, may be held to the Nose, for by its sharp smell People are got both out of Fits and the falling sickness.

Hortius,
N. 1. Obs. 26.

XIII. I observed in a Matron a most grievous Aphony often returning, with Convulsions; She had been Barren many years, and upon the approach of her *Menses*, was taken with a most grievous Fit of the Mother, then with a small Epileptic, at length with partial Convulsions of Hands, Feet, Back, and horrible ones all the Body over. She upon using of proper foetid, uterine Medicines, fell into more grievous Symptoms: for which cause we fell to Perfumes, Musk, to wit, and Amber, and we gave them in a small quantity with other Cephalick strengthening things with good success. Which should also be observed in other Hysterick Women: that is, in such, whose Head and Nervous kind has been weakened in their youth by Epileptick Fits, or some other cause.

Solenander,
Selt. s. conf.
5. §. 10.

XIV. A Woman was afflicted with most cruel Symptoms, Head-ach, Belching, contraction of the Body, pain in her Groin, gnashing of her Teeth, sometimes falling to the ground speechless, her Mouth shut, so that she could not open it, and all these things from the fault of her Womb. She having tried many Medicines to no purpose, an old Woman coming in gave her 13 grains of Musk and as many of common Dragon's blood in 4 drachms of Orange flower water, she was cured, and never after had any Fits. I have given the same Medicine in the like case, and it alwayes did good: I have given it several times.

Riverius.

XV. In the cure of a pregnant Hysterick Woman we must take great care that Remedies be prudently administered, and that violent and very foetid things be not given, lest abortion be caused. And the business must be done more by external than internal things.

XVI. *Aetius* well advises, that a Woman when she has recovered her health, should not wholly be neglected, but for preservation sake she should use Medicines at certain intervals, especially at suspected times; so that the use of them should not wholly be left off, but the quantity abated.

Doringius.

XVII. I and Dr. *Dobritius* had a Woman under Cure of Fits of the Mother, who had a very foul Body. She was taken about Night especially with a straitness about her Stomach, her Heart was oppressed, and almost all her Limbs had a tingling in them, her Head also aking. Various things were tried by us, the Humours were prepared, evacuated, strengthening things were given, yet we did no good. At length through my perswasion, we gave her *Antimonium diaphoreticum*, upon taking of which she began by degrees to amend: We continued it for a Fortnight, in which time she was so much relieved, that because she was better, and grew weary of Medicines, she had rather commit the rest to Nature than longer insist on Medicines. I ascribe her recovery chiefly to the Antimony. She indeed is well now, but not without complaints of a weariness in her Limbs.

XVIII. We often meet with Women, who think they are ill of the Spleen, when they are Hysterick. By Hysterick Affections I mean these Symptoms, that happen not in the Womb it self, but in other Parts which have a Sympathy with the Womb: for the Womb has some Sympathy with all the Parts, especially with such as are contained in the *Abdomen*, to which it is joyned by its Veins, Arteries, Nerves, Membranes and by its Ligaments, from whence, because of some vitious Blood, Seed or other Humours foul vapours expire into other Parts. And there is a very great Sympathy be-

tween the Spleen and Womb by the Arteries, whence come Hypochondriack Ails, rumblings and pains of the Belly: And this Sympathy is so frequent and familiar, that many say, they are only Sick of the Spleen, when the Disease is in their Womb. ¶ A Maid of a Melancholick nature had for several years been troubled with violent Fits, that returned often; Most Physicians thought this mischief came from Malignant Vapors, bred in the Spleen, and rising to the Diaphragm. It so happened, that the Patient was held almost a whole Night with so violent a Fit, that they thought she would dye every moment. I suspecting it to be a Fit of the Mother, gave her compound Balm water (which is much in use among us.) I poured 2 or 3 spoonfuls of it into her Mouth: she came to her self to a Miracle, and all her difficulty of Breathing ceased: Whence we knew, it was an Hysterick Fit.

Erasmiofius.

Thonerus,
Obs. 2. l. 3.
p. 185.

XIX. I was called to a Matron, who was dangerously ill of Fits, I found her lying with her Eyes shut, and speechless: I immediately prescribed her *Aqua matricalis de Melisa Composita*; instead whereof through the Apothecaries mistake *Aqua matricalis camphorata* was sent, a spoonful of which when I had poured into her Mouth, she began to complain as well as she could, What do ye do? Then all her Head burnt as hot as Fire. But when the other *de Melisa Composita* was brought, and given the Sick Woman, she immediately recollected her self, began to open her Eyes and to speak, and was recovered to her former health. Now though Camphire in some Hysterick cases be no ignoble Medicine, yet you may find many Women, to whom it is an Enemy, especially such as have a hot Head, for by reason of its volatil Spirits it presently flies to the Head. This Patient was of a Sanguine Complexion and ruddy Countenance.

Idem,
Obs. 3.

XX. *Laudanum* is admirable in Vapors, that Sympathically annoy the Brain, especially in Fits of the Mother, mixt with Hystericks. *Madamoiselle de la Font* after her Labor, was tormented almost to death with violent pains in her Belly, an irregular motion of her Womb, and with foul Vapors that annoyed and got up into her Brain; when she had taken many Medicines to no purpose, as soon as she came to me, she took *Laudanum*, she slept, and all things were well: Afterwards every Morning she used this Mafs; Take of *secula Bryoniae* half an ounce, *Cassia* 2 drachms, *Myrrhe* 1 drachm, *Asa fetida* and *Saffron* each half a drachm, *Laudanum* 4 scruples and an half. Make a Mafs; of which let her take 25 grains. She used an Hysterick Fomentation twice a day. When her Fits were quieted, she recovered very well. ¶ *Madame de la Varenne* was troubled with Malignant Vapors and a great pain in her Womb, with a great Swelling and very painful about her Guts and Mesentery, and she was almost in a Consumption: At first for every other day, afterwards a little longer space between, she took *Laudanum* for the Symptome, and *Mercury* for the cure of her Disease; She recovered, when she had taken the *Laudanum*; She vomitted viscid matter every day. It is good in a flatulent Hypochondriack illness.

Theod. de
Mayerne,
traët. m. f.
de Laudano.

Medicines especially made use of by eminent Physicians.

1. This is an experiment which never fails; Take every Night before Supper *Pilule de Artemisia* 2 scruples. ¶ Take of *Siler*, *Madder*, *Penniroyal*, *Calamus Aromaticus*, the kernel of Peony Seeds, each 6 drachms, the best Musk 3 scruples, *Spikenard* 1 drachm. Make Pills with juice of Mugwort. The Dose from 2 scruples to 4. abating nevertheless in Summer and hot Seasons, and in Cholerick Constitutions. It helps in Inveterate Suffocations especially

J. Argulanus.

pecially from the stoppage of the *Menses* and retention of Seed; after the Pills a Decoction of Motherwort and Mint in Wine must be taken.

Al. Benedic-
tus.

2. This composition does wonderfully help, as I have often tried, Fits of the Mother, and them whose Limbs are contracted from that cause. It has in it of *Tripheba magna*, dried Chamomil each half a drachm: It is given fasting in Wine or with Sugar.

Theod. de
Bry.

3. The fume of Wens that grow on Horses Legs is good against Fits of the Mother. ¶ Spirit of *Vitriolum Veneris* is a present Remedy, if 3 drops of it be taken in some proper Liquor.

Rod. à Ca-
stro.

4. Give a drachm of Treacle, which also may be dissolved in Oyl of Rue, and applied to the Part, by which you perceive the Vapours ascend, by which means only a noble Matron, when no other Remedies did her good, was cured of a dangerous rising of the Mother.

Carbæus.

5. Some say this is a never failing experiment; They take a head of Garlick, cut it in two, lay it upon the Coals, and lay on it a little *Aloe hepatica*, they take the juice and anoint the Navil, Wrists, Temples and Nostrils of the Hysterick party.

Joh. Crato.

6. In Fits of the Mother this is a singular Remedy; Take the Catkins of the Walnut tree, dry them and powder them. Give 2 scruples thereof with a drop or two of Oyl of Amber dropt on them. I know nothing better.

Pet. Joh.
Faber.

7. *Sal Jovis* is a precious Remedy and Secret against Fits of the Mother, anointed on the Navil. Three grains of it also may be given inwardly, with Hysterick water 3 or 4 dayes in the Morning.

8. Salt of Vitriol, which causes Vomiting and promotes the *Menstrua*, is an excellent Remedy in Fits.

9. A *Galbanum* Plaster is *Montagnana's* Secret. We dissolve *Galbanum* with a little Vinegar, spread it on Leather, and apply it to the Woman's Navil, by which Remedy I have cured several, and raised them out of Fits. ¶ A certain Woman, when she perceived the Fit coming, held only a piece of root of Masterwort in her Mouth, and chewed it a little, and she was freed from the Fit, but she drank a little good Wine Vinegar upon it, which made her belch, and she escaped it alwayes. ¶ We received this for an admirable Secret, to bring away the after-burthen, for the stop *Menses*, to bring away a Mole or dead Child, and it is said to have been tried in them that have kept the afterburthen 14 dayes; Take green Leaves of Lovage, pound them, put Rhenish Wine to them, strain out the juice, and give a Glas of it to drink. In the Winter time bruise the Seed of Lovage and let it boyl a little in Wine, then strain it, or (which is better) give it in Beer.

Forestus.

10. This is a great Secret. Let a Clyster be made of a Decoction of Ground-Ivy, of which take 1 pound, add 1 ounce of Mithridate, and give it. It is proper in coldness of the Womb, and when the Seed is corrupt.

P. Mich. de
Heredia.

11. Hens dung dissolved in White Wine and mixt with some Cordial has helped many.

Fr. Hofman-
nus.

12. Only the Seed of Garden Parsnep dried and powdered, and half a drachm of it given in Wine or in some Hysterick water is a peculiar Specifick for Fits of the Mother.

Querceta-
nus.

13. Equal parts of Cows and Deers dung given in warm Wine to a Woman, when she goes to sleep, presently takes away the pain, and Fits. ¶ Linen clothes dipt in Cows piss or in a Dung-hil, and applied warm to the Navil and Womb, quiets it.

J. Dan. Ru-
land.

14. If the hair of the Patient be burnt and the fume of it received, it does wonders on a sudden. I have often tried it.

Medicines.

I. **WE** must give a Purge of some Medicine, that purges the peccant Humour violently; for, seeing the Humours are gross and impacted, they are rather disturbed than carried off by a gentle Medicine; wherefore I think, for this reason *Hippocrates* said, a disturbed Belly, that is, one very loose, cures Deafness. But we may not use such things frequently without danger, according to *Hippocrates* his advice, we must purge such with that which in a small quantity purges a great deal.

II. I have observed, that Deafness in many arises from abundance of Blood passing by the roots of the Ears. Therefore the Remedy of a certain Bath-keeper of *Bavaria* seems to me not altogether absurd, whereby, as I have been told by several, he has cured many of thickness of Hearing. And it is thus; He orders the deaf Persons to go into the Bath in the Morning, that the Veins, which are behind the Ears, may swell with the heat of the Bath: afterwards he cuts them thus turgid, and takes away as much Blood, as he thinks fit, to the great benefit of such as are troubled with thickness of Hearing.

III. If any one be deaf, who has a hot and dry Head, I would not purge his Head: It is sufficient to take away the matter below, and hinder it from ascending; for so the Head may easily be cured; and so I would do nothing to the Head, neither give sneezing, nor gargarisms, much less pump it, nor any thing else.

IV. In a very stubborn Disease we must proceed to Fluxing with Quick-silver, that if possible, the matter that causes the Disease, may be purged by the Mouth: for Deafness caused by the Pox is so cured, and perhaps, where that is not the cause, it may also be thus cured. ¶ Reason tells us as much; for Quick-silver softens and dissolves hard Tumours, and most powerfully dissolves Humours that are concrete and settled in the Parts, and so perhaps may dissolve Phlegm, concrete in the Ear, when it will not give way to other Remedies. Yet this Remedy must not be tried but in a desperate case; for its event is very hazardous and dubious: because the Brain is much damaged by anointing with Quick-silver, so that either deafness or thickness of hearing takes some, who are cured by fluxing; although, as is said before, Deafness caused by the Pox is sometime cured by fluxing: And fluxing well managed, after sufficient purging, seldom leaves any hurt in the Brain.

V. The cure ought not to be the same in Childbed Women, such as are upon recovery from Sick-

Oethaus,
apud Schen-
ckium.Montanus,
Conf. 152.

Fonsicai.

Riverius.

ness, and others, by reason of the diversity of causes affords divers Indications for cure. For in Women in Travel, the animal faculty does its utmost to deliver the Child, therefore there is a great Influx of animal Spirits about the spinal Marrow, to be distributed into the Nerves of the Muscles of the lower Belly. This intense violence of motion is the cause, why the origination of the Nerves, especially about the hind part of the Head, is affected, to wit, where the spinal Marrow descends: Now the Nerve of the fifth Conjugation, which is allotted to hearing, has its original there, and by a very short duct is inserted into the inner Ear. Whence it is plain that in such straining it may suffer also, and that thick and viscid Humours may after Travel be gathered about its insertion, because of the faintness of the innate heat, and the Woman's weakness by reason of her violent commotion, and seeing upon other accounts the animal faculties are weak in lying in and pregnant Women. And such as are upon recovery, have their concoctive and alterative faculty weakened, wherefore there is a produce of many Vapors from the weak heat, which, when they get into the Organ of hearing, cause a depraved sense. In lying in Women therefore it must be our care that they cleanse well; we must have regard to the whole by preparation and evacuation of the Humours, not neglecting outward applications, that the matter gathered about the Organ of hearing may be cut, dissolved and spent. In convalescents it is sufficient that the innate heat be fortified: But if the Disease go not away of it self, gentle dissolvents should be used.

Horstius,
prob. 4. dec.
3.

VI. The cure of Deafness and Noise should be attempted rather by dry than moist things, because by actual humidity the Tympane is made lax, the implanted Air is thickened, and the cause of the Disease increased. Wherefore suffumigations of Saffron, Myrrhe, *Syrax*, Benzoin and Frankincense are approved by *Hercules Saxonia Panthei lib. 1. cap. 20.* And *Joh. Zmeller* has regard to the Tympane, *Aqua Acoustica Mindereri*, says he, if it must be made use of, I think neither it, nor any thing else, should in any quantity be poured into the Ear, seeing the Membrane expanded upon the annulus and the little Bones underneath, called the Tympane is very thin, so that very easily it may totally be destroyed and eroded by pouring in of sharp Liquors, and so the hearing be quite destroyed. Therefore I think it more advisable, says *Schneider lib. de Cathar. special. p. 99.* that a piece of a wheaten Loaf new drawn out of the Oven be sprinkled with this water and applied and bound hot to the Ear, that so the heat of the bread and the spirituous water acting together, the gross Humours which obstruct the auditory Nerves and Passages, may be incised, attenuated, and evacuated by insensible transpiration, or, being driven back to the palate, by spittle. Wherefore in such cases it would not be amiss to take this water into ones Mouth, for the greater attenuation and attraction of the gross Humours from the auditory passages (got within the Tympane) which can never get out at the Tympane without hurting and eating it through.

VII. *Joel l. 2. praef. S. 2.* commends for Deafness, all things requisite premised, a Sudorifick draught of *Theriac Andromachi* and Rue water. *Osw. Grembs l. 2. c. 1. S. 11.* in imitation of him commends a Sudorifick cure of a Decoction of the Woods to consume the moisture of the Brain. This I have proved by experience, that, if deaf Persons have a thick and cold Humour impacted in the auditory Nerve or in the Tympane, all things requisite being premised, Bathing is good, to sit in water up to the Navil, not too hot, but only that the parts may be warm and the Blood rendered more fluid. A little after, 2 or 3 drops of Apoplectick Water must be dropt into the Ear on the side affected, and so

you will see your Patient cured out of hand. For the Sick say, that after the use of this they feel as if something had fallen out of their Ear.

VIII. Oyl of bitter Almonds is commended indeed in Deafness and a Noise in ones Ears: But because of the windings in the Ear, we must be cautious in the use of it; For when it is got to the Membrane of the Tympanum, because it cannot easily be wiped out, it makes the Membrane lax, and so does not only not cure, but encrease Deafness. It is my opinion, that no unctuous things should be dropt into the Ears, lest the membrane of the Tympane growing thick, should make dull the hearing, whose excellence consists in dryness. All Membranes whether they be softened with oyl, or be often wetted, are puffed up and grow white. If it be thought good to use any Oyls, the exhalation of them is sufficient, without pouring in of the substance, by which evaporation the implanted Air, when inspissated, will be sufficiently attenuated with the adventitious.

S. Pauli,
Quadrup.
Botan. p. 99.

Th. de May-
erne, consilio
pro surdo. M.
S.

IX. Sulphureous and bituminous Bathes, as well by way of Bath, as by washing of the Head, are good for the Cure of this Disease: for by Bathing plenty of Sweat is provoked, and the antecedent matter of the Fluxion is discharged: And by washing of the Head the Brain is strengthened and dried. The peculiar way of using them is described by *Pennotus*, and is very much commended. Nothing does so much good in Deafness, even after the use of an Hundred Remedies, as for the Patient first to cleanse his Body well, and then purge his Head, and wet his Head with Sulphureous Bathes in this manner. Let him wear upon his Head, as it were a Cap of large Sponges sewed together, coming down to his Eye brows and below his Ears: Let him sit under the current of the Bath, and turning a Cock, let him receive the water, which soaked up by the Sponges, will keep the Head warm with its continual heat, and opening all the sutures of the Head and commissures of the Ears, it will take away the Vapours or will waft by exhalation the matter impacted in the Nerves, and auditory Passages, or will so displace it, that it will quickly go away. It is convenient for him to sit thus twice a day for two hours, and then presently to sweat in Bed, and to use a thin diet of Fleish Brothes, and he must abstain from all Wine, unless it be very small. If any one insist upon the use of the Bathes, I utterly disapprove of putting the whole Body into the Sulphureous water, because of the frequent effusion of Blood by the Hemorrhoids, but especially because of the Stone, for which the heating of the Kidneys and Loyns is very bad. I think it sufficient, if the Head (the Body being first well purged) be watred from on high, all cautions observed, which the Physicians there present shall give. My Lord seems to abhor the thick fuliginous Air of the Bath: An Embrocation from on high by some proper Instrument will serve instead thereof, out of which some Cephalick Decoction may run at a Cock, prepared with a Barber's Lixivium, adding Malmsey Wine, upon the Head shaven, and covered with a Cap made of soft Sponges, with other things, which may keep the Liquor from the Parts below, and may deliver it into a basin near it. This irrigation also may be received upon the sutures of the Head naked, which, when the season of the year is heat, done once or twice a week, wiping and drying the Head very well after it, will be very good. It is used daily by the Italians.

Riverius

Th. de May-
erne, consilio
M. S. pro
Comite Den-
bigh.

X. In Deafness from pituitous matter some Topical Medicine must be put into the Ears, which at first must have an inciding and deterfitive, and then a drying faculty, that the Humour which is in the Ears may be attenuated and cleansed, and then the Membrane may be dried. Therefore let a Tent dipt in *Oxymel* of Squills be put especially in the Night time, for Medicines must not be poured in, lest the auditory passage be hurt, as *Galen 3. K. T.* 1. advises, but they must be got in with a Tent or a Probe wrapt in Wool.

Fortis tom.
2. Cent. 1.
conf. 79.

Medicines

Medicines especially made use of by eminent Physicians.

1. A Decoction of Castor and Laurel-berries mixt with a little Vinegar, and dropt into the Ear is admirably good. ¶ Ants Eggs bruised will cure the most inveterate Deafness.

Donatus ab
Altomari.

2. *Prævotius* has Saffron and Cloves with juice of Woodbind for a Secret, with which I use to mix Rose-water, dip Cotton in it, and put it into the Ear.

Thom. Bar-
tholinus.

3. This Tent is a most effectual Remedy; Take of *Coloquintida*, white Hellebore each 1 scruple, *Euphorbium* half a scruple. Mix them. Make a Tent with Honey, juice of Onions or Radish, and keep it in for some dayes.

Capivaccius.

4. In the diminution of the Sense of Hearing; Take of Leaves of *Carduus benedictus* dried 1 handful, sprinkle them with wine, then pour some *Carduus benedictus* water to them, and destill them in a Glasse. Warm a little of this in a Spoon, and hold the Head a little on the contrary side; then let it run out again, and keep the Ear always stoppt with Cotton and Musk.

Crato.

5. Snails with long Ears, and an exquisite touch, if they be boyled in water and salt, and after they are dried be destilled with Oyl of Amber, or Fenil or Castor; The Oyl that comes off is admirable for the recovery of Hearing.

Deodatus.

6. The Steam of boyled Beans received into the Ears is said to be a present Remedy. ¶ Nothing is more certain than spirit of Turpentine, if you drop a few drops into the Ear.

Grulingius.

7. If it come from gross Humours obstructing the Auditory Nerves, destilled oyl of Chamomil flowers is a generous Remedy, a few drops whereof may be dropt in warm.

Joel.

8. Take the fat of an Eel as she is roasting on a Spit and it drops from her, mix it with its own Gall, keep it in a Glasse, when there is occasion, drop a drop or two in the Ear. It is a specifick Medicine for Deafness by what means soever it comes.

Dominicus
Leo.

9. After the Tympany is cleansed, and some Liquor poured in that discusses wind, nothing is better than the Urine of an Hare dropt in warm, the frequent use whereof has done several good.

Tulpius.

10. Several, who had been long Deaf, have been cured with this; One gave *diaolibanum*, and he made a steam under the Ear of a Decoction of hot Herbs, if it came from a cold matter; but of cold Herbs, if it came from hot matter, and he fomented the Ear with the simple Decoction. Afterwards he dropt in this; Take of white Hellebore, Castor, Pellitory of Spain, nitre each a like, mix them all and boyl them in wine till the wine be almost consumed, strain it, and drop a little of it hot into the Ear, and keep it there an hour, afterwards give some sneezing of powder of white Hellebore or Pepper: When the Patient begins to sneeze, let him hold his Nose violently, that he cannot breathe, when he sneezes.

Villanovanus

Swooning caused by the Spleen, cured by looking to it. VI.

By what virtue Medicines act, that cure it? VII.

If it come from the Stomach, things concentrating the Spirits are proper. VIII.

The efficacy of Aromatick Oyls and Volatil Salts. IX.

Spirit of Roses does not cool. X.

They that dye away must not be quickly buried. XI.

All Swoonings that proceed from the wasting of the Spirits must not be cured one and the same way. XII.

If it proceed from pain, Narcoticks are sometimes proper.

XIII.

Medicines.

I. Whether may Blood be let when People are in a swoon? In a spurious Syncope, which the stopping of the Blood in the Veins breeds, which according to *Hippocrates* and *Galen* l. 4. acut. must be esteemed twofold, one from store of Blood in the greater Vessels, another only from the *Carotides* and jugulars, Blood must immediately be taken away, ere it being deprived of its Spirits, become concrete, and the Disease be incurable, as much as convenient, considering the strength and fulness of the Body. Which when done, and a spare course of diet is followed, we must divert, what is contained in the Body, to the lower parts, and afterwards what concrete Blood there is, we must make it fluid with drinking hot things, and by gently rubbing the whole Body. But in this case it is very rare that one can make the Blood fluid, unless the Spirits be much stronger than before: for, if not, (or if the Pulse be bad) it is a sign that the Blood is then concrete, in which case we must wholly abstain from Blood-letting, and make use of such Remedies as may make the concrete Blood fluid, as Hares rennet in water and Honey, or water and Honey with Marjoram boyled in it, with the addition of a little *Oxymel*; or half a drachm of Treacle or Mithridate dissolved in the said water. But if you be certain that the Blood is not concrete, you can no way sooner bring the Patient to life again than by letting him Blood. Which when you have done once, if the Patient bear it well, and if the Blood run high, you may try the Remedy again, till you find the Patient relieved, but if no Blood will come, you may reckon it is concrete, and you need try no more.

II. A Woman, as she saw her Husband fighting with his Neighbour fell into a Swoon, I was called, and by my order she was cured by Bleeding. In this sick Woman the Blood had for fear and grief retired to the Heart as to a tower, by which when the Heart is suffocated, I have observed several have died, both because the vital faculty is extinguished by too great abundance, and because the Spirits cannot pass through the Vessels, for want of which the extreame parts grow dead: In so great decay of Spirits let the Physician never omit Bleeding. But if by reason of extreame loss of strength, and the abolition of the pulse in a manner, the Physician be doubtful, let Cupping-glasses be set to his Hips and Thighs with scarifications instead of Bleeding.

Fontanus

III. It often counterfeits an Apoplexy, but without rattling; nor does it leave a Pulse behind it: If it return often violently, at length it oppresses and suffocates the Heart, not only because the excursion of the Blood is intercepted, by the plentitude of the Vessels, but because some thick substance of the Blood, being forced within the Ventracles of the Heart, oppresses it, which causes an Asphyxy in the motion of the Heart and Arteries. This Disease is as frequent among the Germans as the Apoplexy, from their athletick habit of Body, which is contracted from their continual good fellowship and drinking. Yet they take no care to take down that plethorick habit by Bleeding liberally: And so no wonder, if through such abundance of Blood, they fall into an Apoplexy or a Cardiack Syncope.

Riolanus

IV. Vine-

Syncope, Leipothymia, or Swooning or Fainting.

The Contents.

Whether one may be let Blood in a Swoon? I.

One arising from a fright, cured by Bleeding. II.

Some dye for want of Bleeding. III.

Vinegar of Roses is not good for all. IV.

How Medicines must be poured in, when People cannot swallow?

V.

IV. Vinegar of Roses is not good for every Syncope, for seeing contrary causes must needs be removed by contrary Remedies, therefore it is manifest, that the dissolution of the Spirits must be cured one way, and their suffocation or infection another. Wherefore we conclude with *Capivaccius* 2. pract. cap. 9. that a Syncope coming from a dissolution of the Spirits, may be very well taken off by the use of cooling things, applied especially to the Forehead, Face, region of the Heart and Wrists, in which case Vinegar of Roses is proper, for Vinegar penetrates and Roses cool and concentrate the Spirits. But if suffocation be the cause, attenuation and dissolution of the Morbifick matter is of necessity required, which cannot at all be done by cooling things; wherefore here we must have recourse to Cresses, *Nigella*, Mithridate, Cinnamon water, rubbing the extreame parts, &c. If there be Malignity, we must provide for the Heart by Bezoricks. No wonder then if in the absence of Physicians Patients often dye in a Swoon: For it may so happen, that the Spirits, which are otherwise suffocated, may, by applying some common cooling Remedy, be further conglobated about their principle, and by this means the vital faculty may be utterly suppressed.

Horstius.

V. When a Patient is liker to one dead than alive, so that he can neither open nor shut his Mouth, much less swallow any thing as he should, then it will be the best way to take some Aromatick Oyls, either simple or compound, mingled only and stirred together a little with rectified Spirit of Wine, or more nearly joyned together by a greater artifice and long circulation, and pour 3 or 4 drops into the Patient's Mouth, and sometimes more, and especially by a Silver or Golden pipe into the Throat, to the end they may penetrate both into the Stomach and Guts (from whence the cause of so grievous an evil is often dispersed to all parts) and into the Pipes of the Lungs, to the very Blood that sticks in the Pulmonary Vessels, and so correct and amend this urgent harm.

Sylvius de le Boë.

VI. A Noble man complained to me, that he immediately fell into a Swoon, as he turned himself on his left Side, and his Spirits were so far gone, that he was got out of it with much difficulty. When I inquired into the cause, I reckoned, some Melancholick Humour, having some ill quality in it, sent a poysonous Vapor from the Spleen to the Heart, which must be the cause of this Malignant Symptome; nor was I deceived in my conjecture: For when he was put in a right course of Diet, after his Body had universally been purged of Melancholy, and particularly his Spleen by giving Medicines to open the Obstructions thereof, and his Heart strengthened, he was cured of it.

Riverius.

VII. In a Swooning Fit sometimes such things must be given as powerfully concentrate the Spirits and acid Vapors, and sometimes such as discuss glutinous ones. Subtil things, to the end they may penetrate to all parts, may be mixt with them, such are Spirituous things, and volatil and Oylly Salts, especially such as are prepared by art of divers parts of Animals, or of certain Plants. These are good, Aromatick Tinctures, drawn by means of rectified spirit of Wine from divers Spices, or from any Aromatick parts of Plants or Animals, either by infusion alone, or also by destillation, for example, Take of water of Mint, Fenel each 1 ounce, Scurvy-grass, *Agua vite Matthioli* each half an ounce, *Laudanum opiatum* 2 grains, Syrup of Mint 1 ounce, oyl of Cloves, Nutmeg distilled each 2 drops. Mix them. Give it by spoonfuls. Let no man wonder here, that *Laudanum opiatum* is added. For I maintain, that *Opium* has an excellent virtue in hindring and restraining the vitious effervescency of sharp Humours, both in the small Guts, and in the Heart and elsewhere, without which effervescence, noxious and sharp Vapors could not easily be raised,

and produce Swooning Fits. To this mixture many very efficacious things may be added, made of divers parts of Animals, Tincture of Castor, Spirit of Salt, of Sal Ammoniac, of Urine, the Volatil and Oylly Salt of Blood, Bones, Horns, Hoofs. The Oyls must be rectified, and not only in part be freed from their *Empyreuma*, but made more penetrating and potent. The rectification must be made with Spirit of Wine tartarified.

Sylvius de le Boë.

VIII. We must observe, that when Swooning proceeds from the offence of the Stomach, things that call out the Spirits are not proper, but rather things that repel them to the Heart, as throwing cold water or Rose water in the Face.

Fortis.

IX. In fear of Swooning, and in small Faintings, accompanied with troublesome cold, the following Mixture may be prepared of Shop Medicines, a spoonful to be given often between whiles, Take of water of Mint 2 ounces, *Agua vite Matthioli* 1 ounce, or Tincture of Cinnamon half an ounce, oyl of Cloves 6 drops, Scurvy-grass 1 ounce. Mix them. I do not only commend volatil Salts and Aromatick Oyls from Experience; but because reason perswades the same, drawn from the analysis of the Salts and Oyls, and from the efficient cause of this Hypochondriack suffocation, that is, viscid and acid Phlegm, or viscid, and acid or austere Vapors, compared together: For these Salts and Oyls have a virtue to dissolve and incide every viscid, to temper and correct every thing acid and austere, and to discuss and dissipate whatever is halitious and windy.

X. Spirit of Roses refreshes the Heart and Brain and revives the Spirits, one drop or two perfumes a great quantity of Water. Therefore in Swooning and Fainting, the Dose of it is from 5 drops to half a Scruple or a whole one. But some mistake and give it cool, when yet it is as hot as other Spirit, and is fully separated from the cooling parts of the Roses. For we must know that simple Medicines made of Vegetables have for the most part the virtue of the Plants whereof they are made, and may be put to the same uses, unless these Plants have different parts; Therefore Rheubarb in substance binds.

Sylvius de le Boë.

XI. We must have a care of such Patients, that we think not of burying them presently: for several have come to themselves in the Grave. Let this one Instance suffice. In the year 1582. my Host at Cleves, who lives at the Sign of the Eagle, told me, that 17 years before, he was taken with a most grievous acute Disease, and at length he fell into such a Swoon, that all men thought he had been Dead, that *Johannes Wierus* was called to him, and found that his Soul was not then separated from his Body: and therefore ordered him to be covered up warm in Bed and Cordials to be given him, and while he was busie about the recovery of his Patient, the Friends were preparing for the Funeral, but the next day he came to himself.

Hildanus.

XII. All that faint for want of Spirits must not be brought to themselves one and the same way: for it is necessary to consider in what manner the cause makes its impression and to oppose that. For although all immoderate evacuations dissipate the Spirits, yet you must cure one way, if it proceed from too much Sweating, another way if from a Looseness, another, if from loss of Blood, and another if from Vomiting. For they that Faint for Sweating or great heat, and have a weak retentive faculty, are easily raised by throwing a little cold water, or Rose water, or Vinegar, not all over their Skin, but only their Face and Hands, and that suddenly: both that the Skin being condensed, the Spirits may not waite so much, and that the Patient by the sudden retrocession of the Spirits may be the sooner raised: and for the same reason you must take care to cool the Air by throwing such cooling things on the Floor, and by Fanning it, that

that the Skin may be made close, and the Spirits be thickned. Which Remedies you must not use, if a looseness be the cause of Swooning; for by throwing cold water the Humours are driven inwards, which it is requisite to draw outwards. Nor must you do it, if one faint for plenitude or obstruction. But if it arise from some passion of the mind, which may draw the Spirits outwards, you may use the same Remedy, as if it came from Pain or Evacuation. In the same manner also you must raise the Patient by pulling him by the Nose, especially if the Humours purge downwards. If it proceed from Vomiting, you must bind, heat and rub the Legs; if from a Looseness, the Arms. Those that faint for loss of Blood you may raise by the same revulsions, and by applying warm wine to the staves in a Man, and to the Breasts in a Woman. But you may fetch these and all others again by such things as revive the Spirits, as white, thin, odoriferous Wine, diluted with steel water. If it be occasioned by Sweat, by using Sudorifics, or holding new baked Bread besprinkled with them to the Nose. But in looseness of the Belly, Bread in red Wine is of great moment, if there be neither internal Inflammation, nor a *delirium*, nor any heat. Epithemes and sprinkling of cold water by turns and intervals, lest all efflux of Vapors might be stoppt: The use also of cooling astringent things is good, such as the juice of a Pomegranate. But let them that faint for Sweat, abstain from frictions and Wine, except to smell to. To them that faint for Vomiting you must give a draught of old white or black Wine, especially if it arise from crude and viscid juices, as a draught of cold or hot water, if the Humour be bilious, sharp or salt. All which things you must do (except the revulsions) if the Patient faint through violent heat.

XIII. They that are subject to Swoon because of Pain, passion of the Mind, and diaphoretick evacuations, must use such things as allay pain; but that which does most good, is a thing that stupefies

a little: for either by stupefying the Sense, or procuring rest, it stops the Flux a little, till the Spirits are recruited, and are able to defend the Patient from the cruelty of the Pain and other accidents. But because in these Persons the Spirits are extream low, I advise to use them sparingly and with caution.

Medicines especially made use of by eminent Physicians.

1. It is good in all Swoonings to apply a large Copping-glass with much flame to the left Shoulder.

J. Cæcilius
dinus.

2. When the Body is purged, Spirit of Wine rectified and perfumed with Amber and Musk, and sweetned with a little Sugar is a good Remedy against Swooning. ¶ The Essence of Citron, Corall, Pearl, Balm, and rectified Oyl of white Amber do the same.

Pet. Joh.
Pate.

3. I use to apply the following Plaster with good success to the region of the Heart and the Wrists; Take of the Crum of Wheat bread 1 ounce, Cinnamon, Cloves, Mace each 2 drachms, *Confectio Alker-* 4 Scruples, with Rose water and a little Vinegar make a Paste, which spread on a Cloth and apply it.

Gull. Fabri-
cius.

4. Take leaf Gold, grind it an whole day very diligently with burnt Hartshorn: Then reverberate it in a Potter's Furnace, till it acquire a carnation colour. As it is a Medicine easily prepared, so in vertue it is very efficacious and is better than the most laborious preparations of Gold.

Finkius?

5. Common Salt is a most excellent Remedy, if the Lips be rubbed a little with it, or if the Patient chew it, or the Palms of the Hands or Soles of the Feet be rubbed therewith.

Hofmannus?

6. Balm sprinkled with some odoriferous Wine, heated between hot Tiles, and applied to the Region of the Heart, is very good.

Sennertus?

A GUIDE TO The Practical Physician.

BOOK XVII.

Of Diseases beginning with the Letter T.

Tenefmus, or a continual desire of going to stool, without voiding any thing considerable.

The Contents.

Whether we may purge? I.
Whether we may Bleed? II.
The drying of the Ulcers with Powders. III.
Fasting is hurtful. IV.
Care must be taken to strengthen the part. V.
Medicines.

I. **P**urging seems hurtful, 1. Because it hinders cleansing and healing of the Ulcer. 2. Because it makes the Ulceration worse, which is heated and irritated thereby. 3. Purgers stimulate Nature, whereby the Symptom of vain desire is made worse. But on the contrary, oftentimes we must purge. 1. It often follows a Dysentery, because of some sharp corruption, or peccant Humours unseasonably left behind: but here Purging is requisite. 2. A *Tenefmus* for the most part happens to Phlegmatick Persons, because thick and viscid Phlegm is gathered in the *Intestinum rectum*: but this must be removed by Purging. But we must take notice that Purging is twofold, one Cathartick and another Lenitive, of which this latter is often required, because it evacuates not from the whole, but only the peccant matter in the first wayes. Then we must distinguish between the causes of the *Tenefmus*, which are often such that they stand in no need of lenitive evacuation. I answer to Argument 1 of the negative part, that it holds true of strong Catharticks which we do not allow. To the 2. That although the Ulcer be irritated by lenitives, yet the Disease is not made worse, seeing the cause of that vain straining is removed by them. To 3. that Nature is stimulated by Purgatives, yet not by vain motions, but to the end, what things are noxious, may be voided.

Horstius,
quaest. 6. dec.
6.

II. Seeing a *Tenefmus* is an affection with tension, weight, and sharp pain, wherewith the lower part of the Belly is annoyed, all which things depend upon the shaving of the *Intestinum rectum*, we must oppose it, first upon account of the matter which falls upon it, according to universal precepts, among which Bleeding first occurs, which must not be omitted: for the medical Intentions in this Disease are, to remove plenitude, to cool the Liver, abate the pain of the Guts, to stop or prevent their Inflammation, to cure the Ulcer, and, if there be occasion, to take off the Fever and other Symptomes. All which Bleeding does.

Laelius &
Fonte.

III. When the Ulcer is cleansed, it must be healed. Among Suppositories, all that are made of Metallicks are good, as Cerufs, Tutty, Litharge, Bolus Armenus, Terra Lemnia and Dragons Blood. But I had rather have these Powders blown in by a Servant with a Pipe, or with a pair of small bellows: For since the true Cure of the Ulcer is the drying of it, I have observed, it is easilier procured by Powders than by moister Medicines.

Idem.

IV. We may observe from Hippocrates lib. de Affectionibus, that this Disease can ill endure hunger, it may be because where there is meat, the Guts are less raked. Yet this must be rightly understood so as that crudities and mucosities may not be increased by too much meat.

Fortis.

V. If the Patient overcome all the Symptomes of a Dysentery, and the Disease be protracted a long time, at length all the Guts seem to be affected in their order downwards, till the Disease be thrust down into the *intestinum rectum*, and end in a *Tenefmus*: Upon which, far otherwise than in the Dysentery, when the Stools cause a most violent pain in the Guts, that is, the Excrements as they come down, grate upon the tender Guts, at this time the mucous stools are only troublesome to the lower Guts, namely the *rectum*, for then the matter is only made in it, and voided from it. And if so, then in my opinion it will be to no purpose to endeavour a cure by abstersive, glutinating and astringent Clysters, according to the different times of the Ulcer, as is supposed; or by Fomentation, Infusion,

session, Fumes and Suppositories, which respect the same end. For it is evident, this proceeds not from an Ulcer in the *intestinum rectum*, but rather because the Guts, as they recover strength by degrees, by the same degrees they thrust down the reliques of the Morbifick matter into the *rectum*; which being incessantly irritated every day, scrapes off that mucous matter, with which, by Nature's providence, the Guts are lined. Therefore the part affected should be strengthened, to the end it may, after the manner of the other Guts utterly discharge the reliques of the Illness, which now are upon yielding. And this can be done only by such things, as are apt to give strength to the Body: For a Topical Medicine, whatever it is, applied to the grieved part, because it is a thing aliene, will weaken more by its troublesome Touch than it can strengthen. The Sick therefore must have patience, till by a restorative diet, and some Cordial Liquor he can gain strength, as which returns, this Symptom of a *Tenesmus* Will at the same pace go away of it self.

Sydenham.

Medicines especially made use of by eminent Physicians.

1. This is my most approved Remedy for a *Tenesmus*; It is a drachm or two of Syrup of Buck-thorn in Cinnamon water. The Patient is certainly cured in one day; now the Body is purged without trouble, and when the serous Humours are voided, the Patient is perfectly cured with this Remedy alone.

Baricellus.

2. Some take Cera's, and Litharge well steeped in water; and mix them well with the yolk of an Egg and Rosewater in a Mortar, and apply it with good success.

Alex. Benedictus.

3. This Fume cures the *Tenesmus* to a miracle; Take of Mastich 1 drachm, Frankincense 1 scruple, Myrtle Seed 1 drachm and an half, red Rose flowers 2 drachms. Make a powder for a Fume.

Forestus.

4. This is an admirable Clyster; Mutton broth with about a drachm of Oyl of Wax dropt into it. A few drops of oyl of Mastich given inwardly in Plantain water cures a *Tenesmus* presently.

Hartmannus.

5. Take an old Brick, black with Smoke, break and powder it, put it into white Wine Vinegar, wrap it in a Cloth and apply it.

6. You will find admirable efficacy in these Pills in a *Tenesmus* with a quotidian Ague; Take of Parfly, Anise each 3 drachms and an half, Seed of white Henbane 2 drachms, of Parfly 2 drachms. Pound them together, and make Pills of them with Wine. The Dose 5 grains with Rob of Myrtle and water.

Guilh. Varignana.

7. To take away the pain of a *Tenesmus*; Fill two Bags full of powder of Brimstone, Boil them in Vinegar and let the Patient sit first upon one, then on another, as hot as he can endure; it presently takes away the pain. It is experienced.

Villanovatus.

The Swelling of them cured by Scarification. I.

When they are inflamed, gargarisms must be warm. II.

Whether the cutting them off, when hard, be safe? III.

Their Porous Coat, when they are swelled, shows like an Ulcer. IV.

Upon the abuse of repelling Gargarisms, the Swelling grew into a stony hardness. V.

Whether, when they are inflamed, Repellents may be applied outwardly? VI.

Medicines.

I. A Certain Knight had his Tonsils swelled from I know not what defluxion: which had been so swelled for 2 years, that the swelling could not be got away by internal or external Medicines, no not by Issues. But they were immediately got away, when I had once scarified them.

Sericus.

II. When the Tonsils are inflamed, we must observe with *Arius* and *Paulus*, that Gargarisms must be given rather warm than cold, or very hot, for any thing actually cold is bad for an Inflammation and inflamed parts: And if they first washed their Mouth with warm water, it would be better, according to *Avicenna*, for so the Gargarisms would sooner penetrate.

Epiphanius, Ferdinandus.

III. I have often admired with my self the boldness of the Ancient Physicians, who, when the Tonsils were hardened after Inflammation, took hold of them with an hook, and cut them off with a Knife, as *Celsus* l. 7. c. 12. testifies. For thus I thought with my self, sure it is not safe to cut off these parts, which are of great necessity in the Body, and all over interwoven with Nerves and branches of the Carotid Artery. And which is more, I find *Aquapendent* at the same stand with me. But *M. A. Severinus Pyrotech.* l. 2. c. 64. has given light to this doubt, who writes thus. The Tonsils usually grow out with four eminences, being bred of a viscous and tough Humour, either from the French Pox, or some Rheum, as *Mariscæ* (or Piles) do. Although I have not yet seen this case, yet for the sake of the younger I thought good to note, that the Tongue must be held down, the Tonsils taken hold on with an Hook, and then cut off with a knife crooked backwards, and sometimes they must be seared with a hot Iron.

J. Van Hottel.

IV. Inspection of the Tonsils finds an Ulcer: In which notwithstanding we must observe, as *Fallopian* advises, that the Tonsils contrary to the nature of other Glands, have a Nervous Coat, pervious with many and large Holes, which, while they are Swelled, gaping wider, easily impose on the ignorant, who take them for little Ulcers; but as soon as the swollen Glands fall, these Ulcers disappear.

Joubertus.

V. One could scarce either breath or swallow because of the swelling of his Tonsils: after he had long used drying and repelling Gargarisms; the thinner part of the Humour being dried up, the rest grew into a Stone. And when the Muscles of his *Larynx* grew every day stiffer than other, and his breathing more difficult, he called me, I ordered him to wash his Mouth with a Decoction of Marsh-mallows, Figs and Mallows: and after washing his Mouth I prescribed him to lick clarified Honey, fresh Butter, and powder of Florentine Orrice mixt together, wherewith the Tumour being softened, he voided a Stone, then he could breath freely, and when the Ulcer was cured, he recovered.

Jessenius, Jessen, opud Schenck Jurtij.

VI. Almost all Practitioners, when the Tonsils are inflamed, apply repellents inwardly, yet *Rondeletius* dissents from them, and the common custome, who *lib. 2. cap. 4.* will not only have astringents applied inwardly, and mollifiers outwardly, but astringents both inwardly and outwardly: For when the Parts are lax, he thinks they must not be made more lax, while the matter is in fluxion, but only when the fluxion is stopt, that the matter may be drawn outwards: But in the beginning he applies astringents outwardly to the sides of the Artery under the nether Jaw, which, he writes, he tried in himself, and hindered a Quinsy and a defluxion to the Throat, and cured many, as they were beginning with the Kings-Evil. But here great caution must be used, and we must see what store of affluent matter there is, for if the Body be as yet full, and the afflux great, I would persuade no man

to apply repellents outwardly, since it may easily happen that the Matter being repelled inward, may raise a dangerous Quinsy; and the Matter may always with greater safety be carried outwardly than inwardly.

Boerhaave.

Medicines especially made use of by eminent Physicians.

1. When one was ill of a small Inflammation of his Tonfils without a Fever, I Cured him with this one Gargarism; Take of Plantain water 1 pound and an half, red rose Flower 1 pugil, Quince Seeds 1 drachm. Boyl them a little and strain them. Add of diamoron 2 drachms, dianicum half a drachm, Mix them. Make a Gargarism. ¶ In malignant and crusty Ulcers, when the Body is purged, Ashes of Swallows mixt with Honey is very good, and I have often used a Plaster of Swallows nests with good success.
2. A Decoction of Vervain easily cures the Ulcers of the Tonfils.
3. According to Boerhaave, terra sigillata if applied, or a little of it swallowed by degrees in Broth is very good for an Inflammation of the Tonfils.
4. This is an approved Liniment in malignant Ulcers of the Tonfils, if the ashes of lesser Centaury and powder of Album Græcum be mixt up with Honey to a consistency.
5. We take a Viper's Head and hang it about the Neck in a Scarlet thread, so as that it may touch the Patient's Flesh, and we have found it do wonderful good.

Medicines.

I. I Saw an imperfect crisis in M. N. who had been Sick for a Month of a grievous continual Tertian, he was at length taken with a painful Swelling from his left Foot to his Knee. He in the absence of his Physician, did at the very first apply a repelling Oyntment, and a Cataplasim of the Linseed that remained after the Oyl was drawn, by which means he disturbed Nature in her expulsion, so that the peccant Humor being afterwards very much impacted, could scarce be dispersed with several Medicines in 6 Months time.

Gr. Hortius.

II. Here their Error is confuted, who when the strength is good, do apply to cholerick Tumors suppurators of Milk, Flower and the like, whereby the Pores are stoppt, and sharp Vapors are kept in, and when they are pent up, become so fierce, that they begin either to erode the Part hurt, or destroy it, and breed a Gangrene.

Sanctorius.

III. Varandæus used with success our Emplastrum Vesicatorium, which is made in the shops, alone and unmixt with any thing else, and he cured a great and contumacious Tumor in the Knee, when other Physicians had used Purging, and a sweating Diet and many Applications to no purpose. Sennertus uses the same, but mixt with Anodynes in a long and contumacious Pain, especially if it arise from cold Matter.

Riverius.

IV. The Feet and Legs sometimes swell with an oedematous Tumor. I think the cause of this Disease must be ascribed to the strength of the expulsive faculty in the Bowels and habit of the whole Body, which thrusts down the redundant, pituitous and ferous Excrements, which tend downwards of themselves, to the Legs and Feet, as to the lower and weaker Parts. For I know by Reason and daily Experience, the Feet and Legs sometimes swell, when the Liver ails nothing, for the said reason: Besides, by simple congestion, without any fluxion, both the Feet, and Legs, and other Parts, may rise in divers Swellings, especially cold ones. In such swellings of the Legs, that have been much and long swelled, Incisions and Scarifications, Sinapisms and Vesicatories are much suspected; seeing the Heat can never be strong in Legs so affected; and when a great Incision is made, it exhales the faster, together with the loss of Water and

and Spirits. Moreover with this extraneous humidity, a notable driness is caused for want of nourishment. The pain of the inflamed Wounds, the effect of solution of unity and increase of driness causes Inflammation, and this a Gangrene, which is followed by a *Sphacelus*, while the weak Heat perishes.

Zacchius.

V. Tumors are gatherings, which only swell without Suppuration; but Abscesses are suppurated Tumors, or Suppurations. In Tumors, except they incline to a Gangrene, the Physicians of our time are not accustomed to use the Instrument and Knife: for these timorous People do not dream of taking away Blood, because, what a madness were it to put a Man to Pain, or to increase the Inflammation and mischief? Yet notwithstanding, being both so taught by the Ancients, and confirmed by our experience in Practice, have made bold to cup and scarify several, and upon the Tumors very much. We rely upon the Authority of our Dictator *lib de Ulcer.* But if not, saith he, we must pierce the Tumors with more deep and frequent Wounds, than in other Cases; and this must be done with very sharp and small Instruments. And *lib. 7. Epid. We must pierce Ribes, &c.*

Severinus.

VI. Such Oedomatous Tumors, if they be not discussed with Medicines, require the last Remedy, proposed by *Ben. Faventinus*, To cauterize such Members with an actual Cautey in several Places: for not only the watriness will be drawn out by it, but the exonerated Members will be strengthened so as to be able to concoct their nutriment, and expell what is superfluous.

Forestus.

VII. Topicks in the beginning of an *Oedema* must moderately repell: for seeing the Humor that causes an *Oedema*, is usually thick, it would be too much settled there by strong repellents, for it would not easily go back, although the *Serum* of the Blood be mixt with it usually, as its vehicle. But here we speak of a true *Oedema*, bred of supervacaneous natural Phlegm (not of one that is caused by a pituitous and cruder sort of Blood) in which we use Repellents in the beginning, rather to strengthen the Part than repell the Humor, with which also we mix discutients; as when in strong Bodies we apply Oxycrate of 2 Parts Vinegar and 1 Water, wetting in it either a new Sponge, or one prepared with Nitre or some sort of Salt: for Vinegar not only repells by its coldness, but by its driness, incides, attenuates, and dissolves; also a new Sponge, or one prepared, dissolves.

Chalmetuz.

VIII. A Child was born with a great swelling upon its Loins, which when it was opened, much Water run out, and the Life with it; and when this was gone, we saw the ragged *Vertebrae* and Nerves of the Spine dispersed through the swelling. Let Surgeons take notice of this danger, which has been observed in the Loins, as also to avoid the same in that soft Tumor which arises sometimes upon the dilated sutures of the Skull, into which when a Knife is directed, it may easily hurt the Brain, lying that way. In so dubious a tumor have recourse rather to discutient Plasters than to the opening of it.

Talpizus l. 3. c. 29.

IX. In hardened Parts, we must consider whether they have only some of the 3 sorts of hardness, or whether they have some sharp thin and corroding, Ichorous defluxion mixt withal, upon which account the Schirrous hardness degenerates into an Ulcer. For this purpose indeed such things serve as do soften, but with Minerals mixt with them, or Oyl of Mandrakes, by reason whereof sharp humidities are qualified, and dried up by degrees and slowly. In which also we must have a care of such things as soften very much, or of Medicines of thin Parts, for they by their heat and tenuity do easily enrage the Ichorous matter, and make it degenerate into an Ulcer, which afterwards has not been known to give way to any Remedies.

Mercatus.

X. Asses Milk is good to soften any hard swelling, which is so far from obstructing, that by *Ætius* it is rather accounted a most present Remedy to dry up Obstructions, and by *Avicenna* and all that are skilled in the Art. For it has not much caseous or butyrous substance in it, but by that little fatty and unctuous substance it sticks, by the Serous it penetrates, and so by softning it overcomes dry and pertinacious Obstructions.

Foris.

XI. If the *Scirrhus* have its rise from a melancholick Humor, it must be more cautiously treated, then if from Phlegm, lest it turn to a Canker: and especially if it incline to Suppuration. Have a care, it be not irritated with hot Medicines.

Sennertus.

XII. A long time is required to the breeding of a *Scirrhus*, therefore if the Disease (with hardness) be new, it scarce deserves to be reckoned among schirrous Tumors. I often meet with round Tumors, hard to the Touch, and without Pain, in which I find nothing besides Water, which is contained in a very hard Membrane. I cut one of these Tumors this Month out of the Belly of a Girl of 9 years old, who recovered. Tumors also arise from pituitous Humors, which nevertheless are hard to the Touch. I lately cured a Tumor in a Matron's left Wrist which came from a Contusion, which was so hard, that it was reckoned by all an exquisite *Scirrhus*: When the Tumor was opened, I took out of it an Humor like the Fat of Bacon, which exposed 24 hours to the Air turned into little Stones. Afterwards took out a very hard Membrane. And in such Tumors the Membrane is extended by the Humor, just like a blown Bladder, which is hard to the touch, though there be nothing in it but Wind.

Fab Hildanus.

XIII. A Matron about 40 years old, had a violent Pain in her left Side, with a lingering Fever, and extenuation of her whole Body. I felt it, and laid open a suppurated Tumor with a large Incision cross-ways, out of which I took two Bladders of very unequal and fetid Pus; when this was evacuated, I found the ends of three Ribs very carious, about 3 Inches whereof I was forced to eat away by applying an actual Cautey to the ends of them. Provident Nature had guarded the *Pleura* with much flesh under the *Caries*. The Matron was recovered with a restorative Diet and Milk. ¶ M. N. was troubled with a scirrhus Tumor for a long time in his left side, above the 5th and 6th true Ribs, upon the 6th the Swelling was opened with an actual Cautey, out of which a little Pus ran, a grievous Pain remaining. I observed the Ulcer was as broad as my Hand and the Ribs underneath it were foul, more than half through. Univerfals premised, I cut 4 Inches off the ends of the Ribs, having applied an actual Cautey behind their ends: At length I procured exfoliation of the burnt Parts by catagmatick Powders, and I cicatrized the Ulcer with absterfve and incarnating Medicines.

Gualt. l. 3. mar. Obs. 3.

XIV. Because a *Meliceris*, one sort of coated Abscess, requires a cure by discutients, and an *Atberoma*, another sort, by Septicks, I will speak of the choice of them. As to a *Meliceris*, the cure by Medicines is found in Practice to be difficult and deceitful. Nevertheless because the due cure of a Tumor in the beginning is alwayes desirable, and proposed by most Authors, we must consult first the descriptions proposed by *Galen. 6. K. T. cap. 14.* and then *Ætius* and *Paulus. l. 4. c. 34. Langius l. 3. Epij. and Eponymus Philiatrus.* As to the Chirurgical part *Celsus* has committed it to Writing *l. 7. c. 6.* But here I will add some useful Ways and Observations. First of all, such coated Abscesses as, when they are handled, are moveable every way under the Skin, then we may undertake to cure with confidence: But into others, which stick fast, red hot Irons may safely be run into them, when they are

are

are opened, and the matter that fills them, got out; which is the fittest to be done, when there are signs, that all the Strings by which the Abscess sticks, are not plucked up, and there is danger either that the Blood will run out or Corruption breed. And the Cauteries requisite for cutting must be sharper than ordinary. *Agnapendent* requires a *Smilion*, or recurve Penknife. After this, having all things in order which are requisite and of use, have a Sponge at hand, with which the troublesome Blood may be wiped away as it runs out in cutting, and you must exactly mark with Ink the Site, Magnitude, and Figure of the necessary Dissection: which Section must be extended, as far as the Tumor reaches, or a little within it: for so the Fibres may more commodiously be drawn out, and the Coat taken hold of, and the Belly of it cleansed; then you must slant your Knife and endeavour dissection with an oblique Hand, and so slay off the Skin that you wound not the Bladder. When incision is made, *Cornelius* advises to part the Coat with the handle of the Knife from the Skin and Flesh, and to cast it away with what is in it. But nevertheless I find, that they stick firmer, than to be parted by any blunt thing, wherefore it must be cut with the edge of the Knife run under the Coat, and must all be taken out; or, if the Patient will not suffer this, it must be eaten with caustick Medicines, which often puts the Physician to a great deal of trouble.

Severius.

XV. A *Meliceris*, which rises a little above the Wrist, does often so impose on them that have never seen the Matter, that the Physicians believe it to be a Scirrhus swelling or a *Ganglium*, and so are afraid to cut it. But nevertheless we must know, that this hardness comes from a distension of some copious Humor, like the white of an Egg, or rather like white Honey. You must not therefore handle this every way moveable Tumor too confidently, if you will hear me, you must open it with a Lancet, or a prick of the Sea Parsnep, which the timorous are less afraid of. This observation was made good in myself: for I cut one of these that grew on my *Metacarpus*. One had a Swelling began to rise in his left Hand, which although some took for a sort of *Ganglium*, yet when I prickt it, a pellucid Phlegm that came out showed it to be a *Meliceris*. A *Meliceris*, that grows above the Wrist has no Bladder about it, as far I could observe in several, wherefore you need make no large Section for it; nor when it is cut need you be solicitous to get out any Bladder, which Cure some through mistake have insisted on.

Idem.

XVI. When you have cut out a *Steatoma*, remember to take care of some Intemperature, especially if it be a large one, left in the Part. And it must be the Care of him that cures, to cherish the same with Medicines amicable to Nature. And when you find some Fibres remaining behind, it is the best way to apply a Caustick or a little Fire to it. And this indeed is the Cure, if the *Steatoma* have a broad base, for if it hang by one little foot-stalk, it is sufficient to cut it out by the Root. *Fallopis* is content with Corrosives. And we must not neglect that of *Ætius*, which is observed in the Kings-Evil, if the *Steatoma* be fastned above, it must be cut round with a Pen-knife, and parted underneath with the Fingers; if it be inserted in the Ambit, it must be cut underneath.

Idem.

XVII. But in all kinds of *Atheromata* this among other things must especially be taken notice of, which has been observed only by me, as I often handle them, that when the Coat of the Abscess is amply laid open, it must not always be all parted from the Skin, intire with the Stuff inclosed in it, for the pulling of it out would be painful, and scarce tolerable by all People. It is sufficient to lay open the Skin a good way, especially cross-wise, and to cut as much of the Membrane away as you

can with a pair of Scissers or a Knife: But then you must take away some of it with Medicines, I do not say Causticks, but Digestives and Eroders. I first found this in a young Man, who had had an *Atheroma* upon the *cartilago ensiformis* for above six Months, in which no cutting away was made, but the Bladder when it was opened wide, rotted, and was got out partly by Absterives, partly by Cathereticks. But then the Bladder must not be thick and cartilagineous. Therefore he must be a prudent and an experienced Physician, who can perspicaciously distinguish in all. There was another thing I observed in this Young Man, that this Tubercle cut out about his Breast, caused some distention in the Muscles of the Breast; Wherefore you must be careful to make lax the Muscles continually, by applying Medicines to them and to the Armpits and Groin. Another thing must be observed from *Ætius*, that when the Pellicle is taken away, if the Lips be over lax, the redundant Skin must be cut off, and then the Lips must be sowed together. And this moreover is worth notice from the same, that if such a Swelling be in the Head, we must, after the Pellicle is taken away, cut the Bone about it, and carefully scrape the Skull.

Idem.

XVIII. Whether, when the Bladder is taken exactly out, a Suture should be made, since a bleeding Wound requires conglutination, The determination is not so easie: for if you look upon the greatness, and would have a Suture in regard of it, the small gaping of the Wound is content only with conglutinating Things. If the Sinus be great, as much indeed as the largeness of the Wound requires the help of conglutination, so much also of difficulty and an Ambiguity it creates, lest some hole should be left under the old habit of the Skin, and a false Abscess grow from the former substrate Matter, and so the coalition be in vain. Therefore it is requisite to cut away the proud Flesh and the Skin first, and then sow it. But often when Men are thus treated they will not, being tired out with Pain, allow this; but Suture might be used, would they allow it. *Ætius* has left it to our choice whether we will sow or no, who says, When the Operation is finished, the Lips may be sowed, that they may the better be glutinated, or Liniments may be put deep in, and the Cure may be used for generation of Pus.

Idem.

XIX. The true generation of a *Sarcoma* in my Opinion is this, the Mouths of the Arteries that serve for nutrition of the Muscles are sometimes opener than they should be, either by some fall or blow, or by some internal Cause, especially in plethorick Bodies and in Parts unduly moved. The innate Heat converts the extravasated Blood into Flesh, and when the Part also stands not in need of so much nutriment, hence it is, that it grows to a preternatural bigness; here, if the Blood be impure, Bile produces pain, phlegm viscosity, melancholy a cartilaginous Hardness, and it is by reason of these Humors, that this preternatural Flesh is Yellow, White or Livid. It is seldom enclosed in a Coat of its own, unless it consist for the most part of Phlegm, and such a Tumor comes most in the Neck. The Veins also encrease according to the encrease of the Tumor, so that they may be felt under the Skin as thick as ones Thumb. It is not malignant in it self, but sometimes a bad Cure makes it so: Here the Air does a great deal of harm, when the Swelling is exposed to it. It commonly refuses the best Medicines, and in spite of them the Swelling increases more and more: And you will rarely Cure it, except you take it away with a Thread or a Knife, or with both. In the beginning the Cure must be tried with strong Astringent and repellent Medicines: gentle bindings are also used, after the application of a Plate of Lead, or *Empl. Diabalsitens, de ranis cum Mercu-*

ria

rio, or the following; Take of rinde of Pomēgrate, root of Bistort each 1 drachm, dross of Iron, Quick-silver, burnt Lead each 2 drachms, Bole Armenick, Bloodstone each 1 drachm and an half, Turpentine and Wax what is sufficient. Mix them, make a Plaster according to Art. In the mean time Purging, Bleeding, Scarification, applying of Leeches must not be neglected in their places; Sweating also, Watching and Fasting are very good. But if the Swelling refuse all these Medicines, and grow bigger every day, Suppurators may be applied. If these Medicines for several dayes do no good, and the Swelling continue in the same state, an actual Cautey must be applied: And let not the perverse Censures of false Surgeons, and of them that are by, disturb us, for by the use of it for a long time the increase of the Swelling will be stoppt, yea and at last it will wholly be rooted out. But if contrary to expectation the Flesh begin to bud out anew, the Surgeon must not delay to attempt the perfect extirpation of it with a Thread or a Knife. Here let a Thread that is smaller and stronger be taken, let this be tied twice about the Neck of the Swelling, and having made a double knot, let the straining of it be repeated the same day, yea, and the dayes following, until it be deprived of its Heat, Feeling, and Life, which will require 7 or 8 dayes time; then take it off with a crooked Knife, which may easily be done, since neither great Pain nor Hæmorrhagy need be feared. The use of a Thread dipt in Mercury or Arsenick-water hastens the mortification of this Tumor; but here a phlegmatick Body is required, for in others the Pain and Inflammation, so afflict the Patient, that it is rare but within a short time this Thread must be taken off. Yet the Surgeon may, for mitigation of the Symptoms and cooling, anoint that Part, which the Thread touches, with *unguentum album Camphoratum*, Ointment of Roses and the like by the help of a Feather. If you have a mind to use the Knife only, you must use your utmost endeavor to take all the Tumor away; otherwise you must abstain from the operation, unless you have very great hopes of consuming the remainder by Medicines. In the mean time let the Surgeon have a care, that he cut not the greater Vessels, and to stop the Bleeding.

XX. M. R. complained of a troublesome *Meliceris* in his right Shoulder, which, having first prepared and purged his Body, I dissolved by applying *ceratum Diaphanum* described by *Aquapendent cap. de Meliceris*, and thus corrected by *Spigelius*; Take of Sal Gemm, litharge of Gold, Cerus each 4 ounces, Wax and Turpentine each 2 drachms, *Galbanum*, *Opoponax* each half an ounce, Mustard powdered 2 ounces, old Oyl 4 ounces, strong Vinegar what is sufficient, make a soft Cerecloth according to Art. A Woman also tried the peculiar efficacy of this Cerecloth against a *Meliceris*, which grew in her right Knee, as big as a Goose Egg; she applied this same Cerecloth, which perfectly dispersed the Swelling in a Month's time, and whatever was drawn thither the first dayes, through neglect of Universals.

XXI. The Son of N. had a great *Lupia* (or hard Swelling) as big as a large Fist upon the *Spina dorsii* under the Shoulder blade, which was cured by this method. I ordered an Instrument to be made of Ash or Oak or some closer Wood, like that where-withall Painters grind their Colours on a Marble; and with this I rubbed and chafed the *Lupia* twice a day, half an hour at a time, then I applied an E-mollient and Suppurating Cataplain very hot, and I continued it for 4 or 5 dayes, the *Lupia* suppurated, and when it was open, liquid Pus ran out, and afterwards when the whole matter contained in the *Lupia* was turned into Pus, it was evacuated, and the Ulcer cicatrized. The bag of the *Lupia*

was broken with rubbing with the foresaid wooden Instrument, and the matter contained in it attenuated and divided into Parts, so that it might more easily be concocted. Instead of a Cataplain, a hot Loaf new drawn, cut into halves, may be applied to good purpose.

XXII. Sometimes a Melligineous matter, as in a *Meliceris*, or a Pultaceous, as in an *Atheroma*, is contained within the Bladder. When any such thing comes to be cured, the Skin must be lifted up, and cut either length wayes or cross-wayes (that is, when there is a great Tumor in some place not very obvious to the Eye) and it must afterwards be every way separated, with a broad Probe, or the handle of the Penknife or with the fore-finger, till the whole Bladder appear, which must then be cut off by the root, the Vessels being first tied fast, that feed the Tumor. And we must take notice, that the Surgeon should be very circumspect in this Operation; for if the Bladder happen to be broke, not only the contained matter runs out, but, also certainly causes a Relapse, unless it be consumed by Catharticks. Yet oftentimes the Tumor lies in so strait a place, and the Pellicle is so thin, that it bursts upon the least touch. In this case it is *Aquapendent's* Counsel, that we endeavour to separate the new Bladder with broader Instruments, before it knit it self firmly to the Skin again, for then we must have recourse to Medicines.

XXIII. Many *Natte* arise in the fleshy Parts, and stick moveable and soft to the Skin. I have not observed them to subtract the aliment from the Parts, especially those that grow in the Head; Nor always to putrefy, but to stick as long to the Parts, as Life lasts. My Grandfather on my Mother's side carried a globous, naked, soft and moveable *Natta* above 60 years on his Head behind. He would once have it opened, Pus ran out. It returned a little after, and after that time he left it untouched. *Greg. Horsius*, l. 4. p. 2. Obs. 14. observed a *Natta* successfully taken out by the root below the nape of the Neck, but the Man's Sight grew sensibly duller, and every day worse than other, till he had also almost quite lost his Sight. If *Natte*, when they are breaking out, be gently pincht with the Teeth they wither and go away by degrees. Which I observed twice at Padua, once in a Noble Woman, whose *Natta*, as it was coming out, a Neighbouring Woman pinched with her Teeth: Some tie it with a Thread and intercept the afflux of nutriment.

XXIV. If a *Tessudo* be with the corruption of the Skull, *Guido* thinks we must use a palliative Cure, But if the corruption be not great, the Disease must be cured as a fracture of the Skull, namely by Incision, and Deterision with Honey of Roses, Turpentine, powder of Orrice, Myrrhe and Frankincense, the putrid Flesh must be consumed with *Aegyptiacum* or powder of Mercury, and the rest must be done, as in the Cure of Ulcers. If the Corruption of the Bone be great, you must use the Prognostick, except you will use a palliative Cure. I think the same must be done in the Corruption of the Skull by the Venereal Disease: For where the Corruption is great, the Patient may not be meddled with. And let the Surgeon have a care, when he thinks the Corruption is small, that it be not great, as once it was my case; For when I attempted to take off the perished Skull, which I thought was but little, all the *es bregmaticæ* came out at once, so that a great part of the *crassa meninx*, and the motion of the Brain, might very well be seen: yet the Patient, recovered, but after the Ulcer was cured and cicatrized, the motion of the Brain might then be observed; Nevertheless I would advise no Surgeon, to undertake the Cure of so great Corruption, at his own peril. But if the corrup-

tion be little, the Bone must be taken out with a Trepan, or scraped, the Ulcer cleaned and the Body fluxed, as in the Pox, yet there must be a less quantity of Quick-silver. For a *Talpa* with the corruption of the Bone must be cured, as the corruption of the Bone in the Pox.

XXV. A Nobleman had a *Ganglion* grew in his right Groin by little and little, as big as a Child's head. Headvised with Physicians and Surgeons, who tell him of the danger of Bleeding, of a *Gangrene*, and *Lameness*. He chose rather to dye than endure it any longer, unfit for Arms or Wedlock. The Lump was cut about in an Oval line from the Groin to the *Scrotum*: then at the Membrane a little of the Tumor was cut off; and by degrees the Skin, which was under the Swelling, was separated towards the root; the Veins and Arteries, as they were laid bare, were tied, for fear of an *Hæmorrhage*. The Lump was pulled out with its Coat, glandulous, white, without any Blood or Flesh within, easily separable from its root. As the Wound was healing, he had a Fever, bitterness in his Mouth, filthy Matter, pain in the other Groin, but he was cured by a Purge.

Hollerius.

XXVI. *Fungi* very often grow from the Membranes of the Brain, yet they grow also in divers other parts of the Body, because of the vast conflux of Humors from the whole Body, and that, through Natures great Providence, as *Hildanus*, cent. 2. Obs. 19. says. For since nothing is a greater Enemy to the Nerves, than the injury of the Air, especially if it be cold, Nature, which is ever intent upon the conservation of the individual, covers the nervous and membranous Parts, when wounded and laid bare, with this sort of Excrecence, lest the Nerves should be hurt by the Air, while the Wound is in curing. And their Cure must be begun by drying, and finished by Erosion or Excision. Drying Medicines in the beginning are safer than Eroding or Septick ones: For these in Wounds of the head hasten death, and in Wounds of the Limbs cause Pain, Inflammations, and other most grievous Symptoms; And seeing out of Nature's great beneficence this Excrecence is produced for the Patient's good, it must not be consumed at the very beginning, till the Nerves and membranous Parts be sufficiently covered with Flesh, that they can no more be hurt by external injuries. When the Pain, Inflammation and other Symptoms are abated, if the fungous Excrecence fall not, it must be depressed by Dryers; of which rank are root of round Birthwort, Florentine Orrice, Angelica, leaves of Savine, Rosemary, &c. When these things have been applied for some dayes, if the *Fungus* abate not, but grow up in the Flesh, it must be cured by eating things, as burnt Allum, burnt Vitriol, Mercury precipitate, strewing on the Powder, and then applying a Cataplasim: Or a Ligature may be made, and it may be cut off either with a corrosive Thread, or with a Knife: Which when done, the Powders of the said drying things may be strewed on.

Hofmannus,

XXVII. One had for some Months a Swelling rising upon the right side of his Forehead, with a broad basis, as big as a Hazle-Nut, of the same colour with the Skin, soft, and as it were puffed up; it grew of it self, when it was pressed with the Finger, it gave way, and suddenly rose into the same shape again, without Pain, yet it was not observed to be moveable this way or the other, nor did it increase. And because I thought it was one of those Tumors, which are more easily extirpated with the Knife, than dissolved by Medicines, I order the Skin to be cut obliquely with a sharp Penknife: As soon as it was done, no Blood but a very little limpid Humor, like the vitreous one of the Eye, ran out: It fell upon the Patients

right hand, and he affirmed it was very hot. *Præcipitate* was immediately put into the Wound, and other things put after, to hinder Inflammation, and when it was opened the next day, the Bladder was taken out, and the Wound was within a few dayes so dextrously healed, that there was not the least sign of a Scar left behind. Thus we may easily prevent things in the beginning, which, if neglected till they grow old, will scarce give way at all to any Remedies: And no question, but this Tumor, if it had been let alone, would have turn'd at length into a *Meliceris* or *Steatoma*, when the *Mucus* had grown thick by delay.

J. Rhodius,
Cent. 1. Obs.
29.

XXVIII. If there be a swelling in the Cheek, let the Physician have a care that it break not, for so that Seat of Beauty might be deformed by a Scar; However, because oftentimes dissipaters ripen, and ripeners dissipate, by reason of their likeness in qualities, it may so happen that Suppuration may come contrary to the intention of the Physician. When therefore it is made, let him draw the peccant Matter by proper Medicines to the inside of the Mouth, or to the commisure of the Jaws, which is by the Chin. For Women will sooner endure their Lips to be cut, than to have a Scar in their Cheeks.

Hofmannus.

XXIX. *Dioscorides* writes, that the swelling of the Paps is abated by applying Hemlock, which experience testifies to be true: Although *Dodoneus* disapproves of such a Remedy, because of the malignant and poysonous nature of this Herb, which being applied to the Paps may hurt the Heart.

Riolanus.

XXX. *Steatomata* and several Abscesses are often bred in the *Omentum*, because great store of Fat and Glands is found here. So the Mesentery both of it self, and because of plenty of Glands is very subject to Inflammation, Tumors and Corruption. Because these Diseases are difficultly distinguished one from another, they require an experienced Physician. We may say the same of the *Pancreas* and Spleen. In the meantime I shall communicate this Plaster, the efficacy whereof in curing the Tumors of the said Part I have often experienced, Take of Gum *Carranna*, Ammoniac each 1 drachm, Mercury killed with Turpentine half an ounce. Mix them. Make a Plaster.

Barbette.

XXXI. We must proceed gently and gradually in cutting or pulling out axillary Tumors, for while we draw and separate the Tumor with Pincers or any other way, the Muscles that serve for respiration are contracted also, hence an interception of Breathing. As soon as ever this is observed, we must desist a little from the Operation, till they have gathered strength: also Cold and very repercutive things must by no means be applied to these Parts, lest the Matter be repelled to the *Pleura* or other Parts, and there cause Inflammations.

Fabr. Hildanus.

XXXII. An Infant about eight Months old was ill of a Swelling in his Groin, which when I was intreated by the Parents to bring to a Suppuration, after divers sorts of Medicines had been tried before, I observed that one Stone lay in the Groin, by the same token that the other was alone in the Cod on the other side; and therefore I advised them afterward to abstain from all Medicines, for it was not a Tumor but a stone; which afterwards in 7 or 8 Months time slipped down into the Cod; and so there was no need of cutting it, which a Barber was going to do.

Marchetti
Obs. 58.

XXXIII. Swellings in the Knee are very dangerous and difficult to cure, for want of Muscles, and great store of Ligaments; Tendons and Bones being Parts that are of a cold and dry Nature, and unable sufficiently to disperse Humidity. Therefore it is necessary to give help as soon as can be by hot means: Yea, if there be any signs of Suppuration, the Abscess must be opened at the very first

first time, left otherwise the Patient might fall into a Lameness, Consumption and at length death it self. A continual owzing of some Humour, which renders the cure very difficult, usually follows opening the Ulcers. *Barbette* highly commends his restorative Powder for this.

XXXIV. In swelling of the Knees, this must be observed, that Scarifications, when there is need of them, must be prudently administered; for all joynts are weak, yet endued with exact sense. Wherefore pain and other accidents follow Scarification.

Chalmetz.

XXXV. A Boy after he had had the Small Pox, had a swelling of pituitous and flatulent matter, about his left Ankle, which seemed to threaten an abscess. But because such Imposthumes about the joynts are difficult and tedious in curing, and sometimes erode the Sinews and very Bones, we agreed among our selves to try all means, whether the enclosed matter could be evacuated by insensible evacuation: We therefore applied a Cataplasim of flower of Beans, Lupins, Darnel, Powder of flowers of Chamomil, Elder, Melilior, Bay berries, Aniseed, Cumineed, boyled in a simple *Lixivium*, adding a little Salt. We applied this Cataplasim 15 or 18 days without success, the matter at length being heated in the part affected, an itching and an *herpes pustulosus* or *miliaris* came on a sudden: Wherefore for a day or two we omitted the use of the Cataplasim, and we anoynted the place affected with *Unguentum album Rosæ*, and we suffered the Boy to rub his Foot as much as he list. And after that a great deal of Humour had run at the Pustles, the swelling about the joynt abated, when the pustles were healed, we applied the Cataplasim again, till new pustles arose, which we dried up as before, and applied the Cataplasim again. These being changed by turns, this rebellious evil was at length successfully cured. I therefore write this, that the Surgeon may not change his Medicine as often, as success does not immediately follow: For frequently in Children and weak People time is required, before Nature can bring the Medicine out of power into act. Therefore we must not give over, but expect Nature's motion.

Hildanus.

XXXVI. A Girl 10 years old was after the Small Pox troubled with hard Swellings about her joynts in her Arms, Hands and Feet, that would scarce come to suppuration. Some were open, others not: out of them that were open a thin *Ichor* ran, rarely any pus. I gave her a Decoction of *China* root and *Sassa parilla* mixt with Splenetick and Hepatick Herbs, yea and purgatives, wherewith I use to cleanse the Blood. I ordered that her Sores should be washed with Lime water, and the Tents should be dipt in the following unguent; Take of *Unguentum Diapompholyges* half an ounce, *Saccharum Saturni* 1 drachm. Mix them. And that they should be then covered with *Emplastrum Gryseum*. For the hard Tumours, that remained, I prescribed *Emplastrum Diaphoreticum Myrsiceti*. So she was perfectly cured.

Winckle, Msc. curios. an. 76. Obs. 100.

XXXVII. A Nobleman fell with his Knee upon the pavement, he felt a pain under the whipl-bone, and a little after a certain callous excrescence. When the Swelling was not lessened with the Medicines that the Surgeons gave him, I quickly cured him with the following Plaster; Take of *Emplastrum diaphoreticum Myrsiceti*, de *Ammoniaco Foresti* each 1 ounce, black distilled Oyl of Tartar 1 drachm. Mix them. I have often discussed hard Tumours, that were not fit for maturation, with the same Plaster.

Idem, an. 76. Obs. 101.

XXXVIII. *Johannes à Ketbam* in his *summula venarum* has observed out of *Avicenna* that Inflammations and pains in the Kidneys, Loyns, Hips and Bladder are wonderfully cured by opening the Veins by the Knee. And I by opening the inner Vein of one

Severinus.

Mans Knee, who had a Phlegmonous Tumour over all his Leg and Calf, gave him present Remedy.

¶ One had been greatly pained with an œdematous Inflammation in his Leg, and had been long troubled with a black Vein that ran obliquely up his Leg, which being opened cured him. And so another was cured, who had been long troubled with relapses of Ulcers in his Legs. This was done by me at *Galen's* perswasion. l. 2. ad *Glaucum* and by *Ben. Victorius* his advice.

Idem.

XXXIX. In all Medical Observation nothing is more excellent, than to know all the disaffected parts about a Tumour. And swelling is so near of kin and consensaneous to every Disease, that a latent mischief is sooner declared by nothing than by this: Either because the part being weak, cannot turn the aliment brought thither into it self, and so the matter remains; or partly because Pain calls the Humours from all parts. Now, when with the Swelling the Veins do sometimes strut with their full tubes, as if they would burst, all about the places that feed the Disease, they do but persuade us to empty them with the prick of a Lancet, as I have often done with very good success, when the Body has been well emptied with universals before. Therefore *Hippocrates l. de Ulc.* scarifies round old Ulcers, and opens the strutting Veins thereabout. Most Authors boldly scarify Contusions, Inflammations and Tumours of all parts. But I say if we slash the Flesh, how much better may this subtraction be made out of the Veins, that swell out in the afflicted part, which is more plentiful, commodious, ready, easie, safe, and with less pain?

Idem.

XL. If the matter be bred in the Liver, Spleen or Womb, and tend upwards, you may make an Issue in the Thigh or Leg, observing alwayes the rectitude, which makes revulsion, that the matter may not infect the upper parts. Wherefore take notice, that if the matter be sent from them parts downwards, and get into either Leg, they do very ill, and are quite out, who make Issues in the upper Parts for revulsion sake from the lower, although they observe the rectitude: for so they retract the Malignant matter, peccant either in quantity or quality to the upper parts, not without great damage to the Patient. Therefore *Aguapendent p. 1. oper. chirurg. c. 95.* did well, who was not afraid to make an Issue above the Knee for a swelled foot, which besides the revulsion it makes, does moreover intercept the matter, and stop its way, that it cannot get downwards. And I, following his Footsteps, have cured several of a Swelling in their Feet, especially about the Ankle, by making an Issue in the Thigh above the Knee, and they are still well. And you must take notice, that in Men I chuse the outside, but in Women always the inside of the Thigh above the Knee, because of the Womb.

Glandorpius.

XLI. Men set little by Corns, but they are to blame, for if an error be committed in the Cure of them, a grievous Disease may easily arise, I knew a Nobleman die of such: Whenever, therefore Men ignorant in their Art do cut a Corn to the quick, and apply a drop or two of Oyl of Vitriol or *Aqua fortis* or some Arsenick to it, most acute pains, Inflammations, Convulsions and other things do follow, yea, and death it self, as in the foresaid Nobleman. But I use this safe Method; First of all, because this Disease proceeds from rubbing and straitness of the Shooes, strait and hard Shooes must be left off. Afterwards prepare a Bath of emollient things, in which soak your Feet for 2 hours, then wipe them and do so for 3 days. So when the Corns are well softened, scrape and cut off with a Razor all that is hard, but by degrees, and only the superficies, not cutting from the superficies to the Center; When the Corn is thus cut to the root,

G g g g

which

which is done without pain, let *Emplastrum de Cicutra* be applied; and so tied on, that it may stick on night and day. At first renew it every 4 dayes, afterwards once a Month: but it must be worn many Months, yea for a year, which it may without trouble.

Hildanot.

Medicines especially made use of by eminent Physicians.

For watry Tumours.

1. A Plaster of Mustard Seed is the best thing can be thought of, for any watry or statulent Tumour. This is it; Take of Mustard Seed, Nettle Seed, Brimstone, round Birthwort, *Spuma maris*, *Bdellium* each 1 drachm, Gum Ammoniac, old Oyl, Wax each 2 drachms, mix them, make a Plaster.

Chalmeræus.

For other Tumours.

1. I have cured an œdematous Tumour arising about the emunctories of the Brain, by applying *Emplastrum calcinatum* Paracelsi; which is made thus; Take of Balsame of Sulphur 1 drachm, white Wax 6 drachms, oyl of St. John's-wort 1 drachm, Mercury precipitate red and washed 1 drachm, *terra mortua* of Colcothar half a drachm. Mix them. Make an Unguent, by use of which all œdemata and scrophulous Tumours are cured: for by the virtue of Balsame of Sulphur, and Oyl of St. John's-wort, they are concocted and ripened, and by vertue of the Mercury and earth of Vitriol they are well cicatrized, as I have often seen by experience.

Joh. Per. Faber.

2. Hops are excellent in allaying outward pains of the parts, which the vulgar are not ignorant of, for in Strains and œdematous Tumors, as also in Bruises, they often apply them boyled in Beer to the part, in form of an Epitheme, with good success.

Medicines.

I. **A**lthough only empirical Remedies are wont to be used for a new Cough, and there is not a man among the common sort, but is furnished with many and divers Remedies of this nature, which many without the advice of a Physician take confidently and inmethodically, and give them so to others; yet persons that are of a tender constitution, or hereditarily inclined to a Consumption, or formerly have been in danger from a Cough, should upon the first approach of it have a care, and immediately betake themselves to the Rules of Physick. According to which, that the Method of cure may rightly be insisted on, the therapeutick Indications will be especially these three, First, to appease or remove the disorders of the Blood, from which the defluxions of the Serum proceed. Secondly, to derive the recrements and all the refuse of the Blood, that are apt to separate from it, from the Lungs to the Pores of the Skin, or the Urinary passages, or to other Emunctories. Thirdly, to strengthen the Lungs against the susception of the Serum and other Humours, and also to guard them against meeting with the external Cold, whereby they are usually most hurt. The first Indication respects both the effervescency of the Blood, when by reason of *effluvia* kept in, it æstuates and boyls up in the Vessels; and the dissolution of it, that is, when being dissolved in its frame, it too much lets go its hold of the Serum and other Humours: For taking away both these, a thin course of Diet must be kept, and the injury of the external air being carefully avoided, a little more plentiful transpiration must be procured, or at least the usual restored: Yet, if the Cough grow worse, Bleeding, if the strength and constitution will bear it, is often used with Benefit: which when over, Hypnoticks almost always do good, inasmuch, to wit, as they retard the motion of the Heart, and by consequence the too precipitate course of the Blood; moreover, they bring it to pass, that this traverses the Pneumonick Vessels gently and moderately, without much rejection of Serosities: And pectoral Decoctions also, in as much as they destroy the sharpness of the Humours, and hinder the Dissolution of the Blood and its fusion into Serosities, must be used: By parity also of reason and manner of working, Medicines made of Sulphur do such remarkable Service against a Cough. The second Indication, to wit, that the Serum and other recrements of the Blood, being derived from the Lungs, may be evacuated by other wayes, is performed by Diaphoreticks, Diureticks and by gentle purgatives, which must be used by turns. Therefore after Bleeding them give and sometimes repeat a purge. Let roots of Chervil, Butchers-broom, Elecampane, and other things that move Sweat and Urine, be put in Pectoral Decoctions; *Millepedes*, volatil Salt of Amber, and some fixt Salts and testaceous powders, made into Pills with Turpentine, are often given with success. The third Indication, that the Lungs and their Passages may be defended from fluxions of Humours and meeting with Cold, which is vulgarly called stopping of a Catarrh, is performed by Licks and other private Remedies, and it respects two things especially, namely, that the mouths of the Vessels and Glands, which open into the Trachea, that they may not discharge too much Serosities into it, may be shut with moderate Astringents, And Secondly, that the sides of the ducts of the Trachea may be sufficiently suppled and smoothed,

smoothed, that they may neither be offended with the pouring of sharp Serum upon them, nor by meeting with the external Air, and so not be continually irritated to Cough, and moreover, that when these Passages are sufficiently lubricated, the spittle which sometimes sticks fast to their sides, may more easily be raised and coughed up. For the former intention it is, that Conserve of red Roses, *Olibanum*, Mastich, *Loboch de pino*, *Syrupus jujubinus*, de *rosis siccis*, and other Astringents are prescribed: For the Second intention, Liquorish, with its various preparations, is counted so famous a Remedy against any Cough what ever.

II. You shall see very few Physicians have recourse to Blood letting in a dry Cough, because they think this either comes from a dry intemperature without matter, for which they will have the Lungs smoothed and moistened with Becchicks; or from thin Phlegm or Serum falling (as they perpetually talk) from the Brain upon the Lungs: and then they will have the matter incrassated, and the impurity of the Body evacuated by Clysters, Purges and Sneezing. Which Remedies though we think them not to be despised, yet we affirm that all these should rather wholly be omitted, than altogether to abstain from letting of Blood, especially if the Disease be stubborn, both to cure the affection that accompanies the Cough, and to hinder more grievous mischiefs, which may follow, as Inflammations, bursting of Veins, Ulcerations. ¶ It is judged that Blood must be let in a dry Cough, if it cause a Fever: If there be a sharp and vitious Humour within the Veins: If the Liver be hot or swelled, and so raise a Cough: If a thin and sharp Humour fall from the Head: If the Stones be affected, and a dry Cough therefore arise; for *Hippocrates* 4. *Epid.* orders such to Bleed in the Foot.

III. In a Cough you must purge gently, by turns and at intervals, and with mild Medicines, or such as have their strength some way abated, lest a greater fluxion be caused by sharp ones. But when the defluxion is cold and thin, you may purge often, without premising any preparation; but if it be thick, you must prepare a long time, and let it be late ere you purge.

IV. Vomits, if not alwayes, yet for the most part, cure a Cough whether new or inveterate, if procured by *Aqua benedicta*: for this way the first region of the Belly is freed from all impurities, and distillations are stopt, so that if convenient Pectorals be used after them inwardly and outwardly, it seldom returns.

V. In a thin Catarrh falling from the Head upon the Breast *Trallianus* lib. 5. cap. 4. commends *Diacodium*, for them, who have a thin defluxion running down from the Head upon the *Aspera arteria*, which will not suffer them to sleep because of the Cough following it. It is also convenient in an afflux of matter by the Vessels out of the whole Body, *Trallianus* his caution being used, that it be given with great care and circumspection, not alone, but with other things: not, when the strength is low, or when there is store of recrements lodged in the Breast and *bronchia*. For though it may seem to stop the Cough, and to cause Sleep, yet it augments the straitness of Breast; so that it chokes many, as sure as the halter; therefore he mixes it with *Ozymel* or Syrup of Horehound. *Helmont* commends *Laudanum Opium Paracelsi*; but he adds, a Vomit followed in the Morning. I find by experience that in the Morning it causes vomiting, and I much value the benefit of this Medicine. The reason why it Vomits is not yet known.

VI. The various pituitous matter, that is voided in Coughing, by old Men especially, and in Winter time, does not alwayes come from the Head: But it arises also from excrements continually ga-

thered in the Lungs: for as the Brain by reason of its store of Vessels, is alwayes full of superfluities, especially if the Blood be impure: so the Lungs also, because they consist of innumerable Vessels, do much abound with Blood. If there be a Caco-chymy of the Body, they continually gather such excrements, and discharge them out of the lesser Vessels into the larger Branches of the *Aspera Arteria*, out of which, together with the excrements, that are brought thither by the defluxion, they are afterwards brought up by Coughing.

VII. Roots of Goats beard are commended for a hot intemperature of Stomach, Liver and Kidneys. *Tabernaemontanus* also commends them, especially with the purple flower for Diseases of the Breast, Cough and difficulty of Breathing. But in my opinion it is a *Succedaneum* to Cichory, but only that, because it is sweeter, it more readily frees the Vessels of the Liver from the stoppage of Humours, whose obstruction the fore-cited Symptoms do attend by Sympathy; which Symptoms Practitioners, who are ignorant of Anatomy, do ascribe to the Breast or Lungs, as if they were affected by Idiopathy. So it is to no purpose, if you should cure Hydropick, Coughing People with sweet things & Becchicks, who want Medicines to purge water, and to free the Liver from stoppage of bad Humours. ¶ The Noble Lord *J. Antonius a Seva* after his return to Geneva out of Flanders had got a Cough from an unusual moist Air and his unaccustomed drinking of Beer, which was followed with a swelling and hardness of Belly. The Physicians had long driven against the Cough and Catarrh, not so much as touching or taking any care of his *Hypochondria*. When he was committed to my care, he took things to open and strengthen his Liver, laying aside Becchicks, which had swelled his inwards: Thus in a Month's time he that was near threescore, was rid of his Cough, which, as the Belly fell and grew soft, by degrees abated.

VIII. A Woman, upon swallowing the kernel of a Hazle nut as she was laughing, fell into a violent Coughing, which troubled her for two Months time with a Fever and emaciation of the whole Body. A Physician who was called, suspected a Consumption: But the judicious *J. D. Sala*, observing that her Fever was not continual, nor her Spittle Bloody or streaked with pus, pronounced her free from a Consumption. After many inquiries, when he knew the cause, after a Vomit of Honey of Roses with common Oyl, to no purpose, he added a lambitive of Oyl of Sweet Almonds, to irritate the expulsive faculty, and enlarge the Passages; at length she spate up the kernel and recovered.

IX. One was ill of a troublesome short Cough, and when no Medicines would do him good, after he had born it a long time, he asked my advice: I gave him every day the juice of Horehound with Honey, and at times to lick Honey of Squills, till a worm came out of his Breast with Coughing, which restored the Man to health.

X. I knew a certain Person who fell into a Cough by reason of a defluxion of a bad and noxious Humour into the Breast, coming from a cold intemperature, and when he made him some Causteries in his Head, he was perfectly free of all his Symptomes, so that the plenitude of the efficient Humours being exhausted, his Cough ceased, and he recovered his health by benefit of his Causteries.

XI. Being moved thereunto with the urgency of the business, we resolved to open an Issue in one of his Arms, whereby without any other help the Cough began to abate.

XII In a troublesome Cough, and a thin defluxion upon the Breast, if what falls, escape the straining of the Lungs, and is not discharged, *Laudanum* is

the best Remedy, which incrassates, and by procuring sleep, or rest at least, strengthens Nature, and promotes the concoction of the crude Humour. Upon the experience of *Monsieur de Sigon* and President *Ripant*.

XIII. I was Physician to a certain Student, who had been subject to a Cough from a Child. He seemed to be of a Melancholick constitution and indifferent healthy, but that his Lungs which were originally weak, did suffer upon every running of the Blood into Serosities. In Summer time, while he transpires freely, he lives healthy enough; in Spring and Autumn, when the Blood alters its temper, and either of it self, or upon any the least occasion, suffers serous fluxions, he easily falls into a Cough. Especially when there is a Constipation of the Pores, and errors in his way of living, a cruel, and a pertinacious Cough is raised: In this state his best Remedy, and one that he has often tried with success, is to drink pretty freely of some generous Wine, and very sparingly of any other Liquor, for so the acidity and *fluor* of the Blood being suppressed, and free transpiration procured, he is much relieved, and sometimes recovers in a short time.

Willis:

Most acute

XIV. I advise young Physicians, that in correction of glutinous Phlegm they take great care not to use much Sugar, or Sugared Medicines, seeing thereby Phlegm is not so much amended and dissolved, as it is encreased and made every day more glutinous than other. Wherefore many Physicians have a bad custome in every Cough that is protracted for any time, and threatens a Consumption, (to amend the matter and to maintain it when produced,) to abuse Conserve of red Roses, by devouring a great quantity every day, whereby not only the Ulcer is not cleansed, dried or healed, but moreover a sense of weight, and intolerable Cold arises in the region of the Stomach, with loss of appetite.

Sylvius de le
Boë.

XV. The same must be understood of Emulsions, which are ill used in this case, because they ought not to be used, but for the asswaging of some Symptoms; thus Experience, the Mistress of Fools, has shown the matter to be.

XVI. Whatsoever is unexperienced and new to us, as long as we are ignorant of the cause and reason of it, uses to breed admiration in us; as it happened to me, for I observed, and indeed in my self first, that a Cough, which followed a Catarrh, gave way but slowly to ordinary Medicines, which used to cure such a Cough easily, and that it troubled us most upon going to Bed. Now this observation being made in my self, yet infirm, and in others, seemed strange, and made me curious diligently to enquire the cause and reason of this event; And having observed that Wind troubled me at the same time, I fell to take things to discuss Wind, first in Bed, and then a little before I went to Bed: Whence it came to pass, that when I had belched up Wind sometimes, in a short time the Cough, that was almost dry, was stopt, which otherwise tormented me a quarter of an hour and sometimes longer. From this experiment happily made with like success in others, I thought I got the reason following, to wit, That great store of Phlegm meeting in the small Guts, was by the heat of the Feathers dissolved, and by the sharp bile, then also disturbed, reduced into Wind, which was by and by carried to the Lungs, by which the Lungs being irritated did Cough, and by Coughing did shake all the rest of the Body, and the Brain, and the Humours contained therein, which falling upon the Throat, made as if all were produced there: till having observed Wind, and the ascent of it, the cure of this Cough was eased by Oyls called Carminative, taking a few drops of them in some convenient Liquor, before one laid

down in Bed. ¶ Coughs oftentimes followed Rheums; but the Coughs gave way with more ease and success to things that discuss Wind, than to such as temper Salt briny Humours. Wherefore I showed, that they had their rise not only from a Salt briny Humour, falling from the Head upon the Throat and *Aspera Arteria*, but, and especially, from store of Wind, with a slight Fit of a Fever, carried from the small Guts, by the lacteal Veins and the Thoracick Duct into the upper *Vena Cava*, and thence into the right Ventricle of the Heart, and by and by into the Lungs, irritating the same to Cough, and that it troubled People most, as they went to Bed. But as soon as I observed this first in my self and then in others, the cure for this Cough was eased, by taking Aromatick Oyls that discuss Wind, as Oyl of Orange Peel, Citron, Anniseed, Fenil seed, &c.

Idem.

So I remember above ten years since, the Illustrious and Generous *Monsieur de Verasse*, Kinsman to the Illustrious *Bernardus Budæus*, did commend to me and others, upon his own experience, a Decoction of Anniseed, whereby he affirmed, he had often cured a Cough.

XVII. Blood falling from the Head upon the Lungs, and raising a Cough, must be stopt in its Flux, and indeed by Bleeding, if a *Plethora* concur, or any notable effervescence of it, or a suppression of some wonted evacuation of it, although its too great Heat may be stopt with things a little acid, but especially with things a little austere. Let the following Apozeme serve for an example; Take of leaves of Plantain 2 handfuls, Houfe-leek, Sorrel each 1 handful. Boyl them in Barley water to 20 ounces, adding of Syrup of Jujubes 3 ounces, Salt peter purified 1 drachm, or *Sal prunella* half a drachm, or Spirit of Nitre 20 drops. Mix them. Make an Apozeme. Let the Patient take a middling draught of this now and then to stop any other violent motion of the Blood. The same Blood must be stopt in its efflux by conglutination of the open Vessels by proper Remedies.

Sylvius de le
Boë.

XVIII. The corruption of the Blood into *pus* or matter must be prevented by all means, and especially by *Balsamus Sulphuris anisatus* or any other, that is not ingratul, seeing that by the help of this not only the turning into *pus* or corruption, and further hurt of the Ulcerated part is prevented, but moreover the total cure of it is promoted. The Dose is a drop or two in some convenient peccoral mixture.

Idem.

XIX. And lest the same Blood, whence soever it come into the *Aspera Arteria*, should be coagulated there, and then corrupted, it must immediately be kept dissolved with convenient Medicines, or must be dissolved again and voided: To which end Crabs Eyes dissolved partly at least in a little distilled Vinegar, together with diaphoretick Antimony, taken with some grateful things must be preferred to many other things, for example, let the following prescription be taken a spoonful at once; Take of water of Hyssop, Fenil each one ounce, *Aqua vite Matthioli* 2 drachms, distilled Vinegar half an ounce, Crabs Eyes half a drachm, diaphoretick Antimony 1 scruple, Syrup of Maiden-hair 1 ounce. Mix them.

Idem.

XX. But we must have a care in such mixtures, as have Crabs Eyes dissolved in Vinegar in them, that Syrups made of Mucilaginous things be not added to them, such as *de Althea Fernelii*, of Jujubes, Violets and the like, because they grow presently thick and unfit for use, which would not easily be, if Syrups made of Aromatick things be used, and especially new enough, since several in tract of time grow viscid.

Idem.

XXI. A dry Cough arising either from cold Air or drink will be cured by often holding the Breath some while, that, when the heat is encreased in the Throat

Throat and Lungs, the fault may be amended which arises from external Cold. And I must say, that in this case holding ones Breath as long as one can, does not a little conduce to restrain and stop any Cough, and a dry one especially; by which means I have observed often in my self and others, that a Cough otherwise troublesome enough has either been wholly removed or abated; and I have also seen a Hickup thus cured.

XXII. The Spasmodick Cough in Children is difficultly cured, because not only the Blood must be altered, as in an ordinary Cough, and its recrements should be discharged and derived from the Lungs, to the habit of the Body by transpiration, but moreover an amendment of the Nervous juice must be procured. The method of cure usual in other sort of Coughs seldom does good here, wherefore neglecting the rational method, most use only empirical Medicines. Among many the two following are usually preferred, that is, *Musculus pyxidatus*, and its various preparations, which (as far as we can gather from the Taft) is of an astringent virtue, and contains in it self something sharp particles, favoring of store of volatil Salt, whence we may conjecture, that its use is to fix the Blood, and stop fluxions of the Serum, and moreover by volatilizing the Nervous juice, to remove the Spasmodick disposition. The other Remedy uses to be, to put the Children into some sudden fright; the reason whereof consists in this, because the animal Spirits being put to flight, and forced into new distractions, do leave their former disorders: And moreover the Spasmodick matter is either dispersed by this perturbation, or else it is driven into other Nerves, where it is not very troublesome. Such as are of an hot constitution, and, while they Cough, have an intense red, or rather a black Countenance, I prescribe them Phlebotomy, or Bleeding with Leeches to the loss of 2 or 3 ounces, and sometimes with good success; Take of live *Millepedes* cleansed 1 ounce, powder of Anniseed 1 drachm, Nutmeg half a drachm, white Sugar 5 ounces; when they are bruised, pour to them water of Hyssop 6 ounces; *Limacum magistralis* 2 ounces. Mix them a little in a Mortar, make a strong expression. The dose 2 or 3 spoonfuls twice a day. In the Winter, when Snails cannot be had, Sheep's or Calves Lungs, parboiled and minced must be put in their stead, &c.

XXIII. There was an universal Cough at Rome, and many died. A certain Physician cured himself and several others with this Medicine; Take of Iujubes N° 25. Figs N° 10. Large plump Raisins 1 ounce and a half, scraped Liquorish 3 drachms, roots of Coltsfoot 1 handful. Boil them in a sufficient quantity of water, till half be consumed away. Take a Glass of it every Morning and at the hour of Sleep. They abstained from Wine, and Flesh, they used Bread boyled with Raisins and Butter; or Butter, Bread and Sugar; or Bread boyled in Milk and Sugar.

XXIV. *Celsus* l. 4. c. 3. advises to use reading aloud. Some question, whether this be a proper Remedy, since loud reading dries: But it may be answered, that it certainly does good, because it dries up Phlegm, from whence an old Cough is reckoned to derive its original. Besides, *Antyllus* in *Oribasius* advises to use it, if drought and heat seem to abound beyond measure in our Bodies. Much Air entering by respiration into the passages, will very much moisten what is dry, and because it is of more tenuous parts and more liquid than any water, it will soften hardness caused by dryness. But we must take notice, that the actions of the voice must not be used rashly and unadvisedly,

and especially by them that are not used to the exercise, and are but beginning.

Medicines especially made use of by eminent Physicians.

1. This conduces greatly to mitigate inveterate Coughs, arising from cold and gross Humours; Take of Pine nuts roasted, Starch, Liquorish, Nettle seed, Linseed each 2 ounces, Orris, Pepper, Hyssop, Cresses Seed, bitter Almonds each half a drachm. Mix them with well clarified Honey, and give a small spoonful of it.

2. This is an excellent Remedy for great defillations; Take of Storax, Castor, Pepper, Cardamome, each half a drachm, *Opium*, Jujubes, Henbane Seed each half a drachm. Let the quantity of a Vetch be given to them, when they go to Bed. ¶ The Medicine of the ancients for an old and dry Cough. The common People in a desperate Cough take dayly bruised Beans boyled with Garlick for their meat, and Marsh-mallow flowers boyled in Milk, as a present Remedy.

3. In a Cough caused by a sharp defluxion I gave the yolk of a raw Egg with Sugar Candy, and immediately the Cough went away, so that there was no need of other Remedies. ¶ For an old dry Cough, for Consumptive, Pleuritick, Asthmatick Persons, and such as have a violent Cough I use this; Take an Apple, cut off the top, hollow part of it out, fill it with Honey of Roses, and cover it with the piece first cut off, roast it, and eat it at Night, when you go to Bed.

4. Take Juniper water 6 drachms, white Sugar Candy bruised 2 drachms. Mix them. Burn it with threads dipt in Brimstone, and let the burning threads be put into it also, stir the Liquor, and let it burn, till the Sugar dissolves, then strain it, add to it of Saffron 1 Scruple, of which take a spoonful Morning and Evening. This Liquor loosens and dissolves all Coughs coming from cold Humours.

5. This exceedingly stops a Cough and thin Catarrhs falling upon the Breast; Take of Conserve of Roses 1 drachm, Mastich half a drachm, with as much *Diacodium Montagnana* as is sufficient, make a Bolus.

6. Milk drunk warm, with Sugar Candy or Penidy mixt with it, is very good. ¶ This is very good, Take of the heads of Garden Poppy almost ripe, 3 drachms, *Siliques* freed from the Grains, Liquorish each 1 drachm. Boil them, and add to the colature of Sugar Penidy and Candy each 4 drachms; Boil them again till they grow thick. Use it instead of *Diacodium*, licking it in the Night. ¶ Some write that red Poppy water with Sugar Candy drunk in the Night is very good in a Cough. ¶ Some cry up Garlick mixt with Bears grease, and applied to the Soles of the Feet, as a certain Remedy to cure a Cough.

7. A Deer's Lungs dried with the Wind-pipe in an Oven and powdered, and mixt with Honey, is good for a Cough.

8. I have experienced this to be very good in a Cough without a Fever; Take of *Diapenidium*, *Diabolibanum* each 1 drachm, *Loboch sanum & expertum*, *Diastragacanthum frigidum* each half a drachm, Syrup of Galesat de S. Liquorish 1 ounce, of Hyssop 1 ounce and an half. Mix them, make an Electuary.

9. Take

Arnold. Vil.
lanovanam.

9. Take the crum of a Loaf as it comes hot out of the Oven, fry it in Swines blood, and give it with Honey. This only has cured several of a Cough.

10. There is nothing better for a Cough, than juice of Turneps boyled and Clarified, especially if fresh Butter and Sugar candy be added, and the Soles of the Feet be anointed with the Fat of a

Pike, it is very good in a Catarrh and Children's Weikardus Cough.

11. The middle rind of Bittersweet boyled in Mede is very good for a prevailing Cough: For such a drink is exceeding grateful to the whole region of the Breast and Lungs, wonderfully purges all filthy matter and rotten Phlegm, and strengthens all the Parts.

12. The middle rind of Bittersweet boyled in Mede is very good for a prevailing Cough: For such a drink is exceeding grateful to the whole region of the Breast and Lungs, wonderfully purges all filthy matter and rotten Phlegm, and strengthens all the Parts.

A GUIDE TO The Practical Physician.

BOOK XVIII.

Of Diseases beginning with the Letter V.

Varices, or Swollen Veins.

The Contents.

- The Cure by pricking and cutting. I.
When opening is safe. II.
Sometimes must be burnt with Causticks. III.
The Cure by cutting suspected. IV.
The benefit of opening a Vein in the Leg. V.
The Cure according to the Laws of Circulation. VI.
They that come of crude Blood are more safely cured than they that come of a Melancholick Blood. VII.
Medicines.

I. **T**He Chirurgical handling of Varices is twofold, the one is opening by a certain Puncture, as simple Section, according to the nature of Veins: the other is by cutting the Vessel asunder, or cutting part of it out. We open Varices, that the Patients may at least get some relief, when both themselves and they that have them in hand, are afraid to cut them out: then I say, they must be purged with a Lancet, of which operation Hippocrates l. de Vlc. numero 16 makes mention; Where there is a Varix of the Leg either conspicuous, or in the Flesh, and the Leg is black, and it seems to have need of the Blood, that runs by it, you must by no means cut such through, for oftentimes great Ulcers come from the Fissures, by reason of the running of the Varix, but you may again and again prick a Varix when you think it convenient. The sense whereof in short is this, that you must not thrust your Lancet in promiscuously, where the Swelling is, but that the Varix it self may be gently pricked in several places, where it is turgid, that a convenient quantity of Blood may be taken away. But Galen 4. de comp. med. 2. p. c. 3. advises first to scarifie lengthways a Varix, that is near an old Malignant Ulcer, before the rest of the cure be undertaken. Albucasis l. 2. c. 92. advises to do it thus: Let the Leg, saith he, be fomented with warm water, and let the Thigh be bound from above downwards to the Knee,

with a Roller. The Vein must be cut underneath, with one, two or three pricks of a Lancet, squeezing out the Blood both above and below with both Hands, as much as you shall think convenient, bind down the wound, and the Man is cured. Thus much of opening the Varices, now something of cutting them out. Galen 3 meth. c. 4. and Aetius ser. 14. c. 4. advise, that if Varices be joyned with an Ulcer, it is in vain to hope for a Coalition of the Ulcer, take what pains you can. I have seen Men in our Hospitals, who have had Ulcers two, four, seven years old or Elder, who, when the Varices that were about it were cut out, were happily cured, contrary to all Mens expectation; but it is wonderful, that, when the places below are annoyed with grievous pain, there remains no Ail, where the Varices, that are much higher, were cut out. It is wonderful also, that the Swelling of the parts below should all vanish, and the part should be repressed to its natural place, as soon as these twining Vines are cut out, just as when the River is dry the Plants wither. One Marinellus l. 4. de Mul. ornam. sayes, that when the Varices are cut out the Limb withers: But I can contradict him; for I have cut out several, and never observed any such detriment follow: For what reason is there, why for lack of one Vein a part should cease to be nourished, when several meet together to irrigate it? Severinus.

II. If we observe, that a Melancholick juice actually falls, from the Bowels into the Varices, and that the Body does abound with Melancholy, then the Varices must by no means be cut, for according to Galen lib. de atra bile c. 4. The Varicous are in danger, if you cut the Varices, of becoming Melancholick. And Avicenna l. 3. f. 22. c. de Var. teaches us, when they should be cut, saying, That if Melancholy be not discharged by the Bowels upon the Varices, and if the Blood be clean, you need not fear to cut them: But if it be discharged, and the Blood be impure, they must be cut, because Men will become Melancholick, and fall into worse Diseases. Sanctorius, Meth. l. 6. c. 9. Varices are either old or new; if old they must be kept, the fluxion to the Legs being intercepted, by

Sylvaticus,
Corf. 98.
Geni. 3.

by frequent evacuation of Serosity by purging with Hydragogues; and by Urine with temperate Diureticks. But if they be new, they must be cured by opening them and taking out the Blood, making first a ligature above, but especially below the dilated Vein, for fear of immoderate evacuation, and then the place must be cicatrized by astringents and glutinatives, insinuating upon the operation in the same manner, as *Paræus* delivers it, *Chirurg. l. 12. c. 20.* ¶ Some *Varices* may safely be cured, and we are forced to cure them: Some cannot safely be cured, yet we are forced to cure them; And some can neither safely be cured, nor are we bound to cure them. If therefore the cure be safe, and you be not forced by the Ulcer, you ought to cure the *Varices*: If neither the cure be safe, nor you compelled, they must not be cured: But if the cure be not safe, and yet you be forced by the *Varices* and by an Ulcer, you must try to cure them. Now the cure is safe in a Body not *Cachochymick*, and if the *Varices* be not writhen; when the beginning of them is not in the Groin, and when the Patient is obedient; also when there is no fear from a plenitude, whereby a new dilatation may be made: In these cases the cure may safely be undertaken. Sometimes, though the cure be not safe, yet we are forced to attempt it; I say, we are forced sometimes by an Ulcer, that is very painful, or over runs the whole Leg, or corrupts the Bone, or is Malignant, or the like: Sometimes we are forced by the *Varices* themselves, which are sometimes great and turgid, so as they would break, were they not intercepted, and having made a great effusion of Blood, they kill, of which I have seen two dye. Whenever therefore you see the *Varices* turgid, try to cure them, otherwise that Blood will erode, and the *Varices* will break.

Fallopianus, l.
de Ulcer. c.
16.

III. I observe, all *Varices* are twofold, some writhen, called by the Arabians *Vines*, others simple, running straight along, although they go transverse: It is the best way to burn the former; but some have reckoned that the straight peculiarly require burning. I have found by experience and long observation, that it is the safest way also to burn them that are cut out, with a red hot Penknife, having an Iron plate put underneath: for if it corrupt, it turns to a *therioma*, which when it happens, it must also of necessity be treated with fire. *Alysc. l. 1. c. 55.* sets an Iron pipe with thin edges, red hot, fit to the tubercle, upon corns; and so may *Varices* be burnt, which twine about the Thighs. And as to them in the *scrotum*, to be cured with a Caustery, there is no great difference, but that *Celsus* pierces them with thin and sharp Irons, *l. 2. c. 22.* Here we may add what *Mengus* delivers, that we may cure *Varices* with a Caustick, which may break both the Skin and Vessel, to the end that, when the Ulcer is cleansed and healed, the growing *callus* may stop up the *Varix*. After which advice indeed *Varices* are often burnt, but not with an Iron, lest Men should be affrighted. For this purpose I chose me some large and smooth Galls, pieces of which as big as a Child's Thumb, and in that form, when I have applied them to the Vessels in several places, I set them on fire, and suffer them to burn out. A Nun had a very painful *Varicle*, and when she could find ease by no Medicines either inward or outward, when I had set fire to it, it was discussed at once.

Severinus.

IV. The Chirurgical cure of *Varices*, which *Aquapendent* propounds *cap. 105. Operat. Chirurg.* as it is abhorred by most, so bad Symptoms may easily follow it. I saw a Country fellow, who being ill of painful *Varices* in his Leg, underwent the Surgery, with very good success, under *Spigalius* his Hand. I, in imitation of him, once tried the same operation, first of all I cut the Skin, then I separated the varicose Vein: I tied it on each side with a Thread, I elevated it with a Hook, and cut it cross the mid-

dle. But by the Patient's error, that is, by too much motion, none of which should have been used, before the wound was healed, an Inflammation arose, which cruelly afflicted the Patient, and hindered the success from being according to desire. Wherefore the Patient and his Parents often wished, that the said Inflammation might leave their Son, and take and torment me. Having once made Shipwreck of my fame, I ever after treated such as had *Varices* in their Legs either with Stockings made of a Dog's Skin, or I also applied topical Medicines *Sculretus* to the same Leg under them.

V. Some get benefit by opening the crural Vein, as I observed in a certain Melancholick Person, who by often opening of it, freed himself from so great a trouble. But upon taking over much pains, having neglected Bleeding in his Leg, he avoided much grimeous Blood upwards and downwards, a quiet death following a little after, and no sign appearing outwardly of his *Varix* being broke. It is very likely therefore that the internal *Varices* (which some will have to be common to all Veins, because there are valves) were broken.

J. M. Ferla
mife. curios
an. 1676.
Obs. 26.

VI. *Varices*, now the circulation of the Blood is discovered, must be cured contrarywise to what they were formerly: for the Vein must be bound above the *Varix* not below it.

Walrus.

VII. The Ancients called all dilated Veins *Varices*; and sometimes they come from abundance of Blood which is not Melancholick; but sometimes the Veins are stretched and become varicose from other gross Humours; and especially in the Legs, where the blood, because of its grossness and viscosity, does not so easily move; which after stirring grow black and blew, to wit, when the Blood is heated, and therefore changes colour: But the cure of this varicose affection need not be feared; as the cure of a black one, and that comes from a Melancholick Humour, is suspected, and full of hazard. Yet the true and absolute cure of it is difficult, and must be performed by Surgery: For though *Celsus* bear one in hand, that the cure is not difficult, yet the event does not answer his promises, while he propounds the operation by the knife and fire, as barbarous. Nevertheless, their true and legitimate cure is their extirpation; which cannot be done but by Surgery, that is by fire and the knife according to *Celsus*; only by the knife, according to *Paulus*; by the knife also, according to *Hippocrates* who uses prickings, to avoid a great Ulcer. Among all which Operations that of *Paulus* is to be preferred (See *l. 6. de re Med. 82.*) as safest: for *Hippocrates* his pricking abates the *Varix*, but takes it not wholly away: And *Celsus* his burning, if it be done with red hot Irons, Ulcers are raised scarce cureable; if only with hot ones, the *Varix* will not go away.

Fortis, Conf.
95, Cent. 4.

Medicines especially made use of by eminent Physicians.

1. Take black Snails as many as you please, put them in a Glass, sprinkle them with Salt, and expose them to the Sun, and they will dissolve into Liquor, of which Liquor take 3 ounces, phlegm of Vitriol 1 ounce and an half, Oyl of Roses 2 ounces. Boil them together to an Unguent; wherewith I anointed the *Varices* and they presently went away.
2. Nothing so much restrains the Poyson of them, as Man's Fat. Also oyl of Juniper is a principal Remedy.
3. The roots of the Plant, which they call *Circæa Dioscoridis* bound to the place affected help, and ease pain: Moreover I have found by experience, that only the Leaves laid to the *Varices* are admirable good.

Variolæ.

Variolæ, Morbilli, or the Small Pox and Measles.

The Contents.

The Regular must be distinguished from the Irregular. I.
 The Distinct from the Confluent. II.
 We must have regard to the Symptomes that follow the Confluent, III.
 The essence of the Disease consists in a certain Inflammation of the Mass of Blood. IV.
 We must take care, the Ebullition be not too much. V.
 Cordials and Diaphoreticks must be cautiously used. VI.
 While expulsiō is made, we must have a care of using hot Things too much. VII.
 And we must have a care of Cold. VIII.
 How Cordials may be used? IX, X, XI.
 What the Diet must be, at the first invasion of the Disease? XII.
 The Patient must not too soon be confined to his Bed. XIII.
 The use of Opiates helps to drive them out. XIV.
 Who must be Bled? XV.
 How distinct Small Pox must be cured? XVI.
 Sweating harts this sort. XVII.
 When they are towards the latter end, Wine may be allowed. XVIII.
 Most dye of the Distinct, because a wrong Cure is insisted on. XIX.
 Few of the common Sort dye of it. XX.
 The abuse of Mithridate, and such things, kills many. XXI.
 The Cure of the confluent Small Pox is difficult. XXII.
 We must have regard to Salivation, which accompanies these. XXIII.
 Narcoticks are proper for this sort. XXIV.
 How we must provide for a succeeding Loosness? XXV.
 Narcoticks are sometime of use in the distinct Sort. XXVI.
 If a Phrensy come, how it may be cured? XXVII.
 We must not always Bleed for it. XXVIII.
 If Salivation rise not well in the Confluent, what must be done? XXIX.
 Pissing or Spitting of Blood can no way be stopt. XXX.
 The provoking of suppressed Urine. XXXI.
 How, when they strike in, they may be got out again? XXXII.
 Blood may be let in the state of Convalescence. XXXIII.
 The Cure of Epidemick Small Pox with black Pustules. XXXIV.
 They are a Disease not to be slighted. XXXV.
 We must have respect to the morbidick Matter, before they come out. XXXVI.
 Regard must be had to the times, that is, of Ebullition, Apparition and Maturation. XXXVII.
 Whether they can or ought to be Suppressed? XXXVIII.
 When they were imminent, hindered from coming out by a Purge of Mercurius dulcis. XXIX.
 After they are come out, although the Fever and the concomitant Symptomes cease, yet Begerarticks are proper. XL.
 The Cure must not always be begun with letting of Blood. XLI.
 Children may be bled. XLII.
 And when they appear. XLIII.
 No place for Bleeding in that Sort they call Rosalia. XLIV.
 Letting of Blood hinders not their coming out. XLV.
 Vomiting and other Accidents do not always hinder bleeding. XLVI.
 Nor the Winter. XLVII.
 Repeated Bleeding not always necessary. XLVIII.
 The place for Bleeding. XLIX.
 The manner of Bleeding is various. L.
 Whether Cupping-glasses should be applied? LI.
 Less Bleeding is proper in the Measles than in the Small Pox. LII.
 Scarifications must not be deep in Children. LIII.
 Whether Purgings be proper? LIV.

Clysters are sometimes dangerous. LV.
 The over Ebullition of the Humors must sometimes be restrained with cooling and incrasating Things. LVI.
 Whether the use of Lentills may be admitted? LVII.
 Figs and Salt Fish, when they are proper? LVIII.
 Whether the Face should be preserved? LIX.
 Whether the Pustules may be pricked? LX.
 Whether a speedy drying of them may be procured? LXI.
 With what their slow ripening may be promoted? LXII.
 How the Face may be preserved? LXIII.
 Nothing must be done to the Scars that are left. LXIV.
 Bathes ineffectual in getting out Pock-holes. LXV.
 When they are come out, the ebullition of the Humors must be laid. LXVI.
 Although the Disease be towards the declension, yet the Patient is not safe. LXVII.
 The Small Pox with a bloody Flux cured. LXVIII.
 A Loosness supervening not always fatal. LXIX.
 A Loosness often caused by Worms. LXX.
 The Small Pox struck in, brought out by Vesicatories. LXXI.
 The Cure of the Measles with a Cough and Defluxion. LXXII.
 The Small Pox attended with grievous Symptomes, when they would scarce come out, brought out successfully with a cooling Diet, without Medicines. LXXIII.
 The Cure of them in a young Man, troubled at the same time with Bleeding at the Nose. LXXIV.
 The Cure of them, coming out with grievous Symptomes. LXXV.
 The Cure of them in a lying-in Woman. LXXVI.
 Whether Flesh and Eggs must be denied Children? LXXVII.
 What Diet in the Measles? LXXVIII.
 When they go off, loosning Things may be given. LXXIX.
 Whether Lettuce and very cooling Things may be given? LXXX.
 When the Small Pox are epidemical and bad, Children not infected must be removed far away. LXXXI.
 Medicines.

I. **T**he Small Pox, those years they are epidemical, if they be also regular and gentle, begin about the Vernal Equinox; but those years they do not spread epidemically, and are irregular and of a more dangerous sort, they invade sometimes more early, perhaps in January, infecting whole Families, and sparing none of what Age soever they be, if they have not had this Disease before.

Sydenhami
Observat.
circa Morb.
acut. p. 165.

II. There are two sorts of them, for either they are Distinct or Confluent, which although they differ not essentially, as they say, yet by some remarkable Symptomes, which attend one sort, but not the other, it is no hard matter to distinguish one from the other. The interstinct or discrete come with a Shivering and Coldness, which is presently followed with excessive Heat, a violent pain in the Head and Back, vomiting, a great propensity to Sweat (I mean in grown Persons, for I never yet observed any such disposition in Children, either before or after they come out) a pain at the Stomach, if you lay your hand on the Pit of it, Dulness and Sleepiness, especially in Children, and sometimes epileptick Fits, which Fits, if they take Children, that have bred their Teeth, I reckon the Small Pox are at hand: And when the Small Pox come immediately after such Fits, they rise in large Pustules, they are mild and kindly, and seldom Flux. Distinct Small Pox come out for the most part on the fourth day, sometimes later, very seldom sooner. That sort, which we call Confluent (or, as the People call them, Flux) Pox, have their Symptomes common with the other, only here all things are more violent, to wit, the Fever, Restlessness, Vomiting, &c. afflict more violently, by which signs the Confluent Small Pox bewray themselves to a sagacious Physician, before they come out. Nevertheless here the Patient is not so apt to sweat, as in the other kind, wherein grown People, that have any inclination to Sweat, cannot be kept out of one:

H h h h

Sometimes

Sometimes a Loosness comes before their coming out: This sort comes out generally on the third day, sometimes before it, scarce ever after it; whereas the Distinct show themselves the very fourth day, inclusively from the first being taken, or after, very seldom before: And by how much sooner they come before the fourth day, so much more they will Flux. And although, to speak in general, the Confluent scarce ever tarry till the fourth day, yet it may so happen, though seldom, that their coming out may be deferred till the fourth or fifth day, by reason of some grievous Symptom, as, a most violent pain sometimes in the region of the Loins, like a fit of the Stone, sometimes in the Side, like a Pleurisie; and sometimes in the Stomach, with violent Vomiting before they come out: In these Cases I have observed the Small Pox to come out later than ordinary, because they were restrained and hindered by the extreme violence of the said Symptomes, which Symptomes indeed being more violent than ordinary do plainly indicate to me that the following Small Pox will be of the Confluent kind, and not without danger.

Idem.
p. 171.

III. And there are two Symptomes that attend the Confluent Small Pox, which are as considerable as the Pustules, or Swelling, or any other, that is, Salivation in grown Persons, and a Loosness in Children. The first of these is almost ever a concomitant. It may be, Nature substitutes these evacuations, because in this small and low sort the morbid Matter cannot so fully be discharged, as in the larger and higher Pustules in the Distinct. And this I certainly know, that they do not only always accompany the Confluent Small Pox, but evacuation by them is necessary, as either Pustules, or swelling of the Face and Hands.

Idem.
p. 174.

IV. I ingenuously acknowledge I know not what the Essence of this Disease is, but all the Symptomes seriously considered seem to subindicate to me that it is an Inflammation (but yet specifically distinct from other Inflammations) of the Blood and other Humors, in getting off of which it is Nature's business for 2 or 3 of the first dayes to digest and concoct the inflamed Particles, which afterwards when discharged into the habit of the Body she still ripens, and at length expells out of her territories in the form of little Abscesses. Hence we may take notice, that there are two times in this Disease, of Separation and Expulsion. The first for the most part is spent in the febrile Ebullition, which is performed in 3 or 4 dayes. Separation being thus finished, by the help of Ebullition, in the Blood, Expulsion now takes place, which is performed all the rest of the time of the Disease by means of these little Abscesses. Hence arise these Indications, 1. That an aquable Tenor may be kept in the ebullition of the Blood, that it may not by excessive violence perform Separation too hastily, nor yet by a too torpid Motion may retard the same, or not perform it sufficiently. 2. That the Abscesses, or Pustules may be kept up with the greatest care, that as they run over their due times, they may at length wholly carry off the matter contained in them, and they may also fade away.

Idem.
p. 183.

V. As to the first Indication, we must be solicitously careful, especially at this time, that the Ebullition rise not too high, either by heaping too many Clothes on, or from the Air of the place where the Patient lies, being over-heated by the Fire, or by the use of hot Medicines and Cordials. And you must especially beware of these Things, if the Patient be in the flower of his Age, or have his Blood too much exalted with generous Liquors, or if it be the Spring-time, or but the beginning of Summer. For hence it would so fall out, that Separation, which ought to be

performed insensibly and by slow degrees, so as it may more opportunely perform an universal despumation, would be precipitated, and so either not a sufficient number of Particles be gathered, or (as perhaps it may happen) some Particles may be condemned to Secretion, which Nature otherwise would not have had them undergone, but that being forced to run beyond her Bounds, she creates this Mischief to her self: For when they are separated which are not so fit for separation, the Motion of others that have an inclination to it, is hindered by them mixing together, and so are rendered unfit for Expulsion. To me indeed it seems consentaneous to reason, that the longer Nature is in working and perfecting Separation, so that Ebullition be not quite torpid, so much more certainly and universally the same Separation is performed: And upon its being so finished, it is necessary that the success of the following Cure must especially depend, as from a contrary Method the event of the business must be quite contrary. For from that hot Regiment no good comes, as from an over-hasty Fruit no advantage. Seeing it frequently happens, that the Patient falls either downright into a Phrensy or (which is worse) great Sweats arise, whereby Particles not fit for Separation, nor answering the Nature of Pus (which very Pus notwithstanding is the genuine product of this Excretion) are eliminated: Or the Small Pox, being too much forced out by giving Cordials, and by hot keeping, run all into one, a foul Speckle, and one that threatens a sad Event. And these and the like Symptomes are usually bred of these Errors, whereas I never observed any mischief, from the other Method. For Nature let alone to her self does her Work in her own time, and separates, and then expells the matter in due order and way, so that (in the younger sort especially and those of a lively Constitution) the needs not our help, being furnished with strength sufficient of her own. For neither have I seen or heard of any, that miscarried because the Small Pox came not out at first; although too many have perished, in whom the Small Pox at first came out laudably and hopefully, and have afterwards, upon the striking in of the Pustules, fallen before they were ripe.

Idem.
p. 185.

VI. And as it is unadvised and hazardous to advance too high the Ebullition once begun by means either of a hot Regiment or by Cordials; so on the contrary there is no less danger, to diminish the same by means of Emetics, Catharticks or any such thing, seeing by this means the proper secretion of the separable Particles is much hindered: Although that vulgar Argument, which Men use against Bleeding and other Evacuations (namely, that we must not move the Humors from the Center to the Circumference, since Nature seems to affect the contrary in this Disease) be of no force at all, because upon using these means, a quite contrary effect has often been observed to follow, to wit, a sudden coming out of the Small Pox; yet there are other reasons in readiness, which strongly persuade, that, if by any means it may be voided, we meddle not with this Practice. For (briefly to touch upon the chief of them) by these Evacuations not only the Ebullition is too much hindered, by means whereof the Particles to be despumated ought in the mean time accurately to be separated, but that also is subtracted, which should continually as it were afford fuel to the Secretion begun: Whence it often happens, that the Small Pox coming out at first with a laudable Progress (and perhaps so much the better, because the said Evacuations preceeded) do a little after, struck in as it were all on a sudden, fall flat; and for this reason chiefly, because there wants matter to follow

Idem.
p. 188.

Idem.
p. 190.

Idem.
p. 191.

Idem.
p. 187.

follow that which went before and bring up the Rere.

VII. As to the second Indication, which concerns the time of Expulsion, as it is dangerous, if the Patient, when there is a Fever, and the Pustules scarce yet appear, be made over hot in the very time of Secretion; so also it is a thing full of no less danger, if the same be done at any time of the Disease, and especially at that which is towards the beginning of Expulsion, while the Pustules are yet Crude: For although the Blood, now that Separation is done, and the matter discharged to the carnos Parts, be in a great measure free from intestine Tumult; yet it being as yet tender and young, and having scarce got induction into a new state and texture, it is apt to suffer, and easily be affected by virtue of immoderate Heat coming from all places, and so being irritated upon the least occasion, it takes fire, and is inclinable to a new Ebullition: Which new Ebullition does not, as the former, now endeavor a Suppuration (for we suppose that already finished) but instead thereof, it not only raises the above mentioned Symptoms, but disturbs the Expulsion, begun by the Pustules, and does harm by exagitating the contained matter. Either therefore the Parts now separated and left in the habit of the Body, being hurried by that violent and rapid course of the ebullient Blood, are drawn again into its Mass, or the carnos Parts being heated beyond the degree due to Separation, do not so well perform it; or lastly, perhaps upon the coming of this new Sickness, the economy of the Blood, and the tone of the Flesh is perverted, so that it cannot overcome the matter expelled, and concoct it after the usual manner of Abscesses.

Idem.
p. 188.

VIII. In the mean time we must not be so intent upon preventing too great an Ebullition in the Blood, as by exposing the Patient to the injuries of the Cold to hinder the eruption of the Pustules. The degree of Heat, most proper to promote their Expulsion must be natural, and such as is agreeable to the temper of the carnos Parts: And whatever exceeds or comes short of this is dangerous on either hand.

Idem.
p. 190.

IX. If the Pustules chance to strike in, or the swelling of the Face and Hands fall, upon Bleeding unseasonably, or getting of Cold, we must use Cordials; but we must have a care of being too lavish in giving them; for though you have taken away Blood, yet it may so fall out, that while you are afraid of loss of strength thereby, and so use Cordials, either strong ones or often repeated, you cause a new Ebullition on a sudden: For the Blood is as yet tender, and is easily sensible of the strength of a hot Provocative; Whence it comes to pass, that often repeated Ebullitions arise in the same, to which the Patients death may of better right be attributed, than to the foregoing Blood-letting.

Idem.
p. 191.

X. Moreover, the Small Pox must not therefore immediately be forced out; as soon as any suspicion of this Disease arises, because forsooth the Patient is usually very sick and restless before their coming out, when there cannot so much as one Instance be shown, that any one died how grievously Sick soever he was, because the Small Pox came not presently out, or, that Nature was wanting in forcing them out sooner or later, unless at any time she were hindered by a too hot Regiment, and Cordial Remedies, given too early: For I have more than once observed in young People, and of a sanguine Complexion, that a hot Regiment, and Cordials given on purpose to force out the Small Pox before their due time, have so little promoted their coming out, that on the contrary they have given a check to it. For, the Blood being heated by these means, and put into

a more violent Motion, than is fit to perform aright the separation of the Variolous Matter, only some certain tokens of the Disease show themselves, while the Pustules, lie within the Skin, and do not raise themselves further, by what Cordials soever they were solicited to it, till at length, the Blood being reduced to its moderate and due Temper, that is, by allowing small Beer, and taking off part of that load of Clothes, wherewith he was rosted, I have made a convenient way for the Pustules to go out, and so I have put the Patient out of danger.

Idem.
p. 193.

XI. Nor also would I advise you to give a Cordial before the said fourth day, though a Loosness were urgent, and might seem to indicate the giving thereof: For although a Loosness sometimes go before the coming out of the Confluent Small Pox, which arises from inflammatory Vapors or from the Humors discharged into the Guts, out of the mass of Blood, that is exagitated and boyls for the first dayes, yet here Nature will be no more wanting in driving out the said Vapors of the Variolous Matter, into the habit of the Body (which being done, the Loosness will stop of it self) than she uses to be in turning out and eliminating those Vapors, which being turned upon the Stomach, cause Vomiting at the beginning of this Disease.

XII. As soon as manifest signs of this Disease begin to show themselves, I forbid the Patient the open Air, and drinking of Wine, and eating of Flesh, but I allow them a little small Beer warm with a Tost, and sometimes as much as they have a mind to drink. And I order them for their Victuals Oatmeal and Barly grewel, roasted Apples, and other things, which have neither excessive Cold nor excessive Heat in them, nor give any trouble to the Stomach. I keep them from a hot Regiment, and from the use of any Cordials whatever, whereby some endeavour rashly to force the Small Pox to the Skin, before the fourth day, which is the proper and natural time for coming out. Whereas I am certain, that the separation of the Variolous Matter will be so much the more universal, by how much the longer they are in coming out, and we may therefore be the more secure that they will not strike in again, and that they will ripen the better. But if they be forced out before the time, the Matter as yet crude and unconcocted is precipitated, which, like Fruits too soon ripe, feeds us with vain hopes. Moreover there is danger from this over hasty diligence (especially in hot and brisk Constitutions, whose active Principles do more than enough supply the use of Cordials) lest Nature, being irritated and forced too much, do melt almost all the substance of the Body into Small Pox, so that now they will flux, which, but that you made too much haste, would have rested in the order of the Distinct, with far greater hopes.

Idem.
p. 192.

XIII. Nor have they any more reason on their side, who so pertinaciously confine the Patient to his Bed before the fourth day, than they who so over early and unseasonably pour down Cordials: For bloody Urine, purple Spots and other Mortal Symptoms do come upon People, in the flower of their Age especially, because they are over soon confined to their Beds. But on the fourth day I order my Patient to his Bed, and then, if they come not out as one could wish, some gentle Cordial may well be given, at least for once, to drive out the Pustules.

Idem.
p. 194.

XIV. Among the Medicines, that make for this purpose, those they call Paregoricks, such as *Laudanum liquidum*, *Diafcoridum*, &c. if they be mixt in a small quantity with some proper Cordial Waters, excell the rest: For when these things give a check to the effluating Blood, Nature more reasonably and freely casts out the moribick Matter.

Idem.
p. 195.

H h h h 2

XV. If

XV. If I am called to a strong young Man, who has besides given occasion to the Disease by liberal drinking of Wine or any spirituous Liquor whatever, I reckon it not sufficient for restraining the Ebullition of the Blood, that he abstain from his Bed and Cordials, unless moreover he be let Blood in the Arm. But if this cannot be granted, through the prevailing prejudice of the Vulgar, I beg that I may bleed him. For when that Inflammation, which the Heat of the spirituous Liquors impressed on the Blood, is added to the intense Heat, that attends this Disease, the Blood so rages, that sometimes by the duct of the Vessels it breaks into the Bladder; or causes purple Spots, and other such Symptoms, as through the whole cause of the Disease stand in the Physician's way, and carry the Patient off.

Idem.
p. 196.

XVI. When the Pustules first come out, I then diligently consider, whether they be of the Distinct sort or of the Confluent, because they differ exceedingly one from the other, though they agree as to some Symptoms. If therefore, from the bigness and smallness of the Pustules, and the slowness in coming out, and from the vanishing of Sickness, and other Symptoms, which tire a Man after the coming out of the Confluent, it appear to me that they are of the Distinct sort, I order my Patient to be kept with small Beer, Oatmeal and Barly grewel, &c. And if the Small Pox be, but few, in Summer time, and that very hot, I see no reason why the Patient should be kept stifled up in Bed: And why he may not rather rise a few hours every day, provided, the inconveniencies of too much Cold or too much Heat may be prevented by the Place and Clothing: For when the Patient keeps up sometimes from his Bed, the Disease runs its course, with less trouble and in a shorter time, than if he had continually been fastened to it; which not only makes the Sickness more tedious, but increases the febrile Heat, and when the Blisters arise, cause a painful Inflammation. But if either the cold Season of the Year, or a large eruption of exanthemata lay the Patient under a necessity of keeping his Bed always, I take care that he lie not hotter, nor with more Clothes on him, than when he was in Health, and to have a fire kindled only Morning and Evening, unless the Winter be hard.

Idem.
p. 197.

XVII. I would not have the Arms always kept covered with Clothes, or that the Patient should lie always in one place, lest he sweat too much, which upon confidence of my experience, I boldly affirm, can never happen (especially in young Men) without extreme hazard. I would therefore have him lie free in his Bed and now and then change places.

Idem.

XVIII. When the Disease is determining, because the free eruption of exhalations, that proceed from the Matter now converted into Pus, is hindered by the Pustules, which are at length grown crusty and hard, it would not be amiss to give 3 or 4 spoonfuls of Canary Wine hot, or some other temperate Cordial Medicine, lest these putrid Vapors return again into the Mass of Blood, and truly now, and not sooner, is the time for Cordials. At the same time also, a little hotter Diet, and more Cordials may be given, that is, Panada's made with Beer and Sugar, and Oat-meal Caudle: Nor is there need of any other things at all, that is, in the Distinct and gentle sort, if the Patient will but suffer himself to be treated in this Method and with this Diet, both moderate.

Idem.

XIX. This indeed, though Men's ill grounded prejudice cry out upon it, is the true Method of curing this sort of Small Pox. And although I do not deny, but they, that have been treated with a quite contrary Regiment, have recovered, yet we must acknowledge (though this distinct kind have no danger at all in them from their own Nature) that

nevertheless many dy; And many more also would yield to Fate, but that they are saved, either by the cold Season, wherein the Disease happens, or by Blood-letting (otherwise unnecessary and useless) lately celebrated. Upon which account, if either the obstinacie of Friends, or diffidence of the Patient hinder the aforesaid Regiment, I reckon it safest to let Blood: Which indeed, though of itself it do hurt (inasmuch, that is, as it disturbs and confounds Separation, and moreover substracts the sustenance designed to keep up the Pustules and Swelling) yet it makes compensation for the hot Regiment, which will follow within a while, and therefore renders this Method, which we would not use but against our will, not so dangerous and doubtful.

Idem.

XX. It appears from what has been said, why so few of the common People dy of this Disease, compared with the rich that are killed by it: Which indeed can scarce be ascribed to any other cause, then that because of their Poverty and Country way of Living, they have scarce Power to hurt themselves by a more accurate and delicate Regiment. ¶ In the year 1680. the Small Pox were Epidemical at Geneva in the Winter. There died to the beginning of the Month of January, 1681. Young and Old, an hundred and eleven. In the Hospital forty Boys had them, and only one or two died. Although I would not at all detract from the Physician's Skill, yet I adhere rather to the former reason, for that they were committed to Nature, observing no accurate course, only taking a Decoction of Harts-horn and Lentils. I had some under my Care, whom I saved by the benefit of the foresaid Method.

Idem.
p. 199.

XXI. But this Disease has killed more of the common People, since they learned the use of Mithridate, Diacordium, Decoction of Harts-horn, &c. than in Ages more unlearned indeed, but far wiser: for now there is not a House, where there is not some one foolish, pragmatical Woman or other, which practises that Art, to Man's destruction, which she never learned.

Sydenham.
ubi prius.
p. 200.

XXII. But if the Small Pox Flux, the case is hazardous: for I reckon, this sort is no less different from the other, than the Plague is from this, although among the Vulgar, who take Names and Words for Things, the Cure of both is said to be alike. In this sort of Disease, since it is the product of a more intense inflammation of the Blood, greater care almost must be taken, that the Patient be not heated. But although this sort in its own Nature require greater cooling than the other; yet, to promote the swelling of the Face and Hands (without which the Patient is lost) and the rising and increase of the Pustules, and because the Patient, by reason of his painful Exulcerations, cannot keep up from his Bed, it is expedient that he keep both himself and his Hands in it, so he have not too many Clothes, and have but the liberty of turning his Body to any part of the Bed, as he please, as we mentioned in the distinct kind: Especially toward the latter end of the Disease, when the Fever of Maturation is at hand, the Patient may not only not be deprived of this Liberty, but he must be put in mind to use it, and he must be turned night and day frequently, that the great Heat may be qualified, and Sweats may be avoided, by which the gentle Humor is carried off, wherewith the Small Pox, should be diluted, that they may grow Mild.

Idem.
p. 200.

XXIII. If a Salivation come upon this Disease (as it is often observed to happen in grown Persons after a hot Regiment and Cordials) we may hope well. Many certainly, who have been so handled, ascribe their Health to this Symptom: For the Disease being diverted from the natural way, by which it tried to purge itself, attempts this new one, by Salivation; and therefore thence forward less care need be taken for the Pustules, but Spitting

Spitting must chiefly be regarded, and we must take care, that it proceed in a laudable manner. You must also have a care, that you do not any way hinder or disturb Salivation. Wherefore abstain from Gargarisms, upon what pretence soever; by using of which I have observed sometimes that Death has been caused, while they hindered the Spittle, that would otherwise have passed. I would here only use small Beer a little warm, with which, if need were, the Patient's Mouth may be washed.

And seeing Salivation constantly accompanies this sort, which since it is one of Nature's principal evacuations, and serves instead of that which ought to have been made by Pusules (which evacuation indeed by Pusules in this low and depressed sort proceeds not so well as in the other) we must earnestly endeavour, that the said Salivation may continue and be kept up in its vigour, and not be stopt before its time, either by the use of hot Medicines, or by keeping the Patient from drinking small Beer, or some such other Liqueur. Now since the manner of Salivation according to Nature is, to begin with the first coming of them out, and to abate on the eleventh day, but not to give over altogether as yet for a day or two; if it wholly cease before that day, the Patient's case is dangerous. For seeing the Swelling of the Face (by which a little of the Morbifick matter is evacuated) does ever disappear on that day, if Salivation also withdraw, it self at the same time, the Patient is infected with the Variolous matter, which now putrefies, as with Poyson: And seeing now there is no part more, by which it may be evacuated, he is at death's door, unless perhaps (as sometimes it falls out) the swelling of the Hands, which as it shows it self later than that of the Face, so it goes away more slowly, be of that moment, as to save him from the Gates of Death. Salivation, which is here so valuable and so necessary, is very much promoted, if the Patient have store of small Beer given him, or some such other Liqueur, as may neither heat him, nor provoke him to sweat.

XXIV. Besides, that this violent ebullition of the Blood may be quieted, wherein this sort of Small Pox far exceeds the other, and that Salivation may be kept up (to wit, the necessary evacuation of this Disease) Narcoticks are convenient above all other things whatever: Which, for the incrassating virtue that is in them, though they may seem to hinder the bringing up of Phlegm, yet I have long since quit my self of that prejudice, and have made use of them in this Disease, the success ever answering, so the Patient were beyond pubescence: For since the Blood of Infants and Children does ferment more gently, it wants no such cooler, and moreover a Loosness, which nature has appointed to be an evacuation for Children in this sort of Disease, is by the use of them stopt, to the Patient's damage. But Paregoricks, if they be frequently used, bring these advantages with them. 1. By heating moderately they restrain and prevent the too violent ebullition of the Blood, and thereby a Phrensy. 2. By the use of them, the Swelling of the Face and Hands, which nature has as a chief evacuation in this Disease, comes on the better. 3. The Swelling by means of Narcoticks is kept up and protracted to Nature's due term, which conduces much to the Patient's safety, seeing oftentimes the swelling of the Face falls sooner, to the endangering of the Patient: For when the heat of the Blood is qualified, the inflamed particles are opportunely carried to the Hands, Face and all the superficies of the Body, according to the nature of the Disease. And then Salivation is promoted by them, which though it may be stopt in some for a few hours, by virtue of so strong an incrassating Medicine, yet strength being presently increased by this new Aid, Nature rowzes her self, and finishes what she began, with success. Nay, I have

observed, that Salivation, which usually abates about the 11th day, and sometimes sooner, to the Patient's great hazard, has upon giving Paregoricks more than once been renewed afresh, and has not ceased before the fourteenth day and sometimes after it. I usually give either about 14 drops of Liquid Laudanum, or 6 drachms or 1 ounce of Syrupus de Meconio, in Cowslip water or some such distilled water; Which if they be given to grown Persons, after the Small Pox are all come out, every Night till the end of the Disease, I have found by experience, that not only no inconvenience, but great benefit will accrew to them from thence. But it is expedient, as I think, to give the Paregorick a little sooner than otherwise is usual; for you may easily observe, that in the worst Small Pox the Paroxysm of heat, as I may call it, does usually torment the Patient with restlessness and other Symptoms, which if the Paregorick be taken about 6 or 7 a Clock in the Evening, may be in some measure prevented.

XXV. Moreover, since in the Confluent Small Pox a Loosness does as certainly follow Children, as Salivation does the adult, Nature always appointing one or the other of these evacuations, to carry off the Morbifick matter; as on the one hand I never give a check to Salivation, so on the other I do it not to a Loosness, since both are equally absurd. The ill bestowed pains of several imprudent Gossips, has murdered many Thousands of Infants, while they falsely reckon with themselves, that a Loosness is as dangerous in this sort of Small Pox, as in the other that is distinct; Not knowing, that in the distinct a Loosness does hurt, where evacuation is made by the Pusules, but that here it is Nature's work, seeking a pass for the Disease. Letting alone therefore the Loosness, *ἢ τὴν φουρτίαν*, according to Hippocrates his rule, *συμμετέλλειν*, (and we must work with Nature) I proceed as I begun, and advise them to lay the Children sometimes in the Cradle, sometimes to take them up; and, if they be weaned, I order them the same Diet, as I did grown Persons before.

XXVI. If in the distinct kind, by reason of an over hot regiment, and continual Sweat, the Face do not swell (Pusules in the mean time appearing very thick) but be flaccid, and the interstices of the Pusules be pale; in this case, because I would do my utmost for a more temperate regiment, and to check the fury of the Blood, I immediately order some Paregorick to be given: Which indeed (unless the Brain be over heated) by gently causing Sleep, and thereby checking the Head-strong rage of the Blood, it seasonably determines the Blood together with heat to the Face, as the nature of the Disease requires.

XXVII. But if the mischief coming from this cause proceed so far, as that Sweat, which hitherto ran plentifully, does cease of it self, if the Patient fall into a Phrenzy, make little water and often (because death is at hand) I think the Patient can be relieved by no other means, then by taking away a great quantity of Blood from his Arm, and exposing his Body to the open Air. And indeed, what I have now proposed, seems not so rash and unreasonable, if we consider, how some have got out of death's Iron hands, by Bleeding plentifully at the Nose. This moreover is to be considered, that in this extrem Agony, they are not in danger of death, because the Pusules go in (for they are out and very red, when the Patient is at his last gasp) but because the Face does not swell. Now to promote this swelling of the Face, whatever it is, that conduces to temper the Blood (and I suppose none will deny, that Bleeding and moderate refrigeration has this virtue) it must of necessity do good, as well as the use of Paregoricks, and for the very same reasons.

XXVIII. I would not have this understood, as if in every Phrensy, coming in the Small Pox (since no one Symptom is more frequent than this) I would advise Bleeding immediately; but in that only, which therefore comes, because the Face does not swell, that is, in the distinct kind, and where Pustules appear plentifully enough: Or, when by reason of a very hot regiment, and use of Cordials, the Blood is so fierce, and above all measure exalted, that it will not give time, till it may be reduced to a due temper by paregorick Medicines, and others conducing to the same. When the case stands thus, the Physician, governing himself rather by conscience, than by uncertain fame, ought either to take away Blood, as is said before, or order his Patient to be refreshed with the open Air: To effect which, it seems sufficient to me, that the Patient rise a little while from his Bed, by which means I have saved several from death. Besides these things which I have seen with my own Eyes, there are innumerable instances of Men, who by these means have been delivered from the jaws of Death. For some Phreneticks having escaped their Nurses guard (and men so affected use wonderful shifts) have got out of their Bed, and been exposed to the cold of the Air, in the Night. Others either by stealth, or by snatching, or by entreaty, have got cold water of their Nurse, and drunk it, and so by a happy mistake have obtained their health, which was despaired of. Here I shall produce one story, which I had from his own Mouth, whose the transaction was. Which is this; This young man in the flower of his Age went to Bristol, was taken there with the Small Pox, and a little after them with a Phrensy. The Nurse having occasion to go into the City, left the sick Man to other folks care, till she came again presently. But while she tarried a little longer, the sick man (as the by-standers thought) in the mean time dies. The by-standers, considering both the time of the year, and the habit of his Body, which was gross and corpulent, that the Body might not stink, they lift it out of Bed, and lay it naked on the Table, throwing a Sheet over it; The Nurse at length coming back, and hearing the sad news, enters the Room to behold the sad Spectacle; she presently threw off the Sheet, and looked on his Face, and she thought she discerned some obscure signs of Life, therefore she presently laid him in Bed again. And the man recovered in a few dayes.

Idem.
p. 209.

XXIX. If in the confluent Small Pox the Spittle be so baked and tough by the preceeding heat, that the Patient be almost strangled (which is not usual on the eleventh day) a Gargarism must of necessity be used, and order must be given to Syringe the Throat often with it Night and Day. Let it be made either of Small Beer, or Barley water with Honey of Roses. But if the Patient have been treated as he ought, Salivation, even when it begins to abate, will do its office so well, that there will be no need of this Remedy. And truly, when it is come to this, that the Patient is in danger of being choaked every moment, quite dunned, and his Breath almost gone, we cannot safely trust this Remedy. When the Patient is thus at his last cast, I have sometimes very seasonably and successfully given a Vomit of Infusion of *Crocus Metallorum*, but in something a larger dose, to wit, 1 ounce and an half, because, by reason of the extraordinary stupidity, which the Patient labours under, a less dose will not work at all, and in the mean time, by disturbing the Humours, which it cannot carry off, will put the Patient in great danger of his Life.

Idem.
p. 110.

XXX. By this same tempering of the Blood I have seen purple spots removed: but neither by this nor any other Method could I ever see either pissing of Blood or a violent eruption of it from the Lungs stop as yet: but both these Hæmorrhagies,

as far as I could hitherto observe, do undoubtedly preface death.

Idem.
p. 211.

XXXI. In suppression of Urine, which sometimes takes the younger and brisker sort (from the great confusion, to wit, and disorder of the Spirits, which serve for the voiding of it, by reason the Blood and Humours are disturbed with too great heat) I have taken all the tribes of Diureticks to my assistance, but nothing succeeded so well with me, as to take the Patient out of his Bed, who being supported by some that were by, when he had walked twice or thrice cross the Room, presently made store of Urine, to his great relief.

Idem.
ibid.

XXXII. But the Symptomes, which proceed from repercussion of the Variolous matter by external cold, or evacuation unduly made, they must be removed by the use of Cordials, and a regiment conformable; which yet must not be continued beyond the time that the Symptomes continue; The chief of them are depression or falling in of the Pustules, and a Looseness in the distinct Small Pox: For in the Confluent neither does the depression of the Pustules forebode any ill, because it is the nature of the Disease; Nor a Looseness in Children that are sick of them, because it causes health and no danger. In both these cases a Cordial Potion of some proper distilled waters, with *Diaferdium*, *Laudanum liquidum*, &c. may very well be given, and that not only to remove the foresaid Symptomes, but at any time of the Disease, if the Patient complain of a pain at his Heart, and sickness. And indeed I think, the redness, which is so much upon the often striking in of the Pustules, arises hence, because they who have observed the depression of them in the Confluent sort, have taken it for a recess of the Variolous matter upon taking cold, when it is nothing but the nature of the Disease: And they suspect the same in the distinct kind, because, to wit, they expect the coming out and increase of the Pustules before their time; whereas they have not taken notice of the time, when Nature uses to bring this fruit to maturity.

Idem.
p. 212.

XXXIII. When the Patient is upon recovery, and the Pustules are falling, when the Patient has eaten Flesh a few dayes, namely about the 21th day, I reckon he may be bled in the Arm, if the Disease have been violent; since the Inflammation, which the Small Pox has impressed on the Blood, whether the Patient be old or young, does no less indicate Blood-letting, than the filth, which has then been gathered, does purging: which is evident enough, both from the colour of the Blood, which, when taken after a violent Small Pox, is like that of Pleuriticks; and also from those great Inflammations, which after this Disease fall upon the Eyes; and also from other dire effects of Blood over heated and depraved by this Disease. Which is the reason, that they who lived very well in health all their time before, do all the rest of their Life after conflict with hot and sharp Humours, falling upon the Lungs or on some other part. But if the Pustules be few, there will be no need of Bleeding. After Bleeding I give two or three Purges.

Idem.
p. 213.

XXXIV. The Epidemick Measles which came in the year 1670, and they that were abroad in the year 1674. introduced black Small Pox, whose Pustules were as black as foot, that is, when they fluxed, and the Patient died not, till they came to maturity, for before they were ripe, they were only of a brown colour. Moreover the Pustules were very small, if they were numerous (for when they were but few, they were not less than in other kinds of Small Pox; and very seldom Black.) A great Putrefaction was latent in both, of a thick and incoëst nature. When they were ripe they smelled very ill, so that when People were very bad of them, a man could not come near them for stench. They finished their course slowly, and stuck

stuck longer on, than any that I ever yet saw. This is worth observation, that how much more gentle the Disease is, so much the sooner the Pustules ripen, and the Disease comes to an end. So in the regular sort of Confluent Small Pox, which came in the year 1667. the 11th day was the most dangerous, which once over, there was no further fear usually of the Patient. In the irregular sort of the Confluent next following, which came in the beginning of the year 1670, the Patient was in greatest danger on the 14th or at furthest the 17th day, which if the Patient got over, he was safe: But in this sort of Confluent Small Pox the Patient died even after the 20th day. And sometimes, if he did recover, not only his Legs swelled (which indeed is usual with some in the Confluent Small Pox) but his Arms moreover, Shoulders, Thighs and other parts; which Swellings begun the Tragedy with intolerable pain, just like that of Rheumatick Persons, afterwards they often suppurated, and ended in great Sinuses and Imposthumes of the Muscular parts.

And these Small Pox seem to me a new kind, arising out of the former, then grown old. Although the Black Small Pox, which in the beginning of the year 1670 first showed themselves, according to the disposition of the Air, which made it Epidemical, did go on towards the height, yet like the relapse of some Disease, the old matter fermenting again, the Air which inclined to the production of the Small Pox, drew them out of their old store: which Disease indeed gathering strength anew seemed as it were to revive. And these were so much the more irregular, and showed so much the more intense putrefaction, by how much the matter, of which they were bred, was more thick and saculent.

As to the Cure, I have admired at the quite contrary Indications, which this Disease seems to intimate to me. For on the one hand it was clear, that the Symptoms, which depend upon too great Inflammation, were immediately produced by a hot regimen, as a Fever, Phrensy, Purple Spots, &c. to which this Disease above all other is subject: And on the other hand an over cold regimen did hinder the Swelling of the Hands and Face, which is here very necessary, and render the Pustules more flat. After I had much and often revolved these things anxiously with my self, I at length understood that it was possible to help both these inconveniences together at the same time: for by allowing the liberal use of water boyled with Milk, of small Beer, or of some such other Liquor, it was in my power to check the internal rage of the blood: and on the other hand by keeping the Patient constantly in bed, not putting out so much as an Arm, I could by the gentle heat thereof promote the elevation of the Pustules, and the swelling of the face and hands. Nor is this Method inconsistent with it self, for the blood, when the eruption is at an end, is reckoned to have discharged the inflamed Particles into the habit of the Body, and not then to want provocatives to a further secretion of the matter: so that since then the whole stress of the business lies in the habit of the Body, and in ripening the Abscesses, we must only take care on the score of the blood, that it may be preserved from hot Vapours, struck in from the flesh beset with Pustules, and on the score of the Pustules, that they may be brought to maturity, by the gentle heat of the external parts. But then, how happily soever this Method of mine had succeeded in other Confluent small-Pox, yet in these of this Constitution my Method failed me: so that most of these, that were very ill of them, died, whether they used the Method now recommended by me, or a hotter Regimen and Cordials. Therefore I fully

understood, that something was yet wanting beside these things, which might conduce either to the checking of ebullition of the Blood, or to raise the Pustules, and the Swelling of the Face and Hands; that is, that something was wanting, which might be sufficient to conquer an intense Putrefaction, which was observed to be higher in these than in any other. At last Spirit of Vitriol came into my mind, which I thought might satisfy both intentions, both the resisting of putrefaction, and stilling the rage of the Blood. Wherefore leaving the Patient to himself, till both his pain and inclination to Vomit, which use to go before eruption, were ceased, and all the Small Pox were come out, at length on the 5th or 6th day I ordered Spirit of Vitriol to be dropt into small Beer, to a moderate acidity, for his ordinary drink, to drink his pleasure; but more freely, when the Fever of maturation was at hand, which drink I ordered him to take every day till he was perfectly recovered. This Spirit, as if it had been Specifick for this Disease, did check all Symptoms, to a miracle: The Face swelled sooner and far higher: The interstices of the Small Pox inclined more to a red colour like a Damask Rose: The small Pustules grew great, at least as big as that sort would bear: The Pustules also, which otherwise had appeared to be black did here discharge a certain yellow matter, resembling an Honey-comb: Then the Face was instead of black tinged with a deep brown colour: They ripened sooner, and run through all the other times sooner by a day or two. And all these things came to pass, if they drank freely of the foresaid Liquor: Wherefore whenever I observed that the Patient refused to take a quantity sufficient to conquer his Symptoms, I gave him now and then this Spirit mixt either with some Syrup in a spoon, or with Syrup and distilled water added to it, that the more sparing use of this Liquor might be compensated. I have reckoned up the divers conveniences, of this Medicine, Inconvenience indeed, I could never yet observe any the least arise from it: for although Salivation be usually stopt on the 11th or 15th day by it, instead whereof some fools about that time do serve, yet the Patient will be less endangered by these, than by it: because they that are sick of the Confluent Small Pox, are chiefly in danger, because in these dayes the Spittle being made viscid, choaks a Man, which indeed a looseness in this case helps, which will either cease of self, or at least, when there is no danger from the small Pox, it may be stopt by drinking Milk and Water, and by taking of Narcoticks.

In the mean time the Patient being laid in his Bed, and his Arms covered, I would not suffer him to have more Clothes on him than ordinary, I allowed him also to move himself from one part of the Bed to the other, as he pleased, to prevent Sweats, to which he was much inclined, notwithstanding this Remedy, in the mean time he lived upon Oat-meal and Barly grewel, and sometimes a roasted Apple. Towards the latter end, if either the Patient were faint, or sick at his Stomach, I indulged him 3 or 4 spoonfuls of Canary Wine. And after the 5th or 6th day, I ordered him being a grown Person (for Children had no need of it) a Pategorick draught to be taken every Evening betimes, that is 14 drops of liquid Laudanum in Cow-slip water. On the 14th day I suffered the Patient to rise from his Bed, on the 21th I got him let Blood; and then I purged him twice or thrice; which being done, the Patient's Face looked better and of a more lively colour, than theirs used to do, whom this Disease had handled ill. Besides, the method here recommended does not suffer the Face to be disfigured with Scars, which proceed from hot and enraged Humours eroding the Skin.

Sydenham

XXXV. The Small Pox must not be neglected, but an exact account must be taken of them, and a solicitous care must be insisted on. First, when they are Epidemical; and one or more Children are taken with them in the same House, and there are more yet, that have not had them, and indeed for prevention sake from so grievous and difficult a Disease. 2. Upon the account of them, in whom, while the Fever is urgent, the Humour that produces the Small Pox is moved up and down the Body with the Blood. 3. When Spots and Pustules are come out all the Body over, and they begin to be inflamed, and to hasten to suppuration. 4. When the same Small Pox are in suppuration or cease to suppurate. 5. When signs remain of a Humour that produces the Small Pox, not sufficiently expelled, and changed into Abscesses, and so remaining in the Body, and threatening new Mischief. 6. And lastly upon account of other grievous Symptoms attending them, as an Inflammation in one or both Eyes, or of the Small Pox observed in the Eyes, difficult Breathing, and a Cough both dry and moist, and Tumours and Abscesses in divers parts of the Body, especially in the Limbs.

Sylvius de le
Boe.

XXXVI. We must do our endeavour, if any Humours be found in Children to offend either in quality or quantity, that the same be altered and corrected by gentle Medicines, or also abated and carried off, to the end that if the Small Pox come, they may give the less trouble, and be the more easily overcome. These Medicines both alterative and purgative, according to the diversity of Humours must be divers and grateful, that Children may more easily take them: for it is good for Children to continue in the use of them for a pretty while: for by this means it comes to pass, that the gentle and kindly Small Pox, which then appear, become yet more kindly, and easie to be cured. And as soon as Children have any Fever, or Head-ach, Cough, Vomiting or Loosness, whether others are sick of it in the same House, or they are observed to be Epidemical only in other places, the prudent Physician must diligently observe, what Humours then chiefly offend, and which way they incline, whether to Vomit, or Stool, or Sweat, to the end Medicines proper for each may be prescribed, and that their motion, and useful evacuation being observed, may be promoted. For we must take care, that if Blood abound in any, who can bear Bleeding, it be insisted on immediately. Nor must we stop here, but rather if the Patient's Disease, and his Fever especially will bear it, not only the same day, but an hour sometimes after Bleeding, either a Vomit, or Purge, or Sweat may be given, whenever an inclination to Vomit, or to go to Stool, or a disturbance of the Belly, or Sweat, perswade what should be done; to the end that part of the peccant Humour, which would afterward stick in the *Superficies* of the Body, and cause the Small Pox, may be wholly expelled from the Body, and therefore of necessity the Small Pox must be rendred more kindly and few. Among Medicines to be then used, from experience I commend Antimonials above all other things, both because they have an excellent virtue in cleansing the Blood from any noxious Humour; and because oftentimes they can satisfy several Indications, and according to the occasion and desired operation, they can discharge the noxious Humours by several ways. Nor is it sufficient to give them once, sometimes we must repeat the same for several dayes, till as well the Fever as the other Symptoms be removed, or at least notably abated, upon which the Small Pox use not only to be far fewer, but much more kindly, nay oftentimes I have observed in my Patients the Small Pox voided by Stool, to their great relief.

Idem.

XXXVII. Whoever would cure the Small Pox and Measles in a true and secure method, it is necessary, that he diligently observe and distinguish three especial times of the Small Pox: The first of Ebullition: The second of Apparition: The third of Suppuration. In the time of Ebullition it is dangerous to trouble the Patient with powders of Bezoar alone, and other hot Alexipharmacks, except they be very temperate and a little Astringent; to this end indeed, that the Mass of Blood may not be too much disturbed, nor all of it so soon infected with the base contagion, whereby Nature is forced to the Battel before her time, and vanquished. I know besides, that most dangerous Loosnesses, usually mortal in these Diseases, have followed such unseasonable disturbing of the Humours. I know, that the Humours are so sharpened with such hot things (especially if they were thin before) that being rendred more biting, they have caused a great Itch in the coming out of the Small Pox; so that upon the least rubbing the Skin would come off and bleed, not without an offensive smell, which gave no vain presages of ill luck, to the Physicians there present, and the event a little after shewed that these things were the *prælude* of a following Gangrene, livid and purple Spots following upon the 9th day of the Disease. Wherefore *Avicenna* said well *l. 4. f. 3. tract. 4. cap. 6.* that black and ulcerous Pustules appearing in Children were mortal; Because the turgescence of the fermenting Blood is sometime so great, that it is not only carried as it were in a rage to all the parts, but an exceeding contagious poyson does also thence arise. So *Philipp Salmuth cent. 1. obs. 35.* and others, have seen fatal abscesses in the Small Pox upon the Limbs. For, sayes he, when the Ebullition is too great, and very violent, it makes the Blood in a manner mad, as *Hippocrates* speaks, then it moves from place to place, and gets especially into the Limbs, as the more Bloodless, and therefore weaker parts: The same *Phil. Salmuth cent. 2. obs. 50.* has observed that sucking Children, taken with the Small Pox, have been the cause of their Mothers having very Malignant Ulcers in their Breasts. At the time of Apparition we may more safely use drivers out, especially if Nature seem slow. Frequently, where there is no need of strong expulsion, I am content with some comfortable Alexipharmack water, of which I give now and then 2 or 3 spoonfuls, and often in a day, that Putrefaction may by little and little be resisted, and that Nature successively assisted may be strengthened, for example; Take of water of *Scorzonera*, *Fumitory*, *Borage*, & *toro Citri* each 1 ounce, add about 1 drachm of some Cordial powders with *mannus Christi perlatæ*.

Ignatius
Thiermair.
lib. 1. Conf.
4.

Since the Course of this Disease has three times, which are as so many distinct Goals, the curative intentions should be accommodated to each of these. As to the first, that is, of Ebullition, the Intention is, that all impediments may be removed from nature, to the end the Blood, infected with the ferment of the Small Pox, and apt to be coagulated, may still keep an equable motion in the Heart and Vessels, without stagnation; and while it ferments, may expel the congealed portions with the Venome. In the mean time our care must be, that the work of Fermentation or Effervescence may no way be hindered, or too much put forward: for by this the mass of Blood is put more than it should into congealed portions; by the former it is restrained too much in its motion, and the Poysonous particles with the congealed Blood, are not thrown off. Nature is usually hindered in the work of Secretion and Expulsion, by too great a mass of Humours in the Bowels, or abundance of Blood in the Vessels: Wherefore at the very first coming of the Disease, we must do our endeavour, that

that Evacuation may be seasonably procured by vomit or stool, if there shall be need: therefore we must use gentle Medicines only, which may not irritate or disturb the Humors: Bleeding also may be celebrated with good success, if there be a *Plethora*. In the meantime a thin and moderately cooling Diet may be used, as Barly grewel, Oat-meal Caudle, small Beer and the like. Flesh and Broth made of it must be avoided, by such whose Blood is more inflamed than it should, by reason of abundance of sulphureous Fewel: All cold and acid Things do harm, for they congeal the Blood more, and by their adstriction contract the Mouths of the Vessels, so that the Small Pox cannot come out freely: Also hot Things and Cordials must be cautiously used; for the Blood and Humors are too much disturbed by these, and put into confusion. As to the time of Apparition, we give 3 things, as a constant rule in charge to all that are sick of them, namely, That a gentle and kindly transpiration be still continued in the Blood, and that the Throat and Eyes may be preserved from too great an Eruption of the Small Pox. Besides these, some other Symptoms are sometimes troublesome, which must be timely prevented with proper Remedies: Sometimes there is Watching, Phrensy, Bleeding, Vomiting, Loosness, striking in of the Small Pox: A prudent Physician knows how to take care of these and any other, as there shall be occasion: In which nevertheless there is need of great caution, lest, while we take care of small things, the main work of Nature be interrupted with the trouble of too many Medicines; For all this time there is only one continued *crisis*, therefore nothing must be lightly moved. The utmost diligence and circumspection of the Physician and attendants is requisite when this Disease is at the height, lest the Small Pox being all come out, and at the fullest, might hinder Transpiration; for then the Patients are in danger of the return of the Fever, and of the restagnation of the malignant Matter within; one whereof while we study to prevent we often cause the other. 3. When the Disease is in its declension and the Small Pox begin to dye and grow crusty, the danger is usually over, and the Physician has not much to do. The sick Party must as yet be content, though he be very hungry, with a thin Diet, without Flesh. If the Pustules be long in falling off, we use to hasten their fall with Liniments and Epithemes, which prevents their pitting. When the Small Pox are gone, and the Patient is able to rise and walk round his Chamber let the filth and excrementitious Matter, left in the Bowels and Blood, be carried off by a Purge twice or thrice repeated; and then he may be allowed to fare a little higher.

XXXVII. Whether the Small Pox and Measles may immediately in the beginning, and when they are yet but breeding, be suppressed with safety to the Patient, so as not to encrease or come to the height? Or, at least, may they be so prevented, as never to come? *Augenius lib. 10. de febris cap. 1.* concludes this question with a distinction affirming, that preservation from some Small Pox is safe, from others not safe. "For, he says, that Small Pox coming in a pestilential Constitution are so pernicious that they kill all they take, therefore we ought to do our utmost, that they may not come. Nor truly do these come from a good *crisis* of Nature, but from a pestilential Air, whose great Malignity we may sometimes hinder, and sometimes qualify. But there can be no preservation from a kindly Small Pox; nor if there could, were it safe because no Skill can amend the intrinsic Pollution contracted in the solid Parts from the principle of our Nativity. Whence you may

gather, that *Augenius* in this preservation of his has respect rather to the pestilential Contagion and fatal Malignity of the Air, than to the Small Pox themselves, as such, because they cannot, nor ought not to be absolutely prevented: Especially because as *Fracaflorius l. 2. de morb. contag. cap. 2.* shows well, and as all Physicians agree; This Ebullition is a kind of purification of the Blood, wherein the Blood is defecated by a certain *crisis*, as it were, made by Nature.

XXXIX. Towards the latter end of last Autumn, at which time the Small Pox began, and continue up and down the Country to this very day, being called to a Boy about ten years old, who had been ill of a Fever with a violent Head-ache and scarce any other Symptom for two dayes, and suspecting a little what the Matter was, I advertised his Parents of my Suspicion, who were of a contrary Opinion, imputing the matter to Worms, and they earnestly entreated me to give him something for the Worms: and being tired out with their Importunity, I consented at length; yet I considered with myself, that I must not rashly give a Medicine, which might increase the Fever, or stop the Small Pox: therefore having made a Pill of 10 grains of *Mercurius dulcis* and a little Conserve of Roses, he took it in the Evening long after Meal, and the next day innumerable Pustles appeared, to the relief of the Patient. Not long after a Girl six years old, being taken with a Fever, not very acute, but with convulsive Motions and frequent reaching to Vomit, and being believed to be thus ill because of Worms, which she had lately voided; upon taking a few grains of the said *Mercury* in a Pill, she voided abundance of Small Pox the next day, which I admired. ¶ The mention of the Small Pox puts me in mind how commendable *Mercurius dulcis* is in the Small Pox: Perhaps as it is an enemy to Worms, so to all animated Corruption, as by the help and upon the credit of the Microscope, our modern Philosophers conclude in malignant Diseases. I have observed, that this Medicine, if it be given in the beginning of a suspected Disease, has either perfectly preserved, although others in the same House were infected with the malignity of the Small Pox, or at least freed them from an over abundant Eruption. My own Daughter 10 years old seemed in danger of the Small Pox, her extreme Parts were Cold, and then she was hot all over, her Head ached, she reached to Vomit, was griped in the Belly and had running Pains in her Limbs. Then by reason of her reaching, against the perswasion of Physicians, who abhorred Evacuators, I gave her of *Mercurius dulcis* 1 scruple, with 4 grains of Scammony Sulphurate, she went to stool thrice, in the Evening she vomited violently, she slept quietly, and escaped without the coming out of any Small Pox. A little after a Girl about 8 years old, having had the Small Pox here and there, before she was well, was taken with the Head-ache, a pain in her Eyes and Back, &c. So that all reckoned she would have the true Small Pox: Although I was not called at the beginning, yet I gave her the same Medicine, with so much benefit that she had but a very few.

XL. When the first Fever is over, or at least well abated, and the Small Pox are come out, be they more or less, and the Symptoms preceeding and accompanying their coming out are almost removed, then it is good to use diaphoretick Antimony, *Bezoarticum minerale*, or any other Antimonial, that gently causes Sweat, to the end that what is yet mixt with the mass of Blood may all of it forthwith be driven out, not only the superficies of the Body but partly also by the Pores thereof beyond it, and so out of the Body.

XLII. The Cure must be begun with letting of Blood, if the Blood so abound, and the Patient's Age will bear it, and it must be done speedily. Yet if the Physician be not called the first day of the Disease, nevertheless he may very well take away Blood before they come out, or while as yet a few do but appear, which time commonly uses to extend to the fourth day, after being taken with a Fever. In which notwithstanding, diligent caution is necessary: for if when the Pustules begin to come out, the diminution of the Fever and abatement of the Symptomes do follow, it is better to leave the whole affair to Nature's good conduct, which is about sufficiently to drive out all the morbidick Matter to the Skin; Then Bleeding is not needfull, for Experience shows us, that abundance of Children, that are sick of kindly Small Pox, and not oppressed with a *Plethora*, are happily cured without Bleeding. Nay in the said case Bleeding may rather do harm, because the Small Pox are driven out by the ebullition of the Blood, which if gentle, will be much weakened by taking away Blood, and so will become insufficient for freeing the mass of Blood from impurities. But on the contrary, if when the Small Pox come out, an intense Fever, Restlessness, difficulty of Breathing, thick and red Urine, and other violent Symptomes appear, it is a sign that Nature is oppressed with too great a load of Humors, and that she cannot conveniently rule them, and therefore that Bleeding is necessary, to the end that when part of the Burthen is taken away, the rest may more easily be expelled by Nature. In a word, in an Ebullition, which is merely perfective or depurative, Blood must not be taken away; But in a corruptive one Bleeding is very necessary, even in one that has a little malignity in it.

Riverius.

XLIII. Bleeding is so necessary in dangerous Small Pox, in which the Ebullition uses to be corruptive, that the tender Age of Children does not hinder it: for it has been the Custom to make use of Bleeding at four years old and sometimes at three. The Physicians of *Paris* do not forbear Bleeding younger, even in Children that Suck, which yet this tender Age, little Aliment, and plentiful Efflux by the Skin, will hardly allow; Nor can this new Licentiousness of Bleeding be any way defended. In a little more grown Children only one Bleeding sometimes is not sufficient, but it must be repeated, if a high Fever continue, or a *Delirium*, or any other grievous Symptome afflict them. ¶ Therefore when the most Christian King, who was then scarce past his Pubescency, was ill of the Small Pox the *Archiatrorum Comes* (or Count of the principal Physicians) with the joyn't Suffrages of all the rest, ordered a Vein to be Breathed several times; which when it was done with exceeding good success, the Glory of saving a King, and of the conservation of a Kingdom must be ascribed to Bleeding, and to the Physician the Author of it. The King of *Spain's* Physicians, who are prone to Bleed largely, bled their Infanto King not in one but several Veins.

Riverius.

Relinscius.
lib. 2. c. 1.Epiphanius.
Ferdinandus.
lib. 78.

XLIII. When there is an urgency, Blood may be let at any time, if there be but Indicants. For first when the Small Pox and Measles appear, and the Fever ceases not, nor other grievous Symptomes, then we may let Blood. Secondly, when they appear one day and strike in the next, then immediately Blood must be let. Thirdly, when there are other grievous Symptomes, besides the Symptomes of the Small Pox, as a Phrensy, Quinzy, Lethargy, Dysentery, a grievous Ophthalmie, or any other dangerous and grievous affection. And so *Rhases* lets Blood in the Small Pox and Measles, when there is a dysentery. ¶ Yea when the Small Pox have done coming out, which for

the most part is within 9 dayes, if the Fever be very violent, Blood may be let again, and the Patients may be treated, as People in a continual Fever. Riverius.

XLIV. *Hippocrates*, lib. 2. *Epidem.* sect. 3. sayes, that at a certain Season, in Summer Fevers, about the 7th, 8th or 9th day some milieaceous roughnesses, almost like unto Flea-bitings, which yet did not Itch very much, arose upon the Skin, and continued till the *crisis*, which came out upon no Men; and no Women, who had them, died. These roughnesses, of which *Hippocrates* speaks, are none of that sort of *exanthemata*, (or breakings out) which began to appear in malignant Fevers in our Age, but rather of the sort, which we call *Rosalia*. And they are bred, as I think, of a bilious and ferous Matter, when some Portion of a salt Matter is mixt with it; which Juices indeed are separated from the mass of Blood, upon a certain Ebullition rising therein, and they appear most in Women and Children, because they abound most with the foresaid Humors, and are of a thin texture of Body, in respect of Men. The Romans call this Disease *Rosalia*, very usual among Children, so that none, as they think, can escape these any more than they can the Small Pox. These roughnesses are not unlike them we call *Sudamina* (or Sweat Blisters) wherein the Skin is swelled and rough, with Itching: Although these are a little larger than *Sudamina*: And indeed they are very like those Eminences, which come upon the bitings of Fleas, which does not happen in fever Spots, wherein the Skin is smooth, and only vitiated in colour, although *Vallesius* and others interpret *Hippocrates*, of the fever Spots, or *Petechie*. Children are first taken with an acute and burning Fever, on the third or fourth day, after little red Spots begin to break out, which are elevated by degrees, and make the Skin rough; and the Fever continues till the fifth day, as which ceases, these roughnesses by degrees go off. Vulgar Physicians take this Disease for the Measles, though they differ very much; for the Measles and Small Pox kill many: But Experience shows us, that scarce one dies of the *Rosalia*, and not but by a miracle, and through some great Errors which the Sick commit, or the Physicians chiefly, in letting of Blood. For since this Remedy is in all respects contrary to this Disease, because childhood, whereof this is a peculiar Disease, does by no means admit it; and since it is utterly prohibited by the nature of the peccant Humor, which is bile, and by its motion outwards; And the Disease, which is wholly salutary does not require it: No wonder therefore if a Remedy, so unseasonably administered, sometimes do so much hurt, that of a salutary Disease it becomes mortal.

Prosper Martianus.
commun. in
loc. cit.
p. 245.

XLV. (a) Some Physicians are very timorous in letting of Blood, fearing that Nature's endeavor may be disturbed; and that a retrocession of the Humors from the outer to the inner parts of the Body, may follow. But *Caldera Trib. Medic. lib. de Variolis cap. 9.* does learnedly remove this Scruple. "Nor need you fear, says he, the striking in of the Small Pox upon this letting of Blood, because of a vacuum; for this fear has place only, where nothing superfluous is left in the Body, and Nature works critically, all the Matter being driven out of the Veins (for then we must wait the motion of Excretion) but not when irritated Nature drives out Symptomatically, and while opposition to the evacuating Remedy remains still in the Veins, namely Abundance, which you should well weigh in an equal ballance. Reason is backed with Experience whereby we find, that when, after Bleeding in the Small Pox, the heat of the Blood is abated,

red, the Humor is better concocted by Nature and turned into good pus. But even Nature herself, the Physicians best Mistress, oftentimes prevents the Physician, by letting Blood plentifully at the Nose, that she may make the way more easy for the Measles or Small Pox, and the sooner extinguish the burning Heat. And we must confess that some Physicians are sometimes over timorous, and more intent how they may avoid the obstructions of the vulgar, than they are upon the reason of things, and some, though they know better and approve it, yet for other Folks sake they follow Custome. Say not, that Vomiting hinders Bleeding. ¶ (b) Concerning Vomiting hear *Caldera loc. cit.* "Nor let Vomiting affright you from letting of Blood, nor a Loosness, if it be not profuse, nor a Catarrh, nor pain in the Belly, nor Shivering, because these and many other complicated and various Accidents use to go before the coming out of the Small Pox, which, you may stop after Bleeding, or Cupping, scarified or dry.

XLVI. Far less need any question be made about the Winter Season; Sickness, at what time soever it comes, requires a Cure and a Removal, so much the sooner, by how much the more grievous the Disease lies upon one.

XLVII. The often repetition of Bleeding is not absolutely necessary, when it has been done once or twice, if expedient, (because it hinders Nature's motion, which drives out) unless drowziness, or strangling with a Fever, or a Dysentery, for the most part Mortal, do force us upon this Remedy: We must not neglect frequently to apply young Pigeons split, to the Feet, Hands, and Heart: We must set Cupping-glasses all over the Body frequently, with gentle pricking: A little Bathing in warm Water, when the Season would bear it, has brought them out. ¶ In the year 1676. I had under Cure the Excellent Mr. Alexander Diodati, a Noble Youth of the illustrious Family of the *Chab.ij* 17 years old. The Small Pox had come out, and were then well towards ripening, when a gentle Loosness came: The Pus- tules immediately struck in, and a phrenitick Delirium followed. Nothing would serve the Women (who have all the Skill in Physick) but the giving of some Alexiterial Powder. I was for letting Blood in the Foot, which was done, much against their Wills; hereupon immediately all things were quiet, the Pus- tules rose again, and he quickly recovered.

XLVIII. The place for Bleeding is various among Authors: Most commend the common Vein, and I do the same in such as are above 14 years old, and are Sanguine and strong: But I had rather let Blood in the lower parts, and in the Hemorrhoids especially in Melancholick People.

XLIX. Then the manner is various, by opening a Vein, by Cupping, and by Leeches: And I seldom use to open a Vein, but rather cup, or apply Leeches, and especially in Children, in whom if I cannot use Cupping-glasses, yet a Leech or two may be set on, which will do the same thing.

L. I usually apply Cupping-glasses to all, especially to the Loins, Buttocks and Hams, and I do not only this before they come out, but after they appear, seeing this conduces very much to draw the matter to the out parts.

LI. It is convenient that we know, while the Small Pox are appearing we may Bleed more boldly (because they are the product of greater plenitude) than in the Measles, which rather proceed from the Malignity of the Humors: Therefore in the Measles it is better to use Cupping than Bleeding, unless in adult Bodies.

LII. If opening a Vein be suspected, because of tender Age, or because the proper time is over, the redundancy of Blood may be taken away by Cup-

ping and Scarifying the Back, Thighs and Shoulders: Which also may do good in the state of the Disease, seeing the motion of Nature from the Center to the Circumference is promoted thereby. But care must be taken, that Scarification be not made deep in Children: for sometimes it happens, that when an imprudent Surgeon has thrust his Knife deep in, hot boyling Blood upon cutting the Veins, has come out at the wound with that violence, that it has been a difficult thing to stop it.

LIII. Although Purging be suspected in this Disease, because it causes a motion contrary to that of Nature; wherefore whoever have a Loosness in the Small Pox, a sudden striking of them in and Death usually follows: yet take notice, that a Purge is often beneficially given before the Small Pox come out, and the Fever grow high, that is, when Children are in a neutral state of decidence: for then, if *Cacochymy* abound, it is good to diminish it by purging, that Nature afterwards may more cheerfully undertake expulsion. But when the Small Pox begin to appear, a Purge would be pernicious: And also when there is great Malignity, as in an Epidemick constitution, when many Children dye of that Disease, it is best wholly to abstain from Purging; because in very malignant and pestilential Diseases, it is very hurtful to give a Purge in the beginning of the Disease.

LIV. Although Clysters be not only convenient for all Bodies young and old, Men and Women, and in all Diseases of the Body; yet we must take notice, that in the coming out of the Small Pox, Measles, and *Exanthemata* we must wholly abstain from Clysters, though they be made of lenient softning Ingredients, lest, Nature's motion and inclination from the Center to the circumference be disturbed, and lost, while she is very busy, she and all her Strength be diverted another way.

LV. If the Small Pox come of hot Humors, they must be cured only with cooling and incrasating things; for unless the immoderate ebullition and heat of the Blood be stopt, the Patients hasten to their end; therefore we must then use things that check and moderately cool: As will appear from the example following; whence likewise it will appear, in what cases the Cure must be varied. *Altarpus* his Boy was taken with the Small Pox, some of which ran, so that in two dayes they left the poor wretches Body all excoriated, as I have also seen it happen in other Children. Against which I began thus; First of all because this matter was too thin, I endeavored to thicken it; not only by taking it off, but the ill quality also of the Liver and inner Parts, that no more new might be bred: And this I did with cooling Medicines, as Syrup of Roses, of Cichory simple, of Endive, and Violets, mixing them with the like Waters: His Liver was anointed outwardly with *Unguentum Santalinum*. But his Diet conduced much to it, which inclined to cooling and moistning: By all which means the Matter was made thick and the Small Pox begin to appear thick and large. ¶ In the latter end of Summer 1655. the Small Pox were abroad in our City, many Children had them, but few died, for they were kindly. At the same time two *Greenland* Women were taken with them, to whom, when several sorts of drink, which had done good to others, as well for driving out the Small Pox as to cool the febrile Heat, were profered them, they refused all, denying to take so much as boyled Water: But by making signs they so earnestly desired cold spring Water, that they signified they should dye, if it were denied them, and when it was granted them, they recovered.

LVI. Lentils are rejected by some Neotericks, because they have an astringent Faculty, and so hinder

82,

hinder the coming out of the Small Pox : But the Authority of so many and so great Worthies ought not rashly to be rejected ; but rather it must be concluded, that with the highest reason Lentils either excorticated or a little boyled, are added to things that drive out to the Skin ; inasmuch namely as by their astringent and incrassating faculty they restrain the too great heat of the Humours ; and hinder their running into some noble part : to which end also Tragacanth is added. This is taken from *Galen*, who 1. *de Alim. fac. c.* 18. holds, that Lentils twice boyled strengthen the natural parts, and by the astringent wherewith they are endued, do stop a Looseness : Therefore they may be prescribed or omitted, by the Physician, who has the cure in hand, according as he shall find the necessity to attenuate the Humours and to drive them out to the Skin, to be more or less urgent. For if the matter be subtil, and the ebullition great, they may be usefully prescribed, for the foresaid intentions : But if the matter seem thick, and Nature drive it slowly to the Skin, then they, yea, and Tragacanth also, must be omitted, and other things that are attenuating and diaphoretick must be put in.

Riverius.

LVII. Having made evacuation of the whole Body, unless the Small Pox come plentifully out, it will be good to abate in Meat those things that bind, and to put in some things which may open, as Leaves of Smallage and Parsly. Nor indeed do I approve of giving of dry Figs, for I condemn it for that very reason, for which Physicians commend it ; They say indeed, that Figs drive the matter from within to without, but truly their experience fails them : for Figs do not this, because they drive bad Humours from within, but because by over-heating them, they give them a kind of ebullition, which is usually very grievous, and therefore the common People hold that Figs cause the Scab and Itch : yet they are good for old Men, if they should chance to have this Disease, whose Blood naturally is not so hot as in Children. And it will not be amiss here to enquire, what is the reason that Salt fish are good for them that are sick of the Measles ? For *Aristotle* sayes, that vulgar report is not alwayes without cause : yet there is reason, We find by dayly experience that Salt fish causes the Itch, because it raises an ebullition in the Blood : Now it is found, that in every ebullition thick Humours are made thin, thin turn into Fumes, and Fumes go to the Skin : Whence it is made out, that without doubt Salt Fish are sometimes proper in these Diseases, to wit, when Nature goes lazily about the work of expulsion, especially when the wayes are narrow, and the Humours thick and inept, when there is any one or all of these, Reason demonstrates, that Salt Fish are good. When therefore in a body naturally cold the Small Pox come not well out, for any of the three aforesaid reasons, I think, notwithstanding the Febrile heat, we may with the People in Portugal, with whom this is usual, give Salt Fish ; but otherwise by no means. And this must be done with premeditation, for the Fish must be steeped a whole day in juice of Sorrel. But if it should so happen that Pustules should come within, truly you can by no one Medicine more effectually break them, purge the *Sanies*, nor dry up the Putrefaction that comes from them : And you can by no means sooner give a check, that so the Body may take no further corruption, and at last you can by no other means preserve the sound Particles safe from being affected with the contagion of the running corruption, then by Salt Fish. And it will not be amiss when they come out within, to advise first of all to eat dry Figs for ripening of them, and then to use Salt Fish. But we must remember, that we must have a care of using Salt Fish in the Measles,

(rather than in the Small Pox) and in such as are of a hot and dry constitution.

Brutus, de
victu febri-
cit. l. 3. c.
22. & 23.

LVIII. To preserve the Face, some wash it with Rose water and other astringent things, which I cannot approve of : because the greatest share of the impurities is driven to it : for its Skin is lax and soft, and so fittest to receive excrements. Wherefore if those impurities, which are sent by Nature to the Face, be repelled from it, when they are retained within, they may do much mischief ; and therefore Nature's motion must by no means be hindered.

Riverius.

LIX. I must not omit that several teach, that the Small Pox, when they are brought to maturity, must be prickt with a Golden or Silver pin, lest the pus abiding longer there leave Scars in the part. Which nevertheless is now in a manner out of use, since experience has shown that the Small Pox, when prickt, are cured more slowly, and keep their Scabs longer on, by reason of the weakness of the innate heat, which is caused in the part by pricking, whereby fouler Scars are left. Therefore it is best to leave the matter to Nature.

Riverius.

¶ *Avicenna* and the greatest part of the *Arabians* will have the Small Pox, when they grow white, to be prickt with a Needle, that the *Ichor* and corruption may be got out. For which advice they give this reason, That if the matter were kept long in any part, there would be danger that it would eat the Flesh and the part, and so the Ulcers would grow deep. *Galen* seems to favour them, 3. *lib. de Fract. c.* 48. where he writes that in *Phlyctena* (a sort of blisters) it was his custome to prick the Skin, and so at several times to get out the water and *Ichor*, that the Skin might remain whole. But this to me as well as to many others seems a thing needless and troublesome ; Troublesome, because the Patients at that time are grievously tormented ; And needless, because it is certain, they must not be prickt, till they are turned white ; at which time it is clear the Humour has done all the hurt it can ; for when the whiteness appears, the heat and power of eating the Flesh is over : Wherefore it is better to abstain from pricking, and especially because as soon as they appear white, they also dry and scale off. ¶ If the *Sanies* appear livid, watry, and indigested, and they come from a Pestilential contagion in the Air, which they often preceed, then by reason of the sharpness and virulence of the Humours, I think they should be opened, that their Poyson may exhale, and they may not eat ; yet so as that their crust, which the *Greeks* call *epidemie*, may not be taken away also : But if the *Sanies* be thick, white and well concocted, I think it better not to meddle with them : for in Breeding of such *Sanies* I know, that Flesh also grows underneath, wherewith the spaces of the Pustules are filled up.

Mercurialis.

J. Langius.

LX. There are some who desire of their Physicians, that they would get the Pustules quickly dried off, to which purpose several outward Remedies are made use of, which use to dry them up presently : Especially that, the *Arabians* call *Salting*, concerning which two things must be observed, 1. That it be not used, till the Pustules are white, because if they be then red, they are violently irritated, and the torment encreased. 2. That none use Salt alone, but some other things with it, which may take off its acrimony, for example, Take of River water 2 pounds, Salt half an ounce, Barly, Lupines, each half a pugil, Saffron 1 drachm. Let them boyl according to Art, and then with a Cotton dipt in this water touch the Pustules, which if they be so little, that they need not so much drying, another Decoction may be made ; Take of leaves of Tamarisk, flowers of Roses, each 1 handful, all the Sanders each 2 ounces, Barly 1 Pugil, Salt half an ounce. Make a Decoction. But it is best

best to be patient, and let the tubercles go away of themselves.

Mercurialis. LXI. But if they do not ripen fast enough, I would have them often touched with a Cotton dipt in a decoction of Figs and Mallows, because such a Decoction applied warm, does usually both assuage all pain, and also hasten maturation.

Fromanus, misce. cur. an. 76. Obs. 186. LXII. A Country Woman told a Matron, who desired to know a preservative from much pitting of the Small Pox, that it might be hindered, if at the first invasion of them, the Feet were often held in the Steam of a Decoction of emollient Herbs. The Matron desired to know my Judgment of it; I told her, I could not disapprove of it, because revulsion was thereby made of the fermenting Blood to the lower Parts: for the Feet and Legs are not only heated by the Vapours, but are also softened, and their Vessels and carnos parts dilated: therefore because store of Blood is gathered to them, a kind of revulsion is made of the ebullient Blood from the upper parts. ¶ It is also the custom with some, that they may preserve the Face from many Small Pox, and derive the same to the Feet, to dip the Childrens Feet in warm Cow's Milk, when first the Small Pox begin to come out; which wants not success, though not without notable detriment to the Feet, which are then full of the Small Pox, whereby grievous pains are caused, and a long weakness in the Feet does follow, but so beauty is preserved.

Franc. de le Boë Sylvius. LXIII. I do nothing at all to the Face, to keep it from pitting, because Oyls, Liniments, &c. only make the white Scurf longer in coming off, one part whereof following another, when the Patient rises from his Bed, and is indifferent well, these foul Scars appears by degrees. But the Patient need not much fear them, when by reason of a moderate regiment, the Pustules not having been much exasperated have contracted no caustick quality.

Sydenham. LXIV. The Small Pox hurt Beauty with their marks. The cure of this does not consist in this, that these Pustules be well ripened, but they must be prevented. This is done. 1. If we stop the motion or fermentation of the Humours, that they may not come from the Heart and other internal parts to the habit of the Body. I knew a certain Artist, a votary to true Medicine, who by a certain secret powder can hinder the coming out of the Small Pox, by stopping the fermenting motion of the Humours, although Spots already appear, without any prejudice to health. 2. While we apply repellents to the Face, but we must have a care they be not too strong, and we must see to the coming out of the Small Pox in the rest of the Body. ¶ A beautiful Noble Woman was much disfigured with the Small Pox, wherefore she would use some Remedies, whereby she might get the marks of them out. A certain cold Cataplasm was therefore applied by a Physician, but without judgement, for the remainders of the Disease were driven in, and the Brain was so cooled, that she received death instead of her expected Beauty.

Frid. Hofmannus, m. p. 443.

Pet. Borellus, Cent. 1. Obs. 64.

Hoffmannus.

LXV. To think to take away Pock-holes by the use of Bathes either inward or outward, is a most absurd thing.

Idem. LXVI. When the Small Pox have done coming out, the ebullition of the Humours must again be laid with such Medicines as have a precipitating virtue, and strengthen the Bowels, such as Ivory calcined without Fire, burnt Coral, Crabs Eyes, Pearls, &c. Otherwise if in the beginning we be more solicitous to stop the ebullition of the Humour, and assuage the heat, than to resist the Malignity, it will fare with us, as it does with them who labour more to take away what is rained in, than to mend the Roof.

LXVII. The malicious Small Pox have oftentimes

deceived me, for when Children have been reckoned to have escaped them, they have been over fed before the time, by the silly Women, as if they despised this Disease: But the wicked Small Pox, growing ill again, and burning a new, did fiercely assault the little ones, and scalding them, or rather roasting them, with inextinguishable heat, did at last kill them. And truly edacity in the Small Pox is usually an ill Sign. Therefore we must not trust them in the beginning of the declination and melioration: But according to Hippocrates his rule *Eph. 15. 2.* The Urine and Ordure must be looked into, which if they be bilious and of a bad colour, it is a sign, that the Body is yet impure, which by how much more you nourish, by so much more you hurt. Have a care therefore of a full diet, and you may conquer the remainder of the Putrefaction and Cachochymy.

Joseph. de Medicis, apud Hecali-um. LXVIII. A Boy five years old being ill of the Small Pox, was the third day taken with a Bloody Flux, and frequent desire of going to Stool: he voided pituitous and mucous stuff, with a great quantity of Blood; the Pustules were small, white and flat, I prescribed thus; Take of red Roses 1 pugil, red Sanders half an ounce, scraped Liquorish, and stoned Raisins each 1 ounce, boyl them in Sheep's head broth. In 9 ounces of the Colature dissolve of *Confectio de Hyacintho* 3 drachms, Conserve of Roses passed through a Sieve half an ounce, the yolk of an Egg. Mix them. Make a Clyster. Give it often. Take of water of Scabious, *Carduus Benedictus* each 1 ounce and an half, Syrup of dried Roses 1 ounce, Coral and Pearl prepared each 1 scruple, Bezoar stone 3 grains, *Confectio de Hyacintho* half a drachm. Make a Julep. Give it twice a day. Take *Oleum Scorpionum Matthioli*. Anoint the Groins and Armpits often hot. After he had taken the Clyster twice, and his Julep twice the Bloody Flux quite ceased, and the Pustules began to come out more violently, and afterwards he underwent the Disease quietly, till he was perfectly well. Although the Remedies proposed be vulgar ones, yet this case deserves observation, because the event was not vulgar: for of all the Children in the Small Pox, that I have hitherto seen, only this one had the Bloody Flux.

Riverius, Cent. 1. Obs. 71. LXIX. I learned, that a Loosness coming upon the Small Pox is not always fatal, from my own Daughter *Elizabeth*, who anno 1670 in the Month of September, being about 4 years old, was upon the 7th day from the coming out of the Small Pox taken with a Loosness, which proved critical and salutary, first of serous, then of thick and variegated Humours, which a violent Swooning preceeded. I used no astringents to stop it, being content with the use of gentle Diaphoreticks: because it began on a critical day, appetite was good, and there was no striking in of the Small Pox: This lasted 3 days, and a little after she recovered. And this was observable, that whereas before the coming out of the Small Pox she was impatient of all Clothes, so that her Legs and Thighs were exposed to the open Air, there and about her Face the Small Pox came out more plentifully than about her Back, Arms and Breast, which were clothed: So that it seems very probable to me that the matter of the Small Pox in the covered parts expired by occult transpiration, and that it would have been so in the rest, had they been covered.

LXX. It must be observed, that in Children sick of the Small Pox a Loosness is often caused by Worms, and continues almost all the time of the Disease, whereby Life is in imminent danger, because the coming out of the Small Pox is abated or hindered. And this is easily known by the thickness and sliminess and the gray or white colour of the excrements: for then things that kill Worms, and sweet Clysters must be given.

LXXI.

LXXI. When watry Pustules came here and there all over a Boys Body, but all of them struck in through the ill management of the by-standers, the Patient falling into Swoons and coldness in his extrem parts: left nothing should be done in so dangerous a case, because the Patient could swallow no Medicines I apply four Vescatories to the inside of the Arms and Thighs, following the duct of the greater Veins, in hopes that the Poysonous Humour being recalled to the Skin, might find a more ready passage out. In short, the water returned into its cells, and though they turned slowly into Pus, they made way from certain despair to former health.

Olaus Borrichius.

LXXII. A Woman was taken with the Measles, her whole Body was covered with them, and she had a violent Fever: She had moreover a most grievous Symptome, a thin defluxion upon her Lungs, which often made her Cough, and put her in fear of choaking, with an hoarseness. A Vescatory was applied to the Neck, and 2 grains of *Laudanum* were given in Conserve of Roses, the defluxion stopt that whole Night, it returned the next day, and *Laudanum* was given again with the same effect, whereby the Woman was brought in a few dayes to a convalescence her hoarseness remaining for a long time.

Riverius.

LXXIII. A young Man about 20 years old, of a thin Body and an hot Constitution, in the beginning of Spring began to have a Fever, the first dayes grievous Vomiting, oppression at his Heart, frequent hot and cold Fits by turns, pain in his Loins, watching, &c. did trouble him. On the third day the Small Pox appearing, these Symptomes abated; yet the Fever with thirst and heat continued: Not only the Decoctions usual in this Disease but the most grateful Juleps were nauseous and troublesome to him: Whenever at the hour of Sleep he took *Diastordium*, or any other temperate Cordial, to continue transpiration, though but in a little quantity, he was very restless the Night following, and the next Morning bled at his Nose; which, when the Small Pox indeed were fully come out, happening once and again upon this occasion, the Patients safety was highly endangered. Wherefore observing his Blood to be apt to ferment immoderately upon any slight irritation, I according to the occasion insisted on this method, Leaving off all manner of Medicine, he drank small Beer and emulsions of Almonds to quench his thirst, as much as he pleased. Because he refused all Oatmeal and Barly grewel, he had for his Diet Apples boyled till they were tender, and then seasoned with Sugar and Rose water, which he eat several times a day. Nature being content with this thin course, and seeming to be disturbed with any other, happily finished her work, so that the Small Pox ripening and then falling off of themselves, the Patient recovered, without any grievous Symptome afterwards.

Willis, de feb. c. 15.

LXXIV. In the middle of Autumn a young Man, who had a sharp Blood, and had been often subject to bleed at the Nose, was ill of the Small Pox: His Blood fermented immoderately of it self, so that the Pustules came out very thick all over his Body. Whey with Marygold flowers and other things usually boyled in it, also Juleps, and all Cordials, though temperate, which cause but a gentle breathing, did most certainly set him a bleeding. Wherefore I prescribe such a course of Diet, as I did before (§ LXXIII.) upon which he was better. However at the very height of his Disease (for when the Small Pox are fully come out, a Fever usually returns in all People, because transpiration is stopt) this Sick man fell into plentiful Bleeding, so that after a large profusion of Blood, the Small Pox began to grow flat. After he had in vain tried many Remedies to stop Bleeding, at length a bag with a Toad in it (that was

dried in the Sun and bruised) was hung about his Neck, and at the very first he immediately found benefit by it, for his Bleeding was presently stopt, and it returning no more (for he carried this Epitheme constantly ever after in his Bosome) the Patient still continuing his cooling diet, perfectly recovered.

Idem.

LXXV. I visited a young Gentlewoman, of a florid countenance and hot constitution, when she was 4 Months gone with Child, she was troubled with grievous Vomiting, a most violent pain in her back, and extrem heat and thirst: Her Pulse was very quick, strong and vehement. Although the Small Pox were no where thereabout, yet these Symptomes gave me no small suspicion of this Disease: However, the excessive effervescency of the Blood did indicate the letting of it, therefore I presently took away about 6 ounces; then the heat abated a little, yet the Vomiting and pain in her back continued still. At the hour of Sleep I gave her a Cordial Bolus with half a grain of our *Laudanum*, upon which quiet Sleep succeeded, with a pleasant Breathing, and a ceasing of all the Symptomes. The next Morning the Small Pox came out, which although she had them very full, yet she recovered without any dangerous sickness or fear of miscarriage, and went her full time.

Idem.

LXXVI. A Woman was brought to Bed, and the same day her Children in the same House were taken with the Small Pox; and she her self, as it seems, had taken the Infection, for the second day after her delivery they began to come out with a Fever and pain in her Loins, which indeed in 3 dayes, her *Lochia* flowing moderately, did rise well: Although she cleansed well all that time, she was very full of the Small Pox all over her Body, and not only upon the out side of her Body, but they filled her Mouth and Throat, so that she could scarce speak or swallow. The sixth day after she was brought to Bed, her *Lochia* flowed immoderately, upon which the Small Pox immediately growing flat, she was taken with Swooning, frequent Convulsions, and other ill favored Symptomes, which threatened sudden death. I prescribed her half a drachm of this powder, to be taken constantly once in 3 hours, in a spoonful of the following Julep, that is; Take of Tormentil root powdered 2 drachms, Bole Armenick 1 drachm, *Species de hyacinto* half a drachm. Make a Powder. Take of *Aqua Scordii composita*, water of Dragons, Meadow-sweet each 3 ounces. Treacle Vinegar 1 ounce, Syrup of Corals 2 ounces, burn Harts-horn half a drachm: Make a Julep. I ordered also Tormentil root to be boyled in all her Broths, and drink; by these Remedies her Uterine Purgation wholly stopt, and the Small Pox ripened by degrees without any more grievous Symptome, and fell off. This was a difficult case indeed, and was managed with great hazard, to wit, it was dangerous to keep in either the *Lochia* or the Small Pox, and yet a full eruption of either one of them, hindered the others motion; As long as they both proceeded moderately, the case, being left to Nature, was moderate. But when one exceeded, the help of Art was required. Thus it was convenient to use the curb to the *Lochia* and the spur to the Small Pox.

Idem.

LXXVII. As to meat, the *Arabians* teach that no Flesh, no not a Chicken is proper in this Disease; yea, they condemn yolks of Eggs before the Fever be over, and the Pustules be suppured, and scale off. Which seems to be a bad rule, for Children are often Sick, who, according to *Hippocrates*, want much nourishment: Besides, before they begin to scale off, 10 or 14 dayes are usually over: But to keep Children so long a time without some good food were very pernicious. Wherefore I can by no means follow the *Arabians* advice; But when I see the Sick are out of all danger, I use to feed them

them more liberally, so as their strength may be supported, and the solid parts restored, and then I give them yolks of Eggs in broth with Verjuice or juice of Lemons. And by this way of cure I can attest, not one has died in my Hands, since I practised Physick.

Mercurialis.

LXXVIII. The Measles and Small Pox agree in this, that the Pustules in each are caused by the ebullition of the Blood, while Nature separates the bad from the pure, and forces it out to the Skin: wherefore one may easily gather, that Nature must not at that time be diverted from such expulsion by gross or much food, or that is hard of digestion. But, that Nature may do her work the better, and may drive the noxious Humours from within towards the Skin more conveniently, and lest some Humour might be detained in some of the inner parts, we must give them meat that is a little cooling, and gently astringent; for such as this strengthens the parts, that they can more strongly drive out what is troublesome, besides, it has a virtue to repel hot Humours. Wherefore the broth of Spanish Lentils, with the herb Sorel, green Coriander, Oyl, Vinegar and Salt is very good; Also Gourd boyled, with Purslane, Oyl, Vinegar and Salt; Ptilan, as we prepared it in colliquating Fevers, is very good for them. All things must be avoided, which increase Blood, or add to its ebullition. Wherefore in the beginning, while they have strength, chicken broth, and all sweet and unctuous things must be avoided.

Brudus, de
vittu febril.
lib. 1. c. 22.

LXXIX. But when they begin to go off, it is good to mix such things in meat as loosen the Belly, as Prunes, Violets, Borage and the like. But Prunes that have an Astringent Faculty, as French and Spanish, may be used all the time, boyled with black Maiden-hair, or Purslane, or Plantain. And let the drink of such as have the Small Pox or Measles, be Barly water boyled with black Maiden-hair and Pomegranate.

Idem.

LXXX. There are some, who give Lettuce boyled in Vinegar, and the pulp of Citrus and water-Melon; And some give water of water-Melon to drink. But, as I think, these Meats do more hurt than good: Because they hinder Nature's expulsion, and by their excessive coldness retard the coming out of the Pustules; for such expulsions as these from within to the Skin, are made by Nature, the matter inclining that way, because it is then turned to Vapors, being of a thin substance. Wherefore as the ebullition must not be encreased by hot, fuming things, so neither may it be extinguished by excessive cooling things.

Idem.

LXXXI. Whenever the Small Pox are epidemical, and have grievous and dangerous Symptomes attending them, we must take care quickly to remove Children and the younger sort, who have not yet had the Small Pox, into a more wholesome Air, where no Small Pox reign, and to keep them there till they either cease or grow more kindly. But on the contrary if they be kindly and well conditioned, that is, if most People have but few, if they come quickly and easily to suppuration, and if they fall off without any notable disfiguring, then I am so far from perswading you to avoid the Air that breeds the Small Pox, that on the contrary I think it advisable, to let the Children, that are yet well, be in the same Chamber with the Sick, to the end they may have the Small Pox, while they are gentle.

Sylvius de le
Boc.

(Of the Measles see more BOOK XI.)

Medicines especially made use of by eminent Physicians.

1. In the Small Pox and Measles Oyl of Gold is very good. ¶ The use of *Mercurius vitæ* is good for Children, when you fear they will have the Small Pox. ¶ *Mercurius vitæ fixus* is very good in the Small Pox. Joh. Agri-
cola.

2. This is admirable good for a scar in the Eyes left by the Small Pox; Take of juice of Dasy clarified 2 ounces, juice of red Poppy 1 ounce, water of Honey 6 drachms. Mix them. Drop a little into the corner of the Eye. Augenius.

3. This is very good to take out the pitting of the Small Pox; Take of Oyl Olive 1 ounce and an half, juices of Lemon 6 ounces, washt Litharge, ashes of burnt Snail each half an ounce, fat of an Hen half an ounce. Mix them for a Liniment, after which the Face may be washed with a Decoction of Lupins. Claudius.

4. To drive out the Small Pox give *Avicenna's* decoction, of Figs, excoriated Lentils, and tragacanth. Take it 4 or 5 times Morning and Evening. ¶ A draught also of Fenil water Morning and Evening is good. Crato.

5. I ordered one that had the Small Pox in his Throat, continually to gargle with Goats Milk and Plantain water mixt together warm, which miraculously preserved him. For the same purpose, I ordered him often to swallow Syrup of Pomegranates by degrees, because I had often tried the admirable benefit of it in the like case. ¶ Among things that drive out, some commend water distilled off Lime flowers, as a thing very good for it.

6. I have found the following powder admirable good in the Small Pox, and in all contagious Diseases. Take of Salt of Ash 8 or 10 Grains, *Bezoardicum minerale* from 5 grains to 10. Mix them with *Aqua cornu cervi citrata*, and Angelica water. It is a most effectual, Antilemick, Diaphoretick drink. Joh. Lud. &
Frundekk.

7. To bring out the Measles and Small Pox, this is highly commended; Take juice of Fenil and Parsly, wet a cloth in them warm, and so let the Children be wrapt up therein warm. Or, Take Parsly and Fenil water, wet a double Linnen Cloth in them, wrap the Child up in it warm, repeating it often, it brings out the Small Pox powerfully. Dav. Lipse-
lius.

8. To take off the ill colour of the Skin; Take of Lupines, Beans, Barly each 1 pugil and an half, pound them after a gross manner; boyl them in a sufficient quantity of water, till the water grow as thick as Pap. Wash the Face and Hands Morning and Evening. Mercurialis.

9. I can attest, that by giving half a drachm or a drachm of Columbine Seed in powder, with Mede, or the distilled water of Fumitory, *Carduus Benedictus* or Harts-horn I have saved several Children in the Measles from the Grave. Simon Pauli.

10. The Oyl of Tender Harts-horn and the Skull, may serve Children instead of *Bezoar*, especially in the Small Pox and Measles. Eustachius
Rhodius.

11. The red Oyntment for Children, which is most Famous in the Small Pox and Measles, when you fear them; for the benefit of it is unspeakable, if a little of it be given a Child or a grown Person in small Wine, and then the Patient be covered with Clothes till he sweat, by which Remedy whatever corruption is within, it will break out at the Skin all over. It is made thus; Take of new fresh Butter, that was never salted 2 pounds, *Alcanna* root 2 ounces, red Wine 1 pound, Castor 6 drachms, let the roots bruised be steeped in the Wine for a day, then add the Butter, and boyl them on a gentle Fire till the Wine be consumed, strain

Joh. Steph.
Scrobelber-
gerus.

Strain it, and then put in the Castor. ¶ Oyl and Balsame of Rosemary are approved, in taking out the Pits of the Small Pox, and restoring the Face to its former Beauty.

Venena, or Poysons.

Medicines.

I. NOW that we are treating of the manner how Alexipharmacks act, we presuppose, that Poysons violently oppose the innate heat, or the consistency of the Blood and Serum, and their intimate mixture. 2. That they do not work so much by occult, as by manifest qualities (in regard of the said Hypothesis) inasmuch as they cause a more or less violent resolution of the Blood, according to the degrees of energy in acting. Hence, as many errors have sprung up in Physick, Physicians not thoroughly considering, in what the nature of Poysons consists, and acquiescing in their occult quality only, so also they have been mistaken about the activity and virtue of Alexipharmacks, which have been hitherto thought to work by some occult quality, whence arose so many Elogies of the Bezoar Stone, that it has been reckoned the conqueror of all Poysons, and so in the Unicorn.

II. This is to be observed as a general rule concerning particular Poysons, wherever a particular Poyson is not known, we must fly to general Antidotes; but if it be known, we must oppose to it, besides Universals, which strengthen the Heart and the innate heat, Specifics, that is, proper contraries. And then likewise we must take notice, that there are many Lies in Books concerning Poysons, and there are both Poysons and Antidotes described, which were never seen, used, or any way applied.

III. Poyson directly opposite to our nature is threefold. It hurts, 1. The Spirits. 2. The Humours. 3. The solid Parts: According to the differences whereof the Physician must be diligent and cautious: Nor let him think, that Mithridate or Treacle or Treacle water can conquer all Diseases. And among all Poysons they are the worst, that hurt the Spirits, both because they possess the noblest parts, and because they are difficultly known: For since they are not visible, but for the most part aerial, they enter the Body by Smelling or Breathing, and not by meat or drink. Hence it is, that oftentimes there can be no suspicion of Poyson, and the rather, because, while the Poyson is not yet well rooted, some accidents common to other Diseases appear, which deceive the Physician. Let him therefore have Medicines prepared, which may cherish and defend the Spirits, by expelling the Poyson, which is directly opposite to the Spirits: Nor should he let a Poisoned Prince alone through his negligence, to dye afterwards miserable, as if he had only a little Fever, or some slight Disease. But no Physicians treat of Spirituous Poysons.

IV. Many who do things hap hazard, take almost all their Medicines from Poysons prepared, when yet this should only be done in desperate Diseases, when gentle things have been tried in vain, according to Hippocrates, because very bad Symptoms arise, and often times death, upon applying them only outwardly. So a certain Noble Woman, who desired to make her Breasts less, by the advice of a certain Physician applied Hemlock to them: So another, to get the marks out of her Paps and the top of her Breast, applied a Remedy made of Arsenick and other Poysons. But both of them, while they were careful to preserve their Beauties, lost their Lives.

V. Some say, if two Poysons be taken inwardly, they will fight one with another, and leave the Body unhurt, as Pliny writes of Wolfsbane, that if it find an equal Poyson to contend with, it will be utterly destroyed by its equal Poyson, and the Man will live; but if it find no such Poyson, it kills a Man. And the story in Ausonius of an Adulteress who gave her Husband Poyson, and thinking what she had given too little, she gave him Quicksilver; either of which alone, the Poet thinks would have poisoned

Panarolus
Obs. 27.
Fensce. 3.

Borellus,
Cent. 2. Obs. 3.

poysoned him; but both together one destroyed the other. I cannot allow this, for I know, that Wolfs-bane taken by a sound, or by a poysoned Man, has alwayes a mortal faculty. And I should think that Physician very ill advised, who should give one Poyson after another, that one might weaken the other. *Ausonius* his Adulterers cured her Husband, not because of the fighting of the two Poysons together, as he thinks, but because of the weight of the Quick-silver, that carried down the other Poyson before it was actuated.

Augenius.

VI. *Avicenna* sayes, that in the Venome of Venomous Creatures, which go right to the Heart, Bleeding drives the Venome to the Heart.

Palmarius.

VII. We know that *Diaphorides* and other ancient Physicians evacuated generally in curing of Poysons. In the Poyson of a Sea-Hare, l. 6. c. 30. he gives a drachm of Hellebore and Scammony. *Avicenna* in the bite of a Viper gives Turpeth, and writing of Agarick, he sayes, it is very good against Poysons, if it be taken in Wine: And not only as it acts from propriety, which many of the moderns have thought, but as it purges, for he gives almost 2 drachms of it, which quantity will purge sufficiently. But if purging would hurt those that are poysoned, so great a quantity of it had not been given.

Rubens, in Celsum.

VIII. A Savoyard, a strong Man and Phlegmatick about 40 years old, dwelling near the lake *Lemane*, was, together with his Wife, poysoned at a Feast. She died a little after, he, being very ill, left the care of burying his Wife to his Friends, and crossed the Lake to me about 6 a clock in the Morning. Aphorism 6. 1. of *Hippocrates* came into my mind. Wherefore when I found, that the Poyson was still in his Stomach, from his pain, belching and other signs, and therefore there must be occasion for a strong Vomit, I gave him immediately 6 grains of prepared Antimony in substance (for the violence of the Disease would not admit me to give the Infusion) with 2 scruples of *Confessio Alkermes*, and a little Harts-horn burnt and prepared. The same day after he had Vomited much, the pain and burning at his Stomach almost wholly abated. Every day after he took some strengthening Electuary. For his ordinary drink he had nothing but Almond Milk with Sugar and a little burnt Harts-horn prepared. Within a few dayes he was perfectly well.

Hildanus.

IX. If Poysons be taken inwardly the whole stress of the Cure lies on Vomiting, and giving of Alexipharmacks after. And the Vomits must not be strong and malignant, but gentle and made of such things as have a smoothness in them, as water with common Oyl, of *Sesamum*, Nuts, &c. that if the Poyson have any Acrimony or Corrosive virtue in it, it may be taken off, and the internal parts guarded as it were against it, such as the said Oyls, or fat broth with a Decoction of Broom-flowers, Milk, Butter, Radish and the like. Nor is it sufficient to provoke Vomit once, but it must be continued so long, till no more signs of the strength of the Poyson in the Stomach can be found, from taste, smell, reaching, pain and biting.

Sennertus.

X. But Alexipharmacks or Bezoarticks are either 1. Refiners of putrefaction, and things that preserve its oily parts safe, that it may not turn flat, and that by inflaming and invivifying it, and indeed the more volatil, such as bitter Aromatick, Oily and Balsamick things are, *Angelica*, the Carline thistle, Zedoary, Myrrhe, *Opobalsamum*, Juniper berries, &c. sharp Volatils, Sulphureous and Saline things, as Plow-man's treacle, Garlick, Camphire, &c. Spirit of Harts-horn, Ivory, &c. and acid, by concentrating & penetrating together, Juice of Citron, Vinegar, *Acetum Bezoarticum*. And these are especially proper in Epidemick Diseases arising from a thorow putrefaction, as the stench of dead Bodies, also for Fevers in Lying-in-Women, both

for prevention and cure, also in the biting of a mad Dog and of Spiders.

XI. Or. 2. They hinder Ichorefcence, resolution, and too great rarefaction of the Blood; and so respect the tie, and as it were the individual copula and conjunction of the Serum and Blood, whether they be a little austere Astringents, in which respect Tormentil and Bistort are Famous, but not so convenient for costive People; Or Mucilaginous, as *Cornu corvi Philosophicum*, Gelly of it, *Scorzonera*, or earthy Absorbents, and precipitators of the resolute ferment, as burnt Hartshorn, *Unicornu fossile*, Bezoar stone Oriental and Occidental, and the Bezoarticks of the Chymists, which have no peculiar Alexipharmack virtue, but only to soak up and disperse; wherefore we must not alwayes trust them; Or Acids, which obtund the Sulphur of the Blood, as acid Spirits, volatil Spirit of Salt, compound Spirit of Salt and Nitre, &c. Or Opiates, which indeed, especially joyned with other things, deserve to be reckoned among Bezoarticks, so they be given as they should, and at a due time. For if any thing do it, certainly Opiates preserve the Bond of the Serum and Blood inviolable; wherefore Treacle made without *Opium* does not cause Sweat, nor answer expectation. And these are very good, especially in the Sweating Sickness, a Malignant, Epidemick Dysentery, and in other Malignant Diseases, where there is heat in the Bowels.

XII. Or 3. They promote Serum and its motion, and hinder its coagulation and thickning by boyling (if I may so say) such as, besides some of the foresaid things, that make it fluid, as Salt or Nitrous things, or volatil both Urinous and Mercurial ones, as native Cinnabar, Cinnabar of Antimony, *Mercurius fixus diaphoreticus*. For it must be observed as a rule, In Malignant Fevers, wherever the Serum is as it were coagulated, and then no Sweat can be got, but all things are burnt up as it were, Cinnabarines prudently mixt with other Bezoarticks, do mightily promote its fluidity. But if the Blood incline to dissolution and ichorefcence, they must be wholly avoided, nor are they safe or to be trusted in the convulsive motions, which then follow, from which very thing a vast difference in their power of acting arises: And things that increase it in substance or quantity, and refresh, and dilute it, as distilled waters, Decoctions, Infusions, and especially Emulsions, which in Malignant Diseases are of great advantage to this very end: For unless this Serum be restored, which it may be by plentiful drinking (so it be not too much) all endeavours besides are to no purpose, and sleep especially cannot be recovered, but a violent delirium must of necessity arise from continual waking, and then convulsive motions. These things are good in general for Poysons, either given designedly, or taken by mistake, by defending the Heart and preserving the tone of the Blood inviolable, and for Malignant and Pestilential Fevers, Hungarian, Spotted Fevers, of Lying-in-Women, Small Pox and Measles, and such contagious and ill natured Diseases.

XIII. No one Alexipharmack does equally resist all Poysons, and therefore no more must be attributed to any than what experience can testify. There are indeed three of general use, which a good Physician cannot be without; The Bezoartick Tincture in a liquid form: Treacle and Mithridate in a middle form (whither the like Electuaries, Orvietan, &c. may be referred) very ancient Medicines, approved by so many ages, and therefore, though they be made up of a strange Medley of Ingredients, not lightly to be rejected: In a solid form, Bezoartick powders, but great prudence is required in giving them.

XIV. The promiscuous use of Alexipharmacks is not convenient, therefore the distinction of them according to their strength is necessary, into Volatil,

K k k

til,

til, Middle and Fixt. Therefore *Weiffelius* in *Grato's* Epistles 248 wisely distinguished such Medicines into a twofold *Classis*, namely, Of Absorbents, or of Hydroticks and Sudorificks properly so called, which except it be done, a great deal of ambiguity and controversie must arise, yea and by this means the application will be worse than Empirical.

XV. In the beginning Volatils are most needful, for greater penetration and quicker discurſion: Also where the Malignity is intimate, when nature ceases from expulsion of the Fever Spots, Small Pox or Measles, or these *exanthemata* seem to go in, with difficulty of Breathing, oppression at the Heart, &c. In the progress more fixt ones, where namely there is most need of alteration and precipitation, especially about the state and declension, when the Tumult is laid, Watry things are of a middle nature, and may be joyned to either.

XVI. The more temperate and mild are most proper for Women with Child, Infants and weak Persons, and where the Blood enclines most to Ichoreſcence. Wherefore when Treacle is not proper, *Diaſcordium Fracaſtorii*, as a more temperate one, has place. Where there is no place for *Tinctura Bezoartica*, though it may be qualified, there a Bezoartick powder may be given: For if too Volatil things be given to such, the rarefaction of the Blood is the more increased, and so further mischief may arise.

XVII. Poyſon is not removed only by Sweat: for the Serum must not be wasted too much; Wherefore neither hot things alone, nor temperate things alone, nor sweating alone with any Medicine whatever, is sufficient. In which thing both the vulgar are mistaken, who think they can do all things with powder of *Carduus Benedictus* or Harts-horn, and the Physicians also, who weary their Patients with continual Sweating: for all things should be done according to Nature's duct and indication.

XVIII. We must not trust too much to Medicines made of Serpents, Vipers, to Bezoar Stone, Unicorn, &c. For Salt of Vipers among Volatil things deserves high commendation; Bezoar Stone and Unicorn among fixt ones; but let no Physician trust to the powder of Vipers, nor let him believe in general, that by these alone he can conquer this Lernaean Hydra, to wit, the Poyſon.

XIX. It is better to abstain from things suspected than to use them, at least not alone, such as *Nux vomica*, root of Leopards bane, although it be much used to make Men vertiginous: For it is better to use select things, than to rely on an uncertain effect, which, if it succeed ill, may be ascribed to the Medicine.

XX. Alexipharmacks taken betimes before one go to Sleep, are more effectual, yea by this means Men often quite nip the Disease in the Bud, which is *Helmont's* observation, and most agreeable to experience. Therefore one must not sleep upon them, for in Sleep the Poyſon may easily creep to the Heart.

XXI. And Volatils are inconvenient, especially for Caco-chymick Bodies; wherefore upon urgent occasion leniments, and Balsamick evacuators may be used. But though the Malignity be great, yet we must have a care, that we confound not the Humours with any Alexipharmacks promiscuously.

XXII. And then Authors advise, since Alexipharmacks are of divers temperaments, to oppose cold Poyſons, with hot Alexipharmacks, hot with cold, dry with moist, moist with dry. Which when it can be done, I do not disapprove; But I think we should more regard the Alexipharmack virtue which is properly opposed to the Poyſon, than the manifest qualities. And therefore both Treacle and Mithridate, which are hot, are given in hot Poyſons with success.

XXIII. Let these that Live at the metallick Mines, and at the Furnaces, as also Goldsmiths, Chymists and such take care that they never be without some proper Remedy ready at hand, seeing this of the Poet is true here, *Principiis obsta* (hinder the beginning.) One having Poyſon, it may be Sublimate, given him privately, he swelled immediately in his Head, Lips, Mouth, and all his Body over: A violent heat in his Throat followed with Convulsions: he was given over for lost by all: *T. Knoblochius* gave him *Turpethum minerale* in a large dose thrice in 24 hours, which wrought violently upwards and downwards, then gave him strengthening things, and he recovered perfectly. So we shall scarce be able any other way to expel the malignity of metallick Fumes than by mineral Medicines. Thus a Goldsmith's Boy being very ill of an *Asthma*, was cured by *Mercurius dulcis*.

XXIV. They mistake, who think Alexitericks should not be outwardly applied to the stings and bites of Venemous Creatures, but only be given inwardly: for they think, that if Alexitericks be applied outwardly, they will be so far from drawing out the Poyſon, that they would rather strike it in, Which I allow may hold good in true Alexipharmacks: But if some Medicine should consist of Poyſons and Alexipharmacks, it might do both; by its venome attract through similitude, and by its Alexipharmack virtue cure it.

XXV. *Averroes lib. de Theriaca* and *5. collig. c. 32.* writes, that Bezoardick Medicines are only of use, when the body is infested with poyſon, but that they do hurt to healthy bodies, if given to them: yet he excepts one, which is Citron-feed, this is good for bodies in health. And against Treacle especially he uses 3 Arguments. 1. That all its Vertues are so disposed, that when they suffer nothing from Poyſon, they become like poyſon, themselves. 2. That Treacle attracts Poyſon, and therefore since attraction is made by similitude, it must be like poyſon, and therefore not fit for sound bodies. 3. That is a very strong Medicine, and of great Activity. But *Galen's* opinion is better, who *l. de Theriaca ad Pisonem c. 16.* and *l. de antid. c. 16.* commends Treacle as a most excellent Medicine to defend bodies against poyſon: with whom *Avicenna l. de vir. cordis*, and almost all other Physicians agree, yea experience it self shews, that what things are true and genuine Alexipharmacks, may also safely, and with benefit be given to sound bodies, to defend them against Poyſon. And sound bodies can by no means be poyſoned with true Alexipharmacks, as *Averroes* would have it, but rather acquire from them a certain property repugnant to Poyſons. 2. And Treacle does not attract but resist Poyſon. 3. Although it be strong and of great activity, yet given in a certain dose and with caution, it has its place even in sound people: as is manifest from the example of *Mithridates*, and some Roman Emperors. Yet observe the difference of Alexipharmacks: for some of them have no quality in excess, as Bezoar, *terra sigillata*, Bole Armenick, Harts-horn, &c. which may safely be given to any age and body. But such as are hot and dry, as Treacle and Mithridate, must be given with caution, and care must be taken, that no damage follow the excessive use of them.

XXVI. It may be queried, Whether every venomous creature carry its antidote with it, and whether its flesh be good against its bite or sting. I say, this Position holds not universally true, for however the fat of Vipers, according to our own experience, assuage the wound inflicted by its bite, and the Oyl of Scorpions their own sting: yet this is not equally extended to all. For as to the Viperine and Serpentine Powder in particular, first, I say, the bitings of Serpens are not so hurtful, yea scarce venomous: the Serpent is a dull creature, and if one set on it boldly, it may be handled and killed without harm, and it has far less teeth: But the Viper

Horſius. l. 7. Obs. 25.

Sennertus.

Idem.

per darts its Poyson far quicker into the Body, for it has crooked Teeth, which Serpents have not, and by wounding with these crooked fangs they hurt the Membranous and Nervous parts especially, and besides their *Saliva* full of bile, or a sharp volatil Salt, gets into the wound, whereupon a preternatural, corruptive Fermentation arises. And then we must not altogether and universally give credit to this *Hypothesis*, That the Flesh of Vipers or Serpents expels their own Poyson, either in the cure or prevention: for it were better to drive out the putrid ferment, and hinder the afflux of Humours by Sudorifics and Alexipharmacks, lest because of a caustick, volatil Salt, communicated to the part and Blood, that part itself should be Gangrened, and Convulsive motions should arise. Nor does the vulgar *Hypothesis* hold good, that when one has taken powder of Vipers or Serpents, for this very Antidote Serpents may be handled without harm: for some who have in this manner been over confident, have had the reward of their confidence. Two Noblemen thinking themselves secure in taking powder of Vipers before hand, did nevertheless after this incur danger, and were not well, till immediately after they had taken a Bezoardick.

XXVII. Whether are they, who have once or oftner taken the powder of Serpents or Vipers, for the future, safe from the bites of those Creatures? I answer, It is not confirmed by experience, that if any man have taken the foresaid powder, he is free from the bites of the said Creatures, since it has been often tried, that they who have used this prophylactick, have nevertheless, when they have been bitten in a Nervous place and very deep by Vipers or Serpents, provoked to anger and chafed, violent Convulsions and other dire Symptoms immediately arising, ended their dayes in Groans and Sighs. Besides, if this assertion were universally true, it would follow, that when a Viper bites a Viper, and one man another, there would be no danger in biting one another, since all the bitten Viper consists of the matter of the Viperine powder, and so would be above the activity of the Symbolical Poyson: But it has been tried that a Viper bitten by a Viper has died; and also that a Man bitten by another enraged Man, has been in danger of his Life. Therefore in *Italy*, when Men are bitten by Vipers, they are cured not only by taking the powder or flesh of Vipers, but by speedy Ligatures, Scarifications, Cauterizations, attrahents, and by expellers and Alexipharmacks given inwardly. And whereas some can handle all sorts of Serpents as they list, without danger, though they never took any powder of Serpents, I think this comes. 1. From some peculiar gift or property, granted by Nature to this or the other Man, and sometimes to some whole families. 2. From some mens singular boldness, joyned with a great dexterity in handling them. Besides, provident Nature has implanted a certain dread and fear in Serpents of Men that pursue them boldly: for all those who employ themselves in that business, do confess that the Serpents are so afraid of them, before they see them, and slide away so fast, that they can scarce overtake them or lay hands on them: It happens quite contrary, if timorous men meet Serpents, being moved with hatred they set upon them, and do them what mischief they can: Which very fear may much exaggerate the Poyson received from the biting of these Animals, and disperse it all over the Body, and by consequence cause sudden death; which Poyson of its own Nature is not so very mortal, just as it happens in the Plague, where the timorous are in far greater danger than they who are of a fearless mind. I will easily also grant, that they who have taken the viperine powder, may take heart and strengthen their confidence from thence, so that thenceforth they may not from such hurts be in so great danger of their

lives: for they will slight the hurt, and therefore will be but slightly (yet *ceteris paribus*) thereby affected. Zwefferus.

XXVIII. *Pliny* says that Scorpions in *Italy* are sometimes harmless; nevertheless at *Padua* I have observed their stings to swell much and be very painful. *Petrus à Castro* observed the venome to return in himself and a hen a year after: For when the Sun was passing the Sign *Scorpio*, a black and very Venomous Scorpion stung him in his Fore finger of his right Hand: he presently felt a pain and chilness in his Arm, and a heaviness in his Finger: The Scorpion was taken and bruised and applied to the wound, and other Alexipharmacks; but all to little purpose. He thrust his Finger into a Hen's breach, and his pain ceased in an hour and an half: the Hen swelled and was half dead, yet upon swallowing a little Treacle she recovered, but halted: Upon the return of the very same moment of time the next year, the Hen was convulsed, and fell down trembling and lifeless, till she was restored by taking a little Treacle. That Excellent Person felt the pain in his Finger return at the same time, with a Phlegmonous tumour, who, after sharp and yellow pus had been evacuated, and Antidotes given, he was perfectly well after it. Rhodius, Cent. 3. Obs. 90. *H. Furenius* and I have observed at *Padua* that Tobacco is a Remedy for them.

XXIX. It is observable, that Acids correct most vegetable Poysons, as Monks-hood, Deadly Night-shade, which besides other Symptoms, close the Throat, so that Men cannot swallow Hellebore, &c. which is a manifest token, that their mischief must be ascribed to a volatil Salt, and to a Sulphur, that is immature, indigested, and inviscated with much macilage; wherefore when they are either communicated to the Blood or are still floating on the Stomach, they are apt to obstruct the Pores of the Nerves, and vellicate them, to destroy the frame of the Blood, and to cause death.

XXX. Vomits are good for all, who have eaten Poyson, except such as have eaten Musciromes and are in danger of strangling: for they must be carried downwards, as may be proved from their Antidote, the wild Pear, and other Astringent things. Therefore they must be carried down with Clysters and purging Medicines, and the Mouth of the Stomach must be closed with Astringents, as with Quinces, wild Pears, &c. Their Alexipharmack, according to *Sanctorius*, is Oyl of Citrons. Rondeletius, p. 517.

XXXI. Hemlock according to *Dioscorides*, *Med. l. 4. c. 79.* is a Poyson that kills because of its coldness. Which saying seems to have given Physicians the occasion to determine, that its temperament was cold, without any further search. But on the contrary many Histories of such as have eaten of it, either by chance or through mistake, do show, that it acts on our Bodies, rather by hot, sharp, fierce or otherwise efficacious particles, than by obtuse and torpid ones. Histories of several in *Smetius* his *Miscel.* p. 599. who eat of the Roots of Hemlock boyled instead of Parsneps, prove that it is hot, and does hurt by its hot particles, for they were all mad: Then, it has a nauseous, loathsome scent with it, like wild Parsnep. *Galen* *5. de s. m. fac. c. 18.* calls it even aliene and adverse to Man, while it is yet whole: then it pricks the Tongue with a certain Acrimony, and it is manifest, that its sharp taste is hot. Some of it was given to a Dog: he vomitted, and was very convulsed, when his Body was opened, his Stomach was found contracted and corrugated; the mucus being wiped off, the inner superficies appeared redder than it ought, and there were red and livid Spots in the bottom of the Stomach. It created a certain anxiety in the Dog by gnawing and convulsing the Nervous parts of his Stomach; Convulsions are an effect of no dull and cold cause, the red superficies of the folds show it to be hot and almost caustick. Therefore

caution must be used in reading and imitating those who give Alexipharmacks promiscuously, before the use of evacuators, or when the Hemlock is not discharged out of the Stomach. Many advise generous Wine; but according to *Galen* and *Pliny*, drunk with Wine it sooner kills, because its Acrimony is encreased by the Wine, and more easily carried to the Vitals. Therefore let Vomits be given presently to discharge it, and it is not necessary that they should violently irritate and provoke the Stomach, when the Stomach is already purged up, let large draughts of warm water and oyl be often repeated, for so the wayes are made more lax, and the Vomit comes sooner & with less straining. You must proceed in these draughts, till all the Hemlock be discharged out of the Stomach.

*Wepferus de
Ticina. Aqua-
tica.*

XXXII. Henbane is thought cold in the third and dry in the first degree, the reason is, because *Galen* has said so, and because it is used successfully to hot distillations, to thicken, obtund and sweeten Rheum. But I reckon the same fate has befallen Henbane which befell Hemlock, while its virtues have only been cursorily observed, and almost only according to one or two Mens sayings of it. In the year 1649. A Sallet was prepared, whose matter should have been Cichory roots boyled: they grew on the same Bed together with Henbane: Hereupon some found their Heads go round, others had their Tongues and Lips distorted, their Throat harsh, &c. There was one who studied to take off the heat of the Mouth with a Gargle, but the Tongue was as if it had been fried in a pan, and refused all Medicine. The madness and intemperance, which befell some, were not so very dull, that they could be imputed to cold, &c.

Idem.

XXXIII. Hemlock (as Henbane also) is the safest and certainest way got out of the Stomach by Vomiting. Purges would carry it off by long windings and turnings, not without danger, whilst a new affliction would be added to the Patient sufficiently afflicted already with the raging torments of his Stomach, when the enemy were forced to the Guts, to which it would be no less troublesome than to the Stomach, and some of them would be less able to bear it, because they are tender, and endued with a most exquisite sense. And this must be done before the use of any other Medicines, lest the virulence of the Hemlock be sharpened, the irritated stomach be exasperated, and the Hemlock or the ferment of the stomach tainted with its juice, get into the Guts, and being mixt with the Chyle, into the mass of blood. *Dioscorides* seems to advise the same.

Idem.

XXXIV. When all or the greatest share of the Hemlock is got out of the stomach and guts, *Dioscorides de Alexipharma. cap. 11.* thinks, then men should drink generous wine, as the greatest and most present remedy. *Pliny n. h. 25. l. c. 13.* without doubt commends a hot Wine, because he thought Hemlock among many other things to be cooling, which he plainly intimates, when he affirms, that the juice made of the feed kills a man by thickning his blood: But since from many reasons and experiments it is clear, that Hemlock is hot, Wine must do good some other way than by heating; and it appears more probable to me, that Wine, when the Hemlock is got out of the stomach, is therefore a more present remedy, because it speedily repairs the Spirits lost by the vehement affliction, raises them oppress, because the circulation of the Blood is sometimes hindered, and sometimes most confused, and this way above all others it restores the strength. Wine will do these things more effectually, if according to *Dioscorides* his advice Wormwood, Pepper, Castor, Rue, Mint, *Anonum*, *Styrax*, Nettle-seed, Bay-leaves, be added, or any of the like nature found out by *Dioscorides* his followers. The great Antidotes, Treacle, Mithridate, Orvietan, will do good, in as much as they

dissolve the Blood and *lympha*, while they stagnate somewhere or other, their circular Motion being intercepted, through the conflict upon taking the Hemlock, and therefore leave behind them some oppression of the Spirits, weariness, and other troubles.

Idem.

XXXV. *Santorellus* his Advice, *Antipr. l. 21. cap. 10.* must not here be passed by, who, after he had not disapproved Sudorificks in the fore-said Cases, if the Poyson had insinuated it self to the inmost Parts, and had preferred for a Poyson newly taken fat things, Milk, Butter, Oyl, subjoyns at last, *That drinking of warm Water and Milk, does good, because they have a power to extinguish Heat, which Poysons for the most part cause.* Yet this must be carefully observed, that Milk must not be immediately drunk after Wine, nor Wine upon Milk, lest it should curdle, whence new Disturbances might be feared; which they do experience, who endeavour to cure or assuage the Gout by drinking of Milk.

XXXVI. Antimony is as it were the spring and source of many excellent Medicines, while the energies of all Metals and Minerals, and the Cures of most grievous Diseases are comprehended in this as in an inexhaustible Abyss, so that wholesom Medicines may be got out of this, as out of *Amalthea's* Horn, which by dissolution and absterfion remove and consume Impurities and morbidick Ferments which are Enemies to Nature, together with their Anodyne and comforting Virtue. Yet seeing, according to *Paracelsus*, it is the mere Marcasite of *Saturn*, having an Arsenical Sulphur in it self, it is not void of all poysonous Quality: for it has in it a certain subtil acid Salt, which consists of a poysonous Vapor or Steam, almost of no substance; as is manifest from its Glais; for an halituous Poyson is sent from the Antimony either by the flame of the Fire, or burning of Nitre, then the *Minera*, or its salt Subject is again sated with the said Spirits of the acid Salt, which yet because they consist of Flame and Nitre, are not proper to the Antimony; yet in the mean time they exercise the same violence.

Hobmannus.

XXXVII. Some maintain that Quicksilver is harmless, because it is taken by many, yea, by Children in the Worms, without damage: Others, backed by Experience, say it is poysonous, because it, just as other Poysons do, causes Stupidity, Convulsion, Trembling, the Palsy, Epilepsy, Apoplexy, Swooning, yea, sometimes Death; and they are seldome found to be long-lived, who dig in its Mines. And I think this latter Opinion more consentaneous to Truth. As to the Experience of them that have taken it without hurt, that excludes not its venosity. For, that an Action may be done, a right application of the Agent to the Patient, and some continuance of time, is required, which if wanting in them that have taken Quickilver, it can do no hurt: For it is given either alive or prepared: If alive, it is less hurtful, for seeing it is a Body most exactly mixt, and its minime Parts do pertinaciously one stick to another, which is the reason, why it is perpetually moveable, while it is entire and alive, and that it does our Bodies little or no harm, but is presently voided by stool: for in the very same manner as a leaden Bullet swallowed, is voided presently, without any harm done; but if it be dissolved into minime Particles, and tarry till it contract rust, it may do much mischief: So, if Quickilver be taken entire, moveable and coherent to it self, and by reason of its mobility be presently voided the Body, it does no harm; but if it be resolved into minime Parts, especially by the admixtion of Salts, and by their means be sated as it were to the Body, and penetrate into it, both outwardly

wardly and inwardly used it causes most grievous Mischiefs, as either sublimate or precipitate doth shew. Nor must the corrosive Virtue be attributed to the Salts, for in the Fume, that exhales in gilding of Silver there is nothing of Salt, and yet it is exceeding mischievous: Nor can that little Salt, that is mixt with sublimate or precipitate, do so much damage, seeing Salt, though given in a great quantity, does no such thing. As for prepared Mercury, many indeed extoll Mercurial Medicines: some call the precipitate Powder *Angelicus*, otherwise prepared *Mercurius vite*: Some judge, that *Mercurius dulcis*, rightly prepared is as gentle a Medicine, as *Manna*, *Tamarinds*, or *Cassia*: But these praises are too high, and their rashness is to be blamed, who give Mercury in any Diseases whatever, for there are many Examples of such as have perished, or been in great danger of their Lives by the use of such Medicines: Therefore *Fabricius Hildanus* calls *Mercurius vite* either *Mercurius mortis* or *vite aeterna*. It is certain that *Mercurius dulcis*, which yet is reckoned the mildest, may sometimes do mischief. ¶ Although Quickilver, as quick, and moveable, be not Poyson, nor have any affinity with Poyson, so that it has been experienced, it may be taken safely inwardly; yet the Physician must be very cautious in this, lest it be adulterated, or ill prepared, and that he give it not to Hypochondriacks, Spleneticks, and others that have too acid a Ferment in there Stomach or a Blood abounding with strong, acid and corrosive volatil Salts, which might render Mercury of the Nature of precipitate. For that Mercury resolved, whether precipitate or sublimate, is a Poyson, the dire Symptomes, common to other Poysons, which it immediately causes in the Body, as soon as it is taken, do evince.

XXXVIII. But Precipitate, Arsenick, and Metallicks of the like Nature, &c. as they act plainly by a manifest, that is, by a corrosive Quality, so Treacle, which is properly designed for the Venemous bitings of Animals, and was invented therefore, will scarce alone do these any good; but Obtunders and Aswagers, fat Things, Oyl of Sweet Almonds, common Oyl, &c. serve instead of an Antidote. Therefore they who on the Stage do commend their Treacles by taking Mercury precipitate or Orpiment, do first fore-arm themselves with store of Butter. Then Precipitants of mountain Crystall and other things are given, which of themselves in a slight case might do good, for though they be given in a large Dose, and Nature do not ease her self by spontaneous Vomit, they are in vain; For neither a proportion between the Agent and Patient can easily be found, nor can the Antidote be so well situated by the Stomach, if the Stomach be ruined, and a mortal Eschar and a Gangrene be caused therein. Saturnines taken inwards, as leaden Bullets, do turn into a kind of *Saccharum*, and are corroded by degrees, upon taking Acids.

XXXIX. *Mercurialis*, writes, that to drink Water plentifully is admirable good for such as have taken Arsenick. He proves it first from the example of Dogs, which he put into Caverns, where Arsenick was, and when they were taken out lifeless, he poured Water into them, and they revived. Secondly from Mice, which, they say, escape, if they drink Water. But as I do not dislike Water, so *Forestus lib. 30. obs. 5.* seems well to disapprove of drinking cold Water, because it checks not the Poyson, but seems rather by its coldness to retain it in the Body: warm Water, drunk till one vomits, seems more convenient.

XL. It is queried, whether crude Cinnabar may be given? *D. J. Michailis* approved of it, but

depurated, which is to be valued in the most desperate Diseases, with a multitude of Symptomes; for though directly and of it self it be not a Diaphoretick; yet it is an useful Exalter, and a most pre-ent and safe Alexiterick. But Cinnabar of Antimony, say some, dissolved in warm Water, turns into a white Powder, of the same Nature with *Mercurius vite*: The native is easily turned into running Mercury, and so that back again into Cinnabar: And therefore since both of them retain their pristine Nature, they may cause the very same Symptomes, as Mercury either crude or prepared. But these Arguments do not at all deter me from the use of it; for first of all, that mechanick one of the transmutation of Cinnabar of Antimony with hot Water into white *Mercurius vite*, is false: Then grant, that Mercury may easily be got out of native Cinnabar, what then? Mercury tied up with the Sulphur of Antimony in the Cinnabar, is not at its Liberty, but being tied with the Fetters of the other, is then wholly free from these grievous Disturbances, which, either at liberty or entangled with corrosive Salts, it uses to raise, and it has those illustrious Qualities, which resist contagious and epidemical Diseases, and the Plague it self by a singular propriety (if it be worn outwardly.) And though this Cinnabar, when taken, yield not to the digestion of the Stomach, nor can be received into the economy of our Body; yet as long as it stays in the Stomach, it variously and admirably affects our Ardens by alteration.

XL. Many have taken notice what grievous Symptomes may arise from curdled Milk; but the Question is, whether a Vomit be convenient to get it out of the Stomach? *Matthiolus* denies it, and rejects a Vomit, because if one should endeavour to bring it up, it might easily stick in the Throat and choaka Man. But *Sennertus 6. pract. p. 8. c. 34.* prescribes Vomits, but after Things have been given to dissolve Milk, as *Oxymel*, *Mummy*, *Sperma ceti*, &c.

XLII. In a certain Village three had eaten of one Thing, and they were all Poysoned, and were taken with a violent Pain at the Stomach: One of them sent his Urine to me; which when I looked on, it was thin of Substance and of a green Colour, which gave some suspicion of Poyson: For a green Urine, according to *Avicenna l. 1. feb. 1. c. 2. doct. 2.* signifies a Convulsion in Children, or that Poyson has been taken. And if there be an *Hypostasis* (or settling) in it, there is Hope of Life otherwise there is danger. When he that brought me the Urine, had told me the Story, he increased my suspicion. Therefore I prescribe him a Vomit, and that he should also take fat Things, whereby, as I afterwards understood, he was presently freed of his Pain, and was cured: but another, before he could take any Advice, died suddenly: and the third, when he understood that I had cured the former, did after some delay send his Urine to me: I prescribed him a Vomit also of a decoction of Rhadish and *Oxymel*, and after he had taken Treacle, he was well. For Treacle is a common Remedy against all Poyson: I could not prescribe a proper Antidote; because I knew not what Nature the Poyson was of: but by these means their Pain in their Stomach ceased, and both of them were cured. ¶ *Cardan* Foretold cured some, that were dying of an unknown Poyson, by giving them Milk to drink.

XLIII. It is found by experience that a Mule, when his Guts are taken out, has such an attractive and dissolving Virtue, that it is able to extract and dissipate Poysons. As it was proved in *Valentine Borgia*; Pope Alexander the fifth his Son, who being enclosed in a Mule, which had its Guts taken out, immediately overcame the violence of the Poyson. ¶ In the year 1629. *Falcini* an Illustrious Patavine

Patavine, having by Gods mercy escaped great treachery, had a present of Wine sent him, which when he had tasted, he was long tormented with an Ulcer in his Stomach, and by Sylvaticus his advice, after *Valentine Borgia's* example he escaped, after he had been inclosed, in a Mule, whose Guts were taken out, the Poyson being drawn from within to the out-parts of the Skin. And an accident showed that the Wine was poysoned with *Mercury sublimata*, for as many as drank of it, found the Poyson, one of his attendants among others, after he had pissed Quick-silver (which, however it be prepared, is restored to its former shape by dropping some Spirit of Sale upon it) escaped.

Rhodius,
Cent. 3. Obs.
77.

XLIV. A Nobleman had a Son, who consumed away and at last died: After his Body was cut open, a certain hard mass, like unto horn, was found in the bottom of his Stomach, which was sent to his Father: He in memory of his Son caused a Spoon to be made of it, which he often used at the Table: It happened that when this Spoon was put into a Sallet of Water Cresses and Vinegar, it dissolved. Hence we may easily conjecture, that Water-Cresses has no common virtue against a *Philtrum*.

Schenckius.

XLV. We must know, there are three sorts of Diseases, which are held to come from Witchcraft. The first is no way Witchcraft, but when the Devil observes any one will be taken with a Disease, as he is well skilled in natural things, he persuades Witches and Wizzards, that if they will but do what he orders them, the Man will fall into such a Disease, into which notwithstanding he would have fallen, had the Witches done no such thing: And in the mean time the Witches think the Disease was caused by their power. Secondly, there are other Diseases, which indeed are not caused by the Devil, but by natural causes, while he changes the natural constitution, and corrupts and alters the Humours. Thirdly, there are Diseases, which are simply caused by the Devil, without the Mediation of natural Humours. As to the first sort of these Diseases, it is most manifest and without doubt, that it may be cured with natural Remedies: But the third cannot be cured by natural Remedies, because natural things can have no influence upon the Devil, who is a Spirit. And natural Medicines are good to cure the second sort, however they are not sufficient alone, but besides there is need of a divine cure. For since in such Diseases two causes concur, the Humours and such things as are in a humane Body, and the Devil besides; although the former cause be removed, yet unless the Devil cease from acting and hurting, a perfect cure cannot be expected. And these natural Medicines are either such as evacuate those vitious Humours, which the Devil uses in causing Diseases; or alteratives and Alexipharmacks contrary to the dispositions caused by him, amongst evacuants Vomits are chief, by which, it is evident, many stubborn Diseases have been cured, whose cause lay in the Stomach, Mesentery and thereabout: Therefore *Rulandus* cured *Demoniacs* by giving Vomits: for these vitious Humours being taken away, the Diseases, which by their means the Devil had caused to cease; Nor indeed must Purgatives be neglected. *H. ab Heer's* obs. 13. tells how one who was hurt with a Philtre was purged by Urine, and so cured. As to Alteratives and Alexipharmacks, we must observe that the word *Veneficium* is sometimes taken for Incantment, and an action absolutely magical; sometimes for a Disease caused by *Philtre*. Therefore when in Authors you find that this or the other Herb is good against *veneficia*, they are for the most part to be understood of secret Poysons, rather than of magical actions. For since there are common Alexipharmacks, they may very properly be used in these Poysons, whose natures are for the most part hid. Yea perhaps one may use them

with success even in Diseases caused by the Devil, seeing he also is able to cause poysonous Dispositions in the Body, which may be conquered by such Medicines. Yet in all these natural Medicines, both outward and inward, this must be observed, if we may use them (because often in occult Diseases we may try various Remedies) that they be used without all manner of superstition, ceremony, pronounciation of Words and the like, and that we rely only on their natural Powers, and leave the rest to God.

Sennertus.

XLVI. Because they say, that in these Mountains there is no small number of Witches and Wizzards, by whose Witchcraft several are oftentimes bewitched, I will therefore describe a true and proper Alexiterick to drive away such a Poyson, which I tried at *Geneva* with admirable effect in a certain Girl of *Lions* originally, about 6 years old, who had been long since bewitched by a certain Witch, she was almost quite emaciated, dumb, destitute of her motive Faculty, very voracious, who upon taking a certain Alexipharmack twice or thrice, and repeating it, begun both to Speak and Walk: A little while after her Father signified to me, she was perfectly well. And this Antidote is Dogs-tongue, yet not the common, but that which is described by *Dioscorides*, l. 4. And we have hitherto used the Leaves, not having yet tried the Roots. Now the Witch, who divulged this Alexiterick gave nine leaves to drink in Water; but we, neglecting the number of Leaves, ordered an handful to be boyled in half a pint of Water till half were boyled away, then we gave the Decoction to the Patient on an empty stomach. Afterwards one gave to another Girl at *Geneva*, bewitched almost in the same manner, half a drachm of *Morbans*, his Antidote in white Wine with good success, with which within a little time, after she had been purged upwards and downwards, at last she recovered. Because the virtue of this Alexipharmack is so great against almost all manner of Poysons, I think it not amiss to describe it; Take of root of *Valerian* half an ounce, root of *Swallow wort* 1 ounce, Polypody of the Oak, Marsh-mallow, wild Angelica each 2 ounces, fresh Garden Angelica 4 ounces, Bark of the Root of *Spurge Laurel* 1 ounce and an half. All these Roots must be digged up between the fifteenth of August and the eighth of September, according to *Morbans*, but the Antidote is found as effectual, though they be digged up later; When they are cut, let them be put in a glazed Pot, pouring on strong Vinegar, till it stand 2 inches above. Then let the Pot be close covered with a Lid, and let all the chinks be close stoppt with Flour and the White of an Egg well mixt together, then let them boyl a little, over a gentle Fire, in the Pot; Then open the Pot, cast away the Vinegar remaining, and let the Roots be dried, till they may be powdered: After, when they are all powdered, add of the Berries of herb *Paris*, and make a Powder, a drachm whereof at the most may be given in white Wine, to grown persons; for the weaker sort 2 scruples or half a drachm is enough. *Carrichter's* his Unguent, wherewith a bewitched Girl was cured; Take of Dogs greafe well melted and clarified 4 ounces, Bears greafe 8 ounces, Capon's greafe 24 ounces, 3 bunches of Mistletoe of the Hazle, while green, cut them to pieces, and bruise them, till they be moist, then pound them altogether, Wood, Leaves and Berries. Mix them all in a Glasse, which when you have set in the Sun 9 weeks, you will extract a green Ballame, anoint therewith the Places most pained, and the Joynts of bewitched Bodies, and upon certain experience you will Cure.

XLVII. I have it from Dr. Geisfusius, that he knew a Man who had been long ill of a *Fistula* in his Thigh, out of which all manner of things came, Rags, Paper, Hair, &c. after many Remedies, had been used in vain, one, who was reckoned a Magician, strewed an ash-coloured Powder on the Wound, and the sick Man was cured in a few dayes. The Powder was the ashes of a Witch, that was burnt.

Joh. Doleus.
Misc. cur.
ann. 76.
obs. 61.

XLVIII. Concerning the Cure of poysonous and malignant Diseases *Eustachius Rhodius*, l. 1. de morb. occult. advises to consider, Whether the Body affected, when the Poyson seized him, were pure and entirely sound, or rather plethorick or cacochymick: for the Plethory and Cacochymie must be removed, before Alexipharmacks be used: and he shows, that this must be done very speedily in things very pernicious, and that kill quickly: but in those Poysons that will give truce, longer time may be taken. For he fears, that the Plethora and Cacochymie will weaken the strength of the Antidotes, and not suffer them to pass to the Part affected. And indeed it must be granted, that they are more in danger, who when they are poysoned or seized with a malignant Disease, do labor under a Plethory, Cacochymie or other inward Ail, for the reason aforesaid, and because the Poyson more easily diffuses and multiplies it self in vitious Humors, whence the Disease becomes more grievous: Yet I deny that in Poysons, which come to the Body from without, this advice should be followed. For seeing, we must ever oppose that first, which is most urgent, and that it is certain there is most present danger of Life imminent from Poysons, or that such an impression will be made, as cannot afterwards be got off, it is plain that the Poyson must first be opposed: for if we should first employ our selves in removing the Plethory, Cacochymie or Obstructions, the Poyson will kill in the mean time, or will so insinuate it self into the Body, that no Skill can afterwards expell it. But in Poysons, that will give truce, the advice is not to be rejected.

Sennertus.

Medicines especially made use of by eminent Physicians.

1. This is a most effectual Remedy, to eat Garlic and drink strong Wine, so that there will be need of no other Medicine, if a Man can but bear the use of them. ¶ A preservative, that one cannot be hurt by Poyson; Calamint taken every day does naturally resist all Poyson. ¶ This is a common Medicine, says *Strato*, which preserves from all Poyson; Take leaves of Rue 20, Walnuts 2, Salt 1 grain. Give this any man fasting, and no Poyson will harm him.

Ætius.

2. For eating of Mushromes; One gave Hen's dung finely mixt with Oxycrate or Oxymel, whereby the Patient found great relief.

Baricellus.

3. Against *Napellus* (or Monk'shood) the Plant that grows near the root of *Napellus*, which is called *Mus*. Half a drachm or a drachm of the root of this Plant may be given. It is an Alexipharmack for *Napellus*. A good Medicine also may be made of the great Flies, which feed on *Napellus*. ¶ Treacle or the powder of white water Lily is good against white Hellebore.

Capivaccius.

4. The Tincture of Emerald, or the Powder of it taken inwardly is the true Antidote against Toads.

Aug. Exe-
nis.

5. Quintessence of Vitriol is the chiefest of all Treacles, it expells all Animal, Vetegable and Mineral Poysons. The Dose is 1 drachm at any time in some Broth or an Egg.

Faber

6. A Physician gave a Boy, who had swallowed *Aqua fortis*, mucilage of Quinces to drink, and the Boy recovered beyond all expectation. ¶ For a Trembling from the fume of Quick-silver; It does a great deal of good, if the tremulous Parts be often washed in ones own Urine.

Forestus.

7. A drachm of Dittany in Gentian water with a little Zedoary or Citron seed, drunk fasting brought away a great many Lizards from one Man. ¶ The root of Walnut-tree, if the upper rind be taken off, and boyled in Water and Wine and drunk, is good to bring away Frogs in Men; as also the Powder of Bryony root taken in Milk.

Gabelshover
rus.

8. The following Experiment is highly commended by some; Take of the middle rind of Elder finely scraped, and a little dried in the shade a large handful. Pour half a pint of new Goat's milk to it, boyl it half away on a gentle fire; Drink a draught of it Morning and Evening. It is said, that all Poyson, which has been given a Man in his Meat or Drink for 3 years before, will be utterly extirpated. If it will not do at once, repeat it, till at length through Gods Blessing the desired Event succeed.

Grælingius

9. This is a most excellent Specifick against all Metallick Diseases, arising from Fumes and Damps; The Essence of Tartar, which is thus made; Take Liquor of Tartar, *Laudanum opiatum*, Oyl got out of Colcothar, which being distilled will afford a Liquor, 3 grains whereof for a Dose taken once in half a year is said to defend a Man from all poysonous Vapours of Metals. But for him that is already infected, abstract the Phlegm from the Vitriol, till it grow as sweet as Honey, and incline to a Purple colour. The Dose 1 grain in Speedwell water. Or let the Salt of Nettle be so long rectified in its Water in a moderate heat of Ashes, Sand or Balneo, till the fat of the Oyl appear, which must be separated from its Feces, 3 grains a day may be given for a Dose in Speedwell Water.

Kircherus

10. This is proved by certain Experience, if any one have swallowed Leeches, or eaten Mushromes, or any poysonous thing, let him immediately drink warm Vinegar with a little Salt, and he will presently be cured by Vomiting.

Kunrad;

11. Against Opium; Let Mustard and Castor be taken in equal quantities; and put into the Nose, to cause Sneezing.

Mercurialis

12. Treacle with *Oxymel Simpliciter* or *Scylliticum* satisfies all Indications; for none that ever took this after eating Mushromes died of them, but all through GOD's Blessing recovered.

Panazolus

13. A Decoction of Linseed corrects all Erosions of the Stomach caused by taking *Cantharides*; and it is reckoned their Antipharmack.

Platerus

14. Against Quicklime the Gall of a Roebuck from 1 scruple to 1 drachm taken in warm Water is an Antidote, as also a scruple of Deer's Gall given the same way. ¶ Against *Gypsum* 1 drachm of Mice dung in Wine. ¶ Against *Aqua fortis*, Mucilage of Quince seed; Marsh-mallow and Gum Tragacanth drawn with Rose water, and mixt with Honey of Roses and of Violets. ¶ Against Antimony (besides Treacle) bole Armenick and Oyl of Cloves. ¶ Against Arsenick, Fossile Crytall powdered 1 scruple taken in Oyl of sweet Almonds; also Oyl of Pine-nuts 3 drachms given in drink; also juice of Mint 2 drachms. ¶ Against *Minium*, burnt Ivory 2 drachms in Wine, also Treacle and Mithridate. ¶ Against crude Mercury filings or leaves of Gold; also juice of Burnet and Wine. ¶ Against its Fume, a draught of Wine, wherein Rosemary, *Stachas Arabica* and lesser Centaury have been boyled; as also a draught of Sage and Zedoary water. ¶ Against sublimated

sublimated

sublimate and precipitate, fine powder of Cryſtal 1 drachm with Oyl of ſweet Almonds; alſo 2 drachms of Oyl of Tartar or ſalt of Wormwood. ¶ Againſt Cinnabar, burnt Ivory 2 drachms given in Wine. ¶ Againſt Muſhromes, Hen's dung or aſhes of Vine-branches with a little Nitre drunk with Honey and Water warm: Sowre Pears are commended, whether green or dry; and if they be eaten before Muſhromes, or boyled with them, they render the Muſhromes harmleſs: Treacle alſo is good: But let a Man eſpecially uſe Honey in his Meat, which is a peculiar and proper Antidote againſt Muſhromes. ¶ Againſt *Napellus*; Take of the Flies of *Napellus* (they are blew Flies which fit and live upon no other Plant of the like Nature with this) No. 20, Birthwort, Bole Armenick each 1 drachm. Make a Powder. ¶ Againſt Wolf's bane, *Opobalsamum* 1 drachm. ¶ Againſt Henbane, Piſtachio-nuts eaten and drunk. ¶ Againſt green Coriander, roots of Swallow-wort in Wine. ¶ Againſt *Euphorbium*, Citron ſeed in Wine wherein Elecampane root has been boyled, alſo *terra ſigillata*, Emerald, prepared Cryſtal, &c. ¶ Againſt white Hellebore, powder of the Flowers or roots of white Water Lily, or Parſnep ſeed 2 drachms taken in Wine; alſo Treacle. ¶ Againſt the bite of a Viper, Bezoar, from half a ſcruple to 1 drachm boyled in Wormwood Wine and given: Alſo Garlick, Leeks, Onyons, Rue, Treacle, Mithridate, *Antidotus Matthioli*, which ſome highly commend, the Doſe is 3 drachms in ſome Cordial water. ¶ Againſt a Scorpion, beſides the live Scorpion, taken and bruised, and applied to the Wound, and Oyl of Scorpions, the Milk of a Fig-tree dropt into the Wound is good. ¶ Againſt the biting of a Leech, Agrimony bruised and applied. ¶ Againſt a Spider, the Catkins of the Walnut-tree dried in an Oven from 1 drachm to 2 given in Hydromel or white Wine; alſo Treacle and Bole Armenick taken in Vinegar; alſo the dry Refin of the Fir-tree. Againſt *Cantharides*, Penny royal taken either in Subſtance or in Decoction; alſo *Terra Lemnia* 2 drachms, or Winter Cherries No. 10 with Wine. ¶ Againſt the Venome of Flies, Bees and Waſps, the Animals themſelves bruised and applied to the Part; alſo live Sulphur mixt with Man's ſpittle, Rue, or the Milk of the Fig-tree applied to the Place. And, if there be need, Coriander may be given inwardly with Sugar. ¶ Againſt the Brain and Blood of a Cat, half a ſcruple of Muſk taken frequently. ¶ Againſt Milk curdled on the Stomach, Vinegar ſimple or of Squills; alſo the juice of Mint new drawn; alſo Milk of the Fig-tree given with Wine and Vinegar, alſo the Runnet of any Animal. ¶ Againſt the poiſonous Sweat of any creature; Take Bole Armenick, *Terra Sigillata*, Bay-berries each 1 drachm, the Runnet of a Roebuck, or inſtead of it, of an Hare half a drachm, Myrrh, leaves of Rue, each half a drachm, with clarified Honey make an Eleſtuary; Take 2 drachms every day.

Sen. Tertius.

Vid. Vidiuſ.

15. All things premiſed that ought, it is the beſt way to drive out the Poiſon to the Skin; to which purpoſe this is a moſt excellent Water; Take of *Aqua theriacalis camphorata* 1 drachm and an half, Liquor of Tartar corrected, Spirit of Vitriol each half a drachm, the oily Liquor of red Corall 1 drachm, Oyl of Turpentine 5 drops, of Juniper 4 drops, Eſſence of Celandine half a drachm, Water of the root of Coltsfoot, Eryngo each 1 ounce, of Elder flowers, Wall Gillflowers each half an ounce, red ſweet Wine 2 ounces and an half. Mix them. Deſtill them in *Bain-marie*. Keep it for uſe.

The way to cure a cold Stomach, when the Liver is hot.

LXVII.

Med. cines.

I. **W**hen the Stomach is affected, it is much controverted to what part Application must be made: *Rondeletius* makes it to the back part, about the thirteenth vertebra: Others to the fore part, towards the region of the Liver: *Amatus Lusitanus* contends that things must be applied to both. But in applying Topicks to the Stomach, we must mind what *Joubertus* has observed, whether the Liver labour under the like Intemperature with the Stomach: for if under a different, the Region of the Stomach must not be anointed before, upon the cartilage and *hypochondria*; because if the Liver be first affected, so will the Stomach after, when it receives the quality impressed on the Liver. That this inconvenience may be avoided *Joubertus* had rather anoint the Back over against the Stomach: But because the thickness of the vertebra and other gross parts is such, that it hinders the penetration of the Medicine to the Stomach, it is better, he says, to cure all Diseases of the Stomach by Medicines taken inwardly, whose action is the quickest, for they presently reach it in their full strength, and affect in the inner Part: But it is not so in things that are applied, unless a like Intemperature of the Liver and the Stomach fall under Cure; except in the coolness of the Stomach, which proceeds from the heat of the Liver; for when the Liver is cooled, the Stomach quickly returns to its Temper.

II. The things that are applied to the Back, must be of subtil Parts, that they may penetrate through the thickness of the way.

III. Plasters applied to the Stomach, according to *Galen*, 7. m. m. must not be kept long on because at length they will dissolve its Heat.

IV. As for things to be applied in a moist Intemperature, we must observe, that if Driers be also temperate in the active Qualities, and not astringent, they may be applied to the Stomach so as to reach the Midriff: But if the drying Medicines be cold or astringent, they must not be applied to the Midriff: for respiration would be hurt.

V. Not long since an ingenious person made use of a long, soft flexible Wand, to which was tied a brush of Lint, which when he had a mind, he put down his Throat into his Stomach, to scour the Stomach, and the filth of it, and he drew it out again without Vomiting. If any will follow this mans Example, he ought to have a care that he break not his Wand, and that the brush stick not in his Throat.

VI. The bottom of the Stomach sometimes is wounded and cured, yea it admits of Incision, so as Iron, or any other hard thing may be taken out, when it can neither get up nor down, and hurts a Man.

VII. Very little Meat must be given them, who have any Disease in the Stomach: because seeing

it, being the Part affected, must make the first and greatest alteration in the Meat, and must contend with a great deal of crude Meat, it is plain that the Stomach will be very much hurt thereby, and therefore a Disease therein will not admit of Meat, and for that reason must never be given, unless necessity force a Man to forget its hurt.

VIII. If the Intemperature be different between the Mouth and bottom of the Stomach; so that the bottom is cold and the Mouth hot, the way of Cure is easie, and it is twofold, First at the beginning of the Meal to give hot Things; in the latter end cold and austere ones: Secondly, let hot Things be applied to the fore-Part of the Belly, and cold Things to the hinder Part, about the twelfth vertebra: for there is the Mouth of the Stomach. But if there be an inequality between the Coats and the Humors so as the Humors are hot, and the Coats cold, as it happens in a very hot Liver; we must first carry off the hot Humor, either by Vomit or Stool, which yet may both heat and also purge Choler; such are *Hiera simplex*, *rheubarb*, *aloes*, and *worm-wood-Drink*, which purge Bile, and heat the Coats of the Stomach. If the Intemperatures be unequal in respect of the passive Qualities, so that the Coats are dry for want of substantial Moisture, and yet an excrementitious phlegmatick Humor abound, this is the difficulty. In this Cure, before all things, the Humors contained in the Cavity must be carried off by gentle Medicines, which may moisten, moderately heat, and may rather be alimentary than medicamentous; such are *Manna*, *mel violarum solutivum*, *Cassia*, *Myrobalsans*, *Chebuli*, one or two of which may be given, if they were preserved in *Syria*, (Observe the distinction; If they were preserved at *Venice*, when you pierce them they make a noise: If in *Syria*, not) When the Stomach is purged, it is necessary afterwards both to moisten and dry it. I use to do this several wayes, first when I give Milk, I drop into the Milk 5 or 6 drops of oyl of *Aniseeds*, or *Fennil* or *Cinnamon*; or, if there be suspicion of the Pox, of *Guaiacum*: Sometimes I use *Hog's blood* distilled hot, mixt with a little *Cinnamon* water. All these things moisten, nourish and also dry.

IX. Since the Stomach is all membranous, cold and dry, it scarce ever primarily and of it self labors under a hot Intemperature. Whenever therefore signs of its being hot show themselves by inquenchable Thirst, desire of cold Drink, blackness and driness of Tongue, refreshment by cold Things whether taken, or applied, offence by hot Things, nidorous Belchings, loathing, bitterness of the Mouth, and loss of Appetite, the neighboring Liver must be blamed, from Sympathy wherewith the Stomach is easily affected; for seeing it lies close to the Liver, the Liver easily communicates its Qualities to it.

X. An Intemperature of the Stomach with an Humor, whether it be from a cold or an hot Cause, must be corrected by premising a gentle Vomit. For so we may more easily discharge the mass of Humors, which is continually breeding there, then if we should use Purgers. Moreover by that means the Humor sticking to the folds of the Stomach is more easily cleaned; and the Intemperature, if it be not either innate, or very inveterate, is corrected.

XI. Seeing in a cold Stomach, full of Phlegm the Indicant continues a long time, we must therefore a long time and every day use Medicines for it, if Strength will permit. And the Strength permits the frequent use of hot Medicines, which are not unpleasant, as *Diatrion pip. diacalam*. Which we may use every day; but we

cannot use *Hiera* constantly because of its bitterness. Yet we must not be too sparing in the use of *Hiera*, when Matter is sticking in a cold and moist Stomach: Especially if *Hiera* be made with 80 drachms of Aloes and not 120 drachms. Therefore the Apothecaries must be ordered to have *Species Hiera* made 2 ways: For when we would prepare the Body, *Hiera* of 80 drachms is most effectual; If 2 scruples or a drachm be taken, and made into a *Bolus* with Sugar or Honey, and given frequently; for this is a most wholesom preparing Medicine.

Cappivaccius.

XII. Whether may we give a Purge to a weak and cold Stomach, which concocts slowly and ill, and is also full of cold and gross Humors? For we may strengthen no Part, when it is full of ill Juices: but it is known, that a weak Stomach cannot well bear Purgings. Yet this must be understood of strong Purgers: for such as Purge gently, as *Rheubarb*, *Hiera Simplex*, and *Myrobalan*, may without harm be born by the Stomach, though it be weak.

Zecchius.
Conf. 18.

XIII. As to a cold Intemperature, seeing hot Medicines are approved of, two things must be observed concerning them. 1. That they be not violent Heaters; Therefore Ginger is good, but it must be preserved in Sugar: And *Diatrion Piperacum*, but with Wine: for Honey, Sugar, and Wine moisten substantially: so Pepper is good, but with Meat. 2. We must observe, that Astringents be mixt with Heaters, lest the substance of the innate Heat be wasted: therefore *Avicen* mixes a little *Mastiche* with a decoction of Spike. As to Things applied outwardly, we must observe a difference between hot and cold things: for cold things are prohibited by the innate heat of the Midriff; but not hot things: Yet if it happen that the Part adjoining be affected with a hot Disease, it is safer to apply hot Things about the Navil and the left side because in the right side the heat of the Liver might forbid it. ¶ Things that heat immoderately dissolve the innate heat of the Stomach, and at length cause coolness, as is evident in Girls, that eat Ginger and such things; for therefore they are Pale. ¶ Chymical Medicines, seeing for the most part they have a sharp and a very hot Quality, can be of no use in case of a cold Stomach, especially when the Liver and Parts thereabout burn with immoderate Heat: therefore *Aristot.* 24 probl. sect. 13. When he asks, Why hot Things are sooner cooled in the Sun than in the Shade? He answers, that the less Heat is wasted by the greater. And *Galen* 3 de morborum causis says that a less Flame fades by little and little, if you hold it to a greater.

Hofmannus.

XIV. Have a care that you give not Wormwood Wine when bad matter lies mixt in the Stomach. ¶ But it is good in a cold and moist Intemperature. XV. He that afflicts a weak Stomach by Heaters, as soon as he sees the Urine grow red, must immediately abstain from hot Things, otherwise a Dropsie follows.

Mercatus.

XVI. Things that have Vinegar in them must not be used indifferently in every crudity: for I find it is only useful, when too much Moisture, and that thick, is joyned with heat, at which time it must either be much dilated or mixt with cooling and lenient Things. XVII. That Concoction may do its Office without any fault, things that bind the right Orifice of the Stomach, must be taken after Supper; that the Stomach may be the stronger contracted, and may perform its Action more exactly. And *Rondeletius* says, that they greatly mistake, who give hot Powders after Meals, for by their heat and tenuity they immediately carry with them the Aliment half crude to the Veins, whence obstructions arise.

XVIII. Medicines are made of Confections and Powders to strengthen the Stomach: But it is much better to give them in form of a Powder without much Sugar, for Sugar and Honey, and other sweet Things make lax the Stomach and breed Wind, especially when there is not much Moisture in it. *Rondeletius.*

XIX. Pepper is of a very thin Substance, and so for a time it heats the Stomach, and its Virtue is immediately spent, as all tenuous and hot Things are. *Galen* commends Pepper very much, wherefore I could heartily wish, the moderns were wiser, who, when they find *Galen* gave Pepper with *Prisan* in a Fever, think that *Galen* was out, and they say, it were better to use Cinnamon; and so they order Cinnamon. But they do not see *Galen's* mystery, that Pepper heats the Stomach and not the Liver. And *Galen* 4 de tuend. valetud. says that *Diaspilot*, *Diacalam*, and the like, are very bad for a crude Stomach, because they carry crude Humors to the Liver and cause Obstructions: for although there be not so great a heat in Cinnamon, yet it is more lasting. Therefore I often give Sugar of Roses, bruised very finely with a little Pepper, that it may more easily exhale. *Montanus.*

XX. *Celsus* l. 2. c. 24. reckons the drinking of cold Things to be grateful to the Stomach: and it appears from other places, that drinking cold Water is good for the Stomach: So l. 4. c. 18. he gives warm Water to them that are ill at their Stomachs: He adds, And hot Water, for as lukewarm makes lax the Stomach, and causes Vomiting, so hot Water strengthens the Stomach. Therefore *Plistonius* in *Athenaeus*, to strengthen the Stomach, orders Water to be drunk very warm, in Winter especially and in Spring, and cold in Summer. And *Celsus* l. 4. c. 3. when the Stomach will not retain the Meat, says, it is best either to drink Wine cold, or else very hot. Which yet must so be understood, as, when the stomach is either empty, or full of Phlegm, we must abstain from cold Things, which according to *Hippocrates* are enemies to the Nerves; and then hot drink nourishes the innate heat, and concocts crude Phlegm: but when one is full, then he must use cold Things, wherewith by *Antiparistasis* the heat is gathered and made stronger. *Rubius. comm. in Isac.*

XXI. I have known some who have endeavoured to consume and dry up the matter with Oyl of Vitriol, because it most violently dries and cleanses; and indeed at first the Patients find benefit, for they perceive by using of it, that the Stomach is astringed, their appetite increased, and the matter of the Fluxion abated; but I know at length they have become Cachectick, to say nothing of other Diseases. Truly I have ever suspected the caustick Virtue which remains in that Oyl, prepared even according to the Doctrine of *Paracelsus*. I have indeed used it sometimes in Diseases proceeding from very crass Phlegm: but I would persuade no man by the continued use of a few drops to spoil the moderate heat of the Stomach (which is designed for Concoction) and corrupt the goodness of the Blood: For if we may make our conjecture of internals from externals, what is it that boyls in the Chimney, but heat? And that Acids corrugate the Mouth of the Stomach, and excite Appetite, we know from the use of Vinegar. Such therefore as constantly use this Oyl, although they may flatter themselves for a time in the goodness of their Appetite, and drying up of Defluxions; yet at length, and in process of time, they are forced to acknowledge, to their sorrow the harm done to their Stomach and other Parts. *Gr. Hofmannus.*

XXII. For

XXII. For strengthening of the Stomach Chymists likewise commend Spirit of Vitriol of *Venus*, which they call the Hungry Acetosity of *Venus*, or Spirit of Hungarian Vitriol. And they write of it, that it is of such Virtue, that it consumes all the Impurities that are in the Stomach, whether Tartareous or Sulphureous, and strengthens the Stomach so much, that it is able to concoct all things. But all this is hyperbolic; And though it be often given with advantage; yet Caution is necessary, for it must not be used in every weakness and Disease of the Stomach, but where there are gross and tartareous Humors, which it consumes, and afterwards by Astringent strengthens the Stomach. But we must have a care, that we do not over do it, and that the radical moisture of the Stomach be not dissipated and wasted by it, which often happens upon the unseasonable and excessive use of Spirit of Vitriol.

XXIII. All strong distilled Things must be avoided; which seem indeed to do good; but they shorten life, because they far exceed the degree of innate heat, and all Remedies ought to consist in Mediocrity. For the gentlest Medicines in a diseased and languishing Stomach want not danger, especially in old People.

XXXIV. It is the Custome of some, that if at any time they eat any thing hard of Digestion, or that will surfeit, presently to drink some generous distilled Water, as *aqua vite* or the like, to help Concoction; but this is done not without hazard of Health: for seeing the said Meats use not to be digested but by a long stay in the Stomach, such Waters as these do by their penetrating and permeable Virtue carry these Meats, not yet well concocted into the Veins, whence proceed crudities and obstructions. Thus Physicians do a right forbid the giving of Diureticks with Meat or immediately after Meat, lest they carry the crudities of the Stomach to the urinary Passages. And the reason is the same in Waters that are taken to promote Concoction, because of the great aperient Virtue, they are induced withal. Therefore *Rondeletius cap. de palpitatione*. "We may, saith he, give such things inwardly as heat the Stomach, and discuss Wind; which thing must be observed, for 3 or 4 hours before Meal we may give things that heat much and discuss Wind, so the Liver be not very hot, such as *diatrion pip.* *dianis. aromat. rosar. diagalanga*, and the like: "These things should not be given immediately before Meal, because by their heat and tenuity they would presently hurry with them the Aliment half crude to the first wayes. "Hence it is evident that they are in error, who give very hot Powders after Meal, which should be moderately hot. *Ætius l. 3. ferm. 1. c. 24.* says; neither this nor any other Medicine which penetrates much, must be taken after Meal: for some crude Meat is distributed and digested with it, and causes Obstructions. The use of it is convenient after rubbing in the Morning, two hours before Exercise and Bathing. What we said of things difficult of Digestion, is applicable to things easily corruptible, such as horary Fruits. They are likewise in an Error, who when they find Wind and Crudities upon their Stomachs, drink these Waters, to heat and strengthen the Stomach; for by the tenuity of their substance they easily penetrate into the Bowels, and increase their Intemperature, whereupon their Disease afterwards encreases. You will object, Physicians prescribe Pepper bruised grossly: and that *Ætius* used Wormwood for hypochondriack Winds; but Pepper doe good this way, because it reaches not to the Bowels, but only strengthens the Stomach, and therefore heats not the Liver: Then its heat is extinguished and quickly dissipated in the first wayes, and it cleanses and carries off sharp Humors. Worm-

wood is good, because it binds the Stomach, and helps bilious, not phlegmatick Humors; which afford matter for this Disease, by its detersion, and carries them off by stool and Urine.

XXV. This must be observed concerning those they call digestive Powders, that too strong things are not convenient in Diseases of the Head, caused by Fumes. It is best therefore to make them of things, that are not much scented, and to abstain from such things as have Musk, Amber, Saffron, and other Things that fly to the Head, in them. But I blame such as put Liquorish in them; for although it quench Thirst, and have a little Astringent in it, yet sweet Things make lax the Mouth of the Stomach, and breed Wind. I also blame them that add Nutmeg and Mace, because they are oily Things, and all such subvert the Stomach: It is not amiss also to add Fœnil and *Seseli* seed to Powders that discuss Wind, and to digestives ones as also to other Powders, because they attenuate the visory Spirits, but we must be sparing in the use of Cummin, Carroway and Rue seeds, because of the too ingrateful taste of Cummin and the too great acrimony: Let them be steeped in Vinegar, if Powders be made for digestion of Meat.

XXXVI. The breeding of much Matter in the Stomach will be hindered if the Patient immediately after Meat, Morning and Evening swallow 2 or 3 grains of Mastich whole, or 1 scruple of juice of Wormwood condensed in Pills. For things that heat the Stomach, if they be taken before Meal, hurt the Liver.

XXVII. I have learned by Experience, that green Wormwood worn within the Shoes amends the cold Intemperature of the Stomach, with much benefit in the Noble Lord N. who declared openly, and seriously affirmed, that he found much benefit by treading upon it.

XXVIII. I knew a Man, who had a cold Stomach and an hot Liver, and had very hot Plaisters and Unguents applied to the *cartilago xyphoides*, upon which he was taken with an Inflammation in his Liver, and could hardly be cured of it. If any one desire to enquire the cause, let him look upon the Anatomy of the Liver: for with its hollow side, from the right to the left, its covers almost the whole fore-part of the Stomach, so that hot Medicines first come to the Substance of the Liver, before they come to the Stomach.

XXIX. Wine taken in too great a quantity, not fine, nor exactly depurated from its Tartar and Lees, is very hurtful, both because by the continual and immoderate use of it the innate Heat is destroyed, and Concoction is hindered in the Stomach, especially of Flesh, which hardens in that liquor; the Liver is hurt, a sharp and serous Blood is bred, the Brain and Nerves are weakened, Catarrhs are caused. &c.

XXX. Never give an austere Wine to a dry Stomach, for it hurts the substantial Moisture, for which nothing is worse than Astringents, which feed upon what Moisture there is. Therefore in this case store of moist Things must be given, Broths, Milk, almond Milk, that the dried Coats may be extended, when moistened, and so may close well upon the rest of the Meat.

XXXI. There is a way found, whereby the noxious Vapor is taken from the Wine, that is, by letting it pass through a double glass Instrument, the French call it *Montevin*. This way also it is deprived of its superfluous Tartar, that is, by putting to it some Liquor, that has a precipitating Virtue, such as Oyl of Tartar (by means whereof egre Wine grows sweet) a solution of Litharge, or *Saccharum plumbi*, made with Vinegar,

Mayerne.

a solution of calcined Crystal, by frequent extinctions in Nettle water, and reverberations, with acid Spirit of Turpentine.

Noëferus.

XXXII. When crudities are bred in the Stomach by reason of Surfeiting, it is not advisable, as many do, to remove it by fasting; but it is better the next day betimes to take some delectable food, but in a small quantity: for Nature being delighted at the approach of new food, that is grateful, undergoes the work more chearfully, and turns what is good into aliment, and separates what is bad and crude into excrement, by the help of the expulsive faculty: Wherefore many after a surfeit are taken with a Loosness.

G. Hofmann.

XXXIII. In some People, only an heaviness like a Stone, with shortness of Breathing shew, that there is slow concoction: I tell such, they may safely sleep after Dinner: In others there is a certain fluctuation or vibration, or trembling, or palpitation, sometimes with, sometimes without a rumbling in the Guts, and with shortness of Breath: such may with much more reason sleep after Dinner.

XXXIV. Galen 3. de causis Symptom. c. 1. shows, that an acid corruption alwayes comes from a cold intemperature. And 1. de loc. aff. 1. that a nidorous corruption, when it comes from intemperature, alwayes follows a hot intemperature, yet both these corruptions are caused by external errors: The acid indeed, by excrements, in their own nature acid, as acid Pulegm, acid Melancholy: Or by Aliments, offending either in quantity or quality: In excess, when they suffocate the native heat, though it be strong: In quality, if they are either too cold and moist, as thin Wines, moist Fruits, &c. or when they easily putrefie, as Milk, Pufan, &c. or when they are of an austere taste, as Services and Medlars, which by further concoction are changed into an acid taste. And although Galen 7. Simpl. c. 8. write, that an austere is changed into an acid from encrease of moisture; yet it cannot be denied, but that the same may be done by excessive heat: for he writes, that adust Melancholy is made acid by burning heat: so in the Summer time austere fruits are turned acid by the heat of the Air. Gather from hence, that corruption into an acid in the Stomach is not caused only one way, nor by one cause: And therefore Trallianus l. 7. c. 16. says well, that a corruption to an acid is sometimes caused by a hot intemperature, and cured by cooling things. Therefore the turning of Milk or small Wine fowre, which are moderately hot and do easily putrefie, is not caused by a weak heat in the Stomach, but by a very strong one, which consumes the innate heat of the Milk, or Pufan, or any such other Body. The case is the same in a nidorous corruption: for the meat is so corrupted either by the Aliment or Excrements: By Excrements abounding or deficient: The abundant are either Cholerick or Melancholick, which by their heat burn the Aliment and turn it into a Nidor: The defect of Humours, is defect of Phlegm: For Galen 3. de nat. facult. c. 7. when he mentions things that help concoction, as Bile, Heat, Spirit, reckons up the whole substance of the Stomach and Phlegm. No man has declared how Phlegm helps concoction; but this is my Opinion; Concoction in the Stomach is a sort of Boyling, this is not done without moisture, therefore Phlegm conduces to Concoction, as it is a moist matter, whereby boyling is made; therefore when this fails, meats easily turn into a nidor. Nor let any one say, that Drink serves instead of Moisture; for Sagacious Nature hath therefore made the Stomach the storehouse of Phlegm, that if drink be wanting, the Aliments may not be burnt, which they may easily be, if but a little in quantity, or hot and dry, as sharp and aromattick things: or if they be sweet, as things with Honey in them, fried things, and the like.

Saxonia.

XXXV. They are deceived, who think depraved concoction, pituitous vomit, fowre belchings and wind have only a cold cause; for oftentimes an hot Liver causes these Symptoms: because when this is hot, the Stomach concocts badly; Neither must cold and moisture be presently blamed; nor must we, after the manner of Empiricks, presently fly to hot things. But we must diligently search, whether a cold or hot cause waste its strength, that it may be opposed by a contrary Remedy. When therefore a hot intemperature of the Liver is a cause of depraved concoction, it must be opposed by things that cool and moisten the Liver, whereto may be added things that strengthen the Stomach with a gentle attrition, Wine and other hot Aliments must be avoided: For it is found by experience, that crudities of the Stomach, and destillations arising from the heat of the Liver, and the exhalation of bilious Blood, are very much exasperated with the use of generous Wine and such things, and abate with the contraries. ¶ Now most Physicians have only one intention in weakness of the Stomach, while they fly to astringent, hot and bitter meats, to Wormwood Wine, heating and astringent Plasters and Unguents. Innumerable People at Venice, having their Stomachs polluted with divers Humours, and ill of Hypochondriack Melancholy, wear hot things constantly upon their Stomachs, and take strengthening and hot things, supposing it to be a cold intemperature. Nevertheless their Liver is very hot, their Spleen and Mesentery are laden with Melancholy, whence comes wind in their Belly: And they think they do good with these hot and astringent Medicines, when they encrease their misery. But Galen says plainly, that he has eased Diseases of the Stomach by drinking cold water.

Enchir. Med. Praë.

Sanctorius.

XXXVI. Johannes Riolanus has observed, that when the Colon is full of feces, the Stomach labours under difficulty of Concoction. Therefore the excrements must often be got out by Clysters.

XXXVII. Among the Diseases of the Stomach, the most common is the laxity of it, which may come from any intemperature. One man, when he had been long troubled with this Disease, and many had had him in hand, but none could find a Remedy for him; when he came to me, I easily knew by the Medicines he had taken, that the Physicians thought he was ill of a cold intemperature. And I from the preceding cure, and other evident reasons, thought quite otherwise, that his Stomach was ill of a hot intemperature; Wherefore having recourse to such Remedies, as his dry Body, now almost consumed away, seemed to require, the first day I ordered him only to eat some Lettuce out of Oyl and Vinegar, which when he found beneficial and proper for his Stomach, I order him to leave off Bathing, Frictions, Exercitations, especially of the upper parts, all unctious and hot meats, which he had hitherto used; and rather to turn himself to meats that are cold and difficult of concoction; wherefore I recommend unto him Mutton rather than Fowl or Fish, unless of a hard sort, in this sickness of his. I tell him that cold and austere Wine is the properest drink for him, and that a hot and thick Wine is most improper. To which when he gave way, and carefully observed his directions, using only this sort of diet and cooling Medicines, he was as well, as ever he was, within two Months.

Benivenius.

XXXVIII. The dilatation or resolution of the Stomach is a Disease very frequent, both in healthy and sick People, when its tone is so loosened, with broths and cold drink, and much moisture, that a Loosness follows thereupon, which is attributed to corruption of the food by a hot intemperature of the Stomach, or to the obstruction of the Mesaraick Vessels: which is rather a Symptome of too great laxity (Fernelius his Disease of Matter) which must be

be cured by strengtheners and astringents. In some after their death the Stomach has been found so lax, that it would hold a Childs head. Therefore the observation of Diseases of matter is very necessary for practice, which are cured by astringents and driers, taken inwardly, and applied outwardly, according to the doctrine of the Methodists, who make Lax and Strict to be in Diseases.

Riolanus.

XXXIX. A great heat of the Stomach well concocts hard things and difficult of concoction, as hung Beef, Cabbage and such things. The same heat corrupts tender meats, as Eggs and small Fishes. The cure in these is to change Diet. ¶ I knew two, that were ill of heat in the Liver, and of bile boiling in the Gall-Bladder, which caused inconcoction. A cold intemperature of Stomach was blamed in them, whose heat languished, being wasted by the hot Liver. Many hot things had been used in vain to help concoction. The first of these Men was the Illustrious Monsieur de Molondins, deputy Governour of Newemburg: He was much troubled, to his dying day (which happened in his sixty third year) with a heat in his Stomach, especially if he eat meats easie of concoction, or several things to his Supper: The Chyle fomed up, during concoction, and was almost all brought up in Spittle: If he eat only of one meat, or of what was difficult of concoction, the concoction was performed aright without any disturbance. The other was Gedeon des Bergieres, who till the fortieth year of his age was troubled with such a spitting of a viscid and tenacious matter, the heat of the parts about his Stomach abating afterwards, in the process of his age, he lives free from any such hurt, and now digests very well.

Hofmannus.

XL. The coldness of the Stomach is not alwayes positive, but often privative, from the heat of the Liver and Hypochondria. Therefore Galen primo de loc. affect. 4. has told us, that when concoction in the Stomach is bad, we must presently consider the parts about it, which if they be very hot, it is spoiled by them, but the heat of the Stomach it self is not abated. And although Aciditie be often perceived, yet it proceeds not from cold but from excessive heat, as the primary and chief cause, as Trallianus considers, and it is found by dayly experience, that Wine in Summer in the heat of the Sun turns fowre. ¶ The heat necessary for concoction must be plentiful, sweet and moderate, boiling not roasting: Otherwise, if it be exuberant, it either turns the food to a Nidor, and causes difficulty of concoction, or, as a great flame, it dissolves and wasts the Stomach, and so spoys concoction: Yea, in process of time by drying up the fleshy parts of the Stomach, without any diminution of the innate heat, it weakens it, whence comes ill digestion. Therefore Galen 3. de nat. facult. said, that beside other causes, that concurr to concoction, the whole substance of the Stomach is one. So 2. de aph. 35. he sayes, it is well if the parts belonging to the Stomach be fleshy; therefore the thinness of the Coats hinders concoction: For a lean Stomach alwayes concocts worst. Wherefore 3. de Symptom. causis, he concludes, that natural Organs, the moister they are, so much they are fitter for nourishing; but the harder and the drier, the more unfit.

Fortis.

Idem.

XLI. The diagnostick of the Humour, that causes the pain in the Stomach, is taken from the time of the invasion, increase or abating of the pain. Some have the pain most before meat, and this signifies the dominion of bile, which is exasperated in time of fasting, and drawn into the Stomach, or grows sharper. In others the pain arises immediately after eating, because the crude and biting Humours which before were quiet, and fixt to the coats of the Stomach, are disturbed upon eating, or they that are in the bottom of the Stomach, rise up and affect the Mouth of the Stomach. In others

the Pain encreases, while the meat is concocting, because sharp and biting Vapors are elevated from the morbidick matter, by encrease of the heat in the Stomach, at the time of concoction. In others 4 or 5 hours after meal, because the meat is corrupted after ill concoction, and being corrupted, it vellicates the Stomach. And in some the pain is encreased after sleep, and that is caused by a Catarrh, the Humour flowing from the Brain in sleep, which being gathered in great plenty, produces pain, when waking. And sometime the pain is asswaged after meat, because the acrimony of the Humour is sweetened with the kindliness of the meat.

Riverius.

XLII. If the Blood be not transmittted by the Liver, it being distended with plenty of Blood, will press upon the Stomach, and will cause a most grievous pain in it, and especially after meat it will be so complicated, that the pain can be eased neither by Remedies taken inwardly nor outwardly. As I saw it happen to N. who could not be eased of such a pain, after all had been done, that could be done, otherwise than by the benefit of Nature: For when he was grievously afflicted with it immediately after meal, behold! all on a sudden, he vomitted up much Blood, which presently eased his pain: For which ever after, as often as he was troubled with it, he was let Blood, and it cured him. The History in Hippocrates Epidem. is not unlike this, of a Man, who in a violent pain of his Stomach, could be eased by no other Remedy but by Bleeding.

Joh. Doory.
netus.

XLIII. A certain Matron, who had complained two years of a pain at her Stomach, and could be cured by no Remedies, at last upon taking a Vomit, she brought up a piece of Bacon skin, which she had eaten two years before, and she was well quickly after.

Fabr. Hilde-
nus.

XLIV. Concerning Hiera, which Galen commends in pains of the Stomach, arising from cold matter or wind, we must observe, that it operates slowly, and while it acts upon the viscid matter cleaving to the coats of the Stomach, Wind being thereby raised, it causes the Belly to swell, and the pain to encrease; therefore it is advisable to mix some other purgative, which may encrease the strength of the Hiera, and quicken its operation.

Sennertus.

XLV. In pain of the Stomach, where there is need of Purging. J. Navius according to Scholtzius, gives a Purge with corrected Opium mixt with it: For so he eases pain by causing Sleep: And the Medicine carries off with it the bad juices, contained in the Stomach, which caused the pain; and he sayes, it was formerly Lud. de Leonibus his secret. Frambesarius also in cons. f. 362. in grievous pains, where there is need of Purging out the continent cause, commends the giving of Narcoticks in Purges. Riverius commends this; Take of Diaphen. half an ounce, Philonium Romanum 2 scruples: with Chamomil water make a potion.

Hocerus.

XLVI. I opened the Body of a Monk, who was said to have died of Colick pains, and enquiring into the cause of the Disease, I found the bottom of the Stomach not only inflamed; but corroded also to the middle of the coat. For the cure of such an Inflammation and Erosion of the Stomach Spigelius said, that nothing had been better, than the often taking of terra sigillata, as being a thing, which sticking firmly to the eroded coats of the Stomach (as firmly as ceratum diachalciteos, applied to the inflamed foot) would have dried up the erosion. I after tried the worth of his saying twice in extreme pains of the Stomach, to my admiration; when they could neither be laid by taking any Medicines inwardly, or applying any outwardly, except terra sigillata mixt with Syrup of Comfrey.

Sculterus.

XLVII. When once a Person had taken a Purge of an unskilful Physician, who, to hasten the working, had mixt some sharp corroding things with it, there

there arose so great a pain in his Stomach, that for three Weeks space he could take nothing in at his Mouth without cruel pain in his exulcerated Stomach, and was almost starved with hunger. When the Physicians laboured in vain, he at length used Tragacanth, a thing which his own reason and experience suggested to him, mixt with Rosemary flower water, by the tenacity of which Tragacanth the Ulcer healed, and afterward he lived in health for several years.

Bartholinus.

XLVIII. Galen shows, that a Cupping glass applied to the Stomach, eases pain quickly and to admiration. Yet have a care, that there be no crude Humour in the Stomach, for if there should, it would encrease the pain.

Marcus.

XLIX. In puffing up of the Stomach, drying and astringent Plasters, adding the 4 hot Seeds and Sulphur, must be applied: For these astringent Plasters hinder the great dilatation of the Stomach, and so the Wind is better discharged upwards or downwards. They are made of *Emplast. pro matrice, de mastice* and *contra rupturam*. We add seeds of Cummin, *Seseli*, Parsly, Caroway, and other strong smelling things, as Galangale, *Cyperus*, and astringents, unless pain hinder. For then upon the account of the Pain we must use other discutients, that are a little relaxing. But if it be without pain, the constriction must be encreased, for the parts that are once distended, or made lax by distension, never come to themselves again, unless they be kept swathed, or some other way straitened. For this reason, in such Diseases, after some evacuation and discussion we order to bind the region of the Stomach by degrees and gently, which may be done conveniently, with a swathe over the Plaster.

Ronleletius.

L. In the cure of a weak Stomach we must observe, whether being swollen with wind, it can bear Fomentations, and such Remedies. For, if there be any inflammation in its coats, being irritated by the application of hot Medicines, it puffs up, distends, and is most grievously pained. Which they also do by disturbing corrupt Humors, and upon this account, they rather increase the heat than cure.

Mat. Martini.

LI All the back part of the Stomach lies upon the Spine, with which at the first *Vertebra* of the Loyns it is knit together. Whence it happens, that whenever the Stomach is violently distended with wind, those parts, that are joyned to that part of the Stomach which is distended, do partake of the pain. Wherefore when the hind part is distended with wind, then the pain, lying most upon the Spine and Loins, invades the region of the Kidneys, very sharply, just as if one were troubled with the stone in the Kidneys. Which thing often imposes upon the most skilful in the Art, so that they often think, they have the stone who are only ill of wind.

Ficinus.

LII. In an Inflammation of the Stomach Bleeding must often be repeated, in both Arms, as much as the strength will bear. Thus, though because of swooning and coldness in the extreme parts, strength may seem low at first, yet that weakness is from oppression, which requires evacuation, and therefore cannot hinder bleeding.

Riverius.

LIII. Purgatives are not approved of in this disease, because they disturb the Humours, and draw them to the part affected: Yet *Avicenna* commends a decoction of Tamarinds; or half an ounce of *castia* dissolved in Endive water or Whey, every day, for a week; because this purges by loosning, not drawing, takes off the acrimony, and allwages pain. But it is better in the beginning to abstain wholly from purging. When the 7th day is over, and some signs of concoction and declination appear, a Purge may be given of Infusion of Rheubarb.

Idem.

LIV. Among Lenitives *castia* may be convenient for an inflamed Stomach; for though *Galen* 13. meth. 11. disapprove of purgatives in such cases, yet he would not have rejected *castia*, if he had known it. Fortis.

LV. The Advice of the Arabians must not be followed, who apply to the Stomach not only Lettuce and Endive, but Poppy juice actually cold, Errors, as I think not to be admitted: for this so principal a part, and the store house of the whole body, should not be so much cooled. ¶ We have an excellent Remedy in *Galen* 12. meth. 7. Drinking of cold water, yea, according to *Trallianus* a bladder half full of cold water or snow applied to the Stomach. Which two Remedies notwithstanding must be used with a great deal of caution. For one who was 40 years old, being made very thirsty and lean by a hot and dry intemperature of his Stomach, upon drinking a great deal of cold water, left off being thirsty immediately, grew better and digested well, but his Gullet being over cooled, killed him, *Gal.* 7. meth. 8. Therefore we must be careful how we use such Medicines: for *Benivenius* has observed, that a certain very cooling Plaster being applied to the Stomach, did cause difficulty of Breathing, Hickup, and death at last. ¶ Coolers must be such rather potentially than actually, for things actually cold (when the Stomach is inflamed) shut the pores, thicken the Humours, and settle the Blood in the inflamed part. Saxonia.

LVI. We must also have a care of Opiates; for after much use of them the Stomach is ever after all their life long weak, and the mouth of the Stomach is very sensible, and quickly hurt. They condense also by too much cooling. Wherefore a *Scirrhus* follows an Inflammation. Fortis.

LVII. It is worth noting, what *Dodoneus Obs. Med. cap. 31.* tells us of red Urine, That such Urine is made not only in hot Diseases, but oftentimes when the Stomach, and the Liver are weakened and cooled by long Diseases. And he relates a History of a Man Fifty years old, who after a Quartan Ague fell into a Lientery for five Months, and voided crude matter, and no Fever remaining, his Urine was very red: But he had no regard to that, but only to the crudity, and to make provision for the Stomach and Liver, which were weakened with the Quartan Ague, he put him into a heating and drying course of Diet, and gave most generous Wine. For Medicines he gave *Diagalanga*, *Diatriempipercon*, &c. whereby he prevailed so far, that the excrements appeared concocted, and the colour of the Urine abated, and was like a sound Man's. But when the Patient thought himself well, and privately drunk some Beer, his Urine presently grew red again, which plainly showed, that Urine sometimes may be tinged by the crudity and coolness of the Stomach: And when he abstained from Beer, his Urine became again like a healthy Man's. We may often observe this in practice, especially in such as recover of Quartan Agues; for they, when they have eaten any thing hard of digestion, often make such Urine; which colour is not bloody but such as is in burning Fevers, and it comes not from bile, which does not abound, but rather from a crude, and gross Humour. For, if the Stomach be weak, the sulphureous and grosser parts of the food, are not separated in it and the guts, and so voided by stool, but pass into the blood, and being separated from it in the Kidneys, tinge the blood with a red colour, for Urine has not its tincture from bile only, but from a red salt, as we see Ly is tinged with an impure Salt. So in *Scorbuticks* the Urine is not only red, but shining, afterwards letting fall a red sediment, like to brick dust. Idem.

LVIII. The famous *Michael Rucerus* formerly took notice, that heat of the Stomach, called by the Greek *ἐφύρηγία* which comes from a cold Humour and has been often cured by him with Treacle and

Sennertui.

and generous Wine, must be carefully distinguished from the burning of the mouth of the Stomach: For he says, that this, which Galen 3. de compos. Med. S. loc. cap. 3. mentions by the name of *ἔγκυσσις*, arises from violent hot Cholera, fixt in the coats of the Stomach, and is very rare in Germany which he only saw once all his life time in a certain Nobleman, and that he cured him by drinking cold water and Milk. Paracelsus deriving the heat in the pit of the Heart or mouth of the Stomach, from the effusion of Gall and Tartar, omitting Purging, affirms the pain is only to be allwaged, which he endeavours to do, with Henbane, Poppy, Mandrake, and Darnel, with Treacle: He also gave *Laudanum Opiatum* with Amber, Mace, Sugar Candy and Mint water.

Velschius.

LIX. A Nobleman after high drinking of Rhenish Wine, was taken with a violent burning heat at his Stomach for several dayes, so that, though he was very hungry or thirsty, yet he could neither eat nor drink without pain, I perswaded him to take half a scruple of *Sal prunelle* dissolved in Elder water, he did it, and found ease, and in process of time his heat was quite extinct and went away. Another Nobleman complained as much of such a heat in his Stomach, from the same cause, I recommended to him the abovesaid *Sal prunelle*, which had given several others present ease; but with different success: for his pain encreased, to the hazard of his Life: Being affrighted with this Symptome, and considering that the heat arising from too much sharpness in the mouth of the Stomach, might be encreased by the Salt Nitre, when I found that Mucilage of Quince-seeds would do no good, I gave half a drachm of Cream of Tartar, and what was the effect? It had not been given a quarter of an hour, but the pain was quite gone, and so the Patient was saved to the admiration of several.

A. Cnossellius.

LX. Joh. Raymund. Fortis consult. 89. cent. 2. propounds moistning with some attenuation. Among externals there is no better Remedy than Milk, especially Asses, instead of which, when it is apt to corrupt, I usually apply 5 ounces of Mallow juice depurated. But we must wholly desist from the use of other drying things, Rheubarb, Tartar, and even Chalybeates, which otherwise I am wont to use against hardnesses proceeding from other causes, as condensing cold, or filling abundance of the Humours.

LXI. The Wife of N. was suddenly taken with most violent pains about her Stomach and Spleen, which could neither be stopt by Fomentations, nor Purging: but after she was bled plentiful in the left Arm, her pains left her.

Riverius.

LXII. The Wife of N. the last 3 Months of her going with Child was every day troubled with a tedious palpitation of her Stomach, and she was happily cured of it with no other Remedy, than 1 scruple of *Requies Nicolai* swallowed now and then before meal. ¶ A certain Water-drinker having at a Feast drank several healths in Water, fell into horrible gnawings at his Stomach, and the Heart-burn, the next day he was all Lickerick, the day following he took a Purge. About Evening his pain came afresh, and the upper orifice of his Stomach began to beat as strongly as his heart (which Pulse or rather pulsation, of the Heart, I have often observed in the Colick, especially that of our Country). I gave him flowers of Nitre with Magistery of Crabs-Eyes, Pearl and Coral, and the Pain vanished in a moment and returned no more.

LXIII. Choleric, lean, red haired, and thin bodied people are in the beginning of Summer troubled with a pain at their Stomach: for because the Orifice of their Stomach is endued with a most exquisite sense, it is vellicated by bilious Humours (which were before in some measure checked by the temper of the Spring or Winter). The cure is, to purge with Rheubarb, and to give 3 or 4 grains

of *Laudanum Paracelsi*; for certainly when the exquisite sense of the Stomach is dulled, they live much better.

P. Pachequus
Ols. 34.

LXIV. Revulsion must be made of the Humour that causes the pain in the Stomach by divers means, by frictions, Bathings, Cupping, &c. and it must be derived to the wayes of Urine, the Mouth, and to the Muscles, by cauteries: And sometimes to the very Joynts, though they have been pained before. Galen 7. Meth. c. 11. says, we must consider, whether the part mittent of the Humour to the Stomach be less noble than the part fuscipient. If the part mittent be less noble, the matter must be drawn to the ignoble part, if the pain of the Stomach proceed from arthritick pains, the Physician need not fear to send the pains to the former place. If they be equally noble, we must take care to strengthen both.

Saxonia

LXV. Since Emulsions sweeten the acrimony of the Humours, especially of the Serum, when it is tinged with a bilious saline acrimony, it is observable that they are not so good for acid Humours, or for such in general as are gathered in the first wayes, because acids, as they are contrary to Milk, so also to emulsions; and for this reason they are not so convenient in an acid and pituitous crudity, but they rather add weight to that viscosity, and cause disturbances, wherefore in this case they are often vomited up again.

Wedelius

LXVI. In the use of all Emulsions, also the strength of the Stomach must be looked to, that they be not ordered, when Humours abound, and consequently laxity; nor in wind: for when the Heat is not strong, when Humours in general abound especially acid, bilious, phlegmatick, in and about the Stomach, wind is easily produced, or the Emulsions are windy. Therefore in wind of the Stomach, weak appetite (by an essential fault especially, for in Fevers it is another thing) Colick, Dropsie, diarrhoea and other fluxes of the Belly, they are not altogether so commendable, for they easily turn fower, and corrupt on the Stomach. Wherefore the *Helmontians* little esteem them, because they bring a strange fowerness: hence likewise it is easily evident, that they do no good in any pains, coming from vitiated Chylification, from wind in the lower Belly, or from obstructions there. I observed once, that one sick of a Malignant Fever, when he took much of an Emulsion, that was prescribed him, he fell into the Hickup; others have been troubled with belching, after them.

Idem

LXVII. There arises a great difficulty about a cold Stomach and a hot Liver; how namely a cold Stomach may be heated, and the Liver not inflamed; Since what things heat the Stomach, the same for the most part, also inflame the Liver. And Galen contriving how to obviate this mischief, invented that composition, which he called *Diatrion Piperis*. This Medicine indeed is endued with a singular virtue, to heat the Stomach, so as that its heat shall not be communicated to the Liver: for, seeing it consists of 3 sorts of Pepper, whose heating faculty consists in a thin substance, it is spent before it comes at the Liver. It is therefore a convenient Medicine to heat and take off the intemperature of the Stomach.

Abr. Seyl-
ler, Conf. 64
l. 4. Conf.
Cratony.

Medicines especially made use of by eminent Physicians.

For Imposthumes, Erosion, and Ulcers.

1. I have experienced this Plaster, that it ripens Imposthumes, Take River or Sea Crabs; boyl them in water, let the flesh when boyled and bruised and mixt with Barly flower, be applied. This ripens the Imposthume effectually in 3 dayes.

Bayrus

2. When

2. When the Ulcer is cleansed, Amber may be given. It is good also in Vomiting of Blood.

3. Antimony is the only thing which Purges and rids the Stomach of all its tartareous excrements. When the Body is purged the butter of Pearl is good for a Consumption of the Stomach; but he that can use the sweet and red Oyl of Antimony, needs no other Medicines for the Cure of the Stomach.

4. This Medicine is effectual in healing an Ulcer in the Stomach. Take of Frankincense, Mastich, Tragacanth each 3 drachms, Amber 1 drachm, a little Dragon's Blood, with Syrup of Quinces.

For heat of the Stomach.

1. I have experienced, that Tincture of Tartar is good for heat in the Stomach.

2. It is especially good for such as travel in Summer time to take the tops of the twigs of a green Sloe tree, that have grown that year, and chew them, and swallow them.

For Wind.

1. There is nothing more convenient and proper for concoction, than to wear a Plaster of one part pure *Ladanum* and two parts Wax; for it sweetly maintains the innate heat, and conduces very much to break Wind and help concoction.

2. Dwarf-Elder used any way is exceeding good for Wind in the Stomach or in any part. The root of it is more effectual than the leaves. Boyled in Wine and drunk, it is very good for Dropsies.

3. Three or four drops of Oyl of Carowayes given in broth or wine are good, and Lozenges made of it. ¶ Also *Emplastrum de baccis lauri* is very effectual in expelling of Wind.

For Intemperature.

1. In a cold intemperature of the Stomach I have long experienced this Plaster to be of wonderful virtue; Take of *Diachylum maurus*, Pitch or Turpentine each 2 drachms, *Diarrhodon Abbat* 2 drachms, as much Wax as is sufficient. Make a Plaster and apply it to the Stomach. ¶ Oyl of Fir, Indian Balsame, and oyl of Mastich are also wonderful good in a dry cause.

2. *Crocus metallorum Abyssinicus* is excellent good in all Diseases of the Stomach.

3. In a hot and moist intemperature of the Stomach, I have often with success used this Electuary of Steel; Take of prepared Coriander half an ounce, *Species Diatrion Santalon* 2 drachms, Roses powdered 1 drachm, prepared Steel 6 drachms, Sugar dissolved in Rose water what is sufficient. Mix them. Make an Electuary.

4. This is an effectual Cataplasin in a cold intemperature of the Stomach, which *Rhazes ad Almanforem* makes of *Syrax*, Spike, Wormwood, *Calamus Aromaticus* and Mastich, sprinkled with old Wine and juice of Quinces. ¶ In an intemperature of the Stomach coming from thick bile, when it sticks fast to the Coats of the Stomach, there can scarce be a better Remedy than *Hiera*. ¶ In a cold and moist intemperature the following water is good, which is good for a weak Stomach, purges it of stinky Humours, cures a Cachexy, and hinders the breeding of Worms; Take of Gentian, lesser Centaury each 3 ounces, Galangal, Cinnamon, Mace, Cloves, each 1 ounce, flowers of Sage, St. John's-wort, Rosemary each half an handful, white Wine 4 pounds. Digest them 8 dayes, and then deſill them.

5. Flowers of Roman Wormwood and tops of Melilot, boyled in Wine and strained. The Colature drunk is highly commended in a cold intem-

perature of the Stomach. ¶ Syrup of *Carduus Benedictus* is reckoned a present Remedy in a cold and moist Stomach, if taken warm in the Morning.

Medicines.

I. AN accidental Vertigo, or any that is new, is for the most part cured by Bleeding, and Purging sometimes. For the cure of one that is habitual and inveterate there are three Medical Intentions. 1. When all the matter for the Disease to feed upon is taken away, we must endeavour to preserve the Brain free from new afflux of Morbifick matter; for which purpose when a right course of Diet is ordered, sometimes bleeding, and a gentle purge given frequently at intervals will be convenient. Let a dry and airy place be chosen; let immoderate and unseasonable sleep and study be avoided; let him abstain from Mornings and Evenings draughts; instead of the former let him drink Tea or Coffee made with a few leaves of Sage mixt with them; let an Issue be made in the Leg or Arm, and sometimes let the Hemorrhoid Veins be opened; let the Party affected alwayes rise betimes, and every Morning wash his Temples and Fore-head with cold water, and rub it with a course cloth. 2. The second Intention will be to take away the procatactick causes, wherefore we must endeavour both that the cacochymick Dyscrasie of the Blood, and the weak and too lax constitution of the Brain may be amended. For the First, Medicines, that are powerful alteratives, as temperate Antiscorbuticks, chalybeates, and sometimes Spaw-waters or Whey, are proper. To which, because of the latter thing indicated, cephalick Medicines must alwayes be added, such namely as are made of Coral, Amber, Man's skull, Male Pæony root, Mistletoe, Peacock's dung, &c. 3. The third Intention, which is properly curatory, takes away the conjunct cause, which nevertheless, when the procatactick are removed, usually ceases of it self: For if the approach of all extraneous matter into the Brain be prevented, there will nothing remain but pure Spirits, which having got liberty and room enough within the callous body, they disperse themselves thence every way. However for this scope of cure, we must give now and then Medicines endued with a volatil Salt, whose very subtil and

and active particles recreate the Animal Spirits; such as especially are spirit of Harts horn, Soot, Sal Ammoniac, impregnated with Amber, Mans Skull, &c. Tinctures of Coral, Amber, Antimony, Elixir of Pæony and the like.

Moreover it may not be amiss to adumbrate the method of cure a little more particularly, in showing what must be done upon account of the cure in the Paroxysm; and what for preservation, out of it.
